The most notable feature in the Temperate House just now is furnished by the rhododendrons in the cool portion of that structure. Rhododendron arboreum is freely represented in the shape of large specimens, one in particular of the variety roseum, quite a massive tree, being absolutely laden with trusses of rich rose-coloured blossoms. Another notable form is one with large rosy red flowers, while in another they are pink. These individuals serve well to show the great variability that exists in the colours of the blossoms of this species, while there is also a considerable difference in the leafage of some of them. Rhododendron barbatum, from the rich blood-red colour of its blossoms, can be readily singled out from any of the others, its only rival in this respect being R. Thomsoni, which is not now in bloom. The hybrid between these two last-named species, R. Shilsoni, seems to be gradually advancing in popular favour.

[Photo: Lord Onslow.

VIEW IN THE IRIS GARDEN AT CLANDON PARK, GUILDFORD.

Some dense bushes of R. ciliatum are absolutely laden with their white blossoms, which in the bud state are often slightly tinged with pink. The neat habit and extreme floriferousness of this rhododendron has led to it being largely employed by the hybridist in the production of new varieties, one of which, a cross with R. Edgeworthi, is unfolding its large deliciously fragrant blossoms. Another white-flowered species is R. Gibsoni, also known as R. formosum, a favourite conservatory plant, remarkable for its profusion of bloom. The uncommon R. Hodgsoni, characterised by very large leaves, thickly clothed with tomentum, is bearing its rounded clusters of peculiarly tinted blossoms, a kind of rose lilac in colour. It is certainly less showy than some of the others, but is at the same time very distinct. The pale yellow flowers of R. campylocarpum are just unfolding. This is an exceedingly pretty and distinct species, and suggests the possibility that, by a series of seedlings therefrom, a rich yellow form might in time be obtained. Another species also in bloom is the Chinese R. ciliicalyx, somewhat suggestive of the Moulmein R. Veitchianum, but the white flowers have in the bud state a pinkish tinge.

From the species to the hybrids is but a step, and concerning these one cannot fail to note the important part that R. Griffithianum or Aucklandi has played in the production of many fine forms. Glory of Penjerrick, a Cornish raised hybrid, stands out conspicuous from any of the others, the noble leafage and huge trusses of richly-coloured flowers being all points in its favour. The other Griffithianum hybrids include those raised at Kew between that species and some of the garden forms, while the well-known Pink Pearl is also represented. R. Forsterianum, one of the largest flowered of the Edgeworthi hybrids, being a cross between that species and R. Veitchianum, makes a fine display with its noble blossoms. Besides those above mentioned, some of the garden varieties are used with advantage in the main portion of the Temperate House to lighten up the beds of foliage plants. So situated they were safe from the cutting winds of early April, and consequently the flowers are fresh and bright.

Enkianthus japonicus.

This, like the rhododendrons, is a member of the order Ericaceæ, but in general appearance it differs widely therefrom. It forms a freely-branched deciduous shrub, whose blossoms make their appearance almost simultaneously with the leaves. The flowers are of a drooping urn shape, and suspended by rather long pedicils. In colour they are of a pure waxy white. Though introduced in 1870, it is not often met with. A specimen in the Temperate House is just now in full bloom.

Cytisus proliferous.

This distinct but tender member of the Broom family has mounted upward to the top of one of the pillars of the Temperate House, and, being just now laden with blossoms, it forms a very pleasing object. Compared with the other brooms, it is a strong grower, the long, vigorous shoots being clothed with silky leaves, and studded for a considerable distance with white pea-shaped blossoms. This species is a native of Teneriffe, from whence it was introduced in 1779. It is hardy in the especially favoured parts of the extreme West of England.

Veronica Hulkeana.

A group of this pretty veronica in the greenhouse forms a very attractive feature, the plants composing it being quite laden with their pleasing lilac-coloured blossoms. It is a fairly well-known species, native of New Zealand, and hardy in Cornish and Devon gardens. When large, it has occasionally an unfortunate habit of partially dying away quite suddenly. As a decorative plant for the greenhouse it is, as may be seen at Kew, well worthy of note.

Calceolaria violacea.

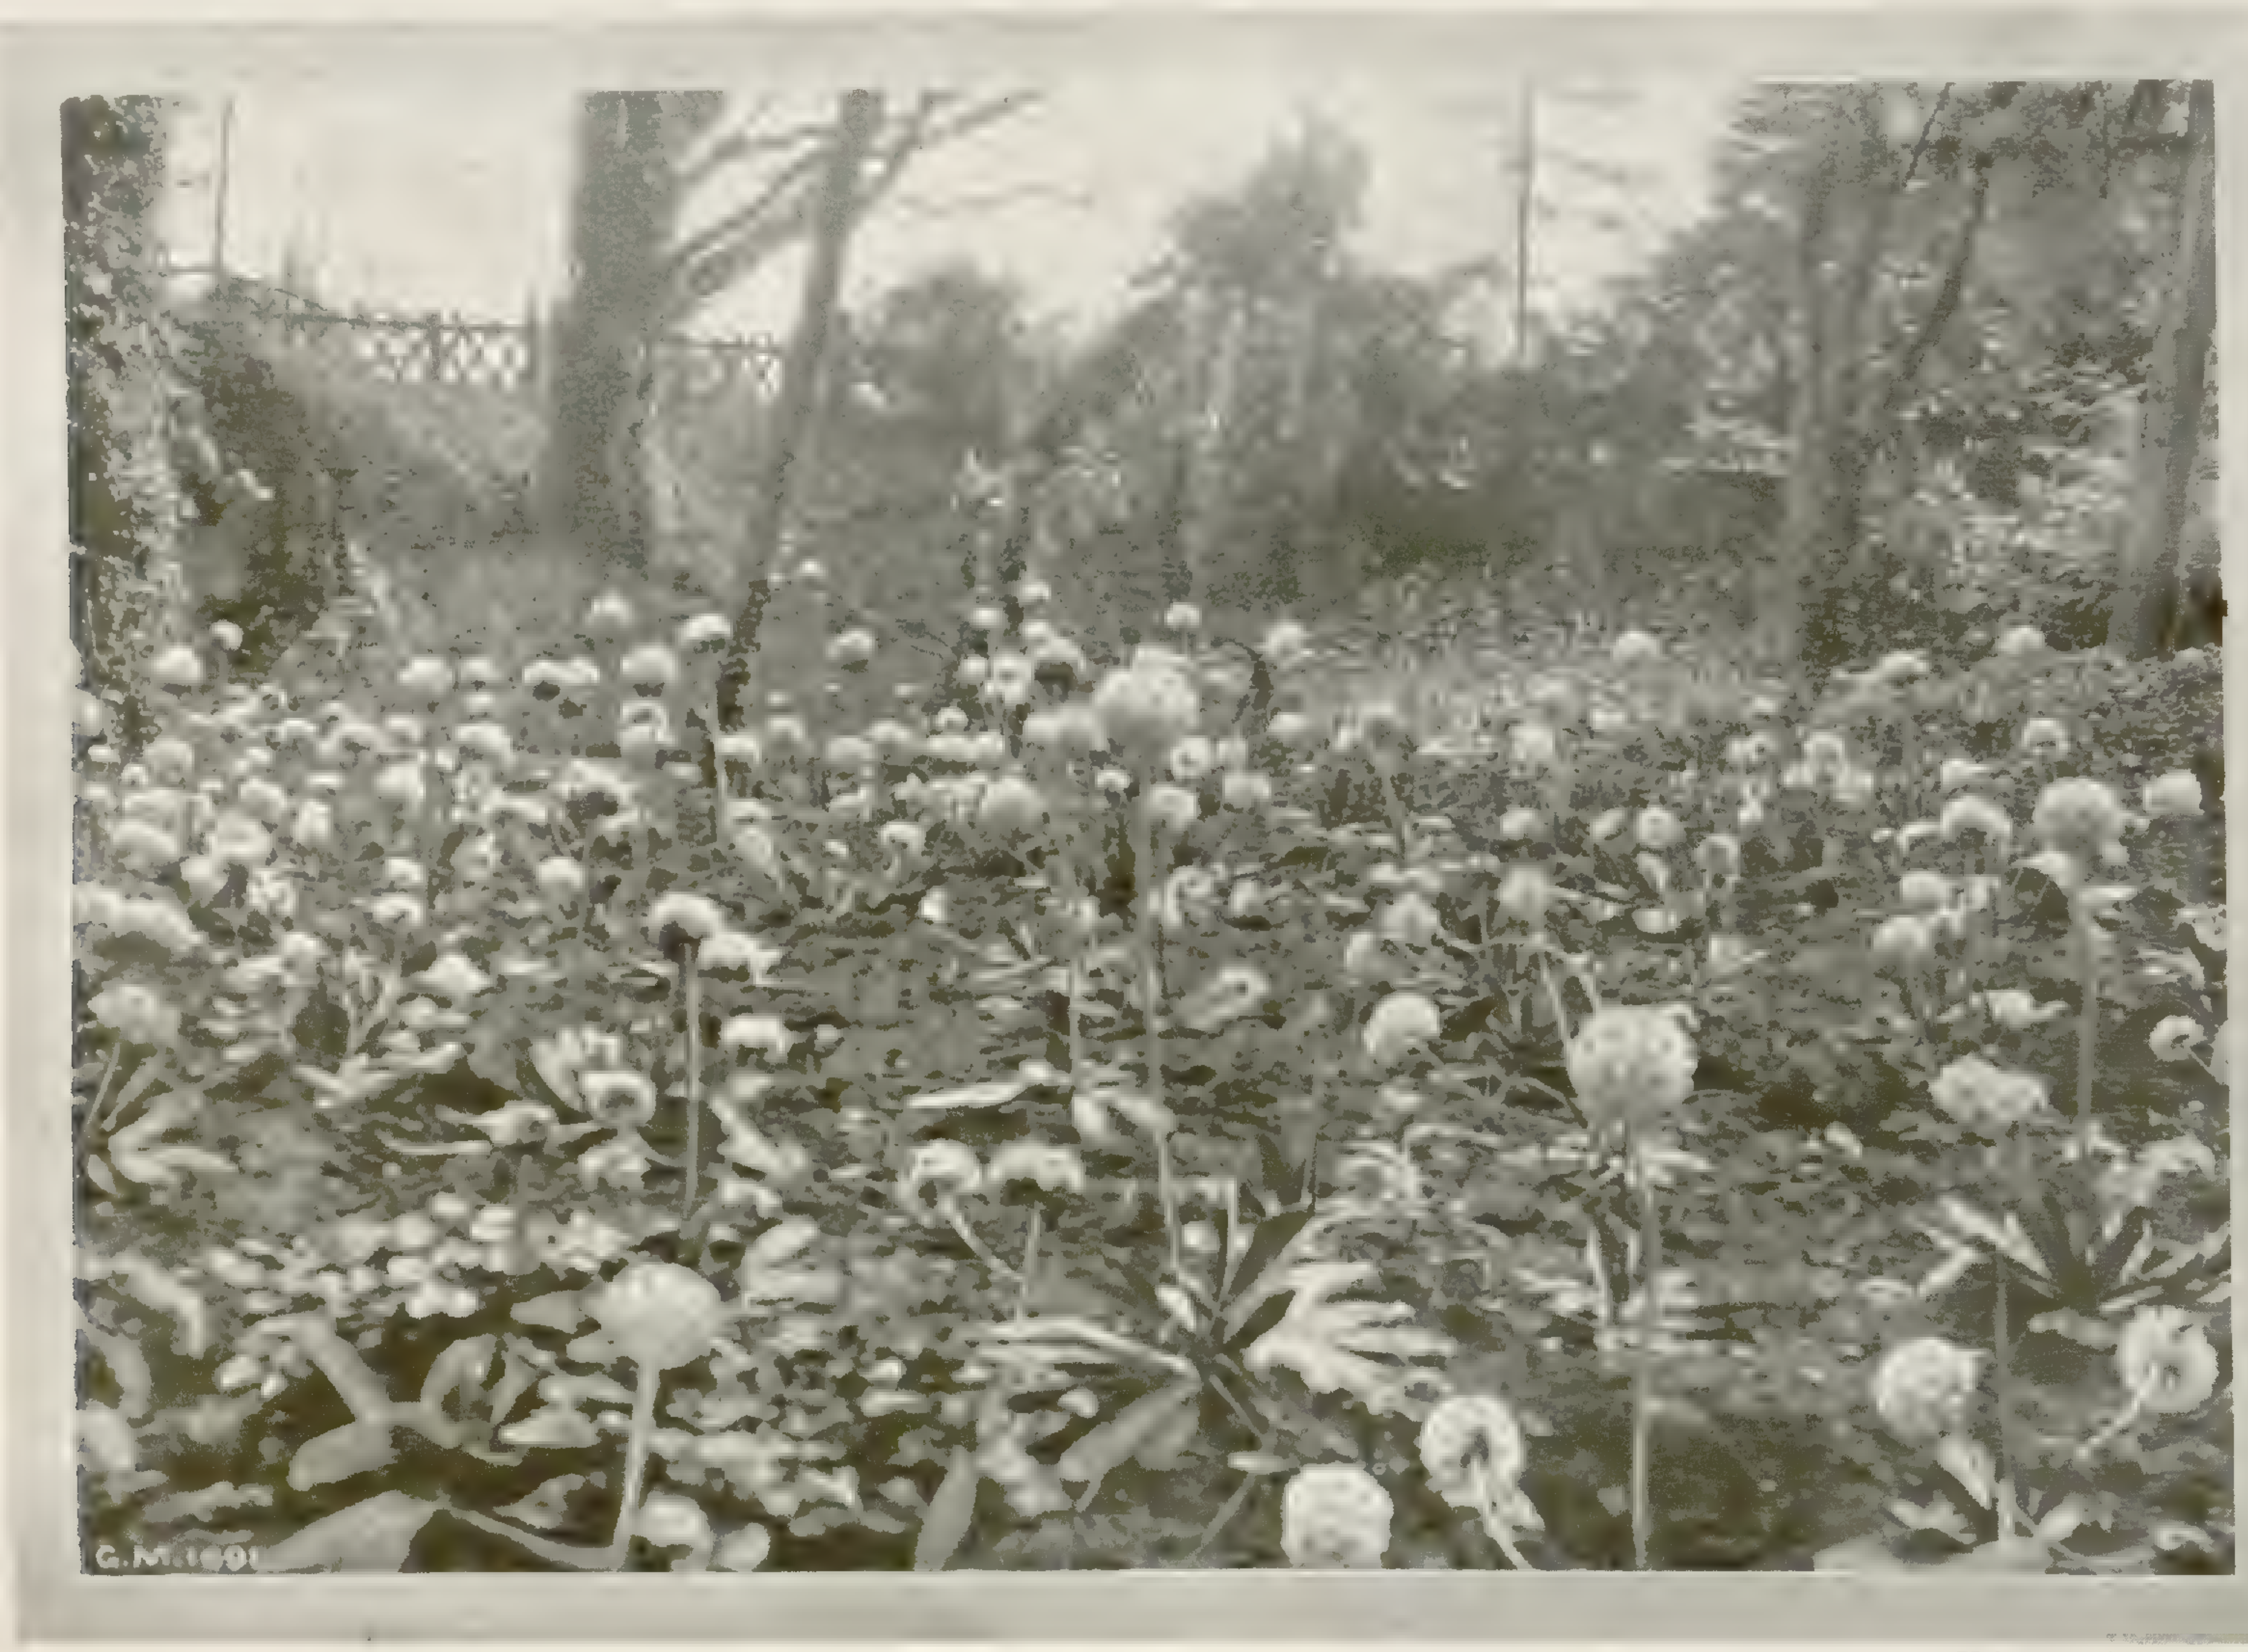
A specimen bush of this calceolaria, some six feet or so in height, is in full bloom in the greenhouse. The general idea of a calceolaria is that the flowers are of some shade of yellow or red, but this is quite a break away therefrom, while in shape also it differs very widely from the garden varieties, being more in the form of a helmet. The blooms are small, but very freely borne, their colour being a kind of deep mauve dotted with violet. This calceolaria forms a much-branched shrub whose comparatively slender shoots are clothed with deeply serrated ovate lanceolate leaves.

Psoralea pinnata.

This attractive greenhouse shrub is now in bloom in the greenhouse. It is a native of South Africa, and, although it was, according to the "Dictionary of Gardening," introduced in 1690, it was till within the last few years very little known; indeed, it does not occur in the "Kew Hand List of Tender Dicotyledons." It forms a rather upright-growing, freely-branched shrub, clothed with light pinnate leaves. The pea-shaped blossoms are of a pleasing shade of blue, marked with a lighter tint. It flowers for some considerable time, and forms a very pretty object in the greenhouse.

Rondeletia cordata.

This South American evergreen shrub is in full flower in the greenhouse, where, planted out in one of the beds, it is much admired. This rondeletia is a near relative of the bouvardias, but is altogether a larger growing plant than any of them. It forms a free, bold-growing shrub, clothed with stout leaves, which are in the largest examples about six inches long and half as much in width. The flowers, which are borne in terminal clusters, may individually be compared to those of the laurestinus. In the bud state they are deep pink, but the interior shown after expansion is blush, with yellow hairs in the centre. Taken altogether, the rondeletias are a very pretty class, this just named species, R. speciosa, and R. gratissima, being perhaps the three best.



[Photo: Lord Onslow.

PRIMULA DENTICULATA IN THE PRIMULA DELL AT CLANDON PARK, GUILDFORD.

Rhododendron racemosum.

One often sees specimens of this charming little rhododendron dotted here and there, perhaps on a piece of rockwork, but it is not in this way that it is seen at its best. At Kew there is a considerable stretch of it planted near the Pagoda in the same manner as the hardy heaths are there treated, and in this way the rhododendron forms a delightful feature. They are apparently seedlings, as in habit and colour of the flower there is a certain amount of individual variation. Lesser quantities are also planted in other parts of the gardens, but they are also very beautiful; indeed, the claim of this rhododendron to be regarded as one of the best of early flowering shrubs cannot be disputed. K.

ANDROSACES.

It is common knowledge that with many genera of plants a single species is so representative of the genus that it forms, as it were, the key whereby we unlock a long series of good things, and after many years of trial may still maintain a foremost position among hardy plants. Of the genus androsace one ascribes this influence rather to the Himalayan members than to those common to Europe, not, however, as being of more beauty or greater merit, but their cultural requirements places them within the reach of all. I particularly have in mind Androsace sarmentosa and A. lanuginosa, for in both we find the great beauty characteristic of the group presented in most exquisite detail, in which form, arrangement and colour of leaf and flower alike contribute, so that in the aggregate we are confronted by two hardy Alpine plants that are practically faultless.

Their cultural requirements are not difficult to provide; both species appreciate an open sunny position, and preferably one that is slightly elevated and well drained; the soil should consist of rich loam, leaf-soil, and grit, with plenty of sandstone chips to render it cool and porous, and the addition of lime in some form is also advisable, as both plants flourish with marked vigour on limestone soils. A suitable position for A. sarmentosa is under the friendly shelter of a projecting rock, with an inclined face to shed the water behind, as too much moisture upon the rosettes and growths in winter is the pressing danger one has to safeguard these subjects from.

A. lanuginosa prefers a deep crevice about middle level, with plenty of rock surface over which the prostrate shoots will hang; the supply of moisture for both species should always be adequate in summer, and in order to protect them from excessive damp in winter some temporary measure can always be adopted by placing sheets of glass raised a few inches above the plants, and at such an angle as readily carries the water away from the roots. Androsace lanuginosa is a choice and most effective plant for "rock" or "dry walls," and in such positions they are singularly free from winter damp.

Although both species are native of the Himalayas, they are quite distinct. A. lanuginosa is a trailer, with silken grey leaves arranged on prostrate stems that are tinted red; the flowers are in umbellate heads borne on short erect stems, and the individual flowers are of a delicate rose shade with a conspicuous eye; it usually begins to flower in June, and stray blossoms may often be found as late as October. In A. sarmentosa the leaves are arranged in perfect rosettes, from which, in the growing season numbers of runner-like growths are produced, each terminated by a miniature plant that, when pegged into the soil produce roots and develop into a fresh individual; by this means increase is easy. The flowers come in May and June, and are borne in umbellate heads on erect stems some five to seven inches in height; the flowers are of a rich clear shade of rose, with a paler coloured eye.

Both species require a top-dressing of rich soil worked in among the shoots every year, early in spring; the rosettes being all securely pegged into the soil at the same time, and care should also be exercised so as not to unduly smear the silken foliage with the soil. Thomas Smith.

AROUND THE ROCK GARDEN

In the GARDENERS' MAGAZINE of April 22 Mr. E. C. Pooley advocates the use of annuals for rock garden adornment. This may be distinctly a good idea where there are large patches of uncovered soil, but it is not one to be followed when planting up a rock garden. There is such a wealth of perennial alpines, rock plants, and mountain shrubs, that I would always advise the almost total exclusion of annuals from the rock garden proper.

One has not only to consider the effect of masses of blossom in spring and summer, but of equal necessity is the drapery of foliage and the colouring it gives to the rock garden during autumn and winter. Herein lies the true charm of the rock garden. It is a garden, not for any special season, but for the whole year. In it one can always find growth, foliage, colouring, and blossom; a perpetual beauty which annuals cannot give. Take aubrietias, alyssums, helianthemums, rhododendrons, lithospermums, sedums, saxifrages, violas, drabas, arabis, yea, and a host of other plant groups of perennial duration, and you will inevitably recognise that even when entirely out of blossom the diverse forms and hues of these spreading mounds of foliage are intensely interesting, and have a quiet beauty of their own. There is nothing dull in foliage effects, even if there is little blossom to heighten the beauty, but the studied charm of varying hues and shades found in alpine shrubs and plants on a winter's day is truly a mine of delight.

One aim of the successful rock gardener should be directed toward the securing of varietal forms which tend to perpetual blossoming. Certain plants have this good habit far above their fellows. Aubrietia Dr. Mules is typical. It is practically perpetual in flowering, and it should be the ideal for the raiser to get other varieties with the same freedom with differing colours.

Violas, again, give forms which are practically ever in flower. Viola gracilis is grandly effective, but if we could infuse this continuous flowering into this species, its value would be greatly enhanced. A golden yellow viola, which I use as a contrasting associate to gracilis, carried its gleams of gold right through the dull days, and is typical of what we want in other species and varieties. Helianthemums, too, are worth consideration, for here again we have forms which give one profuse display, and then pass out of blossom, while others give good secondary displays without impairing their vigour or good habit of growth.

I need not emphasise the value of seedling alpines and rock plants, but the reader will agree with me that in this direction lies one of the great charms of garden work. The raising of seedlings and the interest associated with their blossoming, is of importance to all who value their garden, and ofttimes one gets charming results.

For instance, the raising of mossy saxifrages is fraught with much pleasure. The new red shades which come from various sources are typical. Since the advent of that standard favourite Guildford Seedling, we have had the pleasure of securing R. W. Hosier, Scarlet Queen, decipiens hybrida grandiflora, and bathoniensis, the two last being exceptionally showy.

A batch of seedlings from these now coming into blossom gives promise of many pretty forms, one already surpassing in depth and brilliancy of colouring the varieties under notice. As the range varies from white, through pale and deep pink, to scarlet and crimson, it may be realised by the reader that the flowering of the seedlings is of certain interest.

Again, in violas we are obtaining some useful forms. V. gracilis has favoured us with a fine large-flowered variety with flowers of rounded outline, without losing anything of its inimitable colouring. A vinous purple variety which lights up splendidly in the sunlight is also an acquisition, and several others are noteworthy. A cross between gracilis and a florist's viola has given a bright blue-winged flower of good size, which we anticipate will take the place of V. papilio, as far as we are concerned.

Few bulbous subjects are more charming during spring time than the fritillarias. Even if one confined themselves entirely to forms of F. meleagris, the interest afforded is especially pleasing. There is such a diversity of pretty colouring to be found amongst a good strain of these dainty bell-like flowers, ranging from the purest whites to the deepest maroon purples, that there is ample reason for them to be found in every garden. The addition of a few of the better species, such as persica, recurva, Thunbergi, pyrenaica, aurea, armena lutea, and rubra, and biflora, will give an added interest and charm to even the best of gardens.

Anemones in quantity, including the forms of blanda, apennina, palmata, and the glorious pulsatilla and its variety alba,

FIRST PRIZE TWELVE LONG TRUMPET DAFFODILS.
Exhibited by Messrs. Cartwright and Goodwin, of Kidderminster, at the Midland Daffodil Show, Birmingham.

give fine drifts of blossom. The varied forms of the wood anemone (A. nemerosa) are also charming en masse, the best of these being alba plena, rosea, rosea plena, and the brilliant blue Robinsoniana. Tall plants in certain positions help to give a fine effect to the masses of lowlier subjects, and therefore, if space permits, a few romneyas, Gaura Lindheimeri, flag irises, light habited campanulas, etc., may with wisdom be permitted into the rock garden proper.

Flowering shrubs, including tamarisks, weigelias, rubus in variety, ribes, shrubby spiræas, deutzias, rhododendrons, azaleas, kalmias, etc., may be freely introduced into the large rock garden, and with their beauty will lighten up the heavy pines, cypress, etc., and the dull bronzed rocks during the season of blossoming.

P. S. Hayward.

THE CISTUSES.

Unfortunately these dwarf flowering shrubs are not sufficiently hardy to allow them to be generally planted, yet in the warm districts of the south and south-west, where the winters are not very severe, most of them will survive. The hardiest are C. ladaniferus (the Gum Cistus), C. laurifolius, C. crispus, and C. florentinus. These may be grown in the colder localities, and if afforded wall protection, with a sunny aspect, will usually pass through the winter safely. In the warmer districts, where the winters are fairly mild, they should be largely grown, for there is hardly another class of flowering shrubs more suitable for furnishing dry sunny banks. They all adapt themselves wonderfully well to rock garden planting, and provide an abundance of bloom through the summer months. Although the individual blossoms are but short-lived, they are produced in large numbers over a considerable period.

Pruning is necessary when the plants are in the young stage to secure a bushy habit, but afterwards no pruning is required, unless the plants become too large for the position, then hard pruning may be resorted to. Cistuses derive much benefit if the seed pods are picked off immediately the flowering season is over, as these have a weakening effect when left on. Propagation may be easily accomplished by taking cuttings early in August and inserting them in sand in a close cold frame. Here they quickly form roots, and should be potted and grown in a frame until well established. In two seasons fair-sized flowering plants are thus obtained.

Cistus algarvense has a dwarf spreading habit, and is a most suitable kind for the rock garden. A position in the lower part of the rockery should be afforded it, one where the eye can catch it. The flowers are small and yellow, with a dark blotch at the base of the petals. It requires no pruning. C. albidus is very shrubby, and reaches a height of three to four feet. The foliage is whitish, hence the name, and the flowers are bright rose in colour. It is rather tender, and requires a little protection during hard weather. C. crispus has large saucer-shaped flowers of a reddish-purple colour. It is a great favourite, and grows about two feet high. C. cyprius reaches a height of three to four feet, and bears large white flowers in clusters.

C. formosus is extremely beautiful, its slender growths carrying numbers of yellow blossoms, each having a red blotch at the base of the petals. There is a variety called formosus unicolor, which has clear yellow flowers. C. ladaniferus, the Gum Cistus, is an old favourite, and is perhaps the best known of any. It is sometimes confused with its variety maculatus, which has dark blotches at the base of the flowers, while the species is pure white. C. laurifolius is similar to the preceeding with regard to the flowers, and it also has a variety called maculatus. These two species, ladaniferus and laurifolius, are suitable for grouping in warm sheltered corners.

C. lusitanicus is perhaps one of the best, and should be planted wherever it will stand the winter safely. The pure white flowers, with crimson base, are very effective. C. purpureus has pale purple flowers with a dark base to the petals. It is rather tender, and inclined to become leggy, especially if pruning is neglected in its young state. C. obtusifolius, C. rosmarinifolius, and C. salvifolius all have white flowers, and grow about two feet high. C. villosus makes a delightful little bush about eighteen inches high, and bears a profusion of rose-coloured blossoms. E. C. Pooley.

FIRST PRIZE COLLECTION OF TWENTY-FOUR DAFFODILS.
Exhibited at the Midland Daffodil Show, Birmingham, by Mr. F. S. Staffurth, Frieston Priory, Boston, Lincs.

Coccocypselum hirsutum.—Among the plants which have a very pretty effect when grown in a suspended basket in the stove or intermediate house must be reckoned this coccocypselum, as under these conditions its long trailing shoots will hang down for a considerable distance. These are of a somewhat succulent nature, and are clothed with oppositely arranged ovate leaves, which, in common with the stems are very hairy, hence the specific name. The flowers, which are borne in little clusters in the axils of the leaves, are blue, but small and not at all conspicuous. They are succeeded by berries, which, when ripe, are about the size of large peas, and of a bright blue colour. It is a native of the West Indies and also known as Crepens.—W. T.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

FLORISTS' PENTSTEMONS.

Apart from its uses for general purposes of garden decoration, the pentstemon is one of the most useful plants we have, flowering, as it does, from midsummer to Michaelmas, and even later. It is a hardy perennial, in a limited sense, in favourable soils and situations, but normally it cannot be relied upon to stand a sharp, or even a very wet, winter, 12 deg. to 15 deg. of frost generally being sufficient to blacken the foliage, damage from which plants seldom recover sufficiently to be worth retaining. Where they do stand the winter they will be in flower by the end of May or beginning of June, but they do not last so long in beauty as young examples.

FIRST PRIZE COLLECTION OF NEW DAFFODILS.
Exhibited at the Midland Daffodil Show, Birmingham, by Mr. E. M. Crosfield, Cossington, Bridgwater, who won the Cartwright Cup and Gold Medal with his exhibit.

Pentstemons like a deep, rich, moist soil, flowering very little in a dry one, while they do not object to a considerable amount of shade. As there are so few of our summer bedding plants that are not the better for all the sunshine they can get, this latter characteristic is a considerable point in their favour. Named varieties are, as bedders, certainly rather dear to buy, but this is the quickest way to get a stock of the finest sorts with massive spikes of gloxinia-like flowers. Once a stock has been obtained, however, their propagation by cuttings is a simple matter. Plants of mixed sorts may be bought much more cheaply, but will, as a rule, be of no better varieties than can be obtained from a packet of the best seed, though they will flower earlier, supposing in both cases no preparations for a bed to have been made until the approach of spring. The drawback of mixed seed, as of unnamed plants, is the usually undue proportion of flowers of lilac, maroon, purple, and magenta shades. Some seedsmen sell seed of the best shades of pink and red by themselves, and it is well to buy this, unless one wants as great a variety as possible. Seed sown in gentle heat in February, and the seedlings treated as pot plants till they are ready to put out, will produce good flowering plants by the end of July or the beginning of August. If, however, seedlings are going to be grown at all, it is better to sow the seed in June, and pot them up, standing the pots in a cold frame for the winter, and giving protection in severe weather. Those in pots sometimes begin to damp off after February, and when such is observed to be the case they should be planted out as soon as the weather permits, keeping some light covering handy to throw over the bed in the event of a very sharp frost. Plants raised in this way will be coming into flower in June, and will attain the size of small shrubs by the autumn. Seed may also be sown in the open at the end of May or early in June, and the seedlings pricked out on a nursery bed of good soil, in which case they can be potted up in the autumn and treated as mentioned above, always remembering to give plenty of air in open weather. A pentstemon bed should receive a mulch of short manure as soon as the plants begin to grow together, and in the event of a dry spell should receive one thorough soaking and be then left alone.

If named sorts are grown, as many cuttings as possible should be secured, and, if mixed seedlings are grown, there will generally be some which it will be worth while to propagate. In any case, the first batch of cuttings should be taken before the end of August, putting them in pans of sandy soil, and setting them for the first week or two in a frame, which is kept well ventilated and shaded from the sun. Afterwards it is as well to set them in a shady place in the open. Further batches may be taken, as material becomes available, up to October. Cuttings may be made from the laterals of the flowering stems, from the tops of strong shoots which have not flowered, and from little shoots from the base, cutting them off level just below a joint, and removing one, two, or three pairs of leaves according to the nature of the cuttings. As with seedlings, all the attention they need in the winter is ventilation, occasional protection, and enough water to allow of growth, which continues all the winter in favourable weather. The earliest cuttings may be potted off in October and the rest in February, or as soon after as they are well rooted, and planted out when they are ready for a shift. They will be rather later in coming into flower than the seedlings raised the previous summer, but will become quite as strong later, though not, perhaps, such large bushy plants. When a good stock has been obtained it is worth while marking some of the finest spikes for seed to supplement the cuttings, as it is often difficult to get enough of the latter in good time to allow for casualties—rather numerous sometimes—while the seedlings will sport to a certain extent, and some fine varieties may be obtained.

Alger Petts.

Vegetable Marrows.—If seeds were sown in March the plants will have attained a size sufficient for planting out on hillocks, but will require the protection of handlights for a few weeks to encourage them to make growth, admitting air during the day, especially when the sun is bright. The plants that were raised early and planted on mild hotbeds will be making fruitful growth, and should be carefully watered, and the flowers fertilised during the middle of the day, admitting more air to the frames as the power of the sun advances.—C. F.

WORK FOR THE WEEK.

CONSERVATORY AND GREENHOUSE.

PERPETUAL - FLOWERING CARNATIONS.—The main batch of young plants should now be placed in unheated frames. Cleanliness must be aimed at to keep the plants in perfect health, therefore the frames must be thoroughly cleaned, and receive a new coat of limewash. A good ash bottom is preferable on which to stand the pots. When removing the plants examine each one separately for any signs of rust, and this, if detected, must be picked off and burnt. Ventilation must be carefully attended to at first, gradually increasing the amount as the plants become hardened. A little air may be admitted during the night to prevent the atmosphere becoming close and stuffy. Other plants which are now carrying quantities of bloom will need the assistance of occasional dressings of manure. Weak soot water may be given every alternate day. The growths must be kept neatly tied up to the centre stake. Shade from brilliant sunshine is necessary to preserve the colour in the flowers. Admit an abundance of air without causing a draught on all possible occasions, and keep down the temperature by damping the floor and stages.

CANNAS.—Young plants that were raised from suckers in the early part of the year will now be ready for potting into 48's. The compost used should be fairly rich and porous, and include some dried cow manure. The pots should be well crocked to allow a free drainage, for cannas delight in plenty of water when in full growth.

CAMELLIAS.—As soon as the flowers have fallen the trees should be thoroughly cleaned. Little pruning is necessary, except that required to keep them in shape. See that the roots are well supplied with water. Any pot plants which require repotting should be attended to now, using a good fibrous loam, peat, and coarse sand, and pot firmly. A little shade from hot sunshine is necessary to prevent the young foliage being scorched.

FRANCOA RAMOSA.—This plant is of easy cultivation, and is a very useful subject in many forms of decoration. When grouped amongst low-growing subjects, such as begonias, its long sprays of white flower-show off to great advantage. Associated with other flowers it is most effective for the dinner table decoration, and is also very useful for wreaths and bouquets. Seeds may be sown at the present time in sandy soil, and placed in an intermediate temperature. A companion plant to the francoa is Celsia arcturus, and may be grown in a similar manner. Both plants resent being overpotted, a 48-size pot being large enough for the first year in which to flower them.—A. Grubb, Porter's Park Gardens.

THE ORCHID HOUSES.

CONSTRUCTION OF ORCHID HOUSES.—On two or three occasions recently I have been asked to advise on the building of orchid houses, and this has led me to believe that a note on the subject would be of service. I do not wish to convey the idea that there is a demand for structures for the successful cultivation of orchids differing materially from those used for the accommodation of other classes of plants. At the same time, I would point out that where houses are being built with the intention of growing orchids in them, there are certain points that may be considered desirable, and as these will not make any appreciable difference to the cost of the structure, it will be well to consider them. The first point is the aspect. In my opinion all houses for plant growing are best built north and south, as the plants growing in them have the full advantage of the light obtainable, and as this is one of the essential conditions of successful culture, the suggested arrangement is preferable. Some of the cool houses we have are lean-to, with a north aspect, and I find the odontoglossums grow equally as well in them as they do in the span houses built in accordance with the above suggestion with a south aspect. Lean-to houses are suitable for most of the hot-growing kinds, but I do not consider it an ideal aspect for the intermediate temperature and cool house orchids during the hot summer months.

SIDE WALLS.—I have noticed of late years that in many prominent gardens brick side walls are superseding the horticultural builders' orthodox method of side lights. The wall is carried up to the eaves, or what may now be termed the wall plate. This I have long advocated, for glass sides are of little or no advantage as a means of admitting light. Where they exist there is the necessity of covering the glass for a considerable period of the year with a permanent shading, to prevent scorching, and in winter they afford little or no protection against frost and cold winds. On the other hand, a decided advantage is obtained from brick walls during the cold winter months, in the fact that a more even temperature is obtainable with less artificial heat.

HEATING.—Another point is the provision of a heating apparatus that is fully equal to the work it will have to do. The greater the heating surface the less will be the excessive driving of fires, and thus a considerable saving in the full cost will be effected. I would advocate laying all the pipes flat. One flow pipe and three returns even in the cool houses. I consider this gives the full advantage of heating surface.

RAIN WATER SUPPLY.—It is of the greatest importance to have a full supply of rain water throughout the year. The ground should be excavated and tanks built of brick or concrete sufficiently large to store a supply that will be equal to the necessary requirements.

VENTILATORS.—The lower ventilators should be fixed in the wall, just on a level or slightly above the hot-water pipes, so that when air is admitted it will pass over the hot-water pipes, and thus be warmed before coming into direct contact with the plants. The usual roof ventilators should also be fixed, so that they may be opened at the discretion of the operator. If they are worked on a worm-screw attached to a lever bar this is easily effected. The staging should be made so that it may easily be raised or lowered at discretion. This will be found of considerable advantage in dealing with both small and larger plants; with a movable stage they can be raised close up to the glass, or be lowered some distance from it.—H. J. Chapman, Oakwood Gardens.

HARDY FRUITS.

FRUIT TREE PESTS.—As regularly as the spring appears so do the troubles of the grower of hardy fruits begin. With the first signs of growth pests of every description spring into existence, and soon do much damage if not checked. The earliest to contend against are the fungoid diseases, closely followed by caterpillars, aphis, slugs, and birds. We have advanced so rapidly in our knowledge of different washes that no very serious attack should be allowed. Washing will be the order of the day for fungi and insects at this time of year. The more highly fruit is cultivated the less open are the trees to attack, except in the case of birds. I know of nothing more aggravating after all washing, care, and attention, than to see tits, blackbirds, and starlings damaging the fruit. Tits are especially destructive in this district, and so particular are they that nothing but the choicest specimens are good enough for them. In the winter time a piece of suet is very acceptable to them, and opportunity should be taken at that time to keep them in check. It must be admitted that tits destroy many insects at this time of year, but the number thus destroyed is insignificant as compared with the damage they do in plantations of Cox's Orange apples and Doyenne du Comice pears.

NUTS.—Cobs or filbert nuts may be washed as soon as each shoot has one or two leaves fully developed, thereby allowing no time for caterpillars to establish themselves, or half the crop may be lost before they can be fully checked. The acetate of lead wash has been used freely, with great success among the Kentish fruit growers, this being less injurious to the tender foliage than Paris green. To make this wash use at the rate of 2lb. acetate of lead and 10oz. arsenate of soda to 100 gallons of water. Dissolve the lead acetate first in most of the water, then dissolve the soda arsenate in water in a separate vessel; when both are dissolved mix them and stir well. Double this strength has been recommended, but for ordinary attacks it will be sufficient. When spraying use a very fine nozzle, allowing the spray to fall on the leaves where the poison will remain and be devoured by the caterpillars. This wash may also be used in conjunction with Bordeaux mixture, care being taken not to allow it to go near green vegetables or green gooseberries.

PEACHES AND NECTARINES.—Continue to pay close attention to disbudding, and in the performance of this necessary operation do not allow more side growths than will be necessary to furnish the trees with fruit-bearing wood for next season. Any trees that have been recently replanted or have been weakened by heavy cropping should have a goodly proportion of misplaced fruits removed as soon as possible. Trees suffering with leaf blister should have all injured leaves picked off and burned. On very fine warm days a good washing with the hose early in the day, so that the trees may have time to become quite dry by nightfall, will help them very much in starting into an active and clean growth.—J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

FRENCH BEANS.—A large and important sowing of French beans may now be made on a warm sunny border in many parts of the country. Select deeply dug and well-manured ground. Draw out the drills at from two feet six inches to three feet apart running southwards, and giving a dusting of soot as a stimulant to the plants, and to ward off as much as possible the attack of slugs. Ne Plus Ultra and Canadian Wonder are heavy cropping and reliable varieties. Where plants have been raised under glass with a view to planting them in a similar position, gradually allow them more air. Those who possess narrow portable frames for placing over early vegetables will find them invaluable for this crop.

TURNIPS.—To succeed the smaller sowings made on warm borders, a good sowing should be made in an open quarter of the garden. It is necessary that turnips be quickly grown to be of first quality, therefore choose ground that is rich and in good friable condition. Sow in drills at fifteen inches apart. Model or Snowball are excellent kinds for summer cultivation. The turnip fly at times is damaging to the young plants if the weather is dry. Light waterings, assisted with a stimulant of quick acting artificial manure is often a preventive, or if badly affected syringe the plants with quassia extract.

CELERY.—The early plants will stand more air as the season advances, and as root action becomes more active give them more water at their roots. The later plants will require to be pricked out in rich soil in cool frames at about six inches apart, and brought along steadily for later plantings.

ASPARAGUS BEDS.—Growth will be in full swing, and should be encouraged by giving applications of nitrate of soda or salt, and watering it in, or light doses of diluted liquid manure from the farm tank.

TOMATOES.—The plants raised for planting against walls, etc., outside should be grown along steadily, but gradually may be given more air to harden their tissues without subjecting them to a check. This will materially help the plants at the time when they are fully exposed later. Do not allow them to become dry at the roots. Should they be pot-bound extra care will be necessary till planting out time arrives.—C. Flack, Cholmondeley Castle Gardens.

TAUNTON DEANE HORTICULTURAL AND FLORICULTURAL SOCIETY.

The next ANNUAL EXHIBITION will be held on THURSDAY, August 10th.

Schedule and particulars from—
R. A. GOODMAN, Secretary,
3, Hammet Street, Taunton.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Midland Daffodil Show.

The exhibition held at the Edgbaston Botanic Gardens, Birmingham, on April 28 and 29 was probably the finest ever held in this country. The competition was exceptionally keen throughout, and the number of entrants quite large. The trade displays were also good, and in both the competitive and non-competitive trade exhibits there were daffodils of the most exquisite beauty and variety, these in many cases being the last word to date in certain directions, from the leading raisers.

The show was well arranged, and the infectious good humour and generous hospitality of Mr. Robert Sydenham put everyone in good temper, while the energy of Mr. Herbert Smith, and the good arrangements of Mr. Thomas Humphries compelled admiration.

It is at Birmingham that the leading daffodil raisers and traders foregather, and it is here that the finest sets of new seedlings are placed before the public. Not only is a great deal of business done there, but it is done in pleasant surroundings, and under favourable conditions. During the evening of the first day Mr. Robert Sydenham, assisted by Mrs. and Miss Sydenham, entertained the exhibitors at the Grand Hotel, and a quite large party sat down to dinner, and after dinner discussed "The Progress of the Daffodil," a subject admirably opened up by the Rev. G. H. Engleheart, V.M.H., whose chief point was that raisers, instead of throwing away all but their very finest flowers, should save those that possessed merit for garden purposes, even though these did not quite approach the florists' ideal. He believed there was a good market for garden daffodils of strong constitution and varied colours, and that the dispersal of such varieties would tend to still further popularise the flower; whereas there was a limited demand for the tip-top flowers of perfect form. And with this contention most of those present fully agreed; indeed, many people have felt for some time that there is ample room for the perfect florists' daffodils for exhibition purposes, and ampler room for less perfect, but not less useful, flowers suitable for garden and market purposes. Mr. P. D. Williams, Mr. R. Wallace, Rev. J. Jacob, Mr. Welchman, Mr. H. Backhouse, Mr. R. Sydenham, Mr. J. D. Pearson, and Colonel Howard all spoke, and the last-named gentleman urged raisers to make sure that their new varieties possessed good constitution and freedom.

Needless to say, the host and hostess of the evening were heartily thanked, and accorded musical honours and cheers.

OPEN CLASSES.

In the big class for fifty varieties of daffodils, legibly named, and representing all sections of the family, there were five competitors, and here the premier prize was secured by Messrs. Cartwright and Goodwin, Kidderminster, whose collection of fresh flowers included good vases of Glory of Nordwyk, Coreen, Armorel, Long Tom, Giraffe, Homespun, Lord Roberts, Felspar, Whitewell, Incognita, Clarissa, Circlet, and Barcarolle. Mr. Christopher Bourne, Simpson, Bletchley, came a good second, and he showed Dewdrop, the lovely new Queen of Hearts, Lemon Belle, Horace, Cygnet, Victoria, White Lady, Occident, Lucifer, and Will Scarlet. Mr. J. Pope, King's Norton, was third, and he had fine things in Victory, Winifred, White Lady, White Queen, Circlet, and Middleton; Mr. F. H. Chapman fourth with a good lot of Leedsi and poet varieties.

There was an excellent competition in the class for a dozen varieties of long-trumpet daffodils, three stems of each, and here the premier award was secured by Messrs. Cartwright and Goodwin, Kidderminster, with a grand set of fresh, large, and clean flowers of Lord Roberts, Mdme. de Graaff, Princess Ina (a lovely new variety), Mrs. H. J. Veitch, Glory of Nordwyk, Leiden Jar, Onslaught, Mrs. Betteridge, General Makaroff, Herod, Weardale Perfection, and Cornelia. Second prize fell to Mr. J. Pope, King's Norton, who had Mervyn, and Olympus in good condition; Mr. J. Mallander, Bawtry, third, with a set of his own seedlings, in which Nance Broadley and Miles Standish were good; Rev. J. Jacob fourth.

Messrs. Cartwright and Goodwin also obtained the chief award for six varieties of short-trumpet varieties, three flowers of each, with lovely flowers of Long Tom, Lady M. Boscawen, Giraffe, Bert Sands, Neptune, and Felspar; Rev. J. Jacob, Whitewell, Whitchurch, second; and Mr. C. Bourne, Simpson, Bletchley, third; and Mr. J. Pope fourth.

The class for a dozen large-cupped daffodils proved a great attraction, and there were six competitors. First prize was won by Messrs. Cartwright and Goodwin, who staged very handsome blooms of May Hanson, Homespun, Whitewell, Perseus, Pilgrim, Castile, Eoster, Gloria Mundi, Evangeline, Joan of Arc, White Nectarine, and Marigold; the Rev. J. Jacob was second; Mr. H. D. Phillips, Olton, third; and Mr. C. Bourne, Bletchley, fourth.

Four competitors came forward in the class for a dozen distinct varieties of small-cupped daffodils, and here the Rev. J. Jacob came to the front with Evening, Ecstasy, White Lady, Charlotte, Vivid, Japonica, Jacob Faithful, Scarletta, Delicacy, Firebrand, Pancake, and Ellen Barr; Messrs. Cartwright and Goodwin second; Mr. J. Pope third; and Mr. C. Bourne fourth.

Messrs. Cartwright and Goodwin continued their successes in the class for six distinct poeticus varieties, scoring a first with beautiful examples of Matthew Arnold, Childe, Oliver Goldsmith, Rudyard Kipling, Highland Bard, and Sir Philip Sydney; Mr. C. Bourne was placed second; Mr. F. H. Chapman, Rye, third; and Rev. J. Jacob fourth. For six varieties of flat-cupped daffodils Messrs. Cartwright and Goodwin continued their monotonous way, scoring with Sulphur Eye, Orange Eye, Incognita, Circlet, Semiramis, and Armeline; Rev. J. Jacob second; Mr. J. Pope third; and Mr. C. Bourne fourth.

The Rev. J. Jacob scored for six varieties of bunch-flowered daffodils, and he had good trusses of Orient, Klondyke, Jaune a Merveille, Triumph, Elvira, and Sunset.

AMATEURS.

In the competition in the leading class open to amateurs only, no bulbs to cost more than 10s. 6d., there were seven competitors, and here Mr. S. F. Staffurth led with a beautifully clean and even set, in which the leading varieties were Ida Pope, Glory of Leiden, Horace, Evangeline, Weardale Perfection, Gloria Mundi, Beacon, Brunston, White Lady, Leonie, Tangerine, and Blood Orange; the Rev. T. Buncombe was a good second, and he was strong in trumpet varieties; Mr. N. Y. Lower, third; and Mr. E. H. Wood, Ludlow, fourth.

For the best nine distinct varieties of long-trumpet daffodils, equal first prizes were awarded to the Rev. J. Buncombe, Black Torrington, Devon; and Mr. H. R. Darlington, Potter's Bar; the latter had Glory of Leiden and Admiral Makeroff in good form, and the former presented good flowers of Mdme. de Graaff, and Weardale Perfection; there were nine entries, and third prize went to Mr. J. A. Kenrick, Harborne; and fourth to Mr. N. Y. Lower, Presteign.

In the smaller classes the same keen competition continued; for three trumpet varieties Mr. N. Y. Lower and Mr. H. R. Darlington were first and second. For nine large-cupped varieties Mr. H. R. Darlington, Mr. S. F. Staffurth, and Mr. Lower won prizes in the order named. For nine small-cupped daffodils, three flowers of each, Mr. Lower, Mr. Staffurth, and Rev. J. Buncombe came in order of mention; while for six daffodils, costing not more than 3s. per dozen, Mr. Lower, Mr. W. H. Parton, Moseley, and Mr. H. R. Darlington scored in the order of their names.

Mr. H. R. Darlington, Mr. Gumbleton, Tewkesbury; Mr. W. H. Parton, Mr. H. J. Jones, Ludlow; Mr. B. Brown, Ludlow; Mr. A. Taylor, Olton; Mr. J. H. Padley, Worksop; and Mr. W. F. Mitchell, Leek Woolton, near Warwick, were other prominent prizewinners.

SEEDLINGS.

Great interest centred in the class for a dozen distinct new daffodils raised by the exhibitor, and here Mr. P. D. Williams, Lanarth, St. Keverne, wrested the Bourne Cup from Mr. E. M. Crosfield, Crossington, Bridgwater, after a great fight. Mr. Williams had flat-cupped varieties all through, and his named sorts, Bonfire, and Sheba were lovely things, one numbered, 233 had a lovely bit of delicate colour. Mr. E. M. Crosfield's Charles Surface was a magnificent bit of orange colouring; while Anchorite and Chintz were delightful; Mr. W. Welchman, Wisbech, was third, and his Princess Fushima was a quaint big flower, with striped cup.

Mr. A. Wilson led for six seedlings raised by the competitor, and he showed Hermica, Druid, Seborga, Leontes, Abigail, and Anicot, the latter a most charming flower with a suspicion of pink in the delicately citron-edged cup; Mr. C. H. Cave, Margotsfield, Bath, second; and Mr. J. Pope, third.

Mr. G. Stocks, Doncaster, led for three seedlings, with Mr. W. Wilson, Sheffield, second; and Mr. C. L. Adams, Wolverhampton, third.

NEW VARIETIES.

Premier award—the Cartwright Cup—for a dozen distinct varieties of daffodils that have not been in commerce more than four years, was won by Mr. E. M. Crosfield, who displayed lovely blooms of Zouave, Chintz, Anchorite, Fire Eater, Sarchedon, Gaybird, Royal Lady, Tinsel, Spartan, Iliad, Coquette, and Chic. Messrs. Cartwright and Goodwin came second, their Whitewell, Sulphur Eye, Bert Sands, and Orange Queen being very fine; Mr. T. H. Chapman, Rye, third, with Silver Spangle, and Elegy as good specimens.

The Rev. J. Jacob came first for six varieties, not in commerce more than four years, and he showed a handsome set; Mr. H. D. Philips, Olton, second; Mr. J. Pope, third; and Mr. C. Bourne, fourth. Mr. Crosfield scored for six distinct poeticus varieties not in commerce more than four years, annexing the Chapman Trophy, with beautiful blooms of Sarchedon, Socrates, Snow King, Iliad, Bret Harte, Coronation, and Socrates; Mr. A. A. Wilson, Bridgwater, second; and Messrs. Cartwright and Goodwin, third.

The Walter Ware Cup for a group of obvious triandrus hybrids was won by Mr. E. N. Crosfield, who had some delightful flowers of chaste beauty, refinement, and delicacy; only one, Honey Maid, was named, but the seedling silvery-white forms were lovely; Messrs. Cartwright and Goodwin came second, but they had duplicate blooms of several varieties, such as Princess Ina, Yellow Diamond, Zephyr, etc.; Mr. T. H. Chapman, Rye, third.

PLANTS IN POTS.

In this section Mr. J. Scaney, Harborne, led the way for six pots of daffodils, and he had a fine set of Emperor, Madame Plemp, Madame de Graaff, Glory of Leiden, Empress, and Grandee; Mr. J. A. Kenrick, Harborne, second; and Mr. J. A. Kenrick (gardener, Mr. A. Cryer), Edgbaston, third. For six pots of bunch-flowered daffodils Mr. J. A. Kenrick, Edgbaston, led with perfect sheaves of Klondyke, Elvira, Lucia, Mont Cenis, Jaune a Merveille, and Jaune Supreme; Mr. W. H. Parton, Mosely (gardener, Mr. W. Carpenter), second; and Mr. J. A. Kenrick, Harborne, third.

Mr. J. A. Kenrick, Edgbaston, had the best six pots of tulips, and he showed Prince of Austria, Fabiola, Pink Beauty, Couleur Cardinal, Rose Luisant, and Spaendonck in grand style; Mr. J. A. Kenrick, Harborne, second.

For bunch-flowered daffodils grown in fibre Mr. J. A. Kenrick, Edgbaston, led, with Mr. E. Deakin, Hay Mills, second. Trumpet daffodils in fibre were very fine, and here Mr. Sydenham's special prizes were well won in order of mention by Mr. J. A. Kenrick, Edgbaston; Mr. E. Deakin, and Mr. J. A. Kenrick, Harborne, the first-named showing grand bowls of Emperor, Madame Plemp, and Glory of Leiden.

Mr. A. W. Milner, Sheffield, and Mr. S. Mortimer, Farnham, were first and second respectively for baskets of polyanthuses. Mr. J. Pope, Mr. E. J. Keeling, Small Heath; and Mr. J. Sceaney were the leading competitors in the class for bowls of spring flowers.

NON-COMPETITIVE.

The trade growers once again contributed their share, and that no mean one, to the effective display. One or two growers whom we are accustomed to meet at Birmingham were prevented on this occasion owing to local storms from putting in an appearance, but the exhibits staged were excellent in every way. The Rev. G. H. Engleheart, Dinton, Salisbury, put up a capital group of novelties, which, of course, were a source of attraction to the experts. Several trumpet flowers, both in yellow and cream, were of huge size, and of beautifully modelled build. Poeticus varieties were also well represented.

Messrs. Barr and Sons, Covent Garden, London, occupied their usual position in front of the platform, and upon their stand were displayed a fine array of choice things. Flat-cupped varieties of special note were Sheba, pure white perianth, vivid red eye; Challenger, with an eye graduating from orange to vivid scarlet; Marie Louise, with a pure orange eye; and the very pure white Moonbeam. Pink Beauty, a trumpet flower which is a near approach to Apricot, Pink Czarina, one of the largest trumpets on the stand, and Sevenoaks also of immense size and a glorious butter-yellow.

Robert Sydenham, Lim., Tenby Street, Birmingham, had a beautiful display of fresh, clean flowers, among which Lady Margaret Boscawen, Apricot Queen, Lila, Cardinal, and Weardale Perfection figured prominently. Tulips and lily of the valley in fibre were also shown. Mr. C. Bourne, Simpson, Bletchley, showed about fifty vases of high-class varieties, including many distinctly pretty things. Queen of Hearts, Heroine, White Lady, and Crown Prince were a few of the leading features of the stand.

On Messrs. J. R. Pearson's stand a few of the most striking varieties were Prima Donna, Dorothy Vernon, Crœsus, and Heroine. It may be said that the texture and freshness of the flowers spoke well for the Lowdham district, and for the skill of the Messrs. Pearson as growers.

From Ireland two good exhibits came, one from Miss F. W. Currey, The Warren Gardens, Lismore, and the other from Messrs. Hogg and Robertson, Lim., Mary Street, Dublin. Miss Currey showed Sunspot, Evangeline, Arctic Light, Challenger, Beacon, and a number of other nice things. The daffodils from the Dublin firm were supplemented by brilliant tulips, which showed excellent culture.

Pleasing variety was afforded by a number of exhibits of other spring flowers, among which the alpines brought by Messrs. Bakers, Wolverhampton, were conspicuous. This exhibit was both beautiful and interesting, the gems of the rock garden being pleasingly displayed on an improvised rockery. Incarvillea grandiflora, varieties of saxifragas, primulas, and hardy cypripediums were finely shown. An excellent group of perpetual carnations came from Messrs. Young and Co., Hatherley, Cheltenham. The popular variety Mikado was blended with Whitcombe Riley, a pale yellow, which "goes well" with the heliotrope. Pink, Rose, and White Enchantress, Britannia, Lady Audley Nield, and others were also shown.

A really grand lot of polyanthus, in yellows and crimsons, came from Mr. W. A. Watts, St. Asaph, North Wales. Hybrid gerberas in a beautiful range of colours were put up among choice ferns by Mr. H. N. Ellison, West Bromwich. Messrs. B. R. Cant and Sons, Colchester, staged roses that would do credit to June. A new pink Druschki and two lovely porcelain pink varieties of great merit were shown. Sallie is of a particularly pleasing shade and good shell form; St. Helena is overlaid with a shade of pinkish apricot, leaning toward the colour of G. Nabonnand.

Messrs. Sutton and Sons, Reading, staged cinerarias of both large-flowered and stellata types, the colours ranging from pure white to deepest crimson and richest blue. A nice collection of rock plants and dwarf shrubs came from Messrs. R. Wallace and Co., Colchester; some delightful androsaces and primulas, and choice little saxifragas were shown in good-sized clumps. A number of tulips and narcissi occupied the end of Messrs. Wallace's stand. A group of large-flowered polyanthus in various colours came from Mrs. W. A. Milner, Totley Hall, Sheffield, and another excellent exhibit of the same flower was put up by Mr. S. Mortimer Rowledge, Farnham, Surrey.

A very striking bedding viola, named "Queen's Park," was exhibited by Mr. W. H. Morter, the superintendent of the Birmingham Public Parks. The flower is of good shape, petals crisp and substantial, and the colour orange-yellow, but rayed. Mr. T. E. Dawes, Syderstone, Norfolk, showed his three fine varieties of rhubarb.

Hereford Spring Flower Society.

The second exhibition of this society was held in the fine old Shire Hall, Hereford, on Wednesday, April 26, under very pleasant conditions, the sun shining brightly all day, and attracting a good attendance. Daffodil and spring flower societies are becoming fashionable, especially those where the competition is confined almost entirely to amateurs. Brecon, Glamorgan, Huntingdon, and Hereford are all excellent examples of this kind of spring show, and the keenness of the ladies, either as competitors or visitors, is remarkable.

At Hereford the competition was keen throughout; the daffodils were good, and the little rock gardens, baskets of primroses and polyanthuses, and miniature rock gardens were delightful, while the class for flowering trees and shrubs was unusually fine. Miss A. Barneby, Longworth, Hereford, is the very energetic and capable secretary, and she had all arrangements for judging, etc., well up to time, so that everything was ready for the public well before the time of opening.

DAFFODILS.

Miss Pope, The Ericas, Kings Norton, led in the open class for a set of new seedling daffodils, and she put up a very good and interesting set; one labelled Sol No. 2 had a fine white perianth, and a neat flat primrose cup.

Chief award in the open amateurs' class for a collection of five and twenty varieties of daffodils, three flowers of each, all sections to be represented, was won by Miss Parr, Staunton Park, Staunton-on-Avon, with a beautiful set that included Glory of Leiden, Lord Roberts, Empress, Sunrise, Lady Margaret Boscawen, Lady Audrey, Lulworth, White Lady, and Lucifer; Mrs. Manley Power, Aston Court, second; and Mrs. H. J. Barley, Rowden Abbey, third; there were six competitors.

For a flower of a trumpet variety Mrs. H. J. Bailey scored with Mervyn; Mrs. Davenport, Foxley, Hereford, second, with Weardale Perfection; and Mrs. A. W. Foster third with a grand flower of Olympia. Mrs. Davenport led for a medium crowned variety with a splendid bloom of Homespun; H. J. Bailey, Esq., second, with Orangeman; and Miss Hopton third, with M. M. de Graaff. In the small-crowned section Miss Hopton led with a good bloom of Horace; Mr. H. J. Bailey second, with Circlet; and the Rev. R. H. Wilmot, Bishopstone Rectory, Hereford, third, with Horace.

The premier award for local competitors in a class for twenty varieties, three blooms of each, went to the Rev. A. C. Lee, Lugwardine Vicarage, and his best flowers were of King Alfred, Lulworth, Barri conspicuus, White Lady, Madame Plemp, and Luciter; N. T. Lower, Esq., Presteign, came a good second; and Mrs. H. J. Bailey, Rowden Abbey, Bromyard, third; three entries. The chief award here was a silver cup, presented by Sir John Cotterell.

The challenge cup presented by Mrs. F. Mount for the best collection of twelve varieties of daffodils, representing all sections, was won by Mrs. Greswolde Williams, Bredenbury Court, Bromyard. In this case no bulb had to cost more than 10s. Mrs. Williams' varieties were Gloria Mundi, Emperor, Lucifer, Duke of Bedford, King Edward, Madame Plemp, Madame de Graaff, Fairy Queen, Sentinel, Apricot, Horsefieldi, and Barri conspicuus; Miss Hopton, Homend, Ledbury, second; and Mrs. Davenport, Foxley, Hereford, third; Mrs. Manley Power, Aston Court, Ross, highly commended; eight entries.

In a county class for six varieties of daffodils the Rev. R. H. Wilmot led, and he had Homer in fine form; Mrs. R. Heygarth, The Wells, Hereford, came second; and Mrs. Bedford, Newent, third.

HARDY SPRING FLOWERS.

The class for a collection of eighteen hardy spring-flowering plants (daffodils and flowering shrubs excluded), arranged in rock garden fashion, was a great success, and the competition especially keen. The cup offered by W. H. Barneby, Esq., was won by the Rev. R. H. Wilmot, Bishopstone Rectory, Hereford, who had a charming lot of Arenaria balearica, Primula cortusoides, P. pulverulenta, Saxifraga Arkwrighti, Fritillaria pyrenaica, and Uvularia sessilifolia; Mrs. W. H. Bailey was a good second, while Lady Hopton, Homend, Ledbury, was third.

In a class of similar character, but for eight kinds of plants, Miss Lee, Broadlands, Hereford, scored a first, and had Saxifraga muscoides and Sanguinaria canadensis in good condition; Mrs. Arkwright, Lyonshall, Kington, second, showing a fine example of Arabis aubrietioides; Miss Hopton, third. Hardy flowers, shrubs excluded, were best shown by Miss E. Armitage, who had splendid crown imperials, Iris pumila, and Iris bucharica; Rev. A. C. Lee second, and Mrs. Ware, Hampton Dene, Hereford, third; Miss Barneby was unfortunately disqualified, as she had a white form of Anemone apennina among the blue, and no mixed bunches were allowed.

For unforced spring flowers Mrs. Davenport led the way with a beautiful lot of bloom set in green moss; Gentiana acaulis, crown imperials, auriculas, violas, Corydalis cheilanthifolia, and Primula rosea were very good; Mrs. Clowes second; and Miss Burdon, Munstone House, Hereford, third. Miss Burdon, Munstone House, Hereford, led for half a dozen auriculas, and was followed in order of merit by Lady Rankin and Mrs. G. Williams; there were five entrants, and all showed well.

Mrs. H. J. Bailey led in the class for three primroses, distinct colours, shown in a basket one foot across; Mrs. Arkwright came second, and Miss Burden third, and the competition was a very pretty one. There were no fewer than fourteen competitors in the delightful class for a collection of polyanthuses, four distinct colours, to be shown in a basket, and here Mrs. Davenport again scored, and with fine plants of a fine strain; Mrs. Clowes second, and Rev. R. H. Wilmot third. The baskets of flowers arranged over white paper down a broad corridor looked very fine.

The best collection of four kinds of primulas was exhibited by Rev. R. H. Wilmot, who led with excellent examples of P. denticulata, P. Sieboldi, and a bright form of P. frondosa named P. farinosa Warei; the Dowager Lady Croft, Blairmont, Hereford, second; and Mrs Davenport, Foxley, Hereford, third. Mrs. Clowes, Burton Court, Pembridge, led for anemones. Mrs. Arkwright, Lyonshall, Kington, scored for four sets of violas. Rev. H. Mallinson had the best six vases of tulips—a fine lot.

Miss Betty Barneby had the best table decoration.

HARDY SHRUBS.

The class for a group of sixteen kinds of hardy flowering shrubs was a famous one, and there were six competitors. Had the position been somewhat lighter the display would have been superb, but, as it was, it was delightful and interesting. Premier award fell to Lady Rankin, Bryngwyn, Hereford, who contributed grand bunches of Forsythia suspensa, Spiræa Thunbergi, Kerria japonica, Cydonia japonica, Azara microphylla, Skimmia japonica, Berberis Darwini, Magnolia stellata, and Grevillea rosmarinæfolia. The second award fell to Mrs. A. W. Foster, Brockhampton Court, Hereford, whose best bunches were of Cunningham's White rhododendron, Spiræa Thunbergi, Kerria japonica, Magnolia Soulangeana, and rosemary; W. T. Bareby, Esq., Saltmarsh Castle, Bromyard, secured third place with a very bold exhibit, in which Cytisus præcox, C. radiata, and Amelanchier canadensis were conspicuously good.

NON-COMPETITIVE.

Several excellent trade exhibits were put up which added variety and interest to the display. Messrs. R. Wallace and Co., Kilnfield Gardens, Colchester, brought a choice collection of alpine flowers, small shrubs, and a few bulbs. Fritillarias, various tulip species, and irises were shown, as well as choice narcissi. Violas, aubrietias, androsaces, etc., were prominent among the rock plants. Choice narcissi and tulips were the main features of a bright group staged by King's Acre Nurseries, Lim., Hereford. St. Brigid anemones, iris, hyacinths, and a few early gladiolus were, however, also shown in good form.

Another capital display was that arranged by Messrs. Barr and Sons, King Street, Covent Garden, London, who had clean fresh daffodils in great variety, with tulips, muscari, and a few alpines in the foreground. Mr. G. Reuthe, Keston, Kent, showed auriculas, Primula rosea, P. denticulata, and such other choice rock plants as Shortia uniflora, Ourisia macrophylla, Schizocodon soldanelloides, etc., together with a number of Himalayan rhododendrons.

Messrs. H. and W. Evans, Hardy Plant Nursery, Llanishen, showed a group of freely flowering alpines, such as Gentiana acaulis, Saxifraga Clibrani, Primula denticulata, Waldsteinia trifoliata, etc. Rock plants were also shown by Messrs. Heath and Son, Cheltenham, a few among their many choice things being Scutellaria indica japonica, Viola gracilis, primulas of sorts, Ionopsidium acaule, and Corydalis tomentosa. A small group of choice calceolarias was exhibited by Miss Lee, Broadhead, Hereford.

A really fine collection of splendidly grown carnations was put up by Messrs. Young and Co., Hatherley, Cheltenham. The leading varieties were represented by superb blooms, and the manner of staging was very artistic. Sir John T. D. Llewelyn, Bart., Penllergore, Swansea, contributed a very pretty set of the newer daffodils, and his collection was especially good in poeticus varieties.

MEDALS.

Gold.—To Messrs. Young and Co., Hatherley, for carnations.

Silver-gilt.—To Mr. Wilson, Hereford, for floral designs; to the King's Acre Nursery Company, Hereford, for daffodils, etc.; to Messrs. Barr and Sons, Covent Garden, for daffodils.

Silver Medal.—Messrs. W. and H. Evans, Llanishen, for hardy flowers; to Messrs. R. Wallace and Co., Colchester, for hardy flowers; and to Sir John T. D. Llewelyn, Bart., for daffodils.

Small Silver.—Messrs. Heath and Son, Cheltenham, for hardy flowers; and to Mr. G. Reuthe, Keston, Kent, for hardy flowers.

Kent, Surrey, and Sussex Daffodil and Spring Flower Show.

This exhibition took place at the Great Hall, Tunbridge Wells, on Wednesday, April 26, and was the sixth of its kind held successively. Like those of preceding years, it was marked by a high standard of excellence in all exhibits. The trade added greatly to the attraction by means of their varied contributions.

In the competitive classes the following awards were made:

For a collection of daffodils, consisting of ten varieties of each of the three groups, Magni-Coronati (trumpet), Medio-Coronati (chalice-cupped), and Parvi-Coronati (saucer or flat crowned, including varieties of Poeticus), three blooms of each variety, the first prize and silver challenge cup went to Mr. J. A. Nix, Tilgate, Crawley, for a collection consisting of such varieties as Rev. D. R. Williamson, Sunrise, Fair Maiden, Henri Vilmorin, Red Beacon, Cygnet, Incognita, Lady Margaret Boscawen, Pilgrim, and Mrs. G. H. Barr; Mr. C. G. A. Nix, Forest Lodge, Crawley, second, with a collection that was very greatly admired. For twelve distinct single varieties of true trumpet daffodils, the Rev. G. P. Haydon, Canterbury, led with lovely blooms of Peter Barr, Pearl of Kent, Imp, Moon, Loveliness, and Philip de Vilmorin; Miss A. L. Nix, Tunbridge Wells, and Mr. E. M. Eversfield, Horsham, second and third respectively. For six distinct trumpet varieties as above, Mr. W. C. Bull, Ramsgate, scored with Weardale Perfection, Monarch, Grandis, Admiral Togo, Mdme. de Graaff, and Glory of Leiden; second, Mrs. G. F. H. Banks, Crawley, with F. Barchard, Esq., Maresfield, third.

For twelve distinct varieties of chalice-cupped daffodils, Miss A. L. Nix was first with Sunrise, Gipsy Lad, White Lady, Lady M. Boscawen, and Albatross; Rev. G. P. Haydon second. In the class for six distinct chalice-cupped daffodils, Mr. F. Barchard was first, Mr. W. C. Bull second, and Mrs. G. F. Banks third. The best six distinct, saucer or flat crowned varieties, were from Mr. F. Barchard, who showed Laureate, Purity, Pindar, etc.; second, Mrs Banks.

In the class for nine distinct varieties of daffodils, drawn from any of the three sections, but not to cost more than 3s. 6d. per dozen, Mrs. G. F. Banks led with Mdme. Plemp, Empress, Horsefieldi, Sir Watkin, Katherine Spurrell, etc.; second, J. Shephard, Esq.; third, Miss E. Roberts, Tunbridge Wells. For seedling narcissi, three distinct varieties not in commerce, the Rev. G. P. Haydon was first with Moon, a beautiful bicolor; Muff, and Mouse, a pleasing yellow. The finest single bloom of trumpet daffodil was Weardale Perfection, from Mr. E. M. Eversfield; second, the Rev. G. P. Haydon, with Pearl of Kent; third, F. Barchard, Esq., with Weardale Perfection. The finest single bloom of a chalice-cupped variety was Lord Kitchener, from Mr. F. Herbert Chapman; second, Mr. C. G. A. Nix, with Mermaid; third, the Rev. P. Haydon, with Lowdham Beauty. The Rev. G. P. Haydon scored for the finest single bloom of saucer or flat crowned variety with Kingsley; second, Mr. F. Barchard, with Purity; and third, Mr. C. G. A. Nix, with Harold Finn.

Mr. E. W. Nix was first, Mr. M. Bridgman second, and Mrs. C. G. Nix third for twelve vases of distinct kinds of hardy herbaceous and bulbous spring flowers. For a collection of hardy cut flowering shrubs, in flower, Mr. J. A. Nix scored, and he had Magnolia stellata, Camellia Donckelaari, Rhododendron arboreum, Daphne japonica, Erica arborea, and Drimys aromatica; Mr. C. G. A. Nix second.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, April 26.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Sir Everard im Thurn, Dr. A. B. Rendle, Messrs. A. Worsley, W. C. Worsdell, J. O'Brien, J. Douglas, R. H. Pearson, W. Hales, C. E. Shea, G. Gordon, and F. J. Chittenden (hon. secretary).

GONGORA SP.—Mr. J. O'Brien brought forward a species of gongora, introduced by the late Mr. Tracy from Peru. It was apparently a new species, and was referred to Kew.

ONCOBA SPINOSA VAR. ROUTLEDGEI.—Mr. Shea showed flowers and foliage of this newly-introduced greenhouse shrub from Central Africa. The seed had been sent home to Mr. Shea from Central Africa, a fruit having been presented to a friend of his by a native chief as a parting gift, on account of its great value as a means of ridding one of enemies with little trouble. The instruction given was to soak the hard fruit in water and present the decoction to the person disliked to drink. The fruit has therefore probably very poisonous properties. The plant, which belongs to the Bixineæ, has large showy white flowers, strongly scented, and with numerous yellow stamens. Many of the flowers lacked a pistil. Mr. Shea's plant appears to differ from the type which is a native of Arabia, and the varietal name of Routledgei is in honour of the sender of the seed. It was unanimously resolved to recommend the award of a Botanical Certificate to the plant on the ground of its novelty and peculiar properties.

SPORT IN DAFFODIL. — Mr. Bowles showed flowers of a sport from "Weardale Perfection," which had appeared among a group of that variety in Mr. Cranfield's garden. It had a yellow-tinged perianth, and a much deeper yellow trumpet than the type.

DOUBLE PRIMROSES, ETC. — Messrs. Cocker and Sons, of Aberdeen, sent a large number of flowers of double polyanthus and primroses which they had raised from seed. The colours ranged from primrose yellow through white to purplish-blue shades, but were not, as a rule, very bright. They were raised by crossing the Wisley Blue primrose with the well-known Polyanthus platypetala plena. In the second and third generation numerous double-flowered forms had appeared and a wide range of colours. It was unanimously resolved to recommend the award of a Certificate of Appreciation to Messrs. Cocker in acknowledgment of their work in raising these plants.

RHODODENDRON HYBRID.—Sir John Llewelyn showed flowers cut from the open of a seedling rhododendron, raised from R. Thomsoni x R. Aucklandi. The leaves had something of the blue-green coloration of R. Thomsoni, but were devoid of hair beneath, much longer, and more acute than those of that plant. The corolla was deep red, and lacked the spotting often seen in R. Thomsoni.

PYRONIA x SEDENI.—Mr. Worsley reported that he had examined the fruit of this hybrid shown at a recent meeting, and had failed to find ripe seeds in it. The cells each contained as a rule three undeveloped seeds.

Sparkhill Amateur Narcissus and Auricula Society.

APRIL 29.

Under the auspices of an energetic committee, the exhibition of this society was held in the St. John's Schools, Sparkhill. The staging of the flowers and judging takes place in the evening for the accommodation of the working classes and others not able to attend earlier in the day. The several classes for daffodils were very well filled, and the auriculas, though somewhat lacking in number as compared with last year, were of high quality. Some of the varieties were in such excellent form as to render the judging difficult. Similar remarks apply to the daffodils, so good were they in quality.

NARCISSI.

The committee provided a class for eight bunches of narcissi, not more than five blooms in a bunch, but, unfortunately, made no provision for the naming of exhibits. Hence there was an absence of names, and the exhibition lost much of its interest and usefulness. Naming should be insisted upon by all horticultural societies. The blue riband of the society was won by Mr. Dentin; second, Mr. E. J. Fox; and third, Mr. E. Deakin. For six bunches of narcissi Mr. E. Deakin was first with very good specimens; second, Mr. E. J. Keeling; third, Mr. C. J. Ford. For three bunches, distinct, Mr. E. Deakin was again first; second, Mr. A. G. Henwood; and third, Mr. T. Justice. For the most tasteful arrangement of narcissi, to occupy a space not exceeding 4ft. by 2½ft., no artificial background allowed. First prize secured by Mr. E. J. Keeling with a bold arrangement; second, Mr. F. Anderson, with a somewhat stiff arrangement of flowers and narcissus foliage; and Mr. E. Deakin, Haymills, third, with a somewhat crowded yet effective arrangement. The prizes were awarded in bulbs according to the money value, and the society's bronze medal was awarded to the exhibitor obtaining the most points in the four classes.

AURICULAS.

There was a spirited contest in all the classes. For three named show varieties Mr. Arthur Gilbert was allocated the premier position with excellent examples of Shirley Hibberd, Mrs. Potts, and Mr. Phillips; second Mr. H. W. Miller with Mrs. Barrett, Abbe Lizst, and Geo. Lightbody; third, Mr. A. Freeman with Mrs. Potts, Isabel, and Prince Charlie. For three named alpine auriculas: First, Mr. H. W. Miller with A. F. Kew Agnes, and Geo. Cadbury; second, Mr. E. Saunders with Agnes (very fine), Majestic, and Phyllis Douglas; and third, Mr. A. Gilbert with Argus, Mrs. Gorton, and Miss Baker. For three seedling alpines: First, Mr. H. W. Miller with unnamed plants; second, Mr. J. Freeman; and for one show auricula, Mr. A. Gilbert was accorded the first prize with Alexis, a deep maroon self.

In the members' class Mr. A. W. Millar won with A. F. Kew in excellent form. In Class A, open to all-comers, Mr. E. Saunders occupied the first place with Geo. Rudd, Abraham Barker, and Geo. Lightbody; first prize a silver medal, given by the National Auricula Society (Midland Section). In Class B, three alpines, distinct, first prize a bronze medal, given by the foregoing society: First, Mr. T. W. Eglington with Duke of York, Thetis, and Mrs. Danks; second, Mr. E. Saunders with Mrs. Danks, Charmer, and Mrs. J. Douglas; third, Mr. G. Savory, with Argus, General Buller, and Angus; a Certificate of Merit was awarded to Mr. R. M. Eglington for Premier auricula Mrs. Danks.

At the conclusion of the judging Mr. Wm. W. Staples read out the names of the winners, and complimented them upon the excellence of their exhibits. The Chairman, in adverting to Mr. Stables' resignation of the secretaryship of the Sparkhill Horticultural Society, testified to his abilities and his courtesy to all concerned, including the exhibitors. Mr. Wm. Davison has succeeded Mr. Stables as the show secretary.

Asystasia scandens.—Under the name of Henfreya scandens, this stove climbing plant was introduced from Sierra Leone over sixty years ago. It is now seldom met with, though it is very pretty and distinct, and flowers for a long time. It is one of the few climbing acanthads, but might at a superficial glance be taken as belonging to the bignonia family. The flowers are trumpet-shaped, nearly a couple of inches long, and creamy-white in colour. It needs a fairly open potting compost, and the warmest part of the stove for its well doing.—W. T.

OBITUARY.

◆

MR. SIMON DE GRAAF.

A familiar figure in the great fraternity of Dutch bulb-growers has been removed by the death, on April 25, of Mr. Simon de Graaf, one of the two brothers who built up the extensive business at Leiden, under the title of De Graaf Brothers. In former years Mr. Simon de Graaf was a regular visitor to our spring exhibitions, and his genial, jolly manner won for him many friends. He was among the earliest of those who took up the work of raising new daffodils, and though he was in the field before there was a very big market for new varieties, he was clever enough to bide his time, and profited accordingly. The beautiful daffodil named Mdme. de Graaf he would not part with, except at a fairly high price, preferring to work up a good stock against the time that the public would want it. By the time the daffodil boom had arrived Mr. Simon de Graaf had thousands of bulbs of this lovely and refined variety. This shows the business instinct of the man.

THE LATE MR. S. A. DE GRAAF.

The association of the De Graaf family with horticulture dates back to the latter part of the seventeenth century, when the firm of Messrs. S. A. and H. de Graaf was well known as growers of medicinal plants at Lisse, Holland. In 1720 the firm started growing a few bulbs in addition to their other cultures. In 1762 the firm dissolved partnership, and S. A. de Graaf, the grandfather of the late Mr. Simon Adreanus de Graaf started a nursery in Leiden, where he soon became well known as an importer and grower of Cape bulbous plants. He was the first to flower Cape amaryllis in Europe. The deceased, who for so many years was head partner in the firm of Messrs. de Graaf Bros. besides being a large grower of tulips, made a speciality of the amaryllis family, and the culture of Cape bulbs. In 1872 he made his first journey to England, and it was the late Mr. Peter Barr, who accompanied him on a journey through England, Scotland, and Ireland, and introduced him to various horticultural friends. From that time dated the great friendship existing between the De Graaf and Barr families. Many fine new amaryllis were raised by the late S. A. de Graaf, and were purchased by English growers to improve their strains. From having grown a quantity of the late Mr. Peter Barr's daffodils in his nursery, Mr. de Graaf was caught by the daffodil fever, and soon set to work to raise new hybrids. All daffodil growers will remember the introduction of the beautiful pale trumpet daffodil Madame de Graaf, raised from Empress and Albicans. For this new daffodil the Messrs. de Graaf asked £10 a bulb, a sum then considered by many to be fabulous for such a bulb as the daffodil. It may be said that this initiated the still higher price to follow, such as twenty guineas for "Weardale Perfection," and £50 for "Peter Barr." Following the introduction of "Madame de Graaf" came "Glory of Leiden," "Madame Plemp," etc., by the same raiser. In recent years Mr. de Graaf's finest introductions were unquestionably the pure white daffodils Loveliness, Mrs. G. H. Barr, Mrs. Robert Sydenham, White Knight, Lady of the Snows, Maid of the Mist, etc. In 1900 Mr. S. A. de Graaf retired from active participation in the business, leaving the management in the hands of two of his sons, Jan and William H. de Graaf. He then took a long holiday, and made a journey to the East Indian Dutch Colonies to see his youngest son Dirk, who was then managing a large coffee plantation. For the last few years the deceased has been forced to live a very quiet life owing to an affection of the heart. He expired suddenly seated in his easy chair next to his wife on Tuesday morning, April 25, age 71 years. The funeral took place on Friday, April 28, at the Cemetery "Rynhof," a beautiful private estate just outside Leiden, which has recently been converted into a burial place. A large number of personal friends and acquaintances and employees were present. Among his friends was Mr. Peter Rudolph Barr, of the firm of Messrs. Barr and Sons, London. The floral tributes were many, and very beautiful, including large wreaths of narcissi, etc., from the employees, a wreath of pink roses from the Barr family, and a lovely wreath of orchids, lapagerias, stephanotis, etc., from Mr. Harry Veitch. The coffin was covered with sprays of narcissi Madame de Graaf and Glory of Leiden.

MR. WILLIAM GREENAWAY.

One of the oldest contributors to The Gardeners' Magazine has passed away in the person of Mr. William Greenaway, of Oxford. Deceased, who was 77 years of age, had been ailing for the past few months, but he was kept from his secretarial work barely a month, and his end came quite peacefully on Friday last. For a long period Mr. Greenaway was a regular contributor to this journal of reports and articles, and wrote accounts of the leading horticultural shows with an authority which came of an accurate knowledge of the subjects with which he dealt. Although making no pretence to higher education, he was so well versed in literature appertaining to horticulture that he was an encyclopædia in himself in respect to the names of plants and their merits, and the names to him were not meaningless titles, for he had taken pains to search out the origin of and reason for the family classification, and the Latin terms applied to the innumerable varieties of flowers, both common and rare. He was con amore with his subject: the commercial aspect of it was foreign to his nature, and he was ever ready to pass on to others any information he possessed. The chrysanthemum was his first love, and in the early days of the Oxfordshire Chrysanthemum Society he attained some local success in the culture of the queen of autumn flowers. His work, however, lay in praising the efforts of others. He always wrote appreciatively of merit, whether found in professional or amateur products. In Oxford, where he was a familiar figure, and was highly respected, he will be long remembered as a painstaking and efficient secretary of horticultural societies. For about forty years he was secretary to the Oxfordshire Chrysanthemum Society, and many years ago he succeeded the late Mr. Hobbs in the secretaryship of the Royal Oxfordshire Horticultural Society, whose summer show is the occasion of a grand floral display and a fashionable gathering on the Tuesday of Commemoration week. Four years ago, at the annual chrysanthemum show in Oxford, he was the recipient of a handsome testimonial in recognition of his services to that society and to horticulture generally. He was for some years hon. secretary of the Headington Horticultural Society.

The funeral on Monday was attended by a large and sympathetic gathering, and beautiful wreaths were sent by various societies and friends. H. G. L.

NEW PLANTS, ETC.

NARCISSUS.

Miss Willmott. — This bold handsome flower is the result of crossing poeticus ornatus with a Barri variety. The flowers are large, of fine form and substance, with pure white perianth segments, and a broad cup, yellow, edged with red. The variety obtained an A.M. in April, 1906. F.C.C., R.H.S., April 25. Messrs. Walter T. Ware, Lim., Bath

Queen of Hearts.—A lovely variety with a beautifully-formed creamy perianth, with all the segments very broad and rounded; the cup is rich orange. A.M., R.H.S., April 25. Mr. Christopher Bourne, Simpson, Bletchley.

Socrates. — Another fine addition to the poeticus group; the white perianth segments are very substantial, and the prominent eye or crown is orange with a dark red rim. A.M., R.H.S., April 25. Messrs. Barr and Sons, Covent Garden, W.C.

PRIMULA CHENIES' EXCELSIOR.

A very distinct primula, free-flowering, and almost hardy. The flowers are wine-red in colour of medium size, and borne in whorls after the manner of P. japonica. The new-comer is said to be the result of crossing P. japonica with P. obconica. A.M., R.H.S., April 25. Mr. Dickson, gardener to Adeline, Duchess of Bedford, Chenies.

AURICULA UMPIRE.

A showy alpine variety with large and rich red-brown flowers, the colour being enhanced by the circle of white paste. It is a strikingly effective variety. A.M., R.H.S., April 25. Mr. Jas. Douglas, Great Bookham.

RHODODENDRON PENGAER.

A beautiful hybrid between R. Thomsoni and R. Aucklandi. As shown, the truss carried a dozen blooms each about four inches across, and of a deep red hue shaded or tinted with rose. A.M., R.H.S., April 25. Sir John T. D. Llewelyn, Bart., Penllergaer, Swansea.

ODONTOGLOSSUM RAMOS-EDWARDI.

A very elegant and pretty hybrid between O. ramosissimum and O. Edwardi. The inflorescence is much branched, and the abundant flowers are somewhat larger than those of the first-named parent. The wavy segments are pale pink, freely marked with purple. A.M., R.H.S., April 25. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

DIA-CATTLEYA SANDERÆ.

A remarkable hybrid between Cattleya Mendeli and Diacrium bicornutum. The flowers are of fair size and good shape, white, shaded with rose on the lip, and with a yellow disk. The influence of the Diacrium parent is most marked. . A.M., R.H.S., April 25. Messrs. Sander and Sons, St. Albans.

Lapageria rosea.—In order to succeed in its culture this lapageria needs a thoroughly prepared border for its reception, and, as a rule, for the first year or two after planting the rate of growth is by no means rapid. Such being the case, it is very essential that a good form be selected, for there is a great deal of individual variation to be found in the case of this lapageria, some being greatly superior to others. The best forms are propagated by means of layers, which take a long time to root, and, consequently, a fairly high price is asked for them. They are, however, much preferable to seedlings. The same remarks also hold good with regard to the white-flowered variety.—W. T.

ANSWERS TO CORRESPONDENTS.

SWEET PEA TRAINERS. — R. T. H., Yorks: The trainers you refer to may be used with every prospect of success. Plant the sweet peas inside the lower ring, and train the plants through the lower meshes, and give them a few ties on the outside. With this little assistance to begin with the plants will need no further care beyond an occasional tie to keep an extra strong growth in place. See also reply to "F. A. M.." on p. 332, in our issue of April 29.

FIBRE FOR ORCHIDS.—E. D. B., Chester: The difficulty of securing good peat for orchids becomes greater each year, especially in some districts, but a very good substitute for fibrous peat is Osmunda fibre, and this material all the leading nurserymen and sundriesmen now stock. It is used in precisely the same way as fibrous peat, but, as shown in these columns so many times, the practice of adding broken oak and beech leaves to the fibre for many kinds of orchids is extending. You should regularly consult the notes on Orchid Culture in our "Work for the Week" columns.

ROYAL GEORGE PEACH. — G. R. C., Ely: The late Dr. Hogg was of opinion that the fine peach now so familiar to growers under the name of Royal George, was not so named originally. The original Royal George appears to have been raised by Mr. Oram, of Brompton Lane, some time previous to 1724; apparently it was a good peach, large, and handsome, but it did not unite readily with the stock, and so in time cultivators substituted another variety that would propagate freely and sustain the reputation of Royal George. The variety chosen was Millet's Mignonne, new about the same time, and introduced by Mr. Millet, of North End, Fulham, who was one of the first market growers to force crops under glass. Royal George, as we know it, has small flowers; Oram's Royal George had large flowers. The Barrington peach was raised early in the nineteenth century by a Mr. Barrington, of Burwood, Surrey.

ACÆNAS. — C. P., Frinton: There are about thirty species of Acæna, but only eight or nine of these are at all well known to cultivators. They are all of creeping habit and useful for the rock garden, where they flourish in fairly dry positions. The small, pinnate, toothed leaves are very attractive, while the spiny burr-like flower heads of A. microphylla are an additional attraction to that species. Propagation may be effected by seeds, division, or cuttings. The chief species are A. adscendens, with purple flower heads; A. microphylla, crimson spined heads; A. millefolia, with finely cut, pale-green leaves; A. myriophylla, very elegant leafage; A. pulchella, with bronzy leaves; A. sarmentosa, with quite silky-haired leaves; A. sericea, with long leaves and greenish flowers; and A. splendens, with its leaves clothed in whitish silky hairs.

HARDY SPLEENWORTS. — H. H. S., Cowes: Omitting the Lady Ferns or Athyriums, which are grouped botanically under the aspleniums, we still have a number of very interesting spleenworts that are quite hardy. The Maidenhair Spleenwort, A. adiantum-nigrum, does well in a moist, shady rockery; A. ceterach needs some shade, but does well in a fairly dry position when once established; it is a very pretty fern; A. fontanum and A. germanicum both need sheltered positions, and sandy loam and peat to grow in; A. marinum needs a warm moist spot, and always does well near the seaside. A. ruta-muraria and A. septentrionale do well on walls; while A. trichomanes in a moist shady rockery is a very delightful fern; it has several fine varieties. A. viride frequently succumbs to the wet of winter, hence a sheet of glass should be placed over it as soon as cold wet weather sets in.

"PINGO," Elliott's New Summer Shading. No HOT water, simply add COLD water, and apply. Of Seedsmen, price as ORIGINAL.—[Advt.]

NAMES OF PLANTS.

V. G. J., Faringdon.—1, Odontoglossum crispum; 2, O. excellens.

G. S. B., Axminster.—1, Funckia Sieboldi; 2, Chorezema Lowi; 3, Corydalis thalictrifolia.

J. J., Haverfordwest.—1, Asplenium Fabianum; 2, Nephrodium molle; 3, Selaginella cæsia.

W. H., Selby.—1, Spiræa arguta; 2, Erica mediterranea; 3, Muscari conicum Heavenly Blue: 4, Prunus incana.

A. F. S., Dorking.—1, Primula rosea: 2, Daphne Cneorum; 3, Parottia jacquimontiana: 4, Berberis stenophylla.

L. D., Waterford.—1, Prunus serrulate fl.-pl.; 2, Calceolaria Burbidgei; 3, Pelargonium Clorinda; 4, Allium neapolitanum; 5, Dendrobium Parishi.

P. F., Coventry.—1, Amelanchier canadensis; 2, Cestrum aurantiacum; 3, Callistemon salignus; 4, Forsythia suspensa; 5, Azara microphylla; 6, Prunus triloba; 7, Magnolia conspicua.

C. C. J., Teignmouth.—1, Clematis montana; 2, C. indivisa lobata; 3, Erica Veitchi; 4, Doronicum excelsum; 5, Ribes sanguinea alba; 6, Cytisus albus; 7, probably Magnolia stellata, flower bady damaged; 8, Muscari botryoides alba; 9, Tulipa Clusiana.

TRADE NOTES.

From Messrs. Hayward-Tyler and Co., Lim., of 99, Queen Victoria Street, London we have received a copy of their new catalogue of spraying and lime-washing machines, which is well deserving the attention of all who are engaged in fruit culture. The catalogue contains descriptions and illustrations of a large number of spraying and lime-washing machines, ranging from light sprayers worked by the hand to powerful engines worked by a six-horse-power motor, and capable of supplying thirty branches, each fitted with a nozzle, at a pressure of 60lb. We observe that the firm supply spraying nozzles in sufficient variety to enable operators to use a nozzle adapted to the special work in hand. They also supply in an inexpensive form spraying pumps that can be readily fitted to water barrels. A spraying calendar and a list of washes add much to the value of the catalogue.

GARDENING ENGAGEMENTS.

Mr. H. Cheal, lately with Messrs. McBean, of Cooksbridge, has been engaged by Mr. E. V. Low as sole representative and traveller.

Mr. George Pierce, for the past seven years gardener to J. W. Summers, Esq., M.P., Cam-yr-Alyn, Rossett, has removed with his employer to Emral Park, Bangor-on-Dee, Wrexham.

FORTHCOMING ENGAGEMENTS.

[The Editor will be greatly obliged if Secretaries of Societies will send schedules and dates of exhibitions to him, at Endsleigh, Priory Park, Kew, Surrey.]

MONDAY, May 8.—United Horticultural Benefit and Provident Society.

TUESDAY, May 9.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. by Mons. H. Correvon, on "Alpine Gardens"; Scientific Committee at 4 o'clock.

Horticultural Club: House Dinner, at 6 p.m., followed by a lecture by Mr. T. Ernest Waltham, entitled, "Glimpses of Morocco and the Canary Isles."

WEDNESDAY, May 10.—Royal International Horticultural Exhibition, 1912: Meeting at the Mansion House, the Lord Mayor presiding, for the purpose of promoting the success of this exhibition. Chair will be taken at 3 p.m.

THURSDAY May 11.—British Gardeners' Association, London Branch.

THURSDAY, May 18.—National Sweet Pea Society: Special General Meeting at the Hotel Windsor, Westminster, 2.30 p.m.

SCHEDULES RECEIVED.

NEWMARKET HORTICULTURAL SOCIETY.—Seventeenth annual show will be held at Heath Lodge Paddocks on July 6. The schedule extends to 220 classes.

GRESFORD ROSE SOCIETY.—This society will hold its show in the Vicarage Grounds, on July 14.

Employment THE GARDENERS' MAGAZINE Register.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

Situations Wanted.

GARDENER (Head, where several are kept); thoroughly experienced in all branches. Inside and Out; Grapes, Peaches, Melons, Stove and Greenhouse Plants; 4½ and 11 years' excellent references as head; married, family out. E. STONE, 13, Coniston Road, Addiscombe, Croydon, Surrey.

GARDENER (Head); good Single or Fruit Gardens Manager; Budder, Grafter, Pruner, Cucumbers, Melons, Vines, Chrys., Bedding Plants, Roses, Mushrooms, ridge or flat; Kitchen, Lawn, Flower Garden. Special Prize 1910. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head of two or three) seeks SITUATION; 12 years' good practical experience; age 2[illegible]; married when suited; well recommended. Apply E. WALLIS, The Gardens, Maristow, Roborough, South Devon.

GARDENER (Head Working), married, no family; age 36; life experience in all branches, Inside and Out; excellent references; Wife dairy, or house, if required. A., 27, Effingham Road, Reigate, Surrey.

GARDENER (Head working or Single-handed); married, no family; life experience in all branches Inside and Out, good references. GARDENER, 36, Clarence Place, Gravesend, Kent.

GARDENER (Head Working).—H. ESSAM can with confidence recommend his Foreman, where several are kept; life experience in all branches; age 30; married when suited; excellent references. Address Closes Hall, Gisburn, Clitheroe.

GARDENER (Head working), where two or three are kept; thoroughly experienced, Inside and Out. Early and late forcing, gained in good establishments. Can be highly recommended. age 28. G. SIMS, Junction Road, Cowley, Oxford.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here six years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working, where three or more are kept).—Mr. LAST, The Gardens, Homewood, Chislehurst, Kent, can with every confidence recommend his Foreman, W. WAITE, as above; 13 years' experience, gained in good establishments; five years present situation. Married when suited.

GARDENER (Head Working).—Mr. F. BERRILL, of Hall Close, Kettering, wishes to recommend FRANK DAINTY, who is a thoroughly capable Gardener, with life experience Inside and Out; 8 years in present situation; age 30; married, no children. DAINTY, Hall Close, Kettering.

GARDENER (Head working), age 33, married, desires RE-ENGAGEMENT; 19 years' practical experience gained in good establishments; excellent references. WM. GIBSON, 128, Lansdowne Road, Leicester.

GARDENER (Head Working).—Mr. GOULD, Shernfold Park, Frant, Sussex, highly recommends his Foreman, A. DAY, as above; thorough practical experience Inside and Out; excellent references; age 30.

J. D. BOTTERELL, Esq., J.P., Colne Park, Essex, recommends his Gardener (Second) as HEAD of two or more; 17 years' all-round experience; married, age 4[illegible], one child age five; can cricket. H. BACON, as above.

GARDENER (Single-handed); little or no glass; 10 years' experience in present place; single; age 28. W. REEKS, 89, Amwell Street, Hoddesdon, Herts.

GARDENER (good Single-handed or otherwise); life experience; good all-round Man in all branches; age 45; married, one child; would take very moderate wage with cottage for a comfortable place. Excellent testimonials; willing to be useful. F. OSBORNE, 48, Bradshaw Road, Watford.

MR. SALTER, The Gardens, Avenue House, Church End, Finchley, highly recommends W. BICKER as GARDENER (Single-handed, or with help); experienced Inside and Out; at present in his employ; age 28; Eastern Counties preferred.

GARDENER (Single-handed or Under) seeks SITUATION; age 23; single; Nursery and other experience; good references. Apply A. HILL, Bardney Road, Wragby, Lincs.

GARDENER (Single-handed or with help), experienced Inside and Out; age 30; married, no family; good refs. H. J. C., 64, St. Mary's Road, Reigate.

GARDENER (Single-handed or otherwise); experienced Inside and Out; Vines, Fruit, Flowers, Vegetables; 10 years' excellent reference; abstainer; married when suited; disengaged. C. KIBBLEWHITE, Lyndhurst Lodge, The Grove, Slough, Bucks.

CHARGE HAND on Pleasure Grounds, or as GARDENER (Single-handed); well recommended; 4 years present place; disengaged when suited. H. CONNETT, Marsh Cottage, Sidmouth.

FOREMAN (Inside or General), would take HEAD place where four or more are kept; age 26; 11 years' practical experience in all branches, including Fruits, Orchids, Carnations, Stove, and Greenhouse Plants, etc., House and Table Decoration, R.H.S. certificate, disengaged when suited; England preferred. L. D. DREDGE, Dupplin Castle Gardens, Perth.

FOREMAN (Inside) in good establishment; life experience in all branches; House and Table Decorating; can be well recommended; age 27; three years as Foreman. WM. RANSOM, Easton Grey Gardens, Malmesbury, Wilts.

GARDENER (Second, Inside and Out), where three or four are kept; 9 years' experience; well recommended; age 23. COOK, Ivy Cottage, Scotsbridge, Croxley Green, Herts.

GARDENER (where one more kept); 15 years' practical experience Inside and Out. Essex preferred. Age 33, single; disengaged. R. W., 32, Forest Road, Loughton, Essex.

MR. DARE, Head Gardener to Captain Lynch Staunton, can highly recommend W. ALFORD to any Gardener as JOURNEYMAN, for Inside and Out, or Inside; strong, and good worker; 4½ years' experience; age 20. W. ALFORD, Waterlooville, nr. Cosham, Hants.

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

NOW IS THE TIME TO PLANT KELWAY'S GAILLARDIAS, the rich golden blooms of which are noted for their powers of endurance during the driest season, and as cut flowers retain their freshness and beauty long after they have been gathered. They flourish with a minimum of attention, and give abundant bloom the same year that they are planted. Choice named collections, 12s. and 18s. a dozen.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

KELWAY GLADIOLI flower freely in the open air through the autumn. Their fine bold blooms make an admirable addition to borders or beds, and are invaluable as cut flowers for church or table decoration. Choice named collections, 3s., 4s. 6d., 6s., 7s. 6d., 9s., 12s., and 18s. a dozen.

Order at once.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.

TESTIMONIAL.

From ———, Esq., Guildford.

"I may say that your Illustrated Catalogue is without doubt the finest book of the sort I have had the pleasure of seeing."

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Perpetual-flowering Carnations.

Perpetual-flowering carnations have long been with us, but the varieties that tested the skill of past generations of growers, and gave pleasure to the lovers of flowers in general and carnations in particular in bygone years, were very different to the race of carnations that we have now with us. The perpetual, or tree carnations that gladdened the hearts of some of the old florists, and gave rise to disappointment in others, possessed merit. The best of them were moderately free in growth, and if not profuse in flowering, they yielded in the course of the winter and spring months a fairly good harvest of bloom. They differed in one respect from the varieties constituting the present race, and this consisted in their bearing flowers with petals that were smooth at the edge. Raisers, cultivators, and those who were responsible for making awards to new plants and flowers, were agreed that the edges of the petals should be free from serrations, and if they were serrated they would have none of them, whatever may have been their merits in other respects. This point is of interest as showing how difficult it is sometimes to break away from traditional rules, and also of the necessity for those who are concerned with special classes of flowers to pause now and again for the purpose of carefully considering whether some deviation from existing methods of procedure would not be an advantage. In the case of the flowers under notice it would have been highly advantageous to have considered whether something more than a smooth edge to the petals was not needed. Previous generations of florists had decreed that the blooms of carnations should, to justify the recognition of the varieties, possess certain properties, and had the decree been limited to the show flowers all would have been well. It was regarded, as time went on, as applying to all the sections, and the perpetual-flowering varieties suffered in consequence. In the "show" carnation perfection of form is of primary importance, a fact no one could more readily recognise than ourselves. But in the "perpetual" carnation something more is needed. The flowers should be of relatively large size, good form, and attractive in colour, be borne on long stems, and the plants should have a vigorous constitution, and produce a continuous succession of flowers extending over a long period. The present-day varieties possess all these desirable qualities, and to this fact they owe the high degree of popularity that they now enjoy. They mostly have their petals fimbriated, but this is regarded by not a few of those who appreciate carnations as an additional charm, instead of a defect, as was the case in years now belonging to the past. To our friends across the Atlantic must be given the credit of demonstrating to the world the great value of the new race of perpetual carnations for the supply of cut flowers, and also of raising and distributing large numbers of varieties possessing a high degree of merit. The services they rendered to the flower-loving community could not well be overestimated; and in stating this fact it is gratifying to be able to feel that on this side of the Atlantic the cultivation of perpetual carnations is being carried on with a degree of success that has certainly not been surpassed in any other country. We have had proof of this at the exhibitions of the Perpetual-flowering Carnation Society, at the exhibitions and meetings of the Royal Horticultural Society, and in the flower market at Covent Garden. In immense numbers of private gardens they are largely and successfully grown, and in the raising of new varieties our growers have achieved so high a degree of success that some of the varieties of British origin are quite unsurpassed in their respective shades of colour. Those engaged in the cultivation of perpetual carnations for market do not require advice, excepting that which relates to novelties of promise, but we may with advantage strongly advise owners of gardens to provide one or more structures specially for carnations. Gardeners who have to grow their flowers in association with other plants having different cultural requirements are so severely handicapped as to render it impossible for them to demonstrate their skill, and produce a supply of flowers proportionate to the number of plants they have. The structures need not be elaborate in design or costly in fitting. All that is necessary is a plain light structure, with a heating apparatus equal to maintaining the necessary temperature without excessive stoking, and ventilators so whether some deviation buoyant atmosphere can be maintained without exposing the plants to cold draughts. Span roofs are preferable to lean-to's because of the plants being freely exposed to light on all sides, and the position selected for carnation houses should be open, and beyond the influence of the shade of tall trees. Until within a quite recent period perpetual carnations have been almost exclusively regarded as of value for glass culture. But it is evident that no such limit should be placed on their usefulness. Their chief value is for cultivation under glass, and it is not un-

MR. HARRY A. BARNARD.

reasonable to assume that it will remain so. But the results obtained in the course of the trials conducted by the Perpetual-flowering Carnation Society in the gardens of the Royal Botanic Society, and also in some private gardens, have proved to demonstration that they can be grown with much success in open beds and borders. By bedding out at the end of May plants that have produced a crop of flowers under glass, a succession of blooms of good quality will be obtained from quite early in June until the autumn frosts impose a check upon vegetation. They may, of course, be planted in the borders of the flower garden, but where they are intended for the supply of cut flowers the preferable course will be to grow them in beds in the kitchen garden, or reserve ground. Then, if a light framework is fixed over the beds it will, with the aid of suitable material, be a very easy matter to protect the blooms from heavy rains and moderate frosts. We have no doubt as to perpetual-flowering carnations having a great future before them for outdoor culture, and we advise those who have opportunities for doing so to put their suitability for the purpose to a practical test during the summer on which we are about to enter.

Mr. Harry A. Barnard, whose jubilee with the Messrs. Low, of Clapton and Bush Hill Park, was celebrated in so pleasant a manner the other day, may be heartily congratulated on the good fortune with which he has been favoured during the past fifty years, which, it need hardly be said, form a very considerable portion of a man's activities in commercial life. Entering the nurseries of the Messrs. Low at Clapton at an early period of his life, when the late Mr. Hugh Low was at the head of the firm, Mr. Barnard was successful within a comparatively short period of obtaining a prominent position as a member of the staff, and this position he has maintained until the present time. Mr. Barnard is fortunate in possessing the ability essential to his taking a leading position, and in being able to so discharge the duties associated therewith as to command the esteem of the members of the firm, and to enjoy the respect of the other members of the staff. He has been fortunate also in having been blessed with so robust a constitution that during the fifty years he has been with the Messrs. Low he has not once been absent from business through ill-health. The jubilee of Mr. Barnard was celebrated on Saturday last by a presentation from the staff at the Royal Nurseries, Bush Hill Park, of a remarkably handsome clock and ornaments, the clock bearing the following inscription: "Presented to Mr. Harry A. Barnard on the celebration of his jubilee with the Lows of Clapton, as a mark of esteem and affection from all employed at the Royal Nurseries, Bush Hill Park, April, 1911." The presentation was made by Mr. Stuart Low, the head of the firm, who spoke in eulogistic terms of Mr. Barnard's abilities, which were shown in a marked manner in the readiness with which he could, when the circumstances demanded, change with the times. Mr. Barnard acknowledged the gift in a highly appreciative speech, which was interspersed with many interesting anecdotes, and in his concluding remarks gave some excellent advice to the young employees of the firm.

The Gardeners' Company.—The deputation of this company that recently returned from a visit to the bulb-growing districts of Holland consisted of Mr. Charles Bayer (the Master of the company), Mr. Beaumont Shepheard, Mr. N. N. Sherwood, V.M.H., Mr. J. Francis, Mr. J. Gurney Fowler, Dr. P. Purnell, Mr. J. E. Rubie, Mr. H. S. Harris, Mr. H. C. Bayer, and Mr. A. E. Rogers, the latter, from the Board of Agriculture, being a guest of the company. Mr. E. A. Ebblewhite, the clerk of the company, and Mr. Boone, the beadle, were also in the party. The deputation visited Katwyk, Aalsmere, Leiden, Hillegom, Lisse, Haarlem, Amsterdam, and Wageningen. Mr. R. Bonthius and Mr. K. Volkersz, horticultural experts under the Netherlands Board of Agriculture, placed themselves at the service of the deputation during its stay, from April 27 to May 1. The deputation was everywhere received with great cordiality, and everything possible was done to make the visit instructive and enjoyable.

Flowering Trees and Shrubs at Kew.—The procession of flowers that belong to the season of spring continues, and the Royal Gardens, Kew, now present a highly attractive appearance. Some of the Japanese cherries have, for the season, lost their floral charms, but the finest of all, Prunus pseudo cerasus J. H. Veitch still affords ample evidence of the wondrous beauty of its large deep rose-pink flowers. Some of the pyrus are now in the ascendant, and the large specimens of the Siberian crab (Pyrus baccata) have presented, as seen from a distance, much the appearance of mounds of snow. The group of specimens of Pyrus malus floribunda on the mound contiguous to the tropical lily house are just now in perfection, and the myriads of delicate pink flowers produce a delightful effect. Visitors to Kew who are interested in trees should make note of the trees of P. malus floribunda atrococcinea, which has deep rose-red flowers, and also of the handsome P. Scheideckeri, which has rich pink flowers. The elegant free-blooming Berberis stenophylla has been planted somewhat freely within recent years, and the bold groups in the berberis collection on the east side of the garden, and in the arboretum on the western side, are now in full bloom, and the masses of golden flowers produce an exceedingly rich effect. The glory of Magnolia Soulangeana will have departed before this note appears in print, but the bushes of M. Lennei that are contiguous to the fine specimen in the azalea garden are in perfection, and the mollis azaleas are producing a brilliant display of colour. The narcissi, with the exception of a few stray flowers of the poet's narciss, are over, and are being succeeded by the bluebells in the Queen's Cottage grounds and elsewhere, and by the blue, white, and lilac-coloured flowers of the Spanish Quill in various parts of the garden.

Kew Guild Annual Dinner.—The annual dinner of the Kew Guild will be held at the Tavistock Hotel, Covent Garden, W.C., on Wednesday, May 24, at 7 p.m. prompt. Mr. R. Hooper Pearson will preside. After the dinner the annual business meeting will take place, to be followed by a "social."

Spring Flowers at Croydon.—The last fortnightly meeting of the Croydon Gardeners' Society was of special interest as, on this occasion, the members held their spring show. A special invitation was sent out to members to contribute of their best, and it was suggested in connection therewith that each one should have a small exhibit, so that the single-handed gardeners' contributions should not be overpowered by the products of those who have charge of large gardens. Seventeen collections were staged, and as they differed materially from each other they collectively produced an interesting and attractive display. In the course of the evening there were discussions on the cultivation of the more noteworthy of the plants staged, and these proved of much interest, and most useful. The members who contributed products of their skill included Mr. F. W. Hart, Mr. T. H. Young, Mr. E. Mann, Mr. F. Oxtoby, Mr. G. Rapley, Mr. Mills, Mr. Jeal, Mr. J. Dingwall, Mr. C. Thrower, Mr. J. Brown, Mr. H. Boshier, Mr. J. Gregory, and Mr. A. Edwards.

Site of Natural History Museum.—At a meeting of the Council of the Royal Horticultural Society, held on the 9th inst., the following resolution was carried unanimously and ordered to be forwarded to the Prime Minister: "The Council of the Royal Horticultural Society beg to record their great regret that it should be proposed to encroach on the entirety of the site which was secured to the Natural History Museum by the delimitation of its northern boundary by the Treasury and the Office of Works in 1899, which site they regard as being of vital importance to the efficiency of the Museum." Given under the Common Seal of the Royal Horticultural Society.—W. Wilks, Secretary.

Proposed List of Tulip Names.—The members of the Royal Horticultural Society's Daffodil and Tulip Committee have appointed Messrs. P. R. Barr, R. Wallace, G. W. Leak, Rev. J. Jacob, and the chairman and hon. secretary, to act as a sub-committee for the purpose of drawing up a list of tulip names on the lines of the original and useful daffodil list. Such a list will be very welcome.

Preservation of Wild Flowers.—Mr. W. M. Webb, hon. secretary of the Selborne Society, writes with regard to a recently published letter from the Rev. E. J. Bacon Phillips: "My council has recently constituted, in January last, a special section of the Selborne Society to deal with the important question of plant protection. The chairman is Dr. A. B. Rendle, F.R.S., Keeper of Botany in the British Museum (Natural History), and the recorder is Mr. A. R. Horwood, of Leicester Museum, who has paid considerable attention to the methods by which plants are becoming exterminated. We have the support of Lord Avebury and several distinguished botanists, while a report has been drawn up and adopted by my council with a view to carrying out the objects of the section, which include a strenuous endeavour to influence public opinion and secure legislation."

National Chrysanthemum Society.—We have already published a list of this society's exhibitions and meetings, but the newly-issued schedule of prizes includes additions to the programme. There is to be an outing to Cliveden, by permission of W. Astor, Esq., on July 17: the Floral Committee will visit Messrs. Cragg, Harrison, and Cragg's nurseries, at Heston, Middlesex, on October 21; and there will be a Chrysanthemum Conference at Carr's Restaurant, Strand, W.C., on Monday evening, December 4. Details of the conference will be announced later.

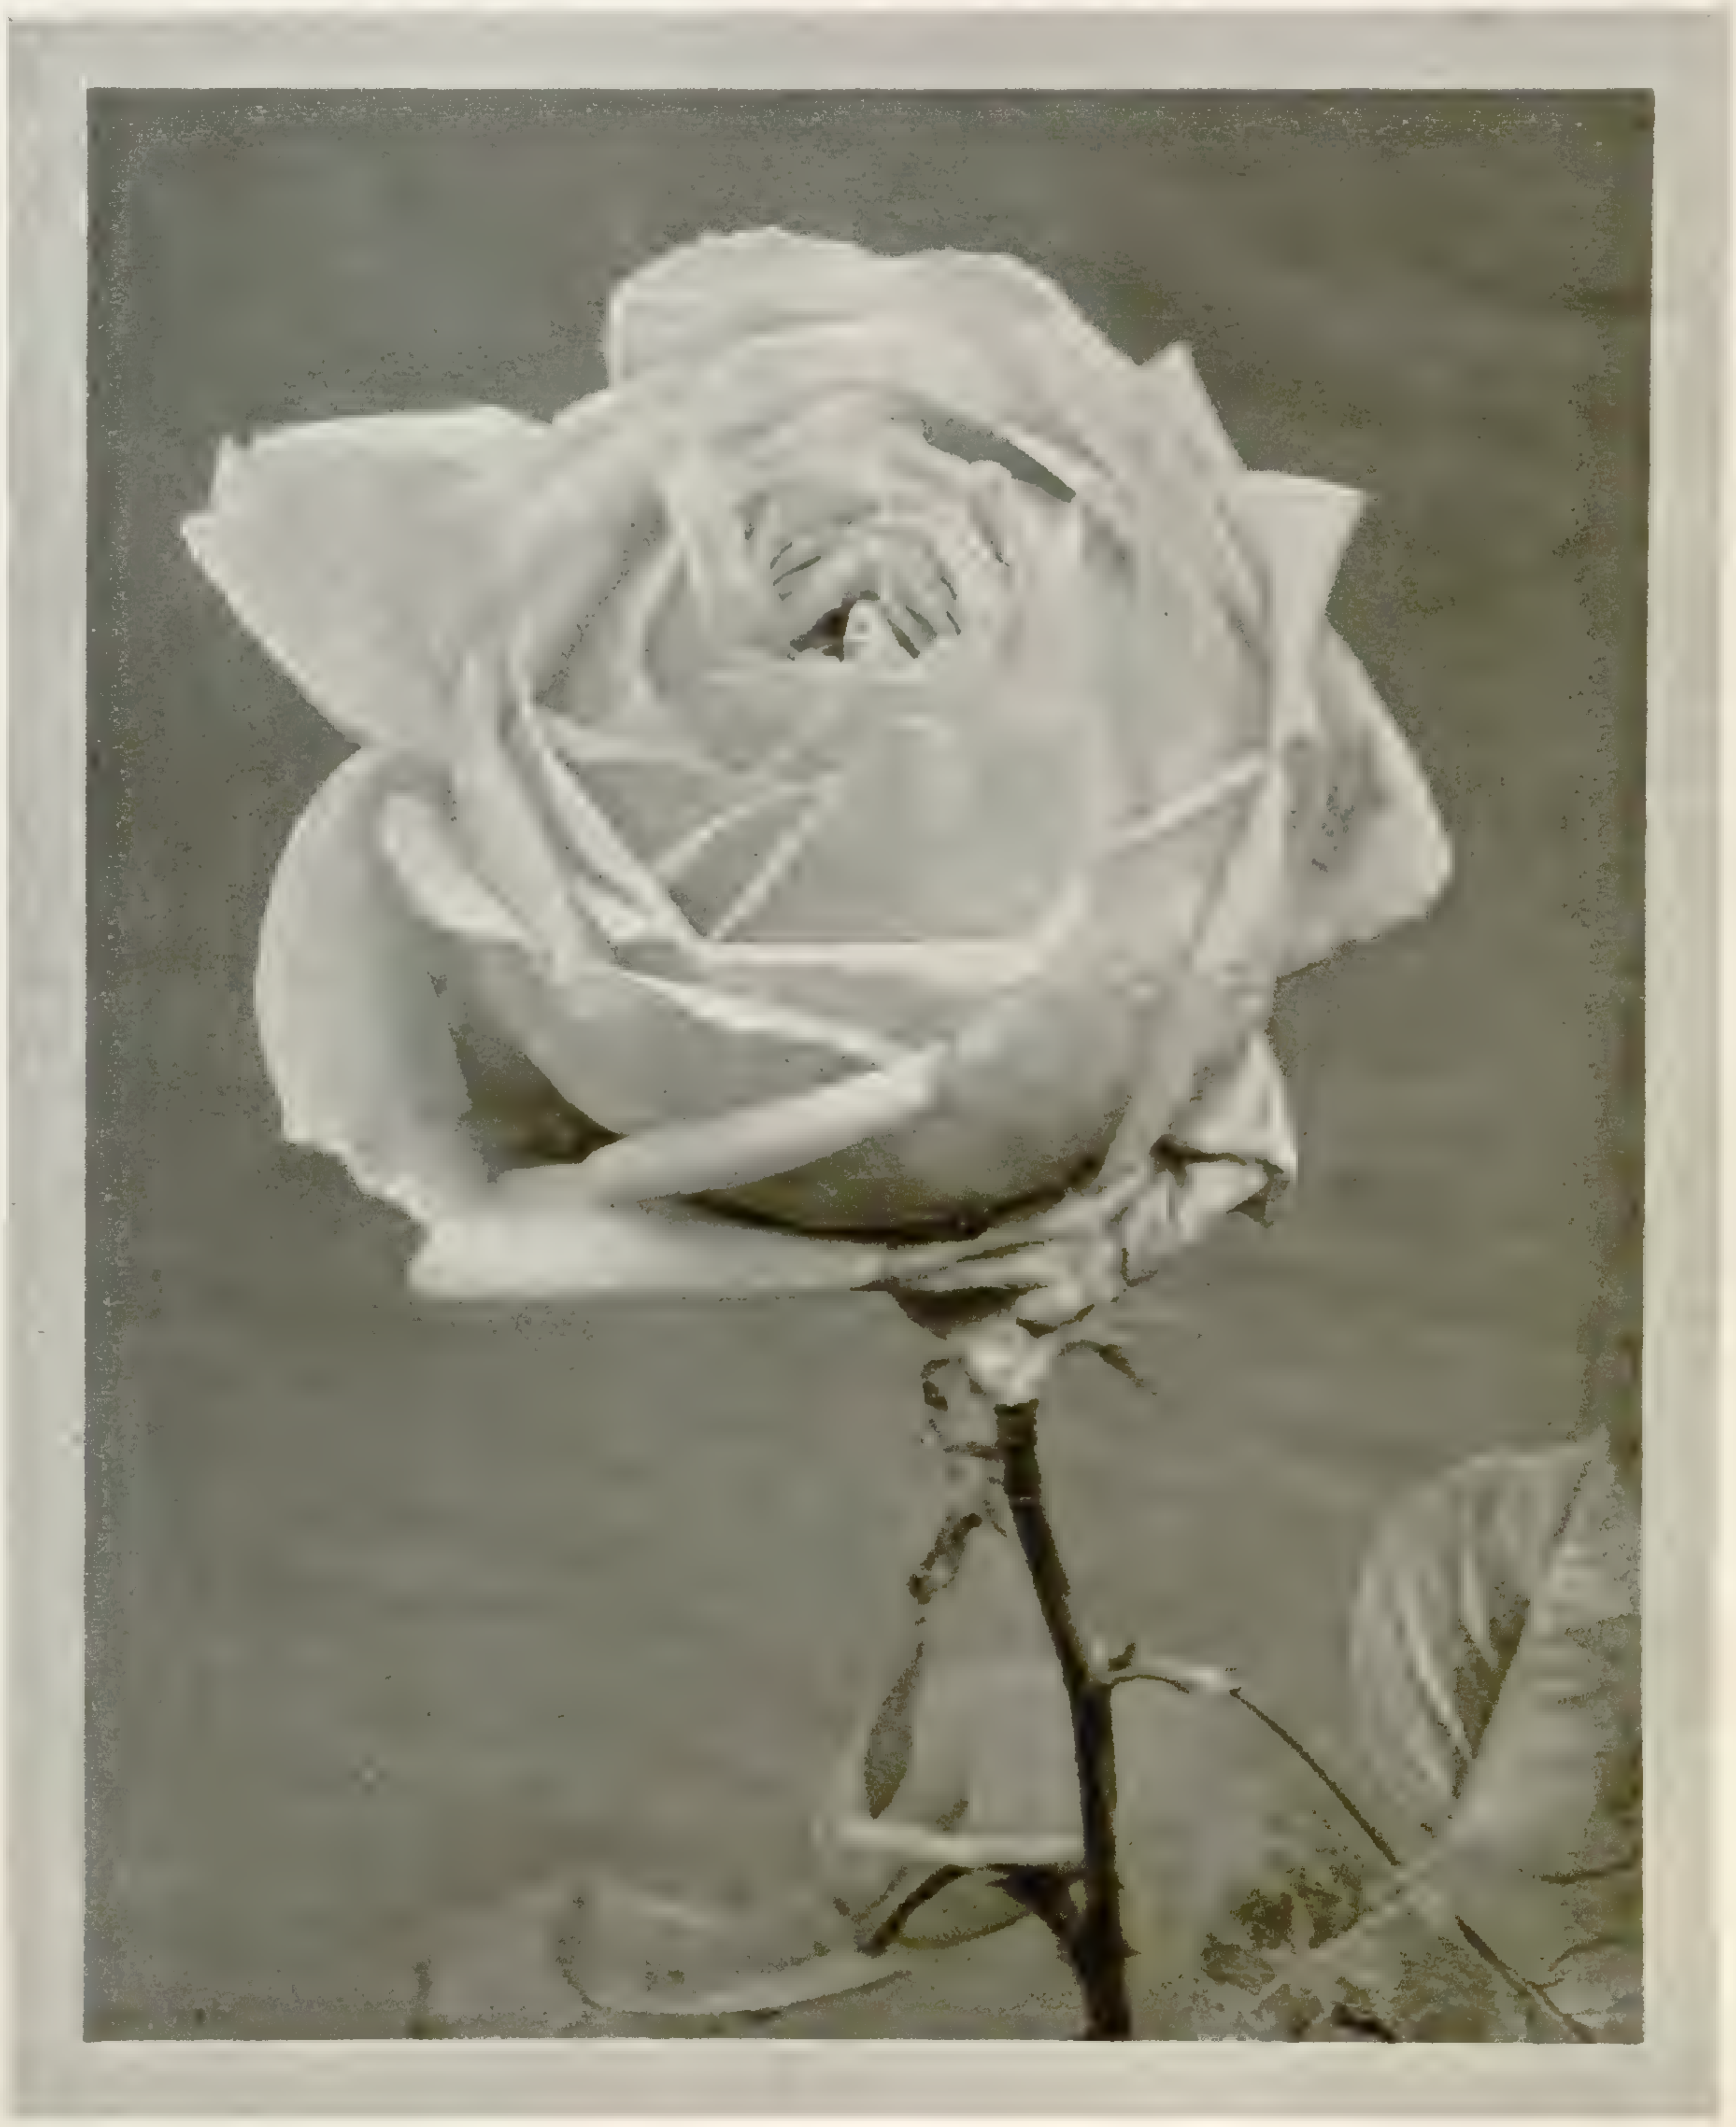
Presentation to Alderman J. W. Bentley, J.P. Much additional interest was given to the exhibition held by the Northern Section of the National Auricula Society at Manchester, on April 29, by the presentation of an illuminated address to this distinguished florist. Alderman Bentley, who has for many years past cultivated with much success in his gardens at Stakehill, Castleton, near Manchester, auriculas, polyanthuses, tulips, and other of the older florists' flowers, was for fourteen years hon. treasurer and secretary of the society. Retiring from the dual office at the close of the last financial year, the members of the society decided to recognise the splendid services he had rendered in the cause of floriculture, by presenting him with an illuminated address. The presentation was made on the occasion of the annual exhibition, by Mr. T. S. Turnbull, one of the vice-presidents, who referred in appreciative terms to the value of Mr. Alderman Bentley's services to the society. The address was as follows: "We the undersigned members of the National Auricula Society (Northern Section), on this, the occasion of your retirement, after fourteen years of active service as hon. treasurer and secretary, desire to tender you our heartiest thanks for the efficient and successful manner in which you have conducted our affairs. During the period of office the society has passed through a critical period in its history, and we fully recognise that the willing service which you have rendered must have been at much inconvenience and self-sacrifice in consequence of your many public and private appointments; we feel that, not this society, but auricula growers in general, are indebted to you for the many seedlings of high merit which you have raised, and for your kindness in distributing them so readily, thereby setting an example worthy of emulation, and materially increasing the taste for the culture of the auricula. The knowledge that your labours have revived interest in these beautiful flowers, the auricula and gold-laced polyanthus, which have been valued by so many generations of flower lovers, will be your chief satisfaction and reward. We hope, therefore, that you will accept this address as a token of our appreciation and respect, and as a memento of your official connection with this society since 1897." The address is signed by the leading cultivators of the auricula in the United Kingdom.

Floral Decorations at Drury Lane.—We understand that the floral decorations for the Gala Performance to be given at Drury Lane Theatre, on Wednesday, May 17, on the occasion of the visit of the Emperor of Germany, will be carried out by Messrs. Wm. Cutbush and Son, Highgate; roses in two colours will be the flowers chiefly employed on this occasion.

Rose Alice Cory-Wright, H.T., which we have the pleasure of illustrating herewith, is a valuable addition to the somewhat lengthy list of hybrid teas, and one of the most noteworthy of the varieties belonging to this section that have been raised and introduced by Messrs. William Paul and Son, of Waltham Cross. The flowers of the variety are of the largest size, remarkable for their fullness, and of a rich rose-pink hue. The bloom illustrated is shown about two-thirds its natural size. This fine rose was introduced by Messrs. W. Paul and Son in 1910, and is proving of even higher value than was anticipated.

Flower Shows at Birmingham.—We are informed that the Birmingham Botanical and Horticultural Society have arranged to hold two exhibitions during the summer months, as for several years past. The first will be held on June 8, at which the chief features will be orchids and early summer flowers, and the second on July 20, when roses and midsummer flowers will predominate. Honorary exhibits of flowers, fruits, and vegetables will be welcomed. The hon. secretaries, Botanical Gardens, Birmingham, will supply schedules and all needful particulars.

Care for the Orphans.—To commemorate the Coronation year Mr. N. N. Sherwood, V.M.H., suggests the formation of a fund that, invested, shall provide for the maintenance of one orphan in connection with the Royal Gardeners' Orphan Fund. If this suggestion is carried into effect it is proposed to ask her Majesty to allow it to be called the Queen Mary Fund. Mr. Sherwood is prepared to start the fund with £50.



H.T. ROSE, ALICE CORY-WRIGHT.

A distinct and beautiful hybrid tea raised by Messrs William Paul and Son, Waltham Cross. The blooms are of the largest size, and the colour a rich shade of rose-pink.

Teaching of Botany.—In the course of an exhaustive article on the teaching of science in secondary schools, which appeared in the issue of "Nature" for May 4, the writer observes with reference to the teaching of botany: Considerable changes have been effected in recent years in the method and scope of botanical teaching. The time given to the purely descriptive work connected with the classification of plants in their natural orders has been greatly curtailed, and it is now common to find included in the course an experimental treatment of plant physiology and some consideration of the question of habitat. There is, too, an increasing tendency to recognise that no adequate study of botany is possible without some knowledge of the elementary facts and principles of chemistry and physics. The broader treatment which the subject now receives, and the substitution of a partially experimental for a purely descriptive method, have led to a healthier development of science teaching in many girls' schools. But the new methods have brought with them their own special difficulties, which, in most cases, still await solution. It is rare, for example, to find the experimental work on plant physiology really well done, and the possibilities of the school garden as an adjunct to the laboratory are insufficiently realised by teachers of botany. Though in connection with this subject it is possible to record a general tendency in the right direction, and in a fair number of instances a real advance, it is still the case that in too many schools botany is regarded somewhat in the light of an accomplishment, making no very serious demands on the pupils' intelligence, and requiring little more by way of equipment than a classroom and a bunch of flowers.

ROSES FOR THE GARDEN.

(Concluded from page 337.)

In dealing with specimen plants, it is advisable to allow them to grow naturally, then thin out the weakly wood and shorten the tips of the shoots that are to remain. Caroline Testout and other strong growers should not be pruned too hard, the best blooms being produced on shoots that are two or three feet high. When growing roses as bedding plants they should be planted more closely than is generally considered advisable, and Mr. Pemberton suggested they should be arranged twelve inches apart in rows with a space of thirty inches between them; when planted thus they fill out the space in the most satisfactory manner, and the hoe can be freely used between them. Pruning was necessary to encourage growth, and if the growth could be obtained, as in the case of Bessie Brown and the Earl of Warwick, without severe pruning, prune moderately.

Speaking of the enemies of the rose, Mr. Pemberton said that prevention was better than cure, and much might be done in this direction by maintaining the roses in a healthy state by means of good cultivation. The best way of destroying grubs that were enclosed in the leaves is a pressure between the finger and thumb, and other caterpillars should be kept down by hand-picking. Aphis were especially troublesome because of the rapidity with which they increased. The finger and thumb can be used with success in keeping down these pests; the sponge also can be used most successfully, and a spraying machine used at an early stage will also render substantial assistance in keeping these pests in subjection.

One of the most destructive of the fungoid pests is the rose mildew, for, when not held in check, it would spread over the leaves and do much injury to the plants. The only way to prevent it doing serious damage was to persist year after year in keeping it under. Mr. Pemberton said that he had used as a spraying solution a mixture of Calvert's carbolic soap and water, and had found it most effective. This was prepared by boiling 1½lb. of the soft soap in 7½ quarts of water, and then diluting it by adding six parts of soft water to each quart of the solution.

Mr. H. R. Darlington said there was little of a controversial character in the President's address, and he congratulated the President on the great success of the conference, and certainly hoped that it would not be the last at which they would have the pleasure of being present. He thought he might perhaps best employ the time at his disposal by making a brief reference to the five points which, in his opinion, constituted a perfect rose. He placed form first, as it could be of little value unless of fairly good form. Colour should, in his opinion, have second place, because upon its colour the value of a rose greatly depended. It was thought by some that if a colour is distinct it must be good; but, in his opinion, the colours of roses should harmonise with each other. The colour of some roses that he could mention would not harmonise with the colours of others, and this detracts from the merits of the varieties, however beautiful they may be in themselves. Perpetual-flowering he placed third, and felt sure that all who were present would agree with him that it was a strong point; certainly a rose that blooms over a period of six months must be superior to one that blooms six weeks, provided other points are equal. Fragrance ought to accompany the perfect rose, and everything that is possible should be done to develop this much-appreciated charm. Constitution was a most necessary quality, and it should be such as would adapt the rose to the English climate. He was longing to see the hardy Marechal Niel, and he was hoping they might see some day a Marechal Niel with the constitution of Rayon d'Or.

Mr. Vivian Rolt said, as an artist, he was much interested in the colour of roses, and he should not stage The Lyon rose in a box if he could help it, because the colour is so brilliant that it would kill that of the varieties with which it was associated.

The Mayor of Colchester (Mr. Frank Cant) said the President had told them about the failures that occurred owing to treating all classes alike. He had many proofs of this, and he had found on investigating complaints of roses not flowering, that the failure of the roses to bloom satisfactorily was due to cutting away the shoots that would have bloomed. In most cases these shoots were cut away simply for the purpose of making the roses tidy. Those who tidy-up rambler roses invariably have a very poor harvest of blossom in the following season.

Mr. Farrow, who stated that his garden was within six miles of Westminster, said that for a long time his roses had been seriously injured by mildew, the fungus having baffled all his efforts to keep it in subjection. Some two years ago, acting on the advice of Dr. Williams, a member of the council of the society, he tried spraying his roses with a solution of a preparation known as Cyllin, and it had proved a complete success. He prepared the solution in accordance with the directions given, and he syringed his roses twice a week, with the result that not a trace of mildew was to be found on the leaves. He found it most necessary not to miss a week.

Mr. R. E. Felton expressed the opinion that it was a mistake to discourage new breaks of colour in roses, simply because the new colour is not quite in harmony with the existing colours. Juliet is very fascinating, and will make history; it gives certain colours that in certain lights are exquisitely beautiful. They should remember in connection with the colours of roses that when one has so brilliant a colour as to overpower colours less bright, it is only a question of time when, as mentioned by Mr. Rolt, we shall have other varieties equally remarkable for brilliance.

Mr. Easlea did not agree with Mr. Darlington that all roses should be perpetual, but thought it an advantage to have some that were quite ephemeral in bloom production.

Mr. G. Birch said that it would be of great assistance to rose-growers generally if a calendar showing the times of the blooming of the several sections could be prepared and published.

Mr. George Paul, V.M.H., strongly advised the planting of the stronger-growing varieties in shrubbery borders. The rugosas and other of the more robust kinds were able to withstand the competition of other shrubs, and when from six to seven feet high were remarkably attractive.

As intimated in our issue of last week, the proceedings terminated with a hearty vote of thanks to the President for his address.

Plumbago rosea.—This plumbago is of exceptional merit as a winter-flowering subject, and well deserves more extensive cultivation. At this season it may be readily propagated from the young shoots which have developed after the flowering season. Place four or six cuttings close to the inner edge of small sixty-sized pots filled with a compost of sand, leaf-soil, and peat in equal parts. Give sufficient water to settle the soil, and plunge in a gentle hotbed, if such is available, and keep the propagating frame closed until root action has commenced. After the plants have been inured to the light they may be potted up singly, using good loam and leaf-soil, with a little sand and peat added; pot firmly, and keep the plants well sprayed to encourage growth. The tips of the growing shoots may be occasionally pinched out if the plants do not break freely otherwise. Plumbagos must not be allowed to suffer from want of rooting space until after the final potting; for the latter use a compost of rougher material, and add a small quantity of well-decayed manure. Pots of five to six inches diameter are usually quite large enough.—John Donoghue, Bardon Hill Gardens.

SPRING-FLOWERING CEANOTHUSES.

With a few exceptions the various kinds of ceanothus which blossom during the spring months are not hardy enough, unfortunately, to stand uninjured in the open ground, except in the more favoured parts of the country, such as Cornwall and South Wales, for, although they may escape from injury through a mild winter, they can never be considered safe. As the majority are evergreen, however, and, in addition, of a floriferous character, they well deserve a place on a wall, where the slight protection thus afforded enables them to withstand the severity of all ordinary winters.

Except that they are not very hardy, it cannot be urged that these ceanothuses are difficult to grow, for in ordinary garden soil they form vigorous shoots, and soon cover a considerable area. They cannot, however, be successfully transplanted, except as quite small examples, for the branch system grows out of all proportion to the roots, and it is difficult to move a plant with a ball of soil so as to cause little or no root disturbance. Propagation is effected by means of cuttings, and it is a good plan to root a small batch of cuttings of each kind every summer, and keep them in a cold frame for the winter, in case of a mishap to the old plants. As they blossom on the previous year's wood care must be taken not to prune away any wood until after the flowers have fallen. Pruning is very necessary, however, in regard to wall-grown specimens, for if not cut well back as soon as the flowers fade the plants quickly become overgrown, and stand out too far from the wall to gain the necessary amount of protection in winter.

Another use to which these plants may be put is to plant them in large pots and tubs, and use them for the decoration of conservatories and corridors. Throughout winter they may be stored in a cold house or frame. Young year-old plants are also effective for table decoration, for the blue flowers supply a colour which is not common at this time of year.

The species which concern us most are chiefly of Californian origin, and are as follows: C. integerrimus, a tall-growing shrub, with slender branches, bearing large inflorescences of lilac flowers. C. papillosus, a vigorous habited plant, readily distinguished from other kinds by reason of its long narrow leaves, which are covered with viscid hairs containing a fragrant oily substance. The flowers are borne from terminal and axillary buds, and are a pretty shade of blue; they open during April and May. C. rigidus is perhaps the most showy of all, for its flowers are borne in dense heads from almost every leaf axil on the previous year's wood. They are of a rich deep shade of blue, and open in April. The species may be readily detected among others by reason of its short leaves, which are deeply lobed, and its stiff manner of growth.

C. thyrsiflorus is sometimes spoken of as the Californian lilac, and is the hardiest of those mentioned. In the neighbourhood of London it grows in the open ground to a height of 15 or 18 feet. Its oval leaves are half an inch to an inch long, and the flowers, which appear with great freedom in May, are blue in colour. C. Veitchianus is an exceptionally showy species. It grows freely, forming sturdy, but somewhat slender growths, clothed with small evergreen leaves, and during May with showy blue flowers. It is suitable for both wall and pot culture.

W. Dallimore.

PERPETUAL CARNATIONS FROM THE FLORISTS' STANDPOINT.

The long list of names and varieties in our flowers are a perpetual embarrassment to the average amateur and gardener alike, who is simply in search of the few best varieties. Those who cannot attend the leading shows have to rely upon reports and catalogue descriptions, which, no matter how they are written, rarely, if ever, convey quite the correct description to the reader. Hence the deductions of others, governed by the editorial blue pencil, are a guide to those who are in search of just the few best varieties.

The merits of a flower as a commercial commodity are revealed more accurately in Covent Garden Market than anywhere else in the world. For there we have congregated together the largest number of expert flower producers selling their products to expert buyers.

Sentiment may rule the enthusiastic amateur, sentiment may govern the specialist, but it never influences the purely commercial florist. It is he who must know the taste of that supreme judge, the public, and it is he who must know those varieties which best enable him to display his art. Hence flowers which are beautiful, shades which harmonise, are the only ones which meet with any considerable favour in the eyes of the florist.

The cool, calculating market grower, who produces carnation flowers, not for their enchanting beauty, nor for their several other charms, but solely for the financial results he can obtain, will only grow such varieties as produce sufficient flowers to make their culture profitable. So that between these two groups of experts, the one searching for beauty, the other demanding healthy, free-flowering varieties, we have the greatest criterion of all. They are the greatest judges of merit in our modern varieties of perpetual-flowering carnations, much to be preferred to floral committees, and their verdict is far more valuable than First Class Certificates.

We will therefore restrict our attention purely to varieties as we find them favoured in London's great floral market.

In white varieties there are only two found in large quantities, White Perfection being the strongest favourite, on account of its purity of colour and perfectly formed flowers. The grower finds that the plants occupy less room than some of the other varieties, hence he is able to procure at least as many flowers per foot of space. White Enchantress, now that the stocks have been carefully selected, and an absolutely pure strain procured, has increased in favour, and promises to be the white grown in the greatest quantity next season. This season's three white novelties will receive their test during next winter, but exclusive of the varieties mentioned there are hardly any other white carnations seen in the market.

In pink shades, Enchantress, of course, and Winsor, lead in their respective shades, with May Day becoming increasingly popular. Its perfectly built flowers and delightful salmon-rose colour, coupled with the freest habit of growth of any variety, makes it indispensable to all. Rose-pink Enchantress and Dorothy Gordon, which are almost, if not quite, identical, are seen in decreasing quantities. The shade of colour, which is considered a little crude, is alone the cause of this decline in the estimation in which they are held by growers.

Mrs. H. Burnett remains the stand-by of the salmon shade, but May Day, though distinct in tone, is being substituted for it on account of its greater productiveness. In dark or cerise-pinks, Mrs. T. W. Lawson and Afterglow are found in decreasing quantities. Mrs. C. W. Ward will supersede both these varieties, and promises to be the most popular cerise variety next season. Its good all-round qualities bespeak a long life for it. There are several other varieties, also some promising novelties and seedlings, seen in varying quantities, but we are restricting our remarks to established favourites.

A battle royal goes on for supremacy in the red section, and it is difficult to judge between Britannia and Beacon as to which is the most popular. I should say Britannia was favoured by those who cultivate in pots, and Beacon by those who grow planted out, while we all expect to see the new variety Scarlet Glow firmly establish itself with both grower and florist next season.

The demand for crimsons is limited, but Carola leads, followed by Wanoka and Black Chief. At present there is no yellow variety of sufficient merit to interest Covent Garden, hence only occasional lots are seen. There is a small, though constant demand for certain fancy varieties, Mikado being perhaps the most popular of these. That variety has undoubtedly made a market for heliotrope varieties. Marmion also sells well, though not nearly so readily as a few years ago. Royal Purple also has a market, and if we only had a good free-flowering white, pink-striped variety, something in the way of old Mrs. A. Patten, it would have a limited, though constant, demand, as also would a good white, flaked pink, in the way of the old variety Prosperity.

It will be seen, therefore, that the average Covent Garden grower only grows some six to ten varieties, the bulk of which are pink and white, followed by red. He aims to grow as few varieties as possible, but makes sure that his collection contains the best, testing each year the most promising novelties.

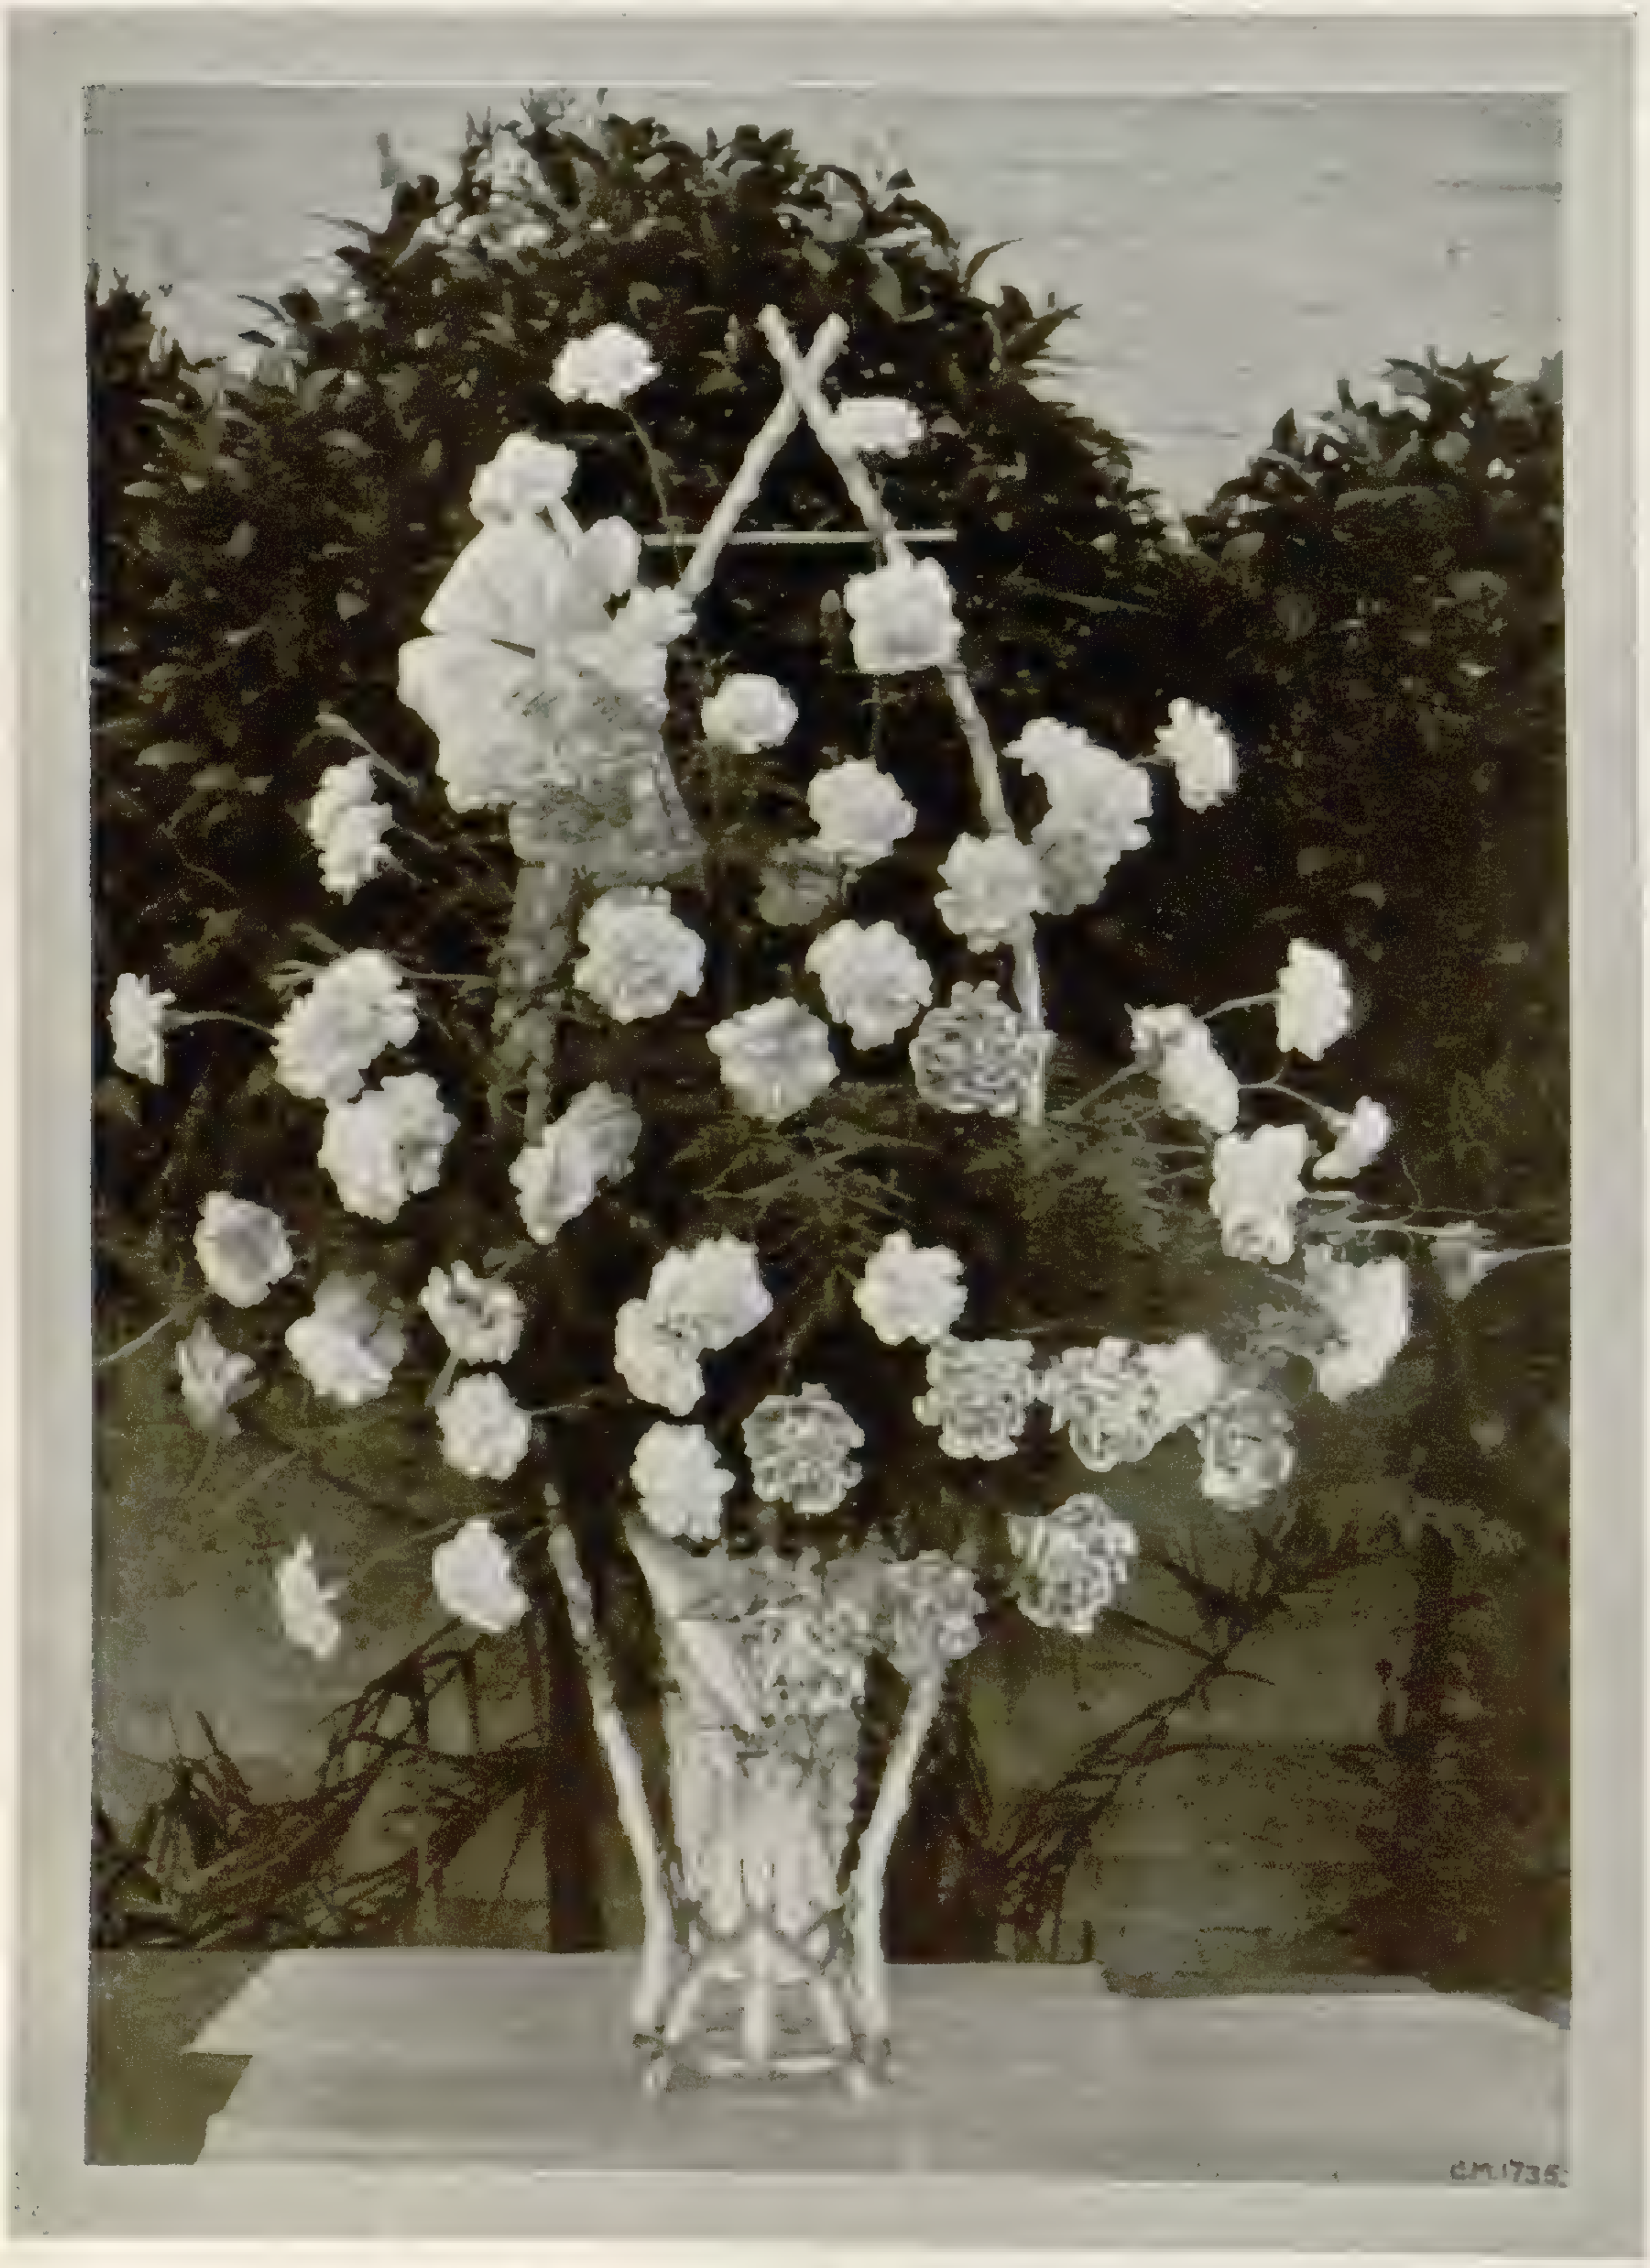
Montagu C. Allwood.

CARNATION R. F. FELTON.

A beautiful and large-flowered pink perpetual variety, raised and exhibited by Mr. H. Burnett, Guernsey.

PERPETUAL-FLOWERING CARNATIONS AS BEDDING PLANTS.

To those who desire to break away from the ordinary run of bedding plants for the summer decoration of the garden, I would suggest that the perpetual-flowering carnation should be given a thorough trial. Of its value for this purpose there is ample proof, as in addition to individual efforts which have been made at various places throughout the country, a series of trials under the auspices of the Perpetual-flowering Carnation Society have been held during the past two years in the Royal Botanic Gardens, Regent's Park. These were instituted in order to prove the value of this popular type of carnation for garden decoration.



FIRST PRIZE BASKET OF CARNATIONS.
Arranged and exhibited by Mrs. K. Hammond, Chelsea, at the Perpetual Carnation Show.

A series of plants were grown in the Royal Botanic Gardens throughout the year, and three distinct stages of growth were selected as most suitable for this purpose. It may perhaps prove interesting to describe the method most satisfactory in detail. Cuttings were taken in the early part of May, placed in a frame in a warm greenhouse, where the majority were rooted by the end of May, or early in June, stopped once, and planted out in the open border not later than the first week in July. Ordinary border culture was given, and due attention paid to watering, staking, and tying as required. The plants commenced flowering in September of the same year, and were lifted early in October, and planted out on the benches in a light glass house, where they continued blooming throughout the whole of the winter months.

After being gradually hardened off they were planted in an open border in May of the following year, and, being in bloom when planted, gave an immediate effect, and continued to provide a succession of flowers throughout the whole of the summer and autumn months, and were only checked by the falling temperature in the winter.

The plants were set out in groups along the front of an open border facing due west, and given ordinary border culture. No stopping was done after planting.

E. F. Hawes.

OUR CARNATION ILLUSTRATIONS.

In the present issue we give some prominence to perpetual-flowering carnations because this is the time of year when the blooms of this delightful class of flowers are at their best, having due regard to size, colour, and length of stem. Then also this is a capital time to secure young stock in small pots, to be grown on into fine plants to flower later in the season.

At the recent exhibition of the Perpetual Flowering Carnation Society, one vase of blooms stood out conspicuously by reason of the fine size and rich colour of its thirty beautiful specimens of the variety named Mrs. C. W. Ward, a deep cerise-pink flower of great beauty and usefulness. This was shown by Mr. Bertie E. Bell, Castel Nursery, Guernsey, and gained for him the first prize in its class, and also the silver-gilt medal for the best vase in the open section.

A particularly attractive exhibit at the Regent's Park show was the group of blooms arranged by Messrs. Young and Co., Hatherley, Cheltenham; not only were the flowers good in size, colour, and length of stem, but they were well set up, and Mr. Taudevin, the manager of the company, had skilfully arranged a greenish background behind his flowers, and in front of the glass side of the corridor. This background was just dense enough to break up the bright light, and so enable visitors to see the flowers in comfort, which would not have been the case had the background been absent. Apparently trivial matters, properly considered, often become important ones, and this question of a background for flowers staged against a bright light is a case in point. Messrs. Young and Co. secured a gold medal for their first prize exhibit.

The use of carnations in floral designs has been exemplified over and over again in these pages, but we give an illustration of one more example. This is a high basket of blooms as exhibited by Mrs. K. Hammond, of Chelsea, at Regent's Park last week, which was awarded a first prize. Only two varieties were used, i.e., White Perfection and Marmion. The latter, grouped towards the base at one side, was very effective, and if a few flowers of this variety had been placed towards the top, near the ribbon, the design would have been more effective, and no less artistic.

As a commercial item the perpetual carnation is no small one in the flower trade of our great markets, and while it is essential that good varieties should be selected and fine blooms produced for market purposes, it is also essential that when these are grown they should be well packed, otherwise the returns will suffer. One class at the recent show was for sixty blooms of each of two varieties, thirty-six to be shown in a vase and two dozen packed in a box, as for market, in each instance. There were several competitors, and Mr. W. C. Wallace, of Eaton Bray, Dunstable, won the first prize. One of his boxes, packed with beautiful blooms of Rose-pink Enchantress, is shown in the accompanying illustration.

A beautiful new variety that promises to occupy a very high position in the pink group is R. F. Felton, raised and exhibited by Mr. H. Burnett, Guernsey. The blooms are of fine size and form, and the colour is a delightful shade of pink, midway between light salmon-pink and rose-pink.

Make your Garden a delight by using

CANARY GUANO.

There is nothing like it for producing the best possible results in the garden. For improving Lawns, increasing the size and brilliance of Flowers, and producing heavy yields of Vegetables there is no Fertilizer that has given such excellent results. Canary Guano is sold by practically all Seedsmen throughout the United Kingdom and is used all over the world. TRY IT.

Sold in **6d., 1/-** and **2/6** Tins; and in bags from **3/6** to **20/-.**

PERPETUAL-FLOWERING CARNATIONS.

The ever-increasing popularity of this delightful section of carnations may yet have a still greater impetus given to its cultivation. The perpetual-flowering carnation is gradually being cultivated in most private gardens. In some places they are well grown, in others with a fair measure of success, and in some very indifferently. The various degrees of success are not always the fault of cultivators.

Very frequently, when owners of private gardens wish these carnations grown they think it only a matter of finding the necessary room, somewhere under glass, but it often happens that the structures are unsuitable. A span house running north and south is the best kind of house for their cultivation. Elaborate structures are unnecessary; a light, well-ventilated house for flowering the plants in, a lower one for growing them on, and some frames for summering them, will afford sufficient room for keeping up a succession of bloom. The amount of accommodation will be governed by the supply of blooms required. Whereever grown, they should have the houses wholly devoted to them, and not be housed with other subjects. One may frequently see them growing in lean-to houses, but such houses do not give them a sufficient amount of light.

Propagation is really not difficult, as cuttings root freely placed in shallow pans of sand. These should be placed in a case or frame, and if a little bottom heat can be given it will hasten the rooting process. A close, stagnant atmosphere in the propagating frame should be avoided. A temperature of 55 degrees to 60 degrees will be suitable, and as soon as the cuttings are rooted they should be removed from the frame and gradually inured to more airy quarters. Put them singly in small pots in medium loam, a little leaf-soil, and sand. Keep the young plants steadily growing near the glass.

As the plants fill the small pots with roots they should be transferred to larger sizes. I am not a believer in overpotting. A seven-inch pot will carry a large plant, and, with judicious feeding, will sustain it in full vigour. After a good crop of flowers has been produced the plants should be bedded out in the open to make room for younger stock coming on. When shifting from the small pots use a five or six-inch pot of a good carnation manure to a barrowload of soil. Cultivators have their pet manure, but the manurial matter used with the soil should not be too stimulating, but should promote a firm growth with that glaucous colour of the "grass" so dear to the cultivator. When they are pushing up their flower stems "Clay's" and soot water are both beneficial, at the rate of an ounce to a gallon. The solution is best prepared by placing a given quantity in a bag, and immersing it in a tub of water. The use of these fertilisers should be alternated with supplies of clear water, and the use of manures should be stopped as the blooms begin to open.

During the summer months the growing plants are best kept in frames, where the sashes can be placed over them if necessary. They can remain in these quarters until autumn, when they should be placed in their flowering houses. While in the frames they should be protected from heavy rains, and also heavy night dews. If aphis show at any time they can be destroyed by fumigation. Some cultivators give the growing plants occasional syringings, others do not believe in it. This is best decided with a full knowledge of the surroundings; no set rule can be given.

"Rust" is the disease most dreaded, and while some varieties are immune from attack, others may be badly affected. Some good cultivators probably think it due to some defect in the cultural details. While improper treatment doubtless fosters the spread of "rust," it is not solely due to that, for in some districts, whatever the treatment, it will appear. In such places the plants will require extra attention. It is in such places that the watering pot must be used with judgment, and also the matter of ventilation requires very careful attention.

Generally speaking, a good market variety is also a good one for private gardens, but in the matter of colour individual taste has to be considered, and with some owners of gardens this is very pronounced. Private growers should be careful to ascertain their employers' wishes in the matter of colour, and only grow those varieties which please them. There are plenty of varieties from which to select; some say too many, but I have not so far found too many good things. The cultivator should always endeavour to obtain the best. Some varieties deteriorate quickly. It is therefore necessary that new varieties should be raised with better constitution, and other good points, if possible, and also to give that stimulus which is so necessary.

The grower who is timorous of buying new varieties should invest in a couple of plants of each to try them; it is the only way to find out which are the best. Promising new kinds are, in pink, R. F. Felton, Gloriosa, May Day (not quite new); rose-pinks are Rose Enchantress, Dorothy Gordon may supersede the last-named; Admiration, Roseate Dawn, Mrs. H. Burnett, salmon-pink; Lady Alington, salmon-rose, scented; rosy-cerise pink, Mrs. C. W. Ward, Colossus, Afterglow, Winsor; salmon-red, Rose Doree, and Rival. Reds and scarlets, Britannia, Beacon, Scarlet Glow; whites, Sarah Hill, White House, White Perfection, Niagara, White Wonder—this may displace other whites; crimsons, Carola, Harlowarden, Black Chief, Gladys; fancies, Fireglow, Jessica, Conquest, Bay State; shades of yellow, Fortuna, and the doubtful J. Whitcombe Riley; this may improve when English-grown stock has been tested.

T. H. Slade.

SEASONABLE WORK AMONG "MAIDEN" ROSES.

There is much to do at the present time among the young, or "maiden," roses, that have resulted from budding last summer. Dwarf stocks of cutting briars are always the most forward in growth, and these will now need looking over carefully. All suckers must be cut out with a sharp knife before earthing the young plants up with a little of the surrounding soil. The soil should always be in a fairly fine condition when drawn against the young rose shoot.

When earthed up in this way the union of stock and bud is made more complete, the soil keeping them softer, and assisting in a better and more uniform swelling. The same process is carried out with all dwarfs no matter whether the stock be polyantha, manetti, or seedling briar.

If a few early and really good flowers are wanted the maiden shoots are not headed, but where good plants are wanted it is well to pinch out the tips of these shoots as soon as they reach a length of six inches. This induces a stocky growth from the lower eyes, which will soon break. Heading, or pinching out the tips also causes a more complete union between rose and stock, securing a sounder base before strain from wind and rain affects the tender plant. The same process of heading should be carried out with the young growth upon standard briars.

Sticks will be needed in most cases to keep the young plants steady during the first season. In the case of dwarfs one should consider a little as to the height each variety will generally attain. It is ludicrous to find a five feet stake to a rose of the La France, Baroness Rothschild, or Victor Hugo type, or one suitable for these asked to do duty for Frau Karl Druschki, Avoca, or Margaret Dickson. The extra-strong growers, such as Crimson Rambler, Gloire de Dijon, and the Wichuraianas, need a strong stick fully four feet out of the ground to make them quite secure. Care must be taken in putting the stick into the ground, or the rose bud will be pushed out of the stock. But more care than ever is necessary when tying the rose to the sticks. If drawn in at all forcibly the rose growth will frequently break out at the socket, and then all past labour will have been in vain. Draw the shoot towards the stick steadily at the first tying, taking it in closer as the plant advances in growth.

When tying standards it is not always possible to procure stakes that reach from the ground upwards, and leave sufficient top to secure the head to; but it is the better plan, where only a few are being worked. In this case the stem itself can be tied to the stake, and the whole made secure. Tie the young rose growth carefully as described for the dwarfs. All suckers should be promptly removed from the stems of standards as soon as they are observable, thus throwing all the sap into the rose growth. If more than one bud has lived upon standards it is not so necessary to pinch out the tips, but the union will be assisted by this check to too rapid growth and swelling, as in the case of dwarfs.

I am much in favour of a little artificial manure sprinkled between the rows of dwarf roses before earthing them up. And seedling weeds that may appear around the plants should be removed by hand, as it needs more than ordinary care to use the hoe around the plants, nor do we want to remove the soil from around their base. Upon all favourable opportunities the hoe should be used freely among the maiden roses.

Some very dwarf growers, such as Mildred Grant and Lady Mary Fitzwilliam, do better if the flower bud is picked out as soon as observable, unless, as before hinted, an early bloom is wanted. Monsieur Noman, Horace Vernet, Louis Van Houtte, Duchess of Bedford, and a few more, are frequently grown as maiden dwarfs solely to secure the first flower, and in such cases one much treat accordingly.

Not a few roses are grafted because of the difficulty found in securing buds at a suitable time during summer; some, too, such as the dwarf polyanthas and Chinas, do not produce a bud sufficiently large and strong to insert upon dwarf stocks, hence the wood is used for grafting, and the young plants turned out later on. My own are already planted in the open. Roses will stand much bad weather if the plants have been partially hardened off, and we like to get the roots into the ground as soon as possible. Let the soil be well prepared, and be careful to plant deep enough to cover the junction of graft and stock. Chinas, dwarf polyanthas, and such free-growing teas as Madame Antoine Mari, G. Nabonnand, Edu Meyer, Corallina, Anna Olivier, Betty, etc., will make quite passable plants, and flower freely by late summer and autumn if treated thus. We also save a year of planting out and budding stocks by this means.

"Rosarian."

IMPROVEMENT OF LAWNS.

During the winter months old, worn-out lawns fall into a very bad state. The surface becomes sour and impervious to the passage of air; therefore the grasses cannot make a healthy growth in springtime. It is then a good plan to take a chain-harrow over the turf, so as to break up and disintegrate the sour and hardened surface. Rolling does not improve a lawn unless it is performed at the proper time, and more harm than good may be done by pressing the surface when it is in a wet, soggy condition. Especially is this so where the soil is inclined to be retentive, for a hard cap will be formed, and the growth of the grass seriously hampered. Where grass seeds are sown with the object of improving old, worn-out lawns, the best plan is to have the bare places dug over and enriched with good, well-decayed manure. All stones and lumps should be raked off prior to sowing. Seeding must be tolerably thick, and a light covering of fine sifted soil should be thrown over the seed. A very effective method of renovating old lawns is by simply sprinkling them with nitrate of soda two or three times during the season in April, May, and June, at the rate of about 3lb. to one square rod. This stimulates growth, and the sward becomes soft and springy.

Lawn Grasses.

For all general purposes, and where the soil is of a comparatively rich and loamy character, the best grasses, and those which most need encouragement, are as follows: Cynosurus cristatus (crested dogstail), Festuca ovina tenuifolia (fine-leaved sheep's fescue), Festuca duriuscula (hard fescue), Festuca rubra (red fescue), Lolium perenne tenue (perennial rye grass), Poa pratensis (smooth-stalked meadow grass), Poa nemoralis (woodside meadow grass), Poa sempervirens (evergreen meadow grass), Trifolium repens perenne (perennial white clover), Trifolium minus (yellow suckling). Standard mixtures are put up by most of the leading seed merchants, and there is no doubt that the finest and most enduring lawns are made by sowing seeds, for suitable turf can seldom be secured, even where a high price is paid. Suitable mixtures may be obtained, without perennial rye grass, to form an ideal garden lawn with a springy and close velvety texture capable of standing a great deal of hard wear. Fescues should enter largely into their composition, and all the grasses should be well blended.

These mixtures take longer to develop than do those including clovers, but they ensure the finest sward. Special mixtures should be ordered for sowing bare patches under trees and in shady places; the fescues should be left out, and similar quantities of Poa nemoralis substituted. Poa nemoralis angustifolium is the best of all grasses for producing a close and velvety sward under trees, for its growth is so close that it displaces weeds, and is green in the spring before most other grasses. It also does well in exposed positions. Lolium perenne (common rye-grass) must be distinguished from Lolium perenne tenue (perennial rye-grass); it is far inferior to the latter variety, which thrives on almost any soil which is not wet, and remains perfectly fresh throughout the winter. Before ordering a mixture of grass seeds it is well to specify the size of the plot that is to be laid down, and also the purpose to which the lawn is principally intended. Any respectable seedsman will then be able to supply the correct quantity and quality of mixture. Sometimes bare spots in lawns are merely scratched over with a rake during dry weather in spring, and seed worked into the soil, which is afterwards rolled.

Fertilisers for Lawns.

Stimulating fertilisers for lawn grasses are often applied too freely, with the result that a somewhat rank and coarse growth is produced; such quick-acting manures as nitrate of soda, for example, must be used with care on this account. Many gardeners sprinkle thin dressings of guano and fine mould over the lawn at frequent intervals in the autumn and spring; or from 1lb. to 3lb. of nitrate of soda per square rod may be substituted. Phosphatic manures are required to promote the growth of the clovers, the grasses being encouraged by the aid of potash. On many lawns the latter are in great preponderance, and during very hot weather they are quickly burnt up, and the lawn given a scorched and unsightly appearance.

Clovers, on the other hand, do not burn so quickly, and their growth may be encouraged by a good top-dressing of superphosphate at the rate of 2 or 3lb. per square rod. Old mortar rubbish forms a cheap and effective dressing for old worn-out lawns; when used, it should be screened, and spread thinly two or three times in autumn or spring. Weeds, such as plaintains, daisies, thistles, docks, etc., must be spudded out or destroyed with lawn-sand, and stimulating fertilisers given in sufficient quantities to enable the grasses to grow luxuriantly at the expense of the weeds. The latter can also be destroyed by a dressing of nitrate of soda, applied during hot weather; the grass will turn brown at first, but will resume its normal colour after the first shower of rain. If used simply for the purpose of stimulating the growth of the grasses nitrate of soda should be applied in dull showery weather.

J. C. N.

FIRST PRIZE AND MEDAL VASE OF MRS. C. W. WARD CARNATIONS.
Exhibited by Mr. Bertie E. Bell, Guernsey, at the Perpetual Carnation Show, on May 2.

CHRYSANTHEMUMS ON WALLS.

Early-flowering chrysanthemums are numerous, and are easily grown and flowered in the open borders in the usual way. But very few of the large-flowered ones can be successfully grown in the open air. A very little protection afforded them, however, makes much difference between success and failure at the flowering period.

Nearly all chrysanthemum growers possess surplus plants at this season, and such specimens are generally good ones. Though not required for pot culture, they may be planted at the foot of some bare walls and fences, where, in due course, both the foliage and the flowers will look very attractive. The blooms on plants so grown are easily protected at night when the weather is frosty, by fastening long strips of scrim or similar material over them. At one time, I believe, Mr. E. Molyneux grew a number of plants in this way, and I well remember an enthusiastic amateur cultivator keeping plants in bloom on a south-west wall until nearly Christmas. My own experience has taught me the usefulness of so growing a number of the larger-flowering varieties, too.

The principal points to note in this system of growing the plants are not to make the soil very rich, but feed judiciously while the plants are growing in the summer time; to avoid overcrowding by planting at proper distances apart and disbudding shoots in due course; to tie or nail up the main stems; to select dwarf and taller-growing varieties so as to clothe the wall with flowers as low down as possible—and this can be accomplished if tall and dwarf-growing sorts be planted alternately—and to disbud at the proper time in the autumn.

Single-flowered varieties look charming growing against walls, and those Japanese sorts that flower in pots under glass during the early part of November should be selected for training and flowering on open walls.

Geo. Garner.

GOLD MEDAL GROUP OF CARNATIONS.
Exhibited at the Perpetual Carnation Show, Regent's Park, on May 2. by Messrs. Young and Co., Hatherley, Cheltenham.

STIGMONOSE IN CARNATIONS.

Mr. Allwood's notes upon the carnation disease designated as "Stigmonose," are very readable, and emphasise the danger of this latter-day trouble to carnation growers. Hitherto my recent work among carnations has led me to depend more and more upon seedlings, as these give one material which is in every way healthy, sound, and free from fungoid disease, insect pests, and the debility associated with over-propagation.

The pity is that carnation growers in the past have thought too lightly of disease. A partial disfigurement of foliage has had little effect, so long as the crop of blossom was fairly good, and the stock of young plants increasing apace. I have handled many consignments of carnations during the past few years, but have rarely received a batch in which every plant was absolutely clean and healthy. My stock of Enchantress came into my hands with the curse heavy upon the plants. I have tended them with the idea of eradicating the disease, but, though the vigour of the stock has been improved, the affliction cannot be shaken off. The whole treatment has been to secure strong natural growth under clean conditions, but it looks as if the once glorious Enchantress will never regain her high place.

The theory that the sun has been the instrument of this disease Mr. Allwood has rightly discarded, for sunlight is inimical to weakness and debility in all walks of life. As to whether the original cause of disease is the punctures caused by insects, I am inclined to doubt. Rather would I hold to the idea that the marring spots are but the outward sign of disease in the tissues of the plant, and that varieties weakened by over-propagation, old age, and faulty cultivation, are susceptible and unable to resist the spread of the curse.

It looks as though we shall have to be very watchful in the future, over the carnation. There is a danger that the disease may be transmitted to seedlings raised from infected varieties, and we shall soon have to ask the raisers of novelties for a pedigree and a clean bill of health before purchasing.

Wise, indeed, is the man who, having a sound, clean collection of carnations throughout, has courage enough to depend upon his own exertions, and raise seedlings from healthy parents as he may require them. Others may secure finer forms than he by buying novelties, but he will have health, and health is the first wealth in the carnation world, as well as in all others.

Mr. Allwood's advice on cultural details is very sound. I have nothing to add to his notes, unless it is to state that artificial manures should be eschewed as far as possible. I manage to get along without them, trusting to a good fibrous loam, with charcoal, burnt soil, and coarse sand to make the compost purer and workable. Even crushed bones should be given sparingly.

P. S. Hayward.

WALLFLOWERS.

Few plants give such a wealth of flowers for spring bedding as do the wallflowers. The secret of success lies in early sowing, transplanting when the young seedlings are large enough to handle, and careful handling when they are removed to their flowering quarters in the autumn. Many failures may be attributed to the seeds being sown too late, thereby not allowing the plants sufficient time to develop.

The present is an excellent time to sow the seeds which, fortunately, may be done outdoors. A piece of ground in the open should be selected in preference to a warm border, and the soil should be in a fairly rich condition, for, although the wallflower will grow under almost starvation conditions, yet good culture is essential when good plants are required. The soil must be made firm, and the seeds sown thinly in shallow drills, which should be drawn about ten inches apart. If dry weather prevails watering must be resorted to, as it will prove beneficial in assisting germination. Immediately the seedlings are large enough to handle they should be transplanted into well-prepared ground. In doing this, the tap roots should be trimmed to induce a more fibrous root growth.

Personally, I am in favour of twice transplanting during the growing season, and am convinced that better roots and sturdier growth is thus obtained. In the first place, they are pricked out about six inches apart, and, after a week or two of growth, transplanted about fifteen inches apart. Whichever plan is adopted, either the once transplanting or twice, the fact must be borne in mind that, if the seedlings are allowed to remain in the seed rows until they become drawn and leggy, poor results will follow.

A good range of colours may be obtained by growing the following varieties: Blood Red is a good reliable dark colour, and not surpassed, providing a good strain is obtained. Cloth of Gold is excellent for massing, the bright yellow being very effective. Ivory White is a good addition, and makes a useful break in colour schemes. Fire King is one of the newer varieties, and gives a brilliant display, especially if a few hundred plants can be massed in one spot as from a distance the effect of such a bed is grand. It is one of the new wallflowers that is well worth growing. The old brown Harbinger is well worthy of a place, if only for its early-flowering propensities. Vulcan still maintains its position as one of the good older varieties, and in habit it is excellent, being dwarf and branching. Anyone caring about other colours might try Purple Queen or Eastern Queen, but these two are not general favourites.

E. C. Pooley.

Arabis albida flore pleno is an excellent plant either for the rock garden, dry walls, or spring bedding, and undoubtedly the finest spikes of bloom are obtained from young plants. These should be grown annually from cuttings, which, if propagated this month, will make excellent plants for putting out in the coming autumn. Young unflowered growths should be selected for the purpose, preparing them in the ordinary way as one would a geranium cutting. They will root quickly in a bed of sand in a close cold frame, and after which they may be planted in nursery beds, where they are to remain until required in the autumn. Increase of stock may also be accomplished by division of the roots immediately the flowering season is over, but the forthcoming flowers will not be so fine as on those plants which have been raised from cuttings. Good culture is necessary to obtain large spikes of bloom; this arabis responds readily to liberal treatment, although it is not particular as to position, and will grow almost anywhere.—E. C. P.

AVAILABLE PLANT FOOD.

The availability of plant food in soils is a matter of great importance in horticulture, and to make the plant food available is one of the chief objects of thorough cultivation. Rotation of crops and the use of farmyard and stable manures, with the judicious use of artificial fertilisers also aid in bringing about the necessary physical and chemical changes in the soil that render the plant food more soluble and available.

A BOX OF ROSE-PINK ENCHANTRESS CARNATIONS,

packed for market by Mr. W. E. Wallace, Eaton Bray, Dunstable. First prize at Perpetual Carnation Show on May 2.

The average good soil will contain about 4,000 lb. per acre of phosphoric acid to the depth of one foot; a similar quantity of nitrogen, and 48,000 lb. of potash. The character and amount of plant growth that a soil is capable of producing is found to differ considerably in different soils, and the largest quantity of produce will be grown on those soils where the natural wild plants could obtain the greatest amount of food. It happens, therefore, that the virgin soils, as they are termed, derived from a meadow or forest, are richly charged with a blackish-brown vegetable substance known under the general name of humus, and is recognised as one of the marks of a fertile soil. In fact, humus was considered by agricultural chemists in the early parts of the past century to be the main source of soil fertility.

Recent investigations have shown that the loss of humus from the soil has affected not only the nitrogen content, but also the chemical combination of the mineral ingredients, particularly the phosphates. In the presence of the necessary potash and lime in the soil, the phosphates and other mineral constituents unite with the organic compounds produced from the decay of the humus, and form muriates—muriate of potash, muriate of lime, muriate of soda, etc.—all of which are available forms of plant food.

Hence it is that good cultivation and right systems of manuring assist in maintaining the supply of available plant food in the soil. Many soils which have been under cultivation for only comparatively short periods, and show upon analysis quite large amounts of plant food, but give poor crop returns, need better cultivation, and the use of a suitable active manure to combine with the locked-up or inert plant food already present, because the rate of decay of the mineral matter is too slow to furnish a liberal supply of plant food even when the crops are rotated, and some farmyard or stable manure is used and good cultivation is given.

In such cases, some readily acting artificial manure, such as superphosphate, bone-meal, fish guano, or nitrate of soda are necessary if the best results are to be obtained, because rotation of crops only hastens instead of retarding the exhaustion of the soil fertility.

Soils of the highest and most lasting fertility are of good texture, and contain a liberal store of total plant food derived from mineral substances which, when the soil is cultivated, decay with sufficient rapidity to furnish the necessary available food to growing crops. The accumulated plant food in a virgin soil is often sufficient to last for long periods of cultivation without material decline in crop yield. This is seen in the rich prairie soils of the New World, but there are few soils, however, so well constituted that they are capable of producing continually maximum yields without the application of some kind of fertiliser.

When the accumulated fertility of a soil is exhausted, then the growing crops have to depend upon the natural supply of the soil, namely, that which is derived from the decay of the minerals and humus matter, and this alone is generally insufficient to produce paying crops. All this teaches us that constant provision should be made to conserve the fertility of the soil by judicious cropping and manuring.

Chemical investigations have further shown that micro-organisms which assist in the conversion of insoluble and unavailable plant food into a usable form, are present in greater or less numbers in all fertile soils, but are most active in soils under cultivation, teaching us the advantage of the frequent use of the hand hoe and other implements of tillage in the open garden and of a friable porous soil for potting purposes.

J. J. Willis.

(To be continued.)

CINERARIAS.

By botanists the cinerarias are now included in the genus Senecio, but as with some other classes of plants, the popular name is not likely to be generally superseded.

Although for a long period cinerarias have been justly valued for the decoration of the greenhouse, they, at the present day have attained a height of popularity never before reached. This is no doubt owing to the many diverse forms that we have now in cultivation, most of them forming far more graceful specimens than the florists' varieties of old.

In my young days, now unfortunately many years ago, the only type of cineraria considered worthy of cultivation was of short growth, with dense massive heads of large round flowers. The finest of these were then named, and increased by means of cuttings. In the early sixties some double-flowered forms arose, and for about a generation they were thought highly of, several of them receiving First Class Certificates from the Royal Horticultural Society. A good price was in those days asked in nurseries for the best of them. These double-flowered forms have, however, now practically disappeared, for they are rarely seen. In those days, when cinerarias were raised from seed, any varieties that did not come up to a more or less rigid interpretation of the florists' standard were ruthlessly destroyed.

In the latter part of the eighties the tide began to turn, it being recognised that some of the original species with their more starry flowers and looser arrangement, possessed a grace and elegance that was altogether wanting in the latest florists' varieties. These had all been gradually evolved from Cineraria cruenta, the typical form of which, with reddish-purple blossoms, was introduced from the Canary Islands as long ago as 1777. This original species was again brought into requisition, as also were Cineraria aurita, or Heritieri, sent from Teneriffe in 1843, and Cineraria multiflora, introduced from the Canaries ten years later. The flowers of Cineraria multiflora are a kind of purplish-lilac, while in Cineraria aurita, or Heritieri, the florets are white, tipped with purple, while the central disc is also purple. This species forms a loose bush, whose comparatively small leaves are thickly clothed on the underside with whitish tomentum. The flowers, freely borne on every shoot, are disposed in a loose open cluster in altogether a far more graceful manner than the blooms of the florists' varieties. From this species much of the more graceful habit of recent varieties has been obtained, while its parti-coloured flowers have in many instances left their mark on the progeny.

Another and more recent species has been employed by Messrs. J. Veitch and Sons in the production of new forms. This was introduced from British Central Africa in 1898, under the name of Senecio auriculatissimus. It is of a rambling, almost climbing habit of growth, with rich golden-yellow blossoms about an inch across. The first hybrid of this kind to make its appearance was Cineraria flavescens, which was given an Award of Merit by the Royal Horticultural Society two years ago. This was obtained by the intercrossing of the species with the garden form Feltham Beauty. The flowers of C. flavescens are, when first expanded, of a sulphur tint, becoming paler after opening. What are known as cactus-flowered cinerarias, in which the edges of the florets are revolute, are very popular, possessing as they do a lightness of aspect which is totally wanting in those forms with larger and heavier flowers.

The cultivation of these cinerarias has been so often dwelt upon, and is now so generally understood, that nothing needs to be said on this point at present.

W. T.

ACHILLEA ARGENTEA.

Some confusion has existed with regard to this plant, which has been sometimes referred to Tanacetum argenteum. The latter, however, is quite distinct, being of shrubby habit, with large golden yellow flowers. Achillea argenta was sent out by Mr. Thompson, of Ipswich, about the year 1888, but its origin is somewhat obscure. At the same time it is a very decorative rock plant, with silvery-white foliage in rosettes of closely set pinnate leaves. Like many of the other dwarf-growing achilleas it forms a spreading carpet that makes it a very attractive plant even when not in flower. During May and June the flowers are produced on stems from four to five inches high, usually about six on a stem. The individual flower heads are about three-quarters of an inch in diameter, with pure white rays, and a pale yellow disc.

ACHILLEA ARGENTEA.
A beautiful Alpine Achillea in the Rock Garden at Kew.

In choosing a position for this plant it must be borne in mind that damp or heavy soil is fatal to it in winter, therefore a sunny, somewhat sloping ledge should be selected. The soil should be deep, but of a strong nature. A. argentea is readily propagated by means of division in early spring, or by cuttings in summer. The latter strike readily in a close frame, and soon make good flowering plants. As a pot plant for the cold house it is very useful and decorative, coming into flower in the cold frame a little earlier than in the rock garden. In a selection of six of the best dwarf achilleas for the rock garden this would be one of the first chosen, others being A. ageratifolia, A. moschata, A. rupestris, A. tomentosa, and A. umbellata.

W. T.

Alyssum saxatile flore pleno and A. saxatile citrinum flore pleno, are two splendid plants for producing early colour, and should be propagated by cuttings. It is necessary to obtain the cuttings as early as possible, as they are slow-growing, compared to arabis, and should be potted when rooted, instead of planted out.—E. C. P.

WORK FOR THE WEEK.

THE ORCHID HOUSE.

ONCIDIUM MARSHALLIANUM.—There is no orchid more serviceable than a finely flowered plant of this species, either for exhibition or decorative purposes, but, unfortunately, its freedom of flowering has a tendency to spoil the future well-being of the plants. It will be generally found that where newly-imported plants are procured there is little difficulty in growing them, provided they are placed in a warm intermediate house and kept free from thrips and other insect pests. Remarkable flower scapes are also produced for the first year or two after importation, but after this they lose their normal vigour, and gradually become unsatisfactory. I feel that we who are in charge are sometimes responsible for this early deterioration, because as the flowers are exceedingly durable, and give such a fine display we are loath to cut the spikes, and thus a great strain is put upon the plants, and the effect is seen in a smaller succeeding growth. There can be no doubt but that it is a considerable advantage to remove the flower spikes within a reasonable time after the flowers have become fully expanded.

POTTING.—Where the plants are actively rooting, after the flower scapes have been removed, any repotting necessary may be attended to without delay, but it is not advisable to disturb the plants more often than is absolutely necessary, and where the compost is in a good state of preservation, and more root room is required, they should be transferred to larger receptacles with the least possible disturbance of the roots. We find a compost of good fibrous peat and chopped sphagnum suits the plants well. It is a good plan to place the plants in the cool odontoglossum house for a few weeks after flowering; the moist cool atmosphere assists them to regain their normal plump conditions, and affords a suitable rest.

ANGULOAS.—The plants of the various species of anguloas are now producing their flowers, as well as new growths. They should now receive every inducement to properly expand their flowers, and where they have had a long period of dry, resting conditions it is essential that little or no water be afforded until the flower scapes are observed or the plants will break into growth without flowering at all. When the scapes appear see that the potting compost is thoroughly wetted through; it is a good plan to dip the pot to the rim in a pail or tub of tepid water. Repotting should be attended to as the plants pass out of flower, as the young growths will then be actively rooting, and they quickly re-establish themselves in the fresh potting compost. We find a mixture of good turfy loam, fibrous peat, and chopped sphagnum, with sufficient broken crocks or charcoal added to render the compost porous, suitable for these and allied genera.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

POINSETTIAS.—Cuttings should be taken as soon as the old plants have developed growths two to three inches long. These may be removed with a portion of the old wood attached, and plunged into powdered charcoal or fine wood ashes to prevent bleeding; then insert them singly in small thumb pots which have been made ready for their reception by filling up with a compost of silver sand and cocoanut fibre refuse or fine peat in equal parts. Take particular care that the base of the cutting rests firmly on the soil at the bottom of the hole made by the dibber. Give sufficient water to settle the soil, and plunge the pots up to the rims in a bottom heat of 80 to 85 degrees. Extreme care must be constantly exercised to counteract excessive moisture in the propagating case. Give shade from sunshine, and take every precaution to prevent flagging; root action will commence in a few weeks, after which the plants may be given a little ventilation in order to harden them off for a position near the glass, which will insure sturdy, short-jointed wood that is so desirable at all times.

POTTING.—With the exception of spring-rooted cuttings most of the potting in the plant stove will now be completed. At this season, and later on, when plants have to be repotted from time to time, the operator must use extreme care after they have been treated, or disastrous results may follow. Thoroughly shade from the sun, and give an occasional spraying with the syringe. Now that the season is so far advanced we may expect the sunshine to be exceptionally strong during the day, so that the pipes must not be overheated or damage may soon be done to young and tender foliage.

MUSA CAVENDISHI.—Where sufficient space is available for the full development of this stately and ornamental foliage plant it may be included in any collection, as it certainly forms a distinct and interesting addition. Suckers with a few roots attached may be removed from the base of the old plants, and if placed singly in small pots, and given a little bottom heat, they will quickly develop into large specimens. When cultivated expressly for decorative use they may be kept in large pots or tubs. They are extremely gross feeders, and during their growing season will require frequent applications of farmyard liquid. If retained for fruiting purposes it is certainly advisable to plant them in borders specially prepared with good loam and peat, and a free sprinkling of lime rubble, with ample drainage. Musas will greatly benefit from an occasional sponging of the foliage to keep them free from insect pests.—John Donoghue, Bardon Hill Gardens.

THE FLOWER GARDEN.

HERBACEOUS BORDERS.—Many plants will now require attention to staking. Support should be afforded before the growths become too far advanced, for if neglected until they actually fall over great difficulty will be experienced in getting them into proper form again. Various methods are adopted, and, whichever one is decided upon, the main idea is to make the support as inconspicuous as possible. The plant should be made to look quite natural after being staked, and this is rather a difficult task with some. A specimen bundled up like a faggot makes a very bad impression, while the same plant, with judicious handling, may be made a beautiful object. Liliums, delphiniums, etc., will require each growth staked separately, and there is nothing better for the purpose than brown bamboos of sufficient strength to afford the necessary support. Thin canes of the same colour answer for Canterbury bells, aquilegias, Campanula persicifolia, and plants of similar habit. For phloxes twiggy pea sticks are admirable, and should be placed round the clump, and also among the growths. If these are put in position fairly early the shoots will grow up amongst them, and eventually hide any suggestion of support. The same idea will be found useful for the Michaelmas daisies, etc., for whilst providing the necessary strength to hold the growths in position there is nothing formal about it, and the plant remains in a perfectly natural condition. Anything replanted early this spring will require watering, should there be any length of dry weather, and a mulching of decayed manure will prove beneficial to those plants which have not yet made sufficient roots to enable them to withstand dry weather.

SWEET WILLIAMS AND CANTERBURY BELLS should be sown now in boxes, and placed in cold frames. When the young plants are large enough to handle they should be pricked out into cold frames, and kept close, and shaded for a few days until fresh root action commences. When large enough to look after themselves they may be transplanted into nursery beds, where they may remain until required for planting out.

BEDDING PLANTS.—Now that the time is drawing near for summer bedding all plants required for the purpose should be gradually hardened off. Full exposure should be afforded on every available occasion, so that no check may be experienced when planted. Many of the hardiest kinds should be stood out on ashes, and have a framework of some description over them, when, in the event of frost, some light protecting material may be laid over them. Now is the time to make a general survey of the spring bedding, noting on the plan any desirable alteration which is to take place in the next season's arrangement. Slight alterations annually makes a garden more interesting than a repetition of the same old style year after year. Perhaps the alteration is not always an improvement, yet at the same time a change is effected, which, in many cases, adds to the charm of the work.—E. C. Pooley, Gnaton Gardens.

FRUIT UNDER GLASS.

YOUNG VINES.—If any vines have been raised this season for planting they should now be put out into their permanent quarters, the soil having been prepared as previously advised. If the vines are being prepared for a house where grapes are still being forced, they had better be transferred to larger pots, or they will become root-bound. This has not been a wonderful year for forcing, and if the vines cannot be put out within the next month little advantage will be gained. Vines planted at the end of March will now be making vigorous growth, and will need tying and regulating every week. Keep the house well supplied with moisture, syringe in the afternoon, and shut up with a good brisk solar heat. Give plenty of air on all fine days; stop the lateral growths, and also the main growth when 8 to 10ft. has been reached. See that the roots are supplied regularly with liquid as often as they require it.

EARLY PEACHES.—As soon as the fruits are well over the stoning period, at which time they swell very rapidly, they should receive a thorough soaking, and a good dressing of some fertiliser, well washed down to the roots, or some good farmyard liquid manure. Then remove all lateral growths that are shading the fruits, and prop the fruits up to the glass with small strips of wood, so that they are exposed to every scrap of sunshine, as this wonderfully improves the colour and flavour. The young shoots should be tied and regulated as often as necessary in successional peach houses, and the fruits be thinned in good time. Keep the roots well supplied with water, and give the borders an occasional dressing of good manure.

MUSCAT OF ALEXANDRIA GRAPES.—These will now be passing out of flower, and should have every aid to ensure a good set especially. The end of the bunch does not open its flowers all at once, and when some are apparently set others are still in flower, therefore a brisk heat should be kept up, and pollination continued till all are out of bloom. Main crop muscats that are to be kept through the autumn and winter should be kept growing now, as these grapes require a long season to produce successful results. When thinning leave plenty of berries on the top of the bunch, and, if need be, tie up the more important shoulders; do not on any account overcrop, or the finishing process will not be satisfactory. A hundred good bunches of grapes are worth infinitely more than double the number of inferior ones. Keep the temperature at about 70 degrees; damp the path, stages, and walls several times daily, and as soon as the wood is in a fit condition tie all the branches neatly and regularly to the wires.

BANANAS.—Where these are grown, and are now showing fruit, plenty of moist heat must be employed; syringe and water freely, and afford alternate waterings of liquid manure or guano. When the fruits are fully grown the bunch should be severed from the plant, and hung up in a warm and dry atmosphere to finish off, using the fruits for dessert as fast as they ripen. Strong suckers may now be removed with some roots attached, and potted up in good rich loam and decomposed cow manure. As soon as these have filled their pots with roots transfer them to large pots or tubs, and place over heated pipes.—W. A. Cook, Leonardslee Gardens.

EXHIBITIONS AND MEETINGS.

◆

National Auricula Society.

(MIDLAND SECTION.)

The twelfth annual exhibition, held at the Edgbaston Botanical Gardens, Birmingham, on May 3 and 4, was probably one of the finest held by the society. The increasing popularity of these charming and old-time florist flowers, more especially in regard to alpine and fancy auriculas, chiefly by reason of their comparative showy, rich colouration, is a matter for much congratulation. In the "show" section the "green-edges" were especially fine, and there were also numerous excellent examples among the white and grey edges. There was a keen competition between the young amateur growers. There was a class for lady amateurs, but there was only one entry, and that was from Miss Mary Chamberlain, who opened the exhibition. The class was for alpine auriculas, and she was awarded the first prize for very good examples of Dean Hole and Miss Aston. The seedlings in both sections were more numerous than usual.

SHOW AURICULAS.

In the class for eight varieties the competition was really very keen, and Mr. Charles Wain, Selly Hill, Birmingham (gardener, Mr. T. T. Sheppard), was first, with very fine examples of Mrs. Potts, Henry Wilson (premier) of great breadth and substance, Eucharis, Lancashire Hero, George Lightbody, Henwood, Mikado, and Rifleman; Mr. F. Simonite, Sheffield (who is enthusiastically emulating his father, of pleasant memory), was a close second, with H. F. Wilson, Lancashire Hero, Letitia, Boadicea, Ossian, Mrs. Potts, Geo. Lightbody, and Acme; Mr. W. H. Parton was third, and staged an excellent set of plants; Mr. G. A. Wright, Bowden, Cheshire, fourth; and Mr. W. M. Shipman, Altrincham, fifth.

For six plants, Mr. C. Winn was again first, staging Lancashire Hero, Harrison Weir, Marmion, Mrs. Potts, Mrs. Henwood, and Geo. Lightbody in fine condition; Mr. F. Simonite repeated his former success by again occupying the second place, he had Rachel, Orient, Fanny Mearbick, Abraham Barker, an unnamed seedling of high promise, and Letitia of high quality; Mr. W. M. Shipman third. The class for four plants was well filled; Mr. W. C. G. Ludford, Four Oaks, was first with Harrison Weir, Shirley Hibberd, Mrs. Potts, and Mrs. Henwood; Mr. C. Reeves, Handsworth, second, with Richard Headley, Acme, Mrs. Phillips, and Mrs. Henwood; and Mr. Richard Holding third. For two plants, Mr. Holding won with Acme and Mrs. Phillips; Mr. H. W. Miller second, with Mikado and Shirley Hibberd; and Mr. G. Saunders and Mr. C. Reeves were third and fourth respectively.

Single plants, green edges, Mr. C. Winn first and second with Mrs. Henwood; Mr. W. H. Parton third, and Mr. Ludford fourth. Grey edges, Mr. Ludford first with Marmion, Mr. C. Winn second with Geo. Lightbody, and Mr. Simonite third with Geo. Lightbody. White edges, Mr. C. Winn first, and Mr. F. Simonite second and third with Acme; the winners of the fourth and fifth prizes had the same variety. Selfs, Mr. R. Holding, Bournville, first, with Harrison Weir; Mr. C. Winn second, with Victor. Selfs (orange, yellow, primrose, or buff), C. Winn, G. Ludford, W. M. Shipman, W. A. Renton were the respective winners with good examples of Daffodil. Parenthetically, it may be remarked that this lovely yellow variety afforded a pleasing relief to such a wealth of the colouration of the other varieties, and the wonder is that Daffodil is not more extensively exhibited.

In the maiden growers' class for two alpines, Mr. A. Gilbert was first with Shirley Hibberd and Mrs. Phillips; Mr. H. G. Spencer second with Geo. Rudd and Favourite; Mr F. J. Twist third. In the local growers' class for three show auriculas, Mr. C. Winn was first with Mikado, Mrs. Henwood, and Geo. Lightbody; Mr. Ludford second with Favourite, Shirley Hibberd, and Geo. Lightbody; Mr. R. Holding third with Mikado, Shirley Hibberd, and Acme. In the class for young amateur growers only, Mr. G. H. Spencer was first with Lancashire Hero, Harrison Weir, and Shirley Hibberd; Mr. J. Freeman, Sparkhill, second, with Abraham Barker, Harrison Weir, and Prince Charming; Mr. E. Saunders third with Mrs. Potts, Mars, and Acme.

ALPINES.

In the leading class, which was for eight plants, Mr. W. H. Parton was the winner of the first prize with a grand collection, comprising Mrs. J. Douglas, Ettrick, Mrs. Martin Smith, Thetis, J. F. Kew, Argus, and Kingswood; Mr. C. Winn second with Thetis, Miss Barker, Majestic, J. F. Kew, Mrs. Banks, Mrs. J. Douglas, Golden Acme, and Argus; Mr. T. M. Eglington third with Mrs. Banks, Blue Peter, Unexpected, Thetis, Duke of York, J. F. Kew, Golden Acme, and Winifred. For six plants, Mr. C. Winn was first with Thetis, J. F. Kew, Mrs. Banks, Majestic, Argus, and Mrs. J. Douglas; Mr. Parton second with Thetis, Ettrick, Mr. M. Smith, Argus, J. F. Kew, and Jack Parton; Mr. R. Holding third with J. F. Kew, Violet Vanbrugh, Mrs. Banks, Golden Acme, and Argus. For four alpines, Mr. H. W. Miller, Handsworth, was first with Thetis, Argus, Geo. Cadbury, and J. F. Kew; Mr. E. Danks, Handsworth, second, with F. Knighton, Sappho, Modesty, and Majestic; Mr. C. Reeves, Handsworth, third, with Phyllis Douglas, Charmer, J. F. Kew, and Argus. For two varieties, Messrs. H. W. Miller, W. J. Ellison, Handsworth, and C. Reeves were the respective winners. In the class for three plants, open to local growers, Mr. W. C. G. Ludford won with Thetis, Duke of York, and Firefly; Mr. W. H. Parton, second, with Mrs. M. Smith, Phyllis Douglas, and Jack Parton; Mr. E. Saunders, Sparkhill, third, with Thetis and Argus. For two plants (local growers), Mr. F. J. Twist first with Argus and Golden Acme; Mr. A. Gilbert second with Thetis and Mrs. Barker; Mr. Hughes third.

For single plants, gold centre, Mr. R. Holding led with a superb example of Unexpected; Mr. F. J. Twist second with Majestic; Mr. Ludford third with Unexpected; and Mr. W. H. Parton fourth with Mrs. Parton. For a light centre, Mr. Parton was first, Mr. E. Danks second, and Mr. Ludford third, all showing Phyllis Douglas.

SEEDLING AURICULAS.

For two plants, dissimilar, Mr. F. Simonite was first with Juliet (premier bloom), a dark self and green edge, Mrs. Simonite; Mr. E. Danks second with Raven Plume and Nubian; Mr. Ludford third with Agnes Wakefield and David Copperfield. For one plant, green edge, Messrs. F. Simonite, C. Winn, and Ludford were placed as in the order named, with promising seedlings, unnamed. For a grey edge, Messrs. F. Simonite, J. Collier, and E. Danks, the foregoing remarks apply. For a white edge, Mr. F. Simonite first with a flower similar but better than Acme, which is saying much for the newcomer. For a self, Mr. E. Danks first with Raven Plume; Mr. C. Reeves second with Mrs. T. E. Owens; and Mr. C. Winn third.

Much interest was created by seedling alpines. For four varieties, Messrs. H. W. Miller, C. Winn, and W. H. Parton were the respective winners with flowers of high merit. For two plants, Messrs. J. Collier, C. Reeves, and T. J. Stevens, Cannon Hill, Birmingham, were the prize winners.

The premier prize for a show auricula was awarded to Mr. C. Winn for Henry Wilson, green edge. The premier alpine was Majestic, gold centre, also exhibited by Mr. C. Winn, who was awarded premier for a seedling alpine. The premier seedling show auricula was contributed by Mr. F. Simonite.

AWARDS FOR HONORARY EXHIBITS.

Mr. H. N. Ellison, West Bromwich, contributed a collection of gerberas and ferns (silver-gilt medal); Mr. F. Bostock, Northampton, polyanthus and primroses (silver medal); Mr. A. R. Brown, King's Norton, polyanthus and primroses (silver medal); Mr. W. H. Edwards, Arnold, Notts, Edwardian epergnes and flowers arranged for effect (silver medal); the Birmingham Botanical and Horticultural Society's silver medal was awarded to Mr. C. Winn, the bronze medal to Mr. W. H. Parton. The Brookes silver medal was awarded to Mr. W. H. Parton; the National Society's silver medal for local growers, to Mr. C. Winn. A silver medal was also awarded to Mr. C. Winn for a collection of dwarf and compact schizanthus.

Scottish Horticultural Association.

The May meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 2nd inst. Mr. Massie, the president, was in the chair, and there was an attendance of 95 members.

The paper for the evening was by Mr. Robert L. Scarlett, C.D.A., Sweethope, Musselburgh, who took as his subject "Some Factors in the Production and Storage of Seeds." The paper was of much interest, and the author, who is one of the young members of the association, was highly complimented on its excellence.

After a reference to the enormous number of plants of all kinds which are raised from seed, Mr. Scarlett pointed out that gardeners, as a rule, paid very little attention to the seeds they used; they trusted to the seed grower, in whose hands lay great power in the matter—the power to produce good or bad seeds. We manure our crops, and cultivate our land, study weather conditions, and fight insect and fungus pests, yet what did it all come to if we used bad seed? The expense of working in both cases was the same, and the difference in the initial cost of good and bad seed was very small, yet the difference in the result was enormous. Cheap seed was not necessarily bad seed, though it was almost always so, and, on the other hand, high price was not always evidence of good quality.

Good stocks were obtained by (1) crossing, (2) fixing of natural sports, (3) selection, which was the most common method, and (4) change of seed. It was a great advantage to have well grown and well fed plants, a fact which was thoroughly realised by German seedsmen in the production of East Lothian stock seed, of which they guarantee 90 per cent. to come double from plants grown in pots under glass and well fed, whereas only 55 per cent. of doubles are got from ordinary treatment in the open ground. In manuring for a seed crop it was very important to use phosphates as the dominant constituents of the manure, as a seed crop required far more of these than a green crop.

Mr. Scarlett dealt next with the testing and storing of seeds. In testing it was necessary to take into consideration (1) purity of sample, (2) germinative capacity, (3) germinative energy, and (4) average weight. It was only in the case of such seeds as peas and beans, which were hand picked, that the sample could be got absolutely pure. Such impurities as bits of husk, etc., gave no trouble with the crop, but it was quite a different matter with seeds of weeds. A sample might be quite pure, but all the seeds might be dead, hence the necessity for testing it for germinative capacity (or the percentage of living seeds), and germinative energy (or the rate at which the seeds germinate). In storing seeds it was absolutely necessary to have perfectly dry conditions, and a sufficiently low temperature, and the greatest possible care was necessary to prevent mixing. The worst enemy of stored seeds was mites, and the most effective method of dealing with them was treatment with carbon bisulphide. On the motion of Mr. Comfort Mr. Scarlett received a very hearty vote of thanks.

The judges' decisions on the short papers read at the April meeting by juniors were intimated: Mr. C. B. Roy, Royal Botanic

Garden, Edinburgh, whose subject was "The Young Gardener's Outlook," being placed first, and Mr. Malcolm Phillips, Granton Road Nursery, Edinburgh, whose subject was "Fern Raising and Growing," second. The prizes were presented by the president.

The President intimated that the association had received a sum of £80 from the surplus of the Scottish National Exhibition (1908) as a contribution to the fund for the foundation of a Horticultural Institution.

The exhibits were: Fine lot of the new dwarf polyantha rose, Orleans, from Messrs. Dicksons and Co., Edinburgh; choice narcissi (including several fine seedlings), from Mr. W. G. Pirie, gardener to C. W. Cowan, Esq., Dalhousie Castle, Bonnyrigg; Begonia gracilis Prima Donna (awarded Certificate of Merit), from Messrs. Dobbie and Co., Edinburgh; new species of deutzia and a hybrid of D. gracilis (awarded a Cultural Certificate), from Mr. A. Porter, Davidson's Mains; new hybrid Indian rhododendrons (one awarded a Certificate of Merit) from Mr. William Williamson, Logie Green Nursery, Edinburgh; Clianthus puniceus and Habrothamnus elegans, from Mr. A. Johnstone, Hay Lodge, Edinburgh; Clianthus puniceus and fruits of strawberry Royal Sovereign from Mr. John Middleton, Callander House, Falkirk; and specimen of the giant puff ball fungus from Messrs. James Grieve and Sons, Redbraes Nursery, Edinburgh.

Eight new members were elected.

The meeting on June 6 will be open for the discussion of any subject brought forward by the members.

Bournemouth Gardeners' Association.

There was a very successful meeting of the members of this association on May 2, to meet Mr. J. Crook, of Camberley, who gave a splendid lecture on "Propagation by Seed versus Cuttings."

The best exhibition of pot plants and cut flowers held this year, so far, was the one at this meeting. The exhibits were staged by the members for the prizes offered at the end of the year for produce to which the highest number of points have been awarded during the whole year by any individual member. The exhibits staged on Tuesday night were exceptionally well grown, showing much cultural skill. Mr. C. Nippard had a magnificent plant of schizanthus, three perfect ones of cinerarias, and three beautiful pots of mignonette, for all of which he was awarded the maximum number of points. Mr. G. Tompkins had four lovely schizanthuses, three fine ones of Cineraria stellata, and three grand vases of East Lothian stocks. These exhibits were awarded nearly the full number of points. Mr. C. Pearce received the full number for a collection of cut flowers, Cineraria stellata, show pelargoniums, and gloxinias being exceptionally fine. Mr. Crook exhibited several bunches of his seedling polyanthuses, his new apricot shades and distinct yellows being very beautiful. He also had a dish of Sturmer Pippin apples, to prove that apples can be kept throughout the winter in a plump condition in an ordinary shed with an iron roof, from which frost is just excluded.

Mr. Crook, at the commencement of his lecture, said there was plenty of room at the top of the best produce, but not any at the bottom. He said that owing to over-propagation of many kinds of plants by cuttings the stock gradually weakened, and he strongly advocated the sowing of seeds very frequently, and the propagation by cuttings from the resultant plants every few years, and by this means keep up the vigour of the stock generally. He gave many illustrations in support of his views. He said that both rhubarb and seakale should be raised from seeds occasionally, and not always be propagated from division thongs. But the propagation thongs from plants raised from seeds occasionally did undoubtedly strengthen and improve the stock. Salvia patens generally died out after six years of propagation by cuttings; at the end of three years, he said, stock should be raised from seeds, followed by propagation by cuttings. He instanced a case where a gardener, many years ago, boasted of being able to keep his cyclamen corms for seven years. At the present time, Mr. Crook said, we obtain extra strong plants from seeds in a very short period, and do not trouble about old corms. In making reference to gloxinias and begonias he said that some persons were under the impression that seeds could not be ripened of Gloire de Lorraine, but he had ripened them, and he found that nearly all the female flowers were the last ones to develop; in his case they were the end pods on each truss, or cluster, of flowers. He deprecated the early and severe cutting back of plants when seed pods are required. Mr. Crook made interesting references to potatoes. Primula kewensis, P. rosea, and P. obconica, to the hardy primroses and polyanthuses, to the way in which Nature fostered seedlings, to the bad practice of placing seed pans and boxes on dry shelves, and the loss of seedlings thereby, to uniformity by selection and the re-introduction of improved and stronger stocks.

During the animated discussion that followed the lecture Mr. Nippard, the assistant secretary, mentioned a case where a gardener had baskets of Begonia Gloire de Lorraine suspended over flowering chrysanthemums, and as the plants were kept rather dry, because of the blooms below them, seed pods formed, the seeds fell on the soil in the chrysanthemum pots, and young begonia seedlings appeared in due course in large numbers.

Very cordial votes of thanks were passed to both lecturer and Mr. King, who ably presided.

Bristol Gardeners' Association.

The thirteenth annual meeting was held at St. John's Parish Rooms, Mr. Hayball presiding over a large attendance. Mr. J. Scott read the annual report, and followed with the financial statement, both of which proved to be very satisfactory. The society is in a prosperous condition, both numerically and financially, and a good attendance has been maintained throughout the session.

An interesting part of the proceedings was the presentation of a travelling bag and mounted walking stick to each of the secretaries (Messrs. J. Scott and H. Woodward), to which all the members had subscribed. The chairman made the presentation, and the recipients suitably replied.

A vote of thanks was passed to the retiring officers. Colonel Carey Batten was again elected president, Mr. A. Perry was voted to the chair, and Mr. Thoday as vice-chairman. Mr. J. Scott, hon. treasurer and secretary, and Mr. H. Woodward, assistant secretary, were again re-elected, with Mr. Coombes as librarian, and Mr. Extence as registrar. The following were elected on the committee: Messrs. Binfield, Hayball, Curtis, Lee, Shelton, Harford, House, Grieve, Ayres, Bastin, Candy, Garnish, Spry, Jennings, Morse, and Shaddick.

For six vases of daffodils Messrs. Scott, Woodward, and Binfield won in the order given. Six new members were elected—a good start for the new session.

Southern Counties (Scotland) Gardeners' Association.

A paper, under the auspices of the above association, this being the second since the movement was inaugurated, was given at a recent meeting held at the Mechanics' Institute, Dumfries. The lecture was given by Mr. James Henderson, gardener to James Wyllie, Esq., Elmbank, Dumfries, and was on a subject with which the lecturer is well acquainted, viz., "Chrysanthemums." Mr. Henderson is an ardent admirer of the chrysanthemum in its various classes, and has frequently been a successful competitor at exhibitions. In the paper he gave a full resumé of the treatment required from the cutting stage to the conclusion of the life of the plant. Early and late varieties were dealt with, both as regards their treatment for large blooms, those of decorative size, and plants. The paper was a thoroughly practical one, and received a hearty reception. The lecturer was warmly thanked. Mr. Prichard, Ellangowan Gardens, occupied the chair.

Norfolk and Norwich Horticultural Society.

Time after time the committee have had thought of abandoning this fixture owing to lack of support from the public, and again this year receipts fell below those of previous years. True the day was wet, but the show was great. It was freely remarked by those present that such a pretty display had not been seen for years. There were groups of plants and foliage. Plants of almost every subject one could expect to find to give a wealth of flowers at this period of the year, and cut blooms in profusion, all combined to make a bright blaze of colour. One or two features stood out as shining lights. First of these must be mentioned the grand new seedling daffodil raised by Mr. George Davison, Westwick, Norwich, and named after himself. In size it easily beat all the blooms of Van Waveren's Giant in the exhibition, and there were some good ones of this from Mr. A. Woodhouse, gardener to Sir H. Cozens Hardy, Letheringsett. In colour it is a golden-yellow self. The form is a perfect broad perianth, and a long, well-formed frilled trumpet. Awarded a F.C.C. The next feature was a seedling odontoglossum, named Miss Violet Fellowes, which was staged by Mr. Lewis Smith, gardener to this lady at Shotesham Hall. It is a strong grower with beautifully blotched flowers of great width and substance. Next came quite a new break in blue polyanthus, from Mr. Frank Neave, Lingwood. It has enormous pips, lengthy footstalks, with a large, bold truss of perfect dark blue flowers. Unanimously awarded a F.C.C.

The trade did much to brighten up the show, and to educate the spectators. Daniels Bros., Lim., Norwich, made a fine display of roses in pots, azaleas, lilacs, deutzias, lilies, carnations, and kalmias, with a massive group of cut blooms of the new rose Lady Hillingdon. Hobbies, Lim., Dereham, staged "roses red" and "roses white," and every other colour known in the rose world. The best ramblers, the latest H.T.'s, with some of the older types, were there in profusion, and the arrangement was all one could wish. It was a place for note-making. Messrs. A. J. and C. Allen, Norwich, made a display of their "Norvic" roses, and they excelled greatly.

Mr. R. C. Notcutt, Woodbridge, sent a fine collection of forced shrubs, beautifully grown, to get the best out of them. Mr. G. W. Miller, Wisbech, made a feature of orchids, odontoglossums predominating. Messrs. Cutbush and Son, Highgate, N., made a miniature rockery to display to the best advantage a comprehensive group of rock plants.

Reading Gardeners' Association.

The final meeting of the spring session took place in the Abbey Hall on Monday, April 24, by kind permission of Messrs. Sutton and Sons, the president, Mr. Alderman Parfitt, occupying the chair. There was a very large gathering, including many ladies who were specially admitted to this meeting. "A Practical Demonstration on the Artistic Arrangement of Flowers," by Mr. T. J. Powell, The Gardens, Park Place, Henley-on-Thames, was the subject for the evening. Members have on many previous occasions had the privilege of enjoying Mr. Powell's demonstrations, but so great is that gentleman's versatility that he is always able to bring something new before his audience, and the meeting under notice was no exception in this respect.

A vote of thanks, carried with acclamation, was accorded Mr. Powell for his highly instructive and enjoyable demonstration.

ROYAL SHOW

NORWICH,
June 26th to 30th, 1911.

President – HIS MAJESTY THE KING.

72nd ANNUAL EXHIBITION of Horses, Cattle, Sheep, Pigs, Poultry and Farm Produce; Jumping, Horse-Shoeing and Butter-Making Competitions, Agricultural Education, Forestry and Horticulture.

HORTICULTURE

ENTRIES CLOSE MAY 31st.
(Live Stock Entries Close May 20th).

Prize-sheets and Entry Forms will be forwarded on application to
THOMAS McROW, Secretary.

Royal Agricultural Society of England,
16, Bedford Square, W.C.

Under the immediate Patronage of H.R.H. the DUCHESS OF ALBANY.

IN AID OF THE FUNDS OF THE LEAGUE OF MERCY.

THE RIVER THAMES GRAND FLORAL
AND DRAMATIC FETE,
to be held on Tagg's Island, Hampton Court,
WEDNESDAY and THURSDAY,
JUNE 7th and 8th, 1911.

£120 IN CUPS AND PRIZES.

Schedules and full particulars of the Joint Secretaries, Fête Office, Tagg's Island, Hampton Court.

TAUNTON DEANE HORTICULTURAL
AND FLORICULTURAL SOCIETY.

The next ANNUAL EXHIBITION will be held on THURSDAY, August 10th.

Schedule and particulars from—
R. A. GOODMAN, Secretary,
3, Hammet Street, Taunton.

SHREWSBURY GREAT FLORAL FETE.
AUGUST 23 and 24, 1911.
£1,200 in Cash Prizes.
Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs.,
Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

Royal Horticultural Society.

Notwithstanding the fact that the show of May 9 only preceded the Temple Show by a fortnight there was a splendid exhibition, and a very large attendance. The weather was perfect, and the sunshine and the crowd made the Hall very warm during the afternoon. Tulips were a great feature of the show, and roses were grandly staged. Flowering trees and shrubs were presented in large numbers, and alpine plants were staged as largely as ever, the saxifrages of the decipiens group being unusually fine.

FLORAL COMMITTEE.

The great display on this occasion was the magnificent contribution from Messrs. Thomas Rochford and Sons, Broxbourne. It was almost wholly of roses in pots, some trained as weeping standards, some rambling over rugged branches, some forming arches in pairs), some as pillars, some as standard heads, some as low bushes, and some as umbrellas. It was a grand display of high culture, and as such was greatly admired. The beauty of the roses and the elegance of their training and arrangement appealed to everyone, and plenty of admiration was lavished upon the specimens of Tausendschon, Dorothy Perkins, Delight, Hiawatha, American Pillar, Lady Gay, Maman Lavavasseur, and Crimson Rambler.

Messrs. Whitelegge and Page, Chislehurst, contributed a small rockwork display with Primula malacoides, Cheiranthus Allioni, saxifrages, and gentians as leading features.

Flowering trees and shrubs in a cut state were submitted in some quantity by Messrs. J. Cheal and Sons, Crawley, and among many good things we noted Pyrus spectabilis Riversi, P. malus sanguinea, P. m. Cheali, P. Scheideckeri, Cytisus præcox, several Japanese cherries, Piptanthus nepalensis, Azalea Yodogama, and Exochorda Alberti.

Messrs. Jackman and Son, Woking, Surrey, showed Alyssum citrinum finely, and also A. saxatile plena; Saxifraga Bakeri, S. Lindsayana, Vesicaria utricularia, Gerbera Jamesoni, Androsace sarmentosa, Anemone alpina sulphurea, and Primula Cockburniana were other good things.

Mr. G. Reuthe, Keston, set up alpine and herbaceous plants against a background of rhododendrons; Gentiana acaulis, Trillium grandiflorum, and Darwin tulips were very prominent.

Mr. J. Crook, Camberley, Surrey, displayed a strain of strong-growing and bright-hued polyanthuses.

Very fragrant were the heliotropiums, so well shown by the King's Acre Nursery Company, Hereford, and the fine heads of bloom were greatly admired; Lord Roberts, Favourite, Mdlle. Marie, and Mdme. Bruant were particularly good.

Messrs. Heath and Son, Cheltenham, set up a rock garden, but it was somewhat thinly planted; the newer saxifragas were good, and so were Primula frondosa, P. sikkimensis, violas, gentians, and alyssums.

In the rock garden display set up by Messrs. G. and A. Clark, Dover, good things were Primula Sieboldi, varieties of Iris pumila, Daphne Cneorum, Anemone baikalense, Primula pulverulenta, and alpine auriculas.

Messrs. Stuart Low and Co., Enfield, presented a group of carnations, and also showed Ceanothus rigidus, Rhododendron fragrantissimum, Callistemon salignus, Hydrangea Mdme. Moulliere, and Acacia pulchella.

Mr. Clarence Elliott, Seven Hills, Stevenage, set up a quite large alpine garden, and planted it with Iris Susiana (very fine), Aubrietia Fire King, the pretty Wahlenbergia serpyllifolia, Primula farinosa, Gentiana acaulis, the lovely little Phlox subulata Vivid, Saxifraga bathoniensis, and Cheiranthus mutabilis purpureus, etc.

Very fine were the carnations, again well displayed by Mr. H. Burnett, Guernsey, and his Snow Queen, Marmion, R. F. Felton, Mikado, and Orpheus were excellent.

Plumose ferns were charmingly shown by Mr. H. Ellison, West Bromwich, who also contributed a delightful set of blooms of the vari-coloured gerberas.

Messrs. James Veitch and Sons, Chelsea, presented a bank of schizanthuses, all well grown, each plant a mass of flowers, and representing a quite wide range of beautiful colours; the same firm exhibited the red-flowered Primula Maximowiczi, some auriculas, and the graceful stove plant Medinilla magnifica. Another display of Messrs. James Veitch and Sons consisted of standard and dwarf mollis azaleas, Rhododendron Vaseyi, R. George Hardy, graceful wistarias, Andromeda cassinæfolia, Azalea Hinodigira, the new Berberis congestifolia hakloides, and Cytisus Kewensis. In yet another group the graceful Feltham Bouquet, plants over a yard through and as much high, with the more slender C. Decorator and a basket of Calceolaria Buttercup were displayed.

Mr. C. W. Breadmore, Winchester, exhibited sweet peas that had wonderfully long stems for so early in the season. Mrs. A. Ireland, Jack Tar, Stirling Stent, Constance Oliver, Elsie Herbert, Mrs. C. W. Breadmore, Princess Mary (a new blue), the soft salmon-pink Iris, and Dazzler were notably good.

Messrs. Barr and Sons, Covent Garden, presented a fine strain of polyanthuses, a selection of saxifragas, Cyclamen repandum, Dimorphotheca Ecklonis, Veronica Hulkeana, and aubrietias and violas.

Alpine and show auriculas were beautifully staged by Mr. James Douglas, Great Bookham, who always shows these flowers perfectly. He also submitted two fine flowering specimens of Myosotidium nobile. Among the auriculas those that most appealed to us were Gold Eye, Canary Bird, Bronze, Ettrick, Isla's Maid, Ilene, and Prince of Tyre, Mrs. Douglas, Old Gold, Mildred Jay, and The Bride.

The sweet peas from Messrs. Dobbie and Co., Edinburgh, were delightful, their colour and fragrance appealing to everyone; the notable varieties were the new rose-flaked May Campbell, Earl Spencer, Dobbie's Cream, which seems to be a good Clara Curtis; Masterpiece, Edrom Beauty, Dobbie's Scarlet, Mrs. Cuthbertson, Melba, and Sunproof Crimson; violas were also beautifully shown by this firm.

Messrs. Eggett and Son, Thames Ditton, made a feature of alpine shrubs, such as Pinus sylvestris pygmæa, and Retinospora pisifera nana variegata.

Mr. G. F. Waters, Balcombe, was an exhibitor of carnations, and presented some excellent flowers of Edith Waters, Alma Ward, Carola, and White Perfection.

Mr. Maurice Prichard, Christchurch, had a particularly pleasing exhibit of alpines, etc., in one of the annexes, and displayed very beautiful colonies of the brilliant Saxifraga bathonensis and S. R. W. Hosier, together with Primula Forresti, P. Munroi, P. japonica, P. pulverulenta, Trillium grandiflorum, Alyssum citrinum, Veronica diosmæfolia, Corydalis nobilis, Tulipa persica, Androsace Chumbyi, and Iris Lorteti.

Messrs. H. Cannell and Sons, Swanley, exhibited the free-flowering Phyllocactus German Empress, and made a very fine display with the elegant golden-flowered Calceolaria Clibrani, a graceful plant totally unlike the solid and dwarf florists' varieties, and useful alike for the conservatory or for summer bedding.

Messrs. Bakers, Wolverhampton, had a somewhat remarkable exhibit, consisting of blocks of Saxifraga Bakeri, S. Apple Blossom, S. Lady Deane—very fine, with unusually large flowers; S. R. W. Hosier, S. Miss Willmott, S. Wallacei, S. A. Lynes, and the yellowish Saxifraga S. T. Wright. Besides these were violas and a good colony of Incarvillea grandiflora.

Dwarf florists' calceolarias from Mr. G. Hill, gardener to G. T. Wigan, Esq., Forest Park, Windsor, made a bright lot of colour.

Messrs. T. S. Ware, Feltham, showed alpines and herbaceous plants in a rock garden, and the leading plants set out in little colonies were Ranunculus gramineus (golden-yellow), Trillium grandiflorum, Tiarella cordifolia, Saxifraga granulata fl.-pl., a lovely mass of the dainty Veronica repens, and some of the new highly-coloured saxifragas.

Mr. W. Honess, gardener to W. Raphael, Esq., Hopedene, Dorking, sent up a box of the new Myosotis Marie Raphael, which has a little central white, feathered stripe on each segment of deep blue.

Messrs. Felton and Sons, Hanover Square, W., showed the fine Lyon rose in connection with gerbera hybrids.

The violas from Mr. J. Box, Lindfield, made a brave show, and the St. Brigid anemones and varieties of Primula cortusoides from the same firm were attractive.

Roses were beautifully exhibited by Messrs. G. Mount and Sons, Canterbury, who presented a number of fine flowers of Mrs. John Laing, White Killarney, Richmond, Mrs. George Shawyer (A.M.), a deep pink, very fragrant H.T. variety; Ulrich Brunner, Frau Karl Druschki, and Lady Hillingdon.

Roses were largely and beautifully shown by Messrs. William Paul and Son, Waltham Cross, who exhibited pot-grown plants of the lovely Juliet, Sylvia, Hiawatha, Blush Rambler, Elsie, Paradise, The Orleans, and Kathleen; it was an elegant exhibit.

Messrs. Sutton and Sons, Reading, exhibited an attractive table of Cineraria Reading Gem, a semi-dwarf form, with small foliage and star-like flowers; it should prove a useful section for decorative uses.

Mr. S. Mortimer, Swiss Nursery, Rowledge, Farnham, exhibited three fine mounds of polyanthuses, yellow and white on either flank, with shades of crimson in the centre; in spite of the hot day the flowers kept up well.

From Mr. C. Turner, Slough, came some fine specimen Rambler roses. The Pink Rambler was in fine form, as were also the weeping specimens of Alberic Barbier. The same exhibitor brought up a few Malmaison carnations, Ceanothus rigidus, and the beautiful golden alpine auricula, Golden Queen.

Mr. A. Hemsley, Crawley, arranged a rock garden exhibit, wherein the leading subjects planted were Gentiana acaulis, Androsace coronopifolia, Cheiranthus Allioni, Geum Rossi, Primula involucrata, Draba pyrenaica, and Linaria triornithophora.

Mr. W. A. Jenkins, Albion Nursery, Farnham, staged a new ivy-leaved pelargonium named Emmeline, a bright red colour, and evidently very free flowering.

A tasteful exhibit of carnations was arranged by Mr. A. T. Paskett, gardener to Mr. E. J. Johnstone, Burrs Wood, Groombridge. The vases of Princess of Wales, Beacon, Royal Purple, and Enchantress being especially conspicuous.

Mr. Vincent Slade, Staplegrove Nurseries, Taunton, again had a fine exhibit of cut zonal pelargoniums, in both single and double varieties.

Hardy flowers from Mr. Amos Perry, Enfield, were staged in the annexe. These included a collection of megaseas, which appear on the eve of large developments, also trolliuses in variety, and Daphne Cneorum.

Messrs. Phillips and Taylor, Bracknell, had a beautiful exhibit of show and alpine auriculas in the pink of condition; the same firm also staged hardy flowers. Here the aubrietias and saxifragas were the chief features, while the primulas were worthy of note.

From Messrs. Paul and Son, Cheshunt, came some flowering shrubs. The deutzias, such as D. discolor, D. gracilis eximea, and D. carnea were the chief items.

The Burton Hardy Plant Nursery, Christchurch, contributed a rock and alpine display. The alyssums, with Ramondia pyrenaica, saxifragas, and Scutellaria indica japonica, with Dianthus microlepis, formed some of the most interesting features.

Messrs. Young and Co., Hatherley, Cheltenham, staged a splendid exhibit of carnations, lightly arranged in tall vases. The most noteworthy varieties were Lady Audrey Neeld, Beacon, Britannia, and Duchess of Devonshire.

Messrs. W. Fells and Son, Hitchin, contributed a nice display of rock plants. Antirrhinum azarina, Cheiranthus versicolor, and primulas in variety formed the best features.

A large exhibit of plants came from Messrs. W. Cutbush and Sons, Highgate. This was composed of Rhododendron Pink Pearl in good condition, with some very good seedling Azalea mollis. A brightly-coloured plant was Coleus James Attfield. Oranges in pots, and tall standard lilacs made a fine background. The same firm also arranged a group of carnations, in which Lady Coventry, Marmion, Rose Doré, and Lady N. Brassey were most conspicuous.

Messrs. H. B. May and Sons, Upper Edmonton, occupied a large space with a collection of zonal pelargoniums in pots, verbenas, and ferns. The verbenas were in splendid condition, as was also the heliotrope Lord Roberts.

NARCISSUS AND TULIP COMMITTEE.

Robert Sydenham, Lim., Birmingham, presented a pretty exhibit of daffodils, and the only trumpet variety in the collection was Weardale Perfection; Bullfinch was well shown, and so were Ptarmigan, Stonechat, Tangerine, the broad-cupped Cavalier, White Lady, Beacon, and the brilliant Gloria Mundi, and the Poet Horace.

Mr. James Box, Lindfield, Sussex, contributed a display of tulips, and set up his flowers in bamboo stands and large vases, associated with sprays of Asparagus Sprengeri.

Messrs. Hogg and Robertson, Mary Street, Dublin, filled the central table in the lower annexe with gorgeous tulips, and they presented grand bunches of Yellow Queen, Corydon, Loveliness, Chameleon, Summer Beauty, Lion d'Orange, Mrs. Moon, Bartigon, and Clara Butt. The flowers were of magnificent size and substance, and very clean, but they occupied an unkind position.

Tulips were also finely shown by Messrs. Sutton and Sons, Reading, who had a rather high-pitched group, in which splendid bunches of Godet Parfait, Mrs. Stanley, Sierrad Von Flora, Turenne, Clio, Psyche, Wedding Veil, Pride of Haarlem, and La Fiancée were well set up.

A grand exhibit of tulips was displayed by Messrs. Alex. Dickson and Sons, Newtownards and Belfast. The flowers were of enormous size and grand colour. Particularly fine were the sheaves of Marie, Clara Butt, White Queen, Jaune d'Oeuf, Enchantress, Sensation, Pride of Haarlem, Nauticus, Scarlet Emperor, Remembrance, Ravenswing, La Fiancée Phœcia, Dora, and the glorious Inglescombe Pink.

A bold and beautiful contribution of glowing tulips from Messrs. Barr and Sons, Covent Garden, was a good feature of the show. The yellow varieties and the brilliant Parrot tulips added the needed note of brightness. A few of the best varieties on view were Europe, Lady of the Lake, Blue Flag, Inglescombe Pink, Moonlight, Clara Butt, Pride of Haarlem, Electra, General Kohler, and Auber.

Messrs. R. Wallace and Co., Colchester, presented a very beautiful display of tulips, and arranged them tastefully with Japanese maples. Le Tulipe Noir was shown well and Rev. H. Ewbank, Eguste, and Electra made up the central grouping; Flame, Mr. Farncombe Saunders, Millet, Inglescombe Pink, the beautiful Psyche, Margaret, Clara Butt, and Beauty of Bath were also grandly shown, and helped with others to make up a most interesting exhibit.

Messrs. R. H. Bath, Lim., Wisbech, contributed good bunches of Rev. H. Ewbank, Parisiana, Mrs. Moon, Mr. Farncombe Saunders, Antony Roozen, Clara Butt, Suzon, Inglescombe Pink, and William Copeland, tulips and some vases of late spikes of Muscari Heavenly Blue.

Tulips were largely shown by Messrs. G. Massey and Sons, Spalding, this firm staging medium-sized bunches of somewhat small flowers, over white paper; the best bunches were of Vitellina, Isis, W. Copeland, Fulgens, Dream, and Lion d'Osaze.

ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, put up a group of orchids, in which leading things were Renanthera Imschootiana, Cattleya Mendeli, C. Schroderæ, Odontoglossum Thompsonianum, odontiodas, and Lælio-cattleya Choletiana.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, showed Lælia Latona, Dendrobium thyrsiflorum, D. crepidatum, Cattleya Mossiæ, and C. Bertheana.

Odontoglossums, light forms, Miltonia vexillaria, Cattleya Skinneri alba, Brassolælia purpurata-Digbyana and Lælio-cattleya Dominiana made up the bulk of a group from Messrs. J. Cypher and Sons, Cheltenham.

Very richly coloured was Odontoglossum illustrissimum Queen Mary (F.C.C.), a cross between O. Lambeauianum and O. ardentissimum, from Mr. W. Stevens, gardener to W. Thompson, Esq., Walton Grange, Stone.

Mr. Edward V. Low, Haywards Heath, sent some choice forms of Odontoglossum crispum, a fine Cattleya Mendeli, Cirrhopetalum Coletti, and C. Roxburghi.

J. V. Moss, Esq., Wintershall, Hants, contributed some odontoglossums, chiefly hybrids.

A beautiful little group of orchids from Messrs. J. and A. McBean, Cooksbridge, contained some fine odontoglossums and grand forms of Cattleya Mossiæ, with C. Mendeli Pearl McBean as the chief feature.

FRUIT AND VEGETABLE COMMITTEE.

Salading was daintily shown by Messrs. Sutton and Sons, Reading, and included good examples of Early Paris and Golden Ball lettuces, Sutton's Market cucumbers, Winter Beauty tomatoes, and a great variety of radishes.

CERTIFICATES AND AWARDS.

First Class Certificate.—To Odontoglossum illustrissimum Queen Mary, from W. Thompson, Esq., Walton Grange, Stone.

Award of Merit.—To Orleans Rose, from Messrs. William Paul and Son, Waltham Cross; to Asplenium decorum, from Messrs. H. B. May and Sons, Edmonton; to Viola Moseley Perfection, from Messrs. Bakers, Wolverhampton; to H.T. rose Mrs. George Shawyer, from Messrs. Lowe and Shawyer, Uxbridge; to Ismene festalis hybrida from A. Worsley, Esq., Isleworth; to Rhododendron Dawn's Delight, from Miss Mangles; to Narcissus Sonata, from Mr. F. H. Chapman, Rye.

MEDALS.

Gold.—To Messrs. Thomas Rochford and Sons, Broxbourne, for roses.

Silver-gilt Flora.—To Mr. James Douglas, Great Bookham, for auriculas; to Messrs. G. Mount and Sons, Canterbury, for roses; to Messrs. Hogg and Robertson, Dublin, for tulips; to Messrs. R. Wallace and Co., Colchester, for tulips.

Silver-gilt Banksian. — To Messrs. Barr and Sons, Covent Garden, for tulips; to Messrs. Alex. Dickson and Sons, Newtownards and Belfast, for tulips; to Messrs. James Veitch and Sons, Chelsea, for flowering trees and greenhouse plants.

Silver Flora.—To Mr. H. Burnett, Guernsey, for carnations; to Messrs. W. Cutbush and Son, Highgate, for carnations, etc.; to Mr. Maurice Prichard, Christchurch, for alpines; to Messrs. R. H. Bath, Lim., Wisbech, for tulips; to Messrs. Sutton and Sons, Reading, for tulips; to Messrs. Sander and Sons, St. Albans, for orchids.

Silver Banksian.—To Messrs. Dobbie and Co., Edinburgh, for sweet peas; to Messrs. Stuart Low and Co., Enfield, for greenhouse plants and carnations, and one for orchids; to Messrs. Wm. Paul and Son, Waltham Cross, for roses; to Mr. H. Pulham and Son, Elsenham, for alpines; to Messrs. James Cypher and Sons, Cheltenham, for orchids; to Messrs. Sutton and Sons, Reading, for salading.

Bronze Flora.—To Messrs, Bakers, Wolverhampton, for saxifragas and violas; to Mr. A. Hemsley, Crawley, for alpines; to A. Wigan, Esq., Forest Park, Windsor, for calceolarias; to Messrs. H. B. May and Sons, Edmonton, for greenhouse plants; to Messrs. Phillips and Taylor, Bracknell, for auriculas; to Mr. L. R. Russell, Richmond, for clematis, cytisus and salvias; to Messrs. T. S. Ware, Feltham, for hardy flowers; to Messrs. A. Young and Co., Hatherley, for carnations.

Bronze Banksian.—To Burton Hardy Plant Co., for hardy plants; to Messrs. J. Cheal and Sons, Crawley, for flowering trees and shrubs; to E. J. Johnstone, Esq., Groombridge, for carnations; to Mr. J. Box, Lindfield, for hardy flowers.

National Auricula Society.

(NORTHERN SECTION.)

The thirty-eighth annual exhibition of this society was held at the Coal Exchange, Manchester, on April 29. As usual, the date fixed proved all too early for the edged auriculas, which were not smooth enough; even selfs and alpines would have been better had the show been a week later; if we are to have cold sunless March-like weather in April year after year the members will have to try a May show. The danger is, that should a spell of warm, sunny weather come at the end of April the bloom is quickly hurried over, but it seems high time to risk it, as for some years the exhibitors have had to come with flowers not fully developed.

Polyanthuses were poor, the only good feature being that there were more exhibitors of them, one of whom, Mr. Grindrod, of Whitworth, made a creditable first appearance, securing the prize for the best polyanthus in the show with a bloom of George IV., the judges being influenced by what it had been, rather than by what it was. As last year, the great feature of the show was the continued progress of the younger members of the society.

There is not much to be said about the show auriculas. Green edges were not as good as usual; Shirley Hibberd seemed poor with most of us; Mrs. Henwood scarcely in show form; there were more of the newer greens, such as Ossian, Orient, and Henry Wilson on view; but the best of all was a beautiful green edge, in the way of Shirley Hibberd, exhibited by Mr. Simonite, called Mrs. Simonite.

In grey edges Lancashire Hero and George Lightbody were supreme. Horner's Orpheus was shown, and would be a useful flower if it were placed in commerce, as it is a good grower, makes a fine truss of even, well-marked pips, with every good property, except that the edge of the petals is not quite round enough. Mr. Dickens had a pleasing seedling in the way of George Rudd called Ledlie Clark. In white edges there was nothing to touch Acme; Letitia is still rough, and we badly want some new varieties of merit. By the way, why do so many exhibitors show Heather Bell, it is rarely good enough for a stage flower. There were some good selfs, Mikado, Harrison Weir, Mrs. Potts, and Miss Violet were well shown; the latter is a fine truss maker, although rather too long in the stem.

The premier auricula was Mrs. Henwood, shown by Mr. Alfred Yates, a fine flower, which wanted a few more days' growth to be at its best.

In alpines the competition was very severe, and there was the usual crop of seedling novelties in bewildering profusion. Of the new varieties from the South Mrs. Douglas was, in Mr. J. W. Bentley's opinion, the best. Bluebell is a very striking light ground, but rather deficient about the centre; Phyllis Douglas was not so good as last year; Dazzle, in the way of Bluebell, was rougher as shown. This well-known authority said he did not like Janet, Lady June, or Claude Halcro. Flora McIvor was pleasing, but not flat enough, and the segments cut into the centre. Amy, Colin Bell, and Rookwood are promising varieties, and especially noteworthy were the well grown excellent seedlings exhibited by a new member, Mr. E. Blomily, of Blackley, near Manchester, of which more will, it is hoped, be seen some day. But the end of it all was that old J. F. Kew, shown by Mr. Dickens, won the prize for the best alpine of the show.

It was a good show, the day wet, as usual, but the exhibitors had a good time among themselves, and the new treasurer and secretary did their work excellently well.

In the chief class for six show auriculas Mr. F. Simonite led with Lancashire Hero, Orient, Acme, Ossian, and a seedling; he was followed in order by Mr. W. M. Shipman, Mr. W. Yates, jun., Mr. Alfred Yates, and Mr. J. W. Bentley. Mr. F. J. Dickens scored for four distinct show auriculas, and his set consisted of Mrs. Potts, Leslie Clark, Shirley Hibberd, and Acme; Mr. J. Antrobus was second, Mr. J W. Bentley third, and Mr. W. M. Shipman fourth.

In the class for a pair of plants Mr. G. Lord came to the front with G. Rudd and Shirley Hibberd, followed by Mr. W. Marshall, Rev. C. E. Bell, and Mr. A. Preston. The Rev. C. E. Bell led in the class for a pair of plants, maiden growers, and he secured the award with Acme and George Lightbody; Mr. J. P. Beaumont came second, and Mr. J. Tonge third.

The single plant classes brought out a fine competition. For a green-edged variety Mr. W. H. Parton scored with Abbé Lizst; Mr. F. J. Dickens second with A. Barker; and Mr. William Yates, jun., third, with Shirley Hibberd. Mr. W. H. Parton scored for a grey-edged variety with George Lightbody, Mr. J. W. Bentley second with the same, and Mr. W. M. Shipman third with Lancashire Hero. Mr. Shipman was both first and second for a white-edged variety, showing Acme in each case; Mr. F. Simonite third with Conservative. The best self was Mikado, from Mr. G. A. Wright, Mr. G. D. A. Hall coming second and third with Mrs. Petts. Mr. F. Simonite showed the best seedling, with Mr. W. H. Midgley second. The premier show auricula was a Mrs. Henwood, shown by Mr. Alfred Yates. Mr. W. Marshall, Mr. F. Simonite, and Mr. W. H. Midgley won in the order of mention for three plants, dissimilar.

In the alpine section Mr. W. H. Parton led for six, distinct, with Mrs. M. Smith, P. Douglas, Mrs. Gorton, Thetis, J. F. Kew, and Kingswood; Mr. J. W. Bentley second, and Mr. F. J. Dickens third. Mr. Dickens, Mr. Parton, and Rev. C. E. Bell scored in order of mention for four plants, dissimilar, while for a pair of plants the awards fell to Rev. C. E. Bell (for P. Douglas and Bluebell), Mr. Jack Bentley, and Mr. E. Blomily. Leading prize winners in other classes were Mr. W. Stringer, Rev. C. E. Bell, Mr. W. H. Parton, and Mr. J. Tonge. Mr. J. W. Bentley, Mr. N. Brownhill, Mr. D. Johnson, Mr. W. Grindrod, Mr. James Lomas, and Mr. G. Lord were the chief prize winners in the classes for gold-laced polyanthuses.

Royal Gardeners' Orphan Fund.

The twenty-third annual festival dinner in aid of this charitable and eminently useful fund was held at the Hotel Cecil, on Thursday, May 4, at 7 o'clock, under the genial presidency of N. N. Sherwood, Esq., V.M.H. There was a record attendance. The room was beautifully decorated with flowers and plants kindly provided by Messrs. James Veitch and Sons, Messrs. Sander and Sons, and Messrs. Barr and Sons.

After dinner, and the usual honouring of the loyal toasts, the Chairman, who had a most hearty reception, proposed "The Royal Gardeners' Orphan Fund." In hearty, pleasant, and effective manner he advocated the claims of the fund, and set forth the duty of those who loved or profited by gardening, to the orphans of gardeners. He said that the fund began in a small way, and the first meeting was called to consider a proposition made simultaneously by Mr. Charles Penny, Mr. H. J. Clayton, and Mr. James Udale, to "establish a gardeners' orphanage or fund for the benefit of the orphan children of gardeners, as a memorial of the Jubilee of Queen Victoria," and was held on March 22, 1887, in the conservatory of the former R.H.S. gardens at South Kensington. At that meeting Mr. George Deal was voted into the chair, and after some discussion it was resolved unanimously: "That in the opinion of this meeting it is desirable to establish a fund to be called 'The Gardeners' Orphan Fund.'"

A provisional committee was appointed to prepare a scheme, consisting of the chairman, Mr. Deal, Mr. Shirley Hibberd, Dr. Masters, Mr. James Douglas, Mr. John Fraser, Mr. Charles Penny, Mr. C. H. Sharman, Mr. Harry J. Veitch, Mr. J. Roberts, Mr. A. F. Barron, Mr. R. Dean, Mr. J. Matthews, Mr. John Wright, Mr. B. S. Williams, Mr. William Richards, Mr. B. Wynne, and Mr. W. Roupell. Mr. William Richards was appointed hon. treasurer, and Mr. J. Wright, Mr. B. Wynne, and A. F. Barron, hon. secretaries.

The first list of subscriptions received up to this date amounted to £28 14s. 6d., and the list was made up in the office of Messrs. James Carter and Co., by Mr. Penny and Mr. Sharman.

After numerous meetings of the provisional committee had been held, and a set of rules drawn up, the fund was duly constituted as a going concern on July 12, 1887, at a meeting held in the arcade over the western annexe of the conservatory at South Kensington, under the presidency of Sir Julian Goldsmid, Bart., and at which there were present, amongst others, Dr. Hogg, representing the council of the R.H.S., Dr. Masters, Mr. H. J. Veitch, Mr. Shirley Hibberd, Mr. G. Deal, and Mr. John Fraser.

The first annual general meeting was held at the Cannon Street Hotel, London, on July 13, 1888, Mr. George Deal presiding. There were ten candidates at this meeting, and at the time the date of the meeting was fixed the committee did not consider it prudent to elect more than six, but by the close of the accounts for the year, the financial position had improved so satisfactorily that the whole of the candidates were put upon the funds. Queen Alexandra, when Princess of Wales, became patroness of the fund in January, 1892, and early in 1893 Queen Victoria commanded that the fund should be called the Royal Gardeners' Orphan Fund.

The Chairman said that twenty-two years ago he had the honour of presiding over an annual dinner, and since that time there had been great progress, but the need for great effort was still present. There were now 117 orphans on the funds, but 21 were still waiting for assistance; 293 children had been helped, and one of the first to receive help had now become an annual subscriber. The cost of maintenance was over £2,000 a year, but the annual subscriptions amounted only to £693 per year. He concluded by asking those present to be generous, to do their best, remembering the old Biblical promise that "Whosoever shall give to drink unto one of these little ones a cup of cold water he shall in nowise lose his reward."

Mr. Arthur W. Sutton, V.M.H., responded to the toast, and said that the funds would not permit the committee to elect all the orphans to its benefits, therefore there was great need for all to do a little more than they had intended to do, to assist in a great work, and to show their loyalty to the chairman.

The Rev. Canon Curtis made a delightful speech in proposing "Gardeners and Gardening." He divided gardeners into three kinds; the professional, who called science to aid practice, and evolved new and beautiful fruits and flowers for the general good; the old gardener, who loved his garden, and concerning whom it was difficult to understand whether the gardens belonged to him or to his employer—he had a great love for such old gardeners; and the amateur gardeners, who delighted themselves, and often vied with professionals in the art of gardening. These were the "Three Jolly Gardeners," and he wished them prosperity. Gardening was of two kinds, that which followed Nature, and that which subverted it. The love of Nature brought out the best in mankind; gardening gave recreation to the toiler in the city, and solace to the aged. Dean Hole had said, "There is nothing like gardening to put before the people, it gives delight in life and peace and solace in old age.

Mr. W. A. Bilney, who responded, referred to the advances in horticulture since Mr. Sherwood first presided at an Orphan Fund dinner, to the work of the Royal Horticultural Society, and the forthcoming International Horticultural Exhibition. He said that a student at Wisley had just been appointed sub-inspector of school gardens—[in Surrey—ED.]—at a salary of 30s. per week, but this statement did not call forth applause.

The list of subscriptions was then read by Mr. Brian Wynne, the secretary, and it totalled up to the record amount of £1,570. Messrs. Hurst and Sons gave £100, Mr. N. N. Sherwood £50, Mr. William Sherwood £50, Mr. Edward Sherwood £50, and Mrs. Campbell (Mr. Sherwood's daughter) 25 guineas; the Covent Garden friends did well again, Mr. D. Ingamells raising £120, Mr. Wright £58 9s., and Mr. W. Poupart £24 16s. Mr. G. Reynolds brought over £100, Mr Cuthbert nearly £50, Messrs. Rothschild and Sons sent £25, Messrs. Sutton and Sons sent £50; Mr. A. W. Sutton, V.M.H., gave £50, and Mr. M. H. Fouquet Sutton gave £5 5s.; and Messrs. W. Leech, A. Turner, J. F. McLeod, D. W. Thompson, W. Nutting, W. Atkinson, — Daniels, R. H. Pearson, J. Veitch and Sons, H. B. May, T. W. Sanders,

A. Watkins, Barr and Sons, Eno, and others brought substantial amounts towards this grand total.

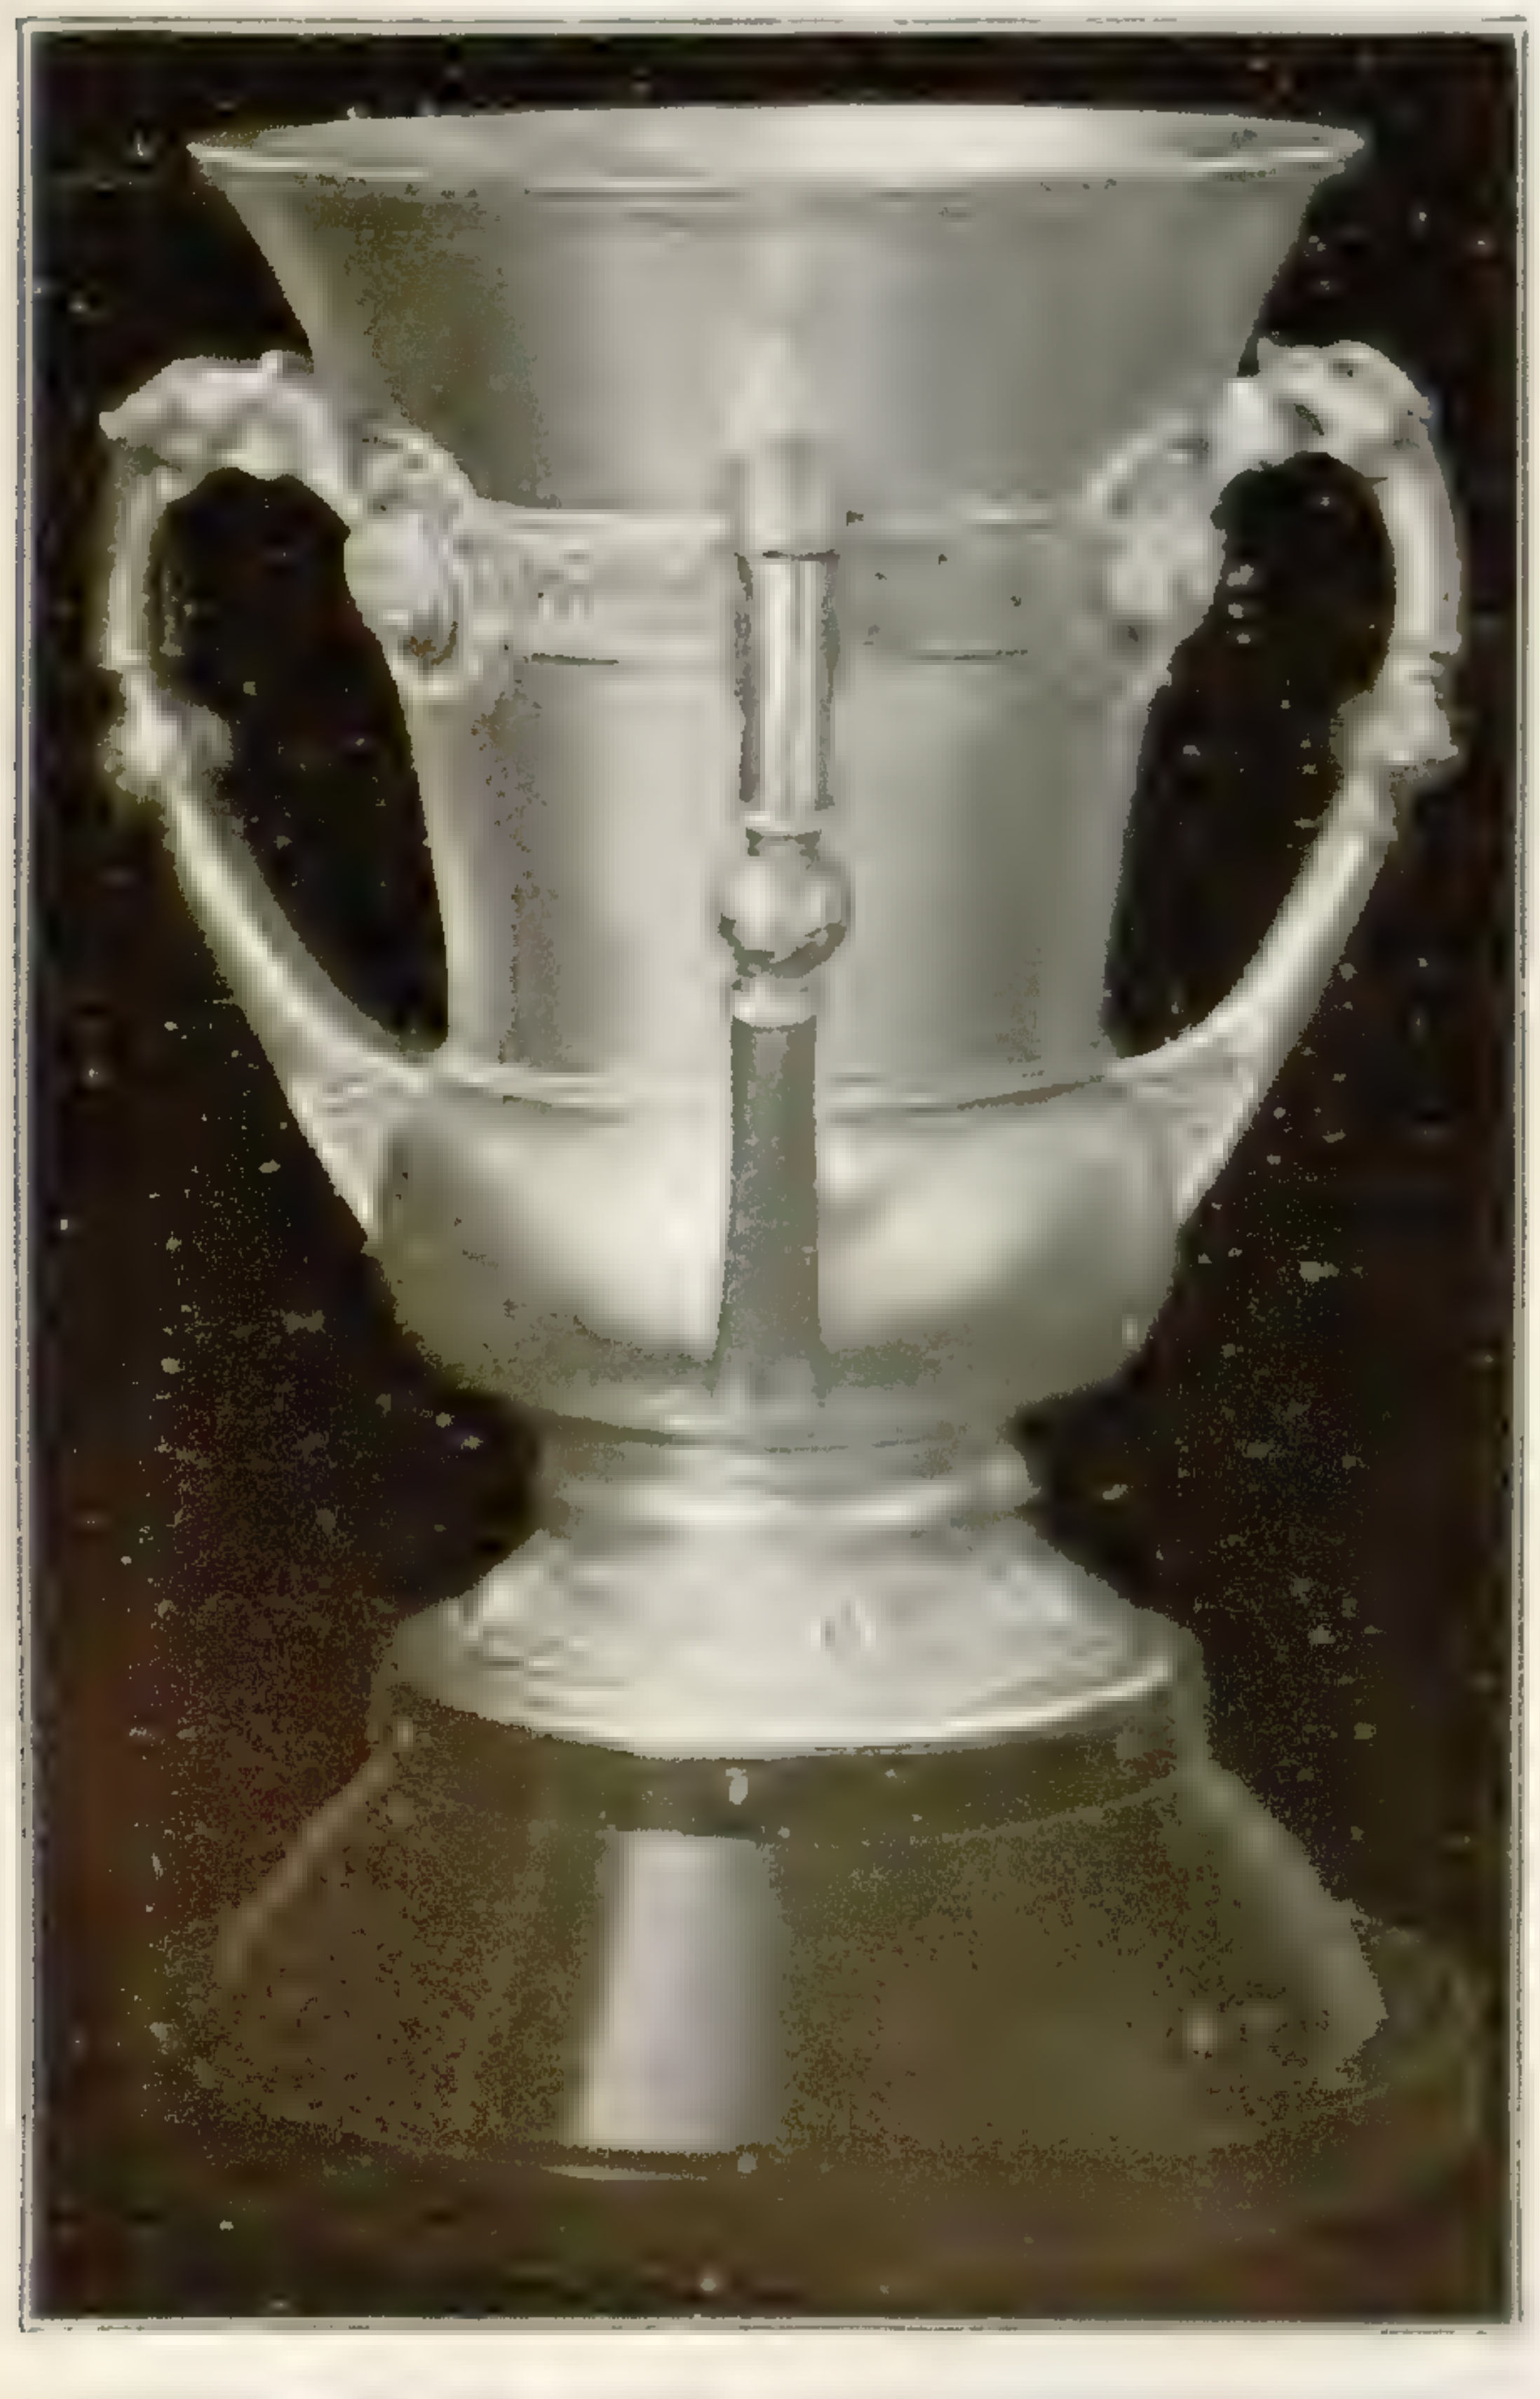
Mr. Edward Sherwood ably proposed "The Visitors," and, as treasurer, he congratulated the chairman (his father) on the success of the evening; he hoped the visitors had enjoyed themselves, and would remember the claims of the Orphan Fund. Mr. William Atkinson, of Sheffield, briefly responded.

Mr. H. B. May proposed "The Chairman," and expressed the committee's thanks to Mr. Sherwood for presiding, and for working so hard to secure the gratifying result they had just heard. He spoke of the Chairman as a peer in the realm of horticulture, a sentiment with which all agreed, as evidenced by the musical honours and rounds of cheering that went with the toast. Mr. Sherwood responded, and thanked all who had so nobly responded to his appeal, and in conclusion he proposed the health of the secretary, to which Mr. Wynne suitably responded

The proceedings were somewhat prolonged; the musical arrangements, in the hands of Mr. Turle Lee, gave every satisfaction.

FESTIVAL OF EMPIRE IMPERIAL EXHIBITION.

As briefly intimated in these pages a short time since, it is intended that horticultural and floricultural products shall form an important part of the Imperial Exhibition, to be held in association with the Festival of Empire, which is now in progress in the grounds of the Crystal Palace, Sydenham. There will be a permanent exhibition in the grounds, and special exhibitions in one of the buildings, the latter, we understand, comprising two rose shows. One of the most noteworthy of the prizes that are being offered is a handsome cup, of the value of twenty-five guineas, that has been presented to the Festival of Empire by Messrs. Clay and Son, of Stratford. This trophy will be awarded as the premier prize for the finest horticultural display produced by nursery firms in the grounds. The trophy is a copy of a fine three-handled ancient cup found at Ardagh, Ireland. In the spaces between the three handles are the following inscriptions, (1) Imperial Exhibition, 1911; (2) Presented by Messrs. Clay and Son, Stratford, London; (3) Awarded for the premier horticultural exhibit. It has been designed and executed by Messrs. Elkington and Co., of Regent Street, and is an excellent specimen of their fine work.



MESSRS. CLAY AND SON'S TWENTY-FIVE GUINEA CUP.

INTERNATIONAL HORTICULTURAL EXHIBITION OF 1912.

MANSION HOUSE MEETING.

A meeting for the furtherance of the efforts already made in connection with the International Horticultural Exhibition of 1912 was held in the Egyptian Hall, Mansion House, London, at three o'clock on Wednesday, May 10. The Lord Mayor presided, and was supported on the platform by Lord Aldenham, Sir Trevor Lawrence, Bart., Sir Jeremiah Colman, Bart., Sir Marcus Samuel, Bart., J. Gurney Fowler, Esq., H. J. Veitch, Esq., and Mr. Edward White.

There was a small attendance, those present being almost all well-known horticulturists, and including the Rev. J. H. Pemberton, Messrs. George Paul, H. B. May, C. Bayer (Master of the Gardeners' Company), J. Green, G. Jackman, R. Wallace, A. Kingsmill, J. O'Brien, G. J. Ingram, A. Gaskill, W. Jennings, A. Turner, C. Blick, W. Pope, D. McDonald, A. H. Rivers, Owen Thomas, H. Mount, J. Harrison, R. C. Notcutt, F. Sander, W. Watson, F. K. Sander, W. A. Bilney, J. A. Alexander, W. Cooper, W. Bolton, R. H. Pearson, W. Harvey, J. H. Dick, C. H. Curtis, etc.

The Lord Mayor opened the proceedings with a few references to the desirability of holding such an exhibition as proposed in London, and he read letters from Lord Rothschild and Lord Balfour of Burleigh, both of whom were unable to be present.

Lord Aldenham expressed his regret at Lord Balfour's absence, and proceeded to state that forty-four years ago a great international horticultural exhibition was held on the site of the Natural History Museum at Kensington. Now it was proposed to hold a great show in 1912 at Chelsea Hospital grounds, where 22 acres would be at disposal, and he hoped the show next year would greatly exceed the brilliance of the last one. Horticulture had now greatly advanced. The Royal Horticultural Society had 12.000 Fellows—then it had about 3,000. Now almost everyone had some knowledge of gardening, and it was time London slept no longer on the matter, since St. Louis, Ghent, Liege, Buda Pesth, and other places had had their great international shows. In the City men worked hard, and they needed relaxation; and, no matter whether their garden was small or large, horticulture afforded such relaxation, and of the highest order. This being so, he moved that "This meeting cordially approves the idea of holding the Royal International Horticultural Exhibition in London in May, 1912, and pledges itself to do its utmost to ensure the success of the undertaking."

Sir Marcus Samuel seconded the resolution, and endorsed the merits of horticulture as expressed by Lord Aldenham. The Royal Horticultural Society was evidently in full sympathy with the movement for a great show in 1912, or it would not have made the great sacrifices it had, and offered to give up the big May show next year. The great advance made in horticulture during the past forty-four years in Great Britain had been almost equally marked in other countries. He believed everyone was ready to support the motion he had the pleasure of seconding.

Sir Trevor Lawrence, Bart., supported the motion, and said that some of his earliest recollections were of the famous old shows at Chiswick. He had been intimately associated with the fortunes of the Royal Horticultural Society, had seen it in grievous trouble, and had seen it recover and achieve its present high position. Almost everyone nowadays could enjoy plants and flowers, from window plants to great collections in well-kept gardens. In recent years British horticulturists had received unbounded hospitality at various great exhibitions on the Continent, and it was high time we returned the hospitality and compliments so often received.

Sir Jeremiah Colman, Bart., further supported the motion, and in doing so outlined the movement. He said the Executive Committee had been fortunate in obtaining the patronage of their Majesties the King and Queen, and he believed they would be able to open the exhibition in person. Queen Alexandra and the other members of the Royal Family had granted their patronage also, and were followed by the "flower of the British aristocracy." There was also an Empire List of Honour, including Lord Strathcona, Sir R. Solomon, Sir J. Reid, and the representatives of nearly all our colonies. Prominent foreign horticulturists to the number of 150 were assisting. The Duke of Portland had become president of the movement, and Mr. J. Gurney Fowler had already proved a most capable chairman of committee, while Mr. Edward White was giving constant attention to the business of the show as hon. secretary. In Mr. Harry J. Veitch they had one who was on the executive of the great show of 1866. At Chelsea they had ample space in the Hospital Gardens for the 1912 show. The scientific and educational side of horticulture would not be overlooked, and a powerful committee was in charge of this section, which would cover such subjects as plant breeding, physiological questions, insect and fungus life, soil sterilisation, legislation, horticultural employment, etc. In respect of resources they had no experience as to the possible amount needed to bring the movement to a successful issue, and he asked that donations or guarantees should be given so that the financial side of affairs might not press heavily upon the executive; Mr. G. J. Ingram had the collection of such donations, etc., in hand. The Royal Horticultural Society had given £1,000, and guaranteed £4,000, and in return the Fellows would receive substantial benefits.

In regard to the show itself he thought the honour of winning cups and medals should be sufficient for exhibitors, but some cash prizes would be given, and the prize-list would amount to about £3,000. Hospitality would be extended to foreign guests, so that the function might be a pleasant as well as instructive one. It was now absolutely certain that the show of 1912 would, from a purely horticultural point of view, be one such as had never before been seen. He suggested it would be a large and glorified Temple Show, and concluded by a grateful reference to the work of the county secretaries, who were working for the success of the movement, and to the generous assistance already rendered by the Press, through whom he would on this occasion be speaking, not to empty chairs, but to all interested in horticulture.

Mr. J. Gurney Fowler moved a vote of thanks to the Lord Mayor for granting the use of the Mansion House for the meeting. They wanted a good send-off for the movement, and hoped in the course of another week to send out particulars to all interested in horticulture. Then the schedule would be finished, and steps at once be taken to secure donations and guarantees, and promises of cups, etc., for prizes. If the weather was good in 1912 the financial side of the show would, he thought, be a huge success, and he hoped there would be a good surplus of profits for presentation to the horticultural charities, etc.

Mr. Harry J. Veitch, in seconding the proposal, said the forthcoming show would be far different, and he believed far finer, than the one of 1866.

Sir Marcus Samuel, who had occupied the chair for the latter part of the meeting, courteously replied on behalf of the Lord Mayor, who, he said, took a keen interest in the movement, and would use his great influence to further it.

The proceedings lasted about three quarters of an hour.

CATALOGUES RECEIVED.

WM. PAUL AND SON, WALTHAM CROSS.—A spring catalogue of roses, in which pot plants of a wide selection of the queen of flowers are offered. Chief [illegible] the new varieties described, and mostly figured such as Florence Haswell Veitch, Sylvia, Elsie, Juliet, Portia, Fairy, Milky Way, Orleans Rose, etc.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

DISEASED TULIPS.—F. J. C., Camborne: The trouble is due to a bad attack of a fungus, and the disease as now evident is the botrytis form of a sclerotinia (possibly S. parasitica). At a later date the fungus produces resting bodies, or sclerotia, at or near the base of the stem, and among the bulb scales. Bulbs containing sclerotia are almost sure to be attacked the following year, and the soil in which diseased bulbs are now growing is certain to be infected, and would cause the disease to appear again even if clean bulbs were planted in it. When the bulbs are lifted all diseased ones should be rejected, and promptly burned, and a further close examination for diseased bulbs should be made at planting time. Plant on soil that has not been used for tulips. An attack may be mitigated if the tulips are sprayed with potassium sulphide at the rate of one ounce to three gallons of water, as soon as the disease is in evidence in the foliage in early spring. Soils heavily charged with organic matter appear to encourage the disease, and an attack is always strongest when cold rains or frosts have caused a severe check to growth.

QUICKLY-GROWING CLIMBERS FOR AN ARCH.—R. B., Maidstone: Cobæa scandens, or the good old Canary Creeper (Tropæolum canariensis) will be suitable for covering the arch. In the autumn you may plant clematis, roses, or ornamental vines to occupy the position permanently.

LIFTING DAFFODILS.—B. P., Taunton: You may lift the daffodils as soon as the foliage turns brown and shrivels; by that time the leaves will have done their work for the season, and the roots made during the winter and spring will also have shrivelled. As new roots soon begin to appear it is always a good plan where lifting is contemplated to lift as early in July as the state of the foliage will permit. Remove the offsets and replant the bulbs at the end of July or in August. Good varieties from which show blooms are expected should not be left unplanted until October or November.

BRUSSELS SPROUTS.—N. D. B., Luton: If the seedlings are of fair size, and the plot is quite ready, then set them out two feet apart each way. We very strongly believe in an early plantation of Brussels sprouts, especially if a somewhat later batch is to follow. If the ground is not yet ready for the Brussels sprouts then prick out the seedlings into nursery beds, from which they may be lifted with a trowel in due course, and put into position.

POETAZ NARCISSI.—S. J. W., Lancaster: We have on numerous occasions referred to the great value of the poetaz varieties of narcissi for pot culture and garden decoration. These varieties have been raised by crossing poeticus varieties with Tazetta, or polyantha forms, the result being sturdy plants carrying heads of fairly large and substantial flowers. One variety that we specially recommend you to try for pot culture is Aspasia, which has white, yellow-centred flowers of quite good size.

MARKS ON TOMATO LEAVES.—T. D. S., Coventry: The marks on the tomato leaves are not caused by a fungus attack, but are due to scalding. Scalding may be due to the action of bright sunshine through moisture on the leaves, the drops of water acting like so many lenses or burning glasses. It may also be produced by faulty glass in the roof, and as the marks have only appeared on two or three plants, this would seem the most probable cause of the damage in your case.

STUDY OF PLANTS.—W. L. S., Stocksfield: Have you tried "Kerner's Natural History of Plants"? If not, we recommend you to do so, as Anton Kerner was a close student of plant life, and he makes many things plain, and presents them in a fashion not general in text books. The English translation, by Dr. Frank Oliver, is published by Blackie and Co., Old Bailey, London. The work consists of two large volumes, freely illustrated, and is issued at 30s.

MOSSES.—W. L. S., Stocksfield: There are several works on mosses, with coloured illustrations, and the chief of these are Braithwaite's "British Moss Flora," a very expensive book; Dickson's "Handbook of British Mosses" (18s. 6d.); and Berkeley's "British Mosses" (21s.) Can you send us other specimens of the willow gall?

WITCHES BROOM ON BIRCH TREES.—C. B. F., Brockley: The peculiar twig formation known as witches broom is caused by the irritating action of a gall mite that is closely allied to the big bud mite so prevalent among black currants. It is a difficult matter to check the pest on a large birch tree, and probably no serious harm is being done. We know some folks who would not for one moment consider the question of removing the witches' brooms from a tall birch tree which we pass every day. If the clusters of deformed twigs increase too freely then cut out all such clusters at once, and, as soon as the leaves fall next autumn, cut away any newly-formed clusters, burning them at once.

NAMES OF PLANTS.

C. B. T., Swindon.—Spiræa arguta.

N. C. B., Godalming.—1, Cytisus præcox; 2, C. albus; 3, Olearia Haasti.

R. C., Westbury.—Pinus laricio pumila.

W. C., Oldham.—A garden form of Clivia miniata.

S. H. J., Earl's Colne.—1, Maxillaria luteo-alba; 2, Muscari botryoides alba; 3, Richardia albo maculata.

P. R. D., St. Albans.—1, Ribes aureum; 2, Pyrus spectabilis; 3, P. aria; 4, Tiarella cordifolia; 5, Tillandsia usneoides.

W. H., Harrow.—1, Sarracenia Drummondi; 2, Daphne laureola; 3, Pernettya mucronata; 4, Myrica Gale.

O. B. R., Sunninghill.—1, A piece of growth of Polygonum Baldschuanicum; 2, Cheiranthus kewensis; 3, Narcissus biflora; 4, Narcissus poeticus recurvus.

TRADE NOTES.

We are informed by Messrs. John Waterer and Sons, Ltd., American Nursery, Bagshot, that on account of the expansion of their Welsh business they have secured the services of Mr. W. Lewis (for many years with Messrs. Clibran), who will, from the middle of May, represent them in the Principality, thus liberating his brother, Mr. Thomas Lewis, for the increasing demand on his time in connection with the firm's landscape and advisory department.

The Vaporite-Strawson Co., of Spencer House, South Place, London, have received a letter from Mr. D. Wilshun Murch, F.C.S., in praise of Vaporite. He writes: "Personally, I strongly believe in the value of Vaporite, having made a number of experiments with it on various insects, and these were in all cases most successful." Vaporite the chemical powder invented by Mr. G. F. Strawson, has long since been proved to be effective in ridding the land of insect pests which prey upon the crops; the vapour which emanates from it in contact with the soil being absolutely fatal to wireworms and other pests which cause cultivators such serious loss, but its advantages by no means end there. If a little Vaporite is mixed with limewash used for coating the interior of poultry sheds and similar buildings, it will prevent insects annoying the stock, and keep the place sweet and free from vermin—a very important point which every poultry-breeder should note.

The double delivery nozzle of the Pine Spray Syringe bends up or down, this way ‿ or that ⌒
on a joint that is as soundly made as a high-pressure steam cock. And delivery of the fluid can be made through an insecticide spray as fine as a mist, or through an ordinary watering rose, by merely half turning the syringe bodily in the hand. Every spraying combination required in Greenhouse or Garden can be obtained instantly without the removal or addition of a single fitment.

You can see it before you buy.
By writing to us, your ironmonger or seedsman can obtain a syringe for your inspection. Neither he nor you are under any obligation to buy if you are not satisfied that it is the most convenient, effective, and best made syringe you have ever seen.

Situations Wanted.

GARDENER (Head, where several are kept); thoroughly experienced in all branches, Inside and Out; Grapes, Peaches, Melons, Stove and Greenhouse Plants; 4½ and 11 years' excellent references as head; married, family out. E. STONE, 13, Coniston Road, Addiscombe, Croydon, Surrey.

GARDENER (Head, or good Single-handed); 10 years' practical experience in good establishments; leaving through death; near London preferred. A. GLOVER, High Street, Stockbridge, Hants.

GARDENER (Head); good Single or Fruit Gardens Manager; Budder, Grafter, Pruner, Cucumbers, Melons, Vines, Chrys., Bedding Plants, Roses, Mushrooms, ridge or flat; Kitchen, Lawn, Flower Garden. Special Prize 1910. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head of two or three) seeks SITUATION; 12 years' good practical experience; age 26; married when suited; well recommended. Apply E. WALLIS, The Gardens, Maristow, Roborough, South Devon.

GARDENER (Head working or Single-handed); married, no family; life experience in all branches Inside and Out; good references. GARDENER, 36, Clarence Place, Gravesend, Kent.

GARDENER (Head Working).—H. ESSAM can with confidence recommend his Foreman, where several are kept; life experience in all branches; age 30; married when suited; excellent references. Address Closes Hall, Gisburn, Clitheroe.

GARDENER (Head Working, where two or more are kept); good all round; 14 years as head in large and well-kept establishments; married; age 40; excellent references. E. MAYLETT, Park Hall, Salford Priors, Evesham.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here six years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working); thoroughly practical, Inside and Out; life experience; 5 years' good character; age 40. Address T. BELL, The Gardens, Rose Court, Havering, near Romford.

GARDENER (Head Working, where three or more are kept).—Mr. LAST, The Gardens, Homewood, Chislehurst, Kent, can with every confidence recommend his Foreman, W. WAITE, as above; 13 years' experience, gained in good establishments; five years present situation. Married when suited.

GARDENER (Head working), age 33, married, desires RE-ENGAGEMENT; 19 years' practical experience gained in good establishments; excellent references. WM. GIBSON, 128, Lansdowne Road, Leicester.

GARDENER (Head Working, where two or three are kept); life experience; age 36; married; good reference. HALES, 8, Ivy Terrace, Old Church Road, Romford.

GARDENER (Head Working or good Single-handed); 24 years' experience Inside and Out; understands Electric Plant; age 38; disengaged May 27. A. COOK, The Hall, Hook, Surbiton.

GARDENER (Head Working, where three or four are kept); thoroughly experienced in all branches; Inside and Out; also land and stock if required; age 38; married; no family; disengaged. HARE, Lynton, Bisley, Woking.

GARDENER (Head Working).—Mr. GOULD, Shernfold Park, Frant, Sussex, highly recommends his Foreman, A. DAY, as above; thorough practical experience Inside and Out; excellent references; age 30.

GARDENER (Single-handed); little or no glass; 10 years' experience in present place; single; age 28. W. REEKS, 89, Amwell Street, Hoddesdon, Herts.

GARDENER (good Single-handed or otherwise); life experience; good all-round Man in all branches; age 45; married, one child; would take very moderate wage with cottage for a comfortable place. Excellent testimonials; willing to be useful. F. OSBORNE, 48, Bradshaw Road, Watford.

MR. SALTER, The Gardens, Avenue House, Church End, Finchley, highly recommends W. BICKER as GARDENER (Single-handed, or with help); experienced Inside and Out; at present in his employ; age 28; Eastern Counties preferred.

GARDENER (Single-handed or with help), experienced Inside and Out; age 30; married, no family; good refs. H. J. C., 64, St. Mary's Road, Reigate.

GARDENER (good Single-handed, or where help is given); married, no family; age 36; good references. State wages. SMITHERS, Lion Lane, Haslemere, Surrey.

GARDENER (Single-handed or otherwise); experienced Inside and Out; Vines, Fruit, Flowers, Vegetables; 10 years' excellent reference; abstainer; married when suited; disengaged. C. KIBBLEWHITE, Lyndhurst Lodge, The Grove, Slough, Bucks.

FOREMAN (Inside or General), would take HEAD place where four or more are kept; age 26; 11 years' practical experience in all branches, including Fruits, Orchids, Carnations, Stove, and Greenhouse Plants, etc., House and Table Decoration; R.H.S. certificate; disengaged when suited; England preferred. L. D. DREDGE, Dupplin Castle Gardens, Perth.

YOUNG MAN seeks SITUATION, either as Single-handed or Foreman; experienced in vines, orchids, etc.; Inside and Out; 7 years' experience; good references; age 23. C. E. RASS, Park House Gardens, Cotham Park, Bristol.

GARDENER (where one more kept); 15 years' practical experience Inside and Out. Essex preferred. Age 33; single; disengaged. R. W., 32, Forest Road, Loughton, Essex.

GARDENER seeks a SITUATION age 21; experience in Herbaceous Borders, Rockery, and Pleasure Grounds; good reference from present place. C. BRAIDEN, Gardens, Nunnery, Rusper, near Horsham.

MR. H. DUKE, Felixstowe Lodge, Suffolk, will be pleased to recommend JOURNEYMAN (Inside or Inside and Out); age 22; past three years here; abstainer.

JOURNEYMAN (Inside) seeks SITUATION; six years' experience Inside and Out; age 21; excellent references; 5 feet 10 inches; South preferred. C. OSBORN, High Street, Turvey, Bedford.

YOUNG MAN seeks SITUATION as JOURNEYMAN, under a Foreman (Inside or Inside and Out); eight years' experience; excellent characters; age 22. ALBERT BROADLEY, Dunnington Hall, York.

Date.......................................

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

OBITUARY.

◆

MR. THOMAS BRYCE.

Many of our Scottish and other readers will learn with regret of the death of Mr. Thomas Bryce, gardener to Sir Charles Dalrymple, Bart., of Newhailes, Midlothian. Mr. Bryce was for a goodly number of years gardener at Newhailes, and under his care the gardens were well known as among the best in a county where good gardens are plentiful. He was a capital gardener, as the condition of the gardens under his charge testified, and was also a man much esteemed by his many friends. He was a member of the Scottish Horticultural Association, and took a quiet, but real, interest in its work and that of other horticultural bodies. Mr. Bryce died on May 1, and his services will be greatly missed by his employer, while his loss will be much felt by a wide circle of others.

MR. ROBERT SERVICE.

We have to record the death, on May 8, of Mr. Robert Service, who was until near the end of 1910 the sole partner of the firm of Messrs. James Service and Sons, nursery and seedsmen, Maxwelltown, Dumfries, which is now being carried on under the same name by Messrs. Barr and Hunter. Mr. Service was trained to his business by his late father, Mr. James Service, by whom he and his brother, Mr. Joseph Service, were admitted as partners under the firm name of James Service and Sons. On the death of his father and the subsequent retiral of his brother, Mr Robert Service became the sole partner of the firm. Failing health and other circumstances largely arising therefrom, led to the disposal of the business towards the end of last year, and since that time Mr. Service has been practically confined to his house by illness. He was an exceptionally able man, his bent of mind, however, leading him more to devote his attention to natural history especially ornithology, than to horticulture. He was recognised as one of the best Scottish authorities on the subject of ornithology, and his services were in much request as a contributor to scientific periodicals and as a lecturer. Mr. Service took some part in public life and was for a short time a member of Maxwelltown Town Council, and Traqueer Parish Council. He was a member of the Floral Committee of the Royal Caledonian Horticultural Society, and took much interest in the local horticultural societies.

GARDENING ENGAGEMENTS.

Mr. J. E. Jones, formerly at Birkenhead, has been appointed head gardener to Sir C. A. Cripps, M.P., Parmoor, Henley.

FORTHCOMING ENGAGEMENTS.

FRIDAY, May 19.—National Horticultural Society of France; seven days; Conference on May 20.

TUESDAY, May 23.—Royal Horticultural Society's Great Annual Exhibition at Inner Temple Gardens, London.

Gardeners' Royal Benevolent Institution; 72nd Annual Festival; Dinner at the Grocers' Hall, Princes Street, London, at 7 for 7.30. Chair to be taken by Sir Marcus Samuel, Bart.

THE BEST REMEDY for MILDEW, GREENFLY, and all forms of INSECT BLIGHT, is

Jeyes' Horticultural Wash,

As used at the Kew Royal Botanic Gardens.

This liquid form of Cyllin Soft Soap has been placed on the market in response to the numerous requests from prominent rosarians and gardeners, to obviate any labour involved in preparing the stock solution incidental to the use of soft soap.

Jeyes' Horticultural Wash destroys greenfly and other aphides, red spider, rose hopper, gooseberry caterpillar, black currant mite, American blight, mildew, etc., etc. It is non-poisonous, and will not injure the tenderest vegetable shoots when diluted as recommended.

Pint tins 1/-, quart tins 1/9, also in drums.
Full directions with each package.

CYLLIN SOFT SOAP may still be obtained in its original form. Prices: 1 lb. tins 9d., 3 lb. tins 1/9, 7lb. tins 3/-; also in wooden kegs.

Jeyes' Horticultural Sprayer, complete, £1 5s.

NOW IS THE TIME TO PLANT KELWAY'S GAILLARDIAS, the rich golden blooms of which are noted for their powers of endurance during the driest season, and as cut flowers retain their freshness and beauty long after they have been gathered. They flourish with a minimum of attention, and give abundant bloom the same year that they are planted. Choice named collections, 12s. and 18s. a dozen.
KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.
From ———, Esq., Guildford.
"I may say that your Illustrated Catalogue is without doubt the finest book of the sort I have had the pleasure of seeing."

POPLAR AND STEPNEY SICK ASYLUM DISTRICT.

GARDENER'S LABOURER REQUIRED.

The Managers of the above-named District REQUIRE the services of a GARDENER'S LABOURER at their Bromley Asylum, situated at Bromley-by-Bow, London, E., at a wage of 30s. per week. Particulars, with printed form of application, which alone will be received, may be obtained on applying at my office, as below, any day before noon, or will be sent by post on receipt of a stamped addressed foolscap envelope. The form must be filled in by the candidate, and returned to me not later than 10 a.m. on TUESDAY, 23rd May, 1911.

A knowledge of gardening is essential to the appointment.

Selected candidates will be written to as to the time of attendance before the Board.

Canvassing the Managers, directly or indirectly, is prohibited.

The appointment will be subject to the provisions of the Poor Law Officers' Superannuation Act, 1896.

By Order.
CARRINGTON F. SIZER,
Acting Clerk.

Clerk's Offices: Devon's Road,
Bromley-by-Bow, London, E.
11th May, 1911.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page vii.

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.
XL ALL NICOTINE VAPORISING COMPOUND, the gardener's favourite Fumigant, both Liquid and Cake.
XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.
XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown both poisonous and non-poisonous are XL ALL WEED KILLER, XL ALL FERTILISER, RICHARDS' ARSENATE OF LEAD PASTE, CUCASA POWDER (fungicide), etc. Don't forget to ask your N.S. or Florist for Richards' small pink list.

VOL. LIV.—No. 3,003. SATURDAY, MAY 20, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Vegetative Activity.

To the unimaginative eye vegetative growth is extremely sluggish, but when we come to consider the amount of constructive work which is going on, say, in a large tree, when it is busily engaged in fashioning its annual set of leaves, we are forced to the opposite conclusion. In the first place, we must remember that the whole panoply of its leaves and flowers is practically completed within a few weeks from the first bursting of the buds, and that these are built up by the multiplication of infinite myriads of tiny cells within each of which a most complicated process of division is performed, and a number of subtle chemical changes effected simultaneously. Take the case of, say, a huge spreading elm or oak tree, with its intricate labyrinth of branches and twigs, all perfectly bare as the wintry blasts have left them. Give some manufacturer of artificial leaves and flowers the order to clothe that tree with fair imitations of such, each one to be carefully attached, and the whole completed within, say, a month from receipt of order, and we should then form a faint idea of the work effected when we saw the busy crowd of workers at their task, first of making and then of attaching seriatim. Then, when all was done, what a pitiable travesty it would be of Nature's perfection! Outwardly, there might be a faint resemblance to the real thing, but where would be that marvellous interior workmanship, the infinitely beautiful network of veins which pervade every leaf, the wonderful delicacy of the pollen grains and incipient seeds, and the organs which effect fertilisation. The human artificer could only produce mere replicas of a single type, but Nature's handiwork is infinitely varied; search as we might we could never find two leaves alike, in every one, although the general plan was the same, the detail would differ. Furthermore, the work done by the tree is infinitely greater than that implied in the travesty we have imagined, since there is not only involved the mere fashioning of the foliage, but in the process the wonderful root system is extended, and throughout the entire fabric, from the huge trunk to the minutest twig, a strengthening sheath of wood is formed, and besides the mere leaves which may be imitated, as many compact little buds are fashioned. In short, the work effected in a few weeks defies description, and against its apparent slowness must be set the fact of that general extension of area of foliage which is built up cell by cell, with microscopic bricks, as it were, fashioned by the tree itself from thin air and earthy salts in solution. Our artificial flower maker would have to start with a ton or two of raw material, and would certainly never accept the contract if confined to the ingredients with which Nature manages to perfect her work. In considering this question of vegetative activity, we have purposely chosen a most familiar example, but if we lived in the tropics or even if we visit a tropically heated stove, we may find examples of far greater activity. Under the stimulus of warmth and humidity, growth becomes incredibly rapid when we bear in mind the fundamental fact that it is not a question of mere inflation, but ever and always of building up cell by cell, brick by brick, on solid and substantial lines. In the early autumn, for instance, we may behold a stately banana plant, with a solid trunk as thick as a twenty-year-old tree, and enormous leaves, from whose axis of growth there hangs a huge pendulous bunch of the now familiar fruits, weighing perhaps a hundredweight. With our ordinary notions of vegetative growth, we should estimate the age of this plant at several years at least, and yet, in the self-same year in the spring it was a sucker of comparatively small size. Take, too, the giant bamboos, with their rods 80 or more feet long, the product of a season's growth, and remembering always how it is done, it dawns upon us that the activity of cell growth is something marvellous. We are, indeed, reminded of the old tale of the horseshoe nails and the infinite numbers that result from repeated doubling. This, in fact, is what growing cells are always doing, but in addition, they are always following subtle plans, the end result of which is those wonderful and infinitely varied organisations which we term vegetation on the one hand, and animal life on the other.

MR. S. F. STAFFURTH.
Winner of the Barr Cup for Daffodils at Huntingdon, and First Prize in the chief Amateur Class at Birmingham, 1911.

The Fruit Crop.

Although the season is not as yet sufficiently advanced for those who write with some sense of responsibility to express a definite opinion as to the extent and quality of the fruit crop that will be gathered in British gardens and orchards during the forthcoming summer and autumn, there is full justification for anticipating by far the best crop within recent years. It is not a case this year of this or that kind of fruit promising an abundant yield while other kinds present an appearance that justifies but little hope of the results being otherwise than unsatisfactory. All kinds are highly promising. It was feared by some that the sharp frosts experienced during the first week of April would do an immense amount of damage to the flowers of plums

2-2½ ft. ..	10/6 ,,	40/- ,,	350/- ,,
2½-3 ft. ...	17/6 ,,	55/- ,,	500/- ,,
3-3½ ft. ...	21/- ,,	75/- ,,	700/- ,,

CLIMBING ROSES, Extra Strong, in 8 in. pots, with shoots 5-8 ft. long, for planting out now.

Also **BUSH ROSES** in 7 in. pots for filling up at **2/6** each, **24**/- doz.

New List of Bedding Plants and Dahlias post free on application.

DICKSONS ROYAL NURSERIES, CHESTER.

PERPETUAL CARNATIONS.—Everyone interested in PERPETUALS should write for our 1911 Illustrated Catalogue, FREE. Read our "TREATISE ON CULTURE." 1s., post free. YOUNG and CO., Carnation Specialists, HATHERLEY, CHELTENHAM.

WATER CATALOGUE NOW READY
PERRY, ENFIELD, MIDDX.

STALKER'S Forest Trees, Fruit Trees. Roses, Bulbs, and Seeds
Are known all over the world, and cannot be surpassed for hardiness and quality.

Famous for Quality and Cleanliness.

D. STALKER & SON,
Government Contractors,
Catalogues Free. NAIRN, N.B.

BY APPOINTMENT.

ROSES IN POTS.

WM. PAUL & SON, WALTHAM CROSS, LTD.,

beg to offer a magnificent stock of DWARFS and RAMBLERS for present Planting and for Greenhouse Culture.

In 5-in. pots **10s. 6d.** to **18s.** per dozen, **75s.** to **120s.** per 100; extra strong in 8-in. pots **24s.** to **60s.** per dozen. Also a fine collection of New Roses.

Catalogue on application.

PAUL'S ROYAL NURSERIES,
Waltham Cross, HERTS.

NOTICE.

The AZALEAS and RHODODENDRONS planted in Hyde Park, near Rotten Row, finest to be seen in London, are supplied by ANTHONY WATERER, whose only address is Knap Hill Nursery, Woking, Surrey.

No connection with any other firm of similar name.

PRIMULA OBCONICA GIGANTEA GRANDIFLORA.

The most beautiful Free and Hardy Perpetual Greenhouse Plant grown.

ONCE IN FLOWER ALWAYS IN FLOWER.

We are NOTED for having the most — SUPERB Strain in commerce. —

SEED.

Mixed colours, also Compacta and Fimbriata, mixed, 1s. per packet; separate colours of Purple, Rose, Lilac, Deep Red, Crimson Scarlet, Pale Lilac, and Crimson (fringed petals), **2s. per packet; double flowering, including Pale Mauve and Rose, 2s. per packet. Instructions as to sowing with each packet.**

PLANTS, 3s., 5s., 7s. 6d., 10s. 6d., and 15s. per doz., according to size.

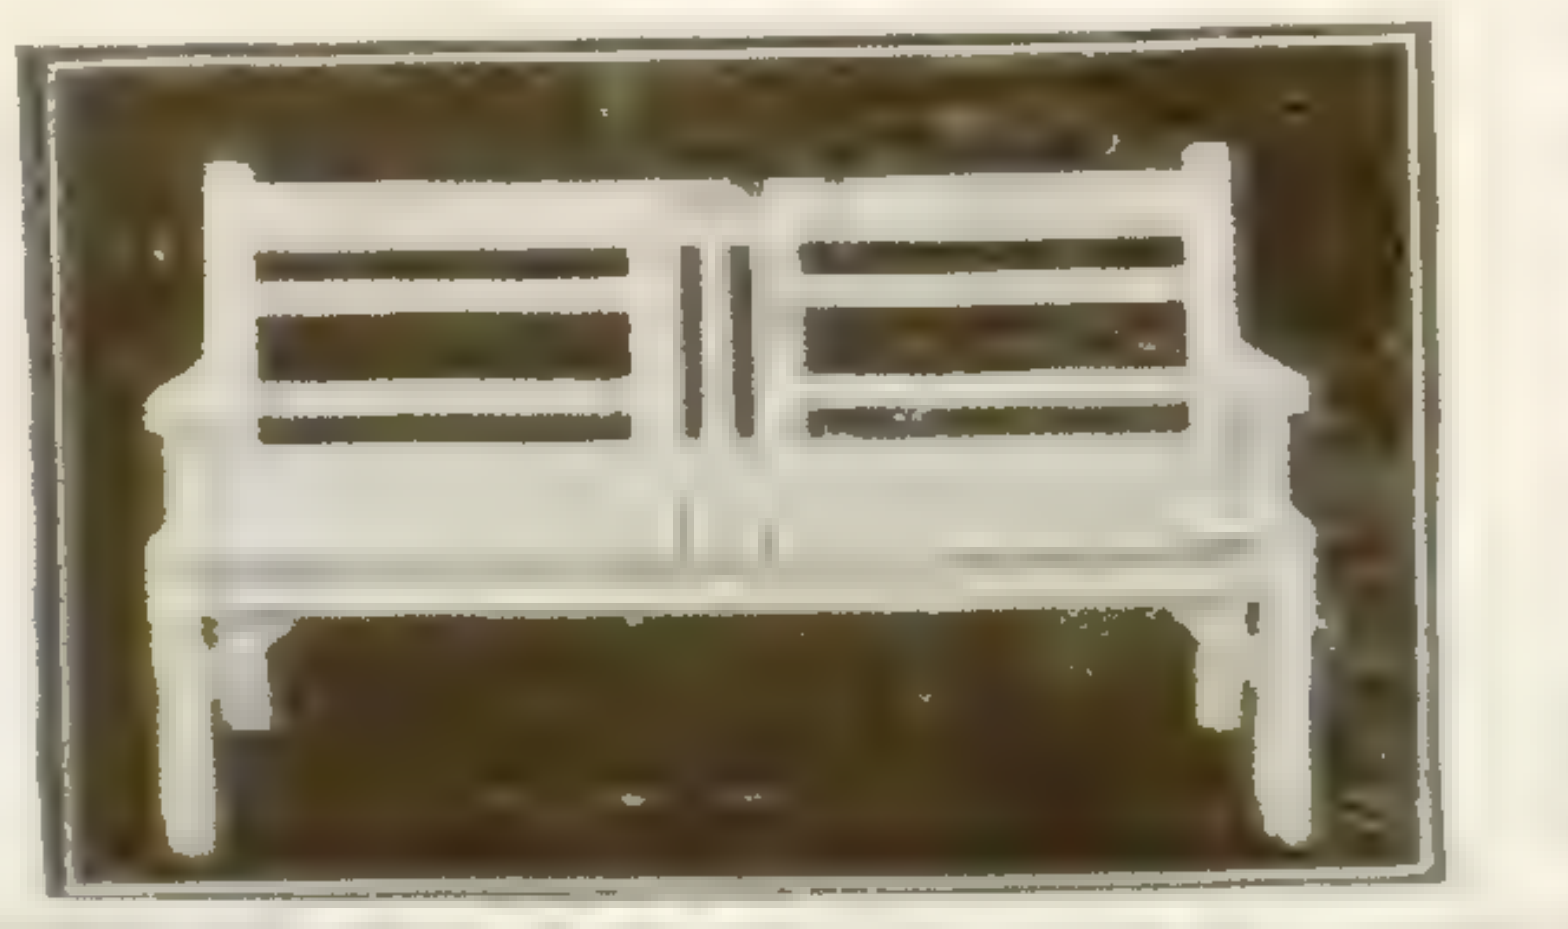
W. A., Esq., Reigate, Surrey, writes:—
I had a packet of seed from you last year, and am pleased to inform you that I have blooms measuring two inches and more across each individual flower. They are the best strain I have ever seen, both for variety of colours, and substance of bloom.

WM. ARTINDALE & SON,
Nether Green Nursery,
SHEFFIELD.

For 3 penny stamps we will send you our Catalogue of Plants, which is not merely a price list, but literature which gives all the cultural notes of plants therein mentioned. We have received hundreds of testimonials commenting on the value of this book.

OUR SEED CATALOGUE WILL BE SENT FREE ON APPLICATION.

IDEAL, 5 feet long.



In best redwood, painted two coats white

£1 : 7 : 6.

Delivered any Station.

Full catalogue on application.

PETER PATRICK & SON, OTLEY, YORKS.

VOL. LIV.—No. 3,003. SATURDAY, MAY 20, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Vegetative Activity.

To the unimaginative eye vegetative growth is extremely sluggish, but when we come to consider the amount of constructive work which is going on, say, in a large tree, when it is busily engaged in fashioning its annual set of leaves, we are forced to the opposite conclusion. In the first place, we must remember that the whole panoply of its leaves and flowers is practically completed within a few weeks from the first bursting of the buds, and that these are built up by the multiplication of infinite myriads of tiny cells within each of which a most complicated process of division is performed, and a number of subtle chemical changes effected simultaneously. Take the case of, say, a huge spreading elm or oak tree, with its intricate labyrinth of branches and twigs, all perfectly bare as the wintry blasts have left them. Give some manufacturer of artificial leaves and flowers the order to clothe that tree with fair imitations of such, each one to be carefully attached, and the whole completed within, say, a month from receipt of order, and we should then form a faint idea of the work effected when we saw the busy crowd of workers at their task, first of making and then of attaching seriatim. Then, when all was done, what a pitiable travesty it would be of Nature's perfection! Outwardly, there might be a faint resemblance to the real thing, but where would be that marvellous interior workmanship, the infinitely beautiful network of veins which pervade every leaf, the wonderful delicacy of the pollen grains and incipient seeds, and the organs which effect fertilisation. The human artificer could only produce mere replicas of a single type, but Nature's handiwork is infinitely varied; search as we might we could never find two leaves alike, in every one, although the general plan was the same, the detail would differ. Furthermore, the work done by the tree is infinitely greater than that implied in the travesty we have imagined, since there is not only involved the mere fashioning of the foliage, but in the process the wonderful root system is extended, and throughout the entire fabric, from the huge trunk to the minutest twig, a strengthening sheath of wood is formed, and besides the mere leaves which may be imitated, as many compact little buds are fashioned. In short, the work effected in a few weeks defies description, and against its apparent slowness must be set the fact of that general extension of area of foliage which is built up cell by cell, with microscopic bricks, as it were, fashioned by the tree itself from thin air and earthy salts in solution. Our artificial flower maker would have to start with a ton or two of raw material, and would certainly never accept the contract if confined to the ingredients with which Nature manages to perfect her work. In considering this question of vegetative activity, we have purposely chosen a most familiar example, but if we lived in the tropics or even if we visit a tropically heated stove, we may find examples of far greater activity. Under the stimulus of warmth and humidity, growth becomes incredibly rapid when we bear in mind the fundamental fact that it is not a question of mere inflation, but ever and always of building up cell by cell, brick by brick, on solid and substantial lines. In the early autumn, for instance, we may behold a stately banana plant, with a solid trunk as thick as a twenty-year-old tree, and enormous leaves, from whose axis of growth there hangs a huge pendulous bunch of the now familiar fruits, weighing perhaps a hundredweight. With our ordinary notions of vegetative growth, we should estimate the age of this plant at several years at least, and yet, in the self-same year in the spring it was a sucker of comparatively small size. Take, too, the giant bamboos, with their rods 80 or more feet long, the product of a season's growth, and remembering always how it is done, it dawns upon us that the activity of cell growth is something marvellous. We are, indeed, reminded of the old tale of the horseshoe nails and the infinite numbers that result from repeated doubling. This, in fact, is what growing cells are always doing, but in addition, they are always following subtle plans, the end result of which is those wonderful and infinitely varied organisations which we term vegetation on the one hand, and animal life on the other.

MR. S. F. STAFFURTH.
Winner of the Barr Cup for Daffodils at Huntingdon, and First Prize in the chief Amateur Class at Birmingham, 1911.

The Fruit Crop.

Although the season is not as yet sufficiently advanced for those who write with some sense of responsibility to express a definite opinion as to the extent and quality of the fruit crop that will be gathered in British gardens and orchards during the forthcoming summer and autumn, there is full justification for anticipating by far the best crop within recent years. It is not a case this year of this or that kind of fruit promising an abundant yield while other kinds present an appearance that justifies but little hope of the results being otherwise than unsatisfactory. All kinds are highly promising. It was feared by some that the sharp frosts experienced during the first week of April would do an immense amount of damage to the flowers of plums and gooseberries. A few may have suffered from the effects of the frost in early districts where the flowering of these two kinds were well advanced, but the general effect of the frost and the low temperature that followed was to check the development of the flowers and to delay the blooming of the majority of the fruits by a fortnight or more. Since the commencement of this month the weather has been warm and genial, with the result that they are setting their fruits in the most satisfactory manner. According to the reports that have reached us from our correspondents, plums and cherries have set well, and the young fruits are swelling freely; pears have set fairly well, but in some cases the trees have cast their flowers rather more readily than could be desired; apples, which are not so advanced as the other kinds, are setting freely, and we may anticipate that the later varieties will be not less satisfactory in this respect than are those which bloom early. Bush fruits are, on the whole, promising an abundant yield, and the strawberry crop will, if favourable weather continues, be in every way satisfactory. As the trees of the several kinds have not had their strength heavily taxed by fruit bearing for several years past, they are now in a robust state of health, and provided excessive cropping is avoided will be able to bring their fruit to a high state of development.

Mr. S. F. Staffurth, whose portrait we present to our readers in the present issue, is a gentleman who has taken up one particular flower as a hobby, and finds a vast amount of pleasure in it. He works under some disadvantages and difficulties because he is engaged in the scholastic profession at Brighton, whereas his flowers—they are daffodils—grow in his father's garden at Frieston Priory, Boston, Lincs. With a fairly long Easter vacation to fill up he turned his attention to the flowers that bloom at that season, and, of course, the daffodil was selected as first favourite. He started with a small collection of bulbs about eight years ago, and he was aided in his selection of varieties by Mr. A. M. Wilson, now of Bridgwater, and then of Spilsby. For the last five or six years Mr. Staffurth has been a regular exhibitor at the Lincolnshire Daffodil Society's show at Spilsby, and has been successful chiefly with medium, small-crowned, and poeticus varieties, but until this year he has not had great success with trumpet daffodils. In 1910 Mr. Staffurth competed in the chief class at Huntingdon, for thirty varieties of daffodils, and gained second place in a keen competition; this year he again competed, and secured the gold medal and first prize with a very beautiful collection. Two years ago he exhibited at the Midland Daffodil Show, at Birmingham, with practically no success, but this season he won first prize in the leading amateur's class with a delightful display that we figured in our issue of May 6. Mr. Staffurth is at home at Frieston Priory for three periods of the year, autumn, Christmas, and Easter, and it is during these times that he attends to his daffodil beds, and prepares for coming exhibitions; his sister reports progress during his absence, and she also lifted the stocks of his best varieties last year in early July. Daffodil culture is a holiday recreation for Mr. Staffurth, one he is devotedly fond of, and one that he has been very successful in.

Awards of R.H.S. Committees.—The Rev. W. Wilks, M.A., secretary of the Royal Horticultural Society, sends us the following copy of a letter which has been sent by the Council to the chairmen of the R.H.S. Committees: "Dear Sir,—I am desired by the Council to recall to the minds of the members of the committees the high merit which should be represented by all the awards, certificates, and medals of the society. It is probably to be expected that the number of awards should increase slightly year by year, but there exists a constant danger of their too lavish bestowal. It should, therefore, be a matter for constant watchfulness that the relative standards of merit be fully maintained, and that none of the medals, etc., should become depreciated by neglect in the use of the award ranking below it. If, for example, the use of the Bronze Medal is allowed to lapse, it can only result in the equivalent depreciation of the next higher awards, which, in turn, will have a tendency to fall out of use and depreciate those still higher; until at last little value would attach to even Gold Medals. The value attaching to each medal can only be upheld by maintaining the appropriate value of the medal ranking below it, and so on in descending scale. The value attaching to the society's bronze medal is therefore the primary factor of the value which attaches to the highest Gold Medal, and whatever depreciation the Bronze Medal suffers the Silver and Gold will inevitably reflect in their turn. The Council therefore urge the committees to make greater use of the Bronze Medals, regarding them as very honourable awards suited to groups and collections which require something more than a mere 'vote of thanks.'—Faithfully yours, W. Wilks, Secretary."

Queen Mary's Coronation Bouquet.—The well-known and attractive border carnation Lady Hermione, which has rich rose-pink flowers, has been selected for the bouquet which will be presented to Queen Mary by the Worshipful Company of Gardeners on the occasion of her Coronation.

Spring Flowers at Kew.—The procession of flowers that belong to the season of spring continues to make a visit to the Royal Gardens, Kew, immensely enjoyable and of much interest. The species of pyrus and their varieties which followed the British and Japanese cherries have flowered with great freedom, and the masses of white and pink flowers have formed a delightful feature. Unfortunately, the rain which fell on the 14th inst. had the effect of shortening the period of flowering of the somewhat ephemeral Pyrus malus floribunda, one of the most elegant of small trees. It also rather spoilt the flowers of the Snowdrop Tree (Halesia tetraptera), which bloomed with exceptional freedom, and the wreaths of the pure white campanulate flowers have produced a charming effect. Rhododendrons now constitute a glorious feature, and the dell that is devoted to these attractive shrubs is aglow with colour, and some of the groups alongside the main walk leading to the palm-house and contiguous to that structure, are fully in bloom, notably the fine rosy-red Lord Palmerston, one of the best of its colour, and Cunningham Cunningham's White, an old but valuable white variety of good habit and blooming profusely. The group at the southern end of the lake is so freely furnished with flower trusses that if it does not exactly present the appearance of "a mountain of snow," it attracts the attention of the visitors immediately it comes within the range of vision. Many of the hybrid rhododendrons of recent introduction in the dell are fully in bloom, the pale pink Kewense being especially attractive. Several of the older hybrids are also at their best, and visitors should not overlook the huge specimen of Broughtoni at the south end of the dell, for it is not less remarkable for its fine habit and handsome leaves than it is for its huge trusses of rich rose-red flowers. The azalea garden, which has been considerably extended within recent years, is resplendent with colour, to which both the Ghent and mollis varieties contribute their full share. Another feature of interest is the fine display of May-flowering tulips and other spring flowers in the geometric garden on the east side of the palm house. The visitor, whatever may be the trend of his taste, should not miss the delightful effects produced by the bluebells in various parts of the arboretum and in the grounds that form so beautiful a setting to the Queen's Cottage.

Straw for Strawberries.—The strawberry season will soon be with us again, and in this connection it is interesting to notice that nearly 3,000 tons of straw are used in the Swanwick district of Hampshire, to lay under the strawberries for the purpose of keeping the fruits clean. Altogether, there are some 3,000 acres under strawberry cultivation, and some further idea of the magnitude of the industry may be obtained from the fact that in the height of the season a million and a-half of 4lb. baskets of strawberries are dispatched from Swanwick Station in a week.

Edinburgh Autumn Show.—The Council of the Royal Caledonian Horticultural Society have decided to alter the date of the autumn show. It has accordingly been arranged to hold the show in Edinburgh on September 13 and 14, instead of September 6 and and 7, as intimated in the schedule. The arrangements made with the railway companies will apply to September 12, 13, 14, and 15, instead of the dates previously noted. The date on which the entries will close is September 6.

Gardeners' Royal Benevolent Institution.—We are asked to remind our readers of the 72nd anniversary festival dinner of this institution, which will take place on Tuesday next, May 23, at the Grocers' Hall, Princes Street, City, at seven o'clock, under the presidency of Sir Marcus Samuel, Bart., who will be supported by an influential company. Subscriptions in aid of the funds, to be placed on the chairman's list, are earnestly solicited, and will be thankfully received by Sir Marcus Samuel, Bart., 3, Hamilton Place, W.; Harry J. Veitch, Esq., V.M.H., Chelsea; or the secretary, Mr. George J. Ingram, at the office of the institution, 92, Victoria Street, Westminster, S.W.

Pollination of Plums.—In an interesting communication to the "Journal of the Board of Agriculture," Mr. C. H. Hooper discusses the importance of the study of pollination of fruit blossoms. He points out that experiments conducted in 1910 showed that plums are, on the whole, "self-fertile," but that hybrids tend to be completely sterile. Thus "Rivers' Early Prolific" appeared to set fruit with its own pollen with the greatest difficulty, only nine plums setting out of as many thousand flowers, whereas "Victoria" proved completely self-fertile. The Histon Apricot plum, the Blue Bullace and Sloe were all found to be self-fertile. The "old greengage" showed itself self-sterile, but when dusted with the pollen of "Early Rivers" it set plentifully; in like manner the pollen of the "greengage" on the "Early Rivers'" gave a good crop. As a practical example of this, a case may be mentioned where it was found that "Rivers' Early Prolific" and "Black Diamond," if planted in large blocks fruited badly, fruiting chiefly on the outsides of the plantation, where they adjoined plum trees of mixed varieties. In another case, a block of 20 acres of "Victoria" plums were practically a failure until a number of trees were taken out and other varieties planted in their place.

British Gardeners' Association.—At the meeting of this association, held on May 9, Mr. W. H. Divers presided, and twelve new members were elected, bringing the total up to 2,142. It was decided that a sum of £250 should be invested in Local Loans, and that an honorarium be granted to each of the secretaries of the local branches of the association. In reference to the National Insurance Bill a resolution was passed approving of the Government scheme, and deciding that the B.G.A. should watch the progress of the Bill through Parliament in conjunction with the United Horticultural Benefit and Provident Society. The annual meeting of the association will be held on Thursday, May 25, at 7 p.m., at Carr's Restaurant, Strand.

Exhibiting New Daffodils for Awards. The President and Council of the Royal Horticultural Society have approved a recommendation of the Narcissus Committee to the effect that "five flowers of a daffodil be submitted for an Award of Merit instead of eight as heretofore." The society's regulation No. 25 for the Standing Committees is therefore amended accordingly.

Slug Hunting. — Notwithstanding the many remedies for and preventives against slugs, many people still believe in the old-fashioned method of systematically hunting over the flower borders or the beds of seedlings after rain. Probably not many of our readers are so industrious as one at Hounslow, who last week captured nearly five hundred and fifty. Slices of parsnips were used as traps.

Plant Diseases in Holland. In connection with the recent visit of the Gardeners' Company to the bulb-growing districts of Holland, which was recently referred to in these pages, it may be of interest to mention that hitherto the growers have relied wholly upon their own endeavours in contending with insect and fungoid pests. Consequently, there is not at the present time any law requiring growers to take steps to keep their stocks free from disease. A Bill is now before the Dutch Parliament, the chief object of which is to prevent the spread of the American gooseberry mildew, and as it has not met with any opposition, it is hoped by the promoters that it will pass in the course of the present session. ◆ The Phyto-Pathological Institute, of which D. J. Ritzema Bos, the State entomologist and vegetable pathologist is the head, undertakes the inspection of nursery stock of all kinds intended for exportation to foreign countries. This inspection on the part of the growers is purely voluntary, and in carrying out their duties the inspectors report upon the diseases present, and endeavour to determine, as far as possible, the extent to which it has been developed. Crown gall and root gall on pear and apple trees are diseases that are having special attention paid to them at the present time, but such common diseases as rose mildew and rose rust are by no means overlooked. The nurseries that are under inspection are examined sometimes two or three times, and there are special inspections of stock that have been collected for export from several growers. A few fruit trees are imported into Holland, and those from England are invariably inspected, more especially gooseberry bushes, because of the American gooseberry mildew. Fruit trees from America are not imported because of the risk that German and other nations might in consequence of their importation into Holland, refuse to receive them from the Dutch growers.

The Temple Show is this season creating much additional interest, from the fact that the International Horticultural Exhibition will take its place next year. The exhibition promises to be at least fully equal to the best of its predecessors, and fine weather alone is necessary to ensure its success. We shall give a full and illustrated account of this great gathering in our next issue.

A Munificent Gift for Advancing Science has been made by the Worshipful Company of Drapers to the Battersea Polytechnic. This is to be devoted to the erection of a building to house a department that will include such scientific studies as bacteriology, physiology, hygiene, and town planning. It is also hoped that geology, in its special relation to soil formation and vegetation will be added to this list.

Early Flowers from the South of France.—The United States Consul at Toulon, Mr. F. M. Mansfield, has recently reported in most interesting fashion upon the trade in spring flowers carried on in the South of France. He tells how the flowers are picked and packed, and handled direct by the railway authorities without the intervention of the regular postal authorities, and he states that every year a million parcel post packages of cut flowers, with a total value of 40,000,000 francs, are sent from the gardens of Southern France. Every night during the winter months a special train, popularly called the Rapide des Fleurs, leaves Toulon for Paris, carrying cut flowers in baskets and cardboard boxes from all stations on the line from Nice to Toulon, to the Paris markets. Certain cars are switched off to Frankfort, Berlin, and Munich, others continue to Brussels, and others to Calais, where their perishable freight is transferred to steamships crossing the English Channel and rushed to the markets of London and Manchester.

Available Plant Food.—Mr. J. J. Willis writes: In the article on "Available Plant Food," page 362, it is stated that in the presence of the necessary potash and lime in the soil, the phosphates and other mineral constituents unite with the organic compounds produced from the decay of the humus, and form "muriates." This should read "humates"—humate of potash, humate of lime, humate of soda, etc., all of which are available forms of plant food.

Small Holdings.—Six new Commissioners have been appointed under the Small Holdings Act for the purpose of assisting County Councils to satisfy outstanding demands for small holdings and to put into force the provisions of the law in cases of default where necessary. The new Commissioners are Mr. A. Allsebrook, Mr. J. H. Diggle, Mr. E. O. Fordham, Mr. Sydney Mager, Mr. F. E. N. Rogers, Mr. T. Baines, and Mr. E. J. Cheney. Mr. Allsebrook was for six and a-half years resident agent to Earl Beauchamp on the Madresfield Estates, where there are over a thousand small holdings under 50 acres. All the other gentlemen have had considerable experience in the management of land and the work of small holdings, so that their appointment seems eminently fitting.

SWEET PEA NOTES.

Sweet pea enthusiasts will be now feeling the effects of what is the fever which will reach its culminating point at or about the dates of the National Show or the great "Daily Mail" competition later in the month of July. Between now and then there is much work to be done, and to ensure success it is not only necessary to obtain good reliable seeds, raise good sturdy plants, prepare the ground well, and plant out when both plants and soil are in good condition, but the plants must be properly tended after planting.

The spring, on the whole, has been a very boisterous one; in fact, I cannot remember when we had so much wind, and I am afraid in many instances sweet peas will have suffered from it; more especially are those likely to have suffered that were planted out quite early in April. Many, I hear, were very sadly treated at that time, but, provided they were fairly hard and had good roots this crippling ought only to be of a temporary character, although enough to retard the blooming by two or three weeks. However, by now they ought to be breaking away nicely at the base, and the plants should be regularly attended to; see that these young shoots are not laying about on the ground, or during the showery weather slugs may set to work on them, and provide check number two.

Plants raised from autumn-sown seeds that were put out about the second or third week of April, have fared very much better, and although we have had plenty of wind since then, it has not been so cold and trying to tender vegetation; indeed, beyond a tendency to hardness, they have not suffered from it. I find by an examination of the roots that they are running freely through the soil in all directions, which bodes well for the future.

According to my experience, it is not a wise plan to put the permanent stakes to the plants very early. I hear of many growers, who stake before planting. I prefer to leave them out till the plants are about a foot high, as the stakes naturally rob the plants of just a little light, and to keep the haulm sturdy should be the aim right through the season of cultivation.

Sweet Peas in Pots.

Those who are cultivating sweet peas in pots are no doubt admiring the first few good blooms, and very welcome, indeed, they are to the sweet pea lover. Now that the plants are actually in flower they should have plenty of food, such as liquid manure, with the addition of a little artificial once or twice a week. Water they will take ad. lib., and on bright days it will be found necessary to attend to them three times a day.

If the plants are placed where they can root through the pots into a layer two or three inches in thickness of short manure it will help them materially, and the blooms will be much finer. If the pots are stood on stages then it will be almost impossible to use manure, but good flat turves (upside down) may be substituted. Even this will do much to conserve the moisture, and provide a little more rooting medium. With the admission of plenty of air very few varieties will require shading.

Should they be growing on the back of fruit houses trouble may arise through the dropping of the buds, this being caused in many instances through shutting the house up fairly early in the afternoon, the consequent rise in the temperature being more than sweet peas like, or will stand. It is advisable to have them in a house in which the temperature can be adjusted to their requirements.

THOMAS STEVENSON.

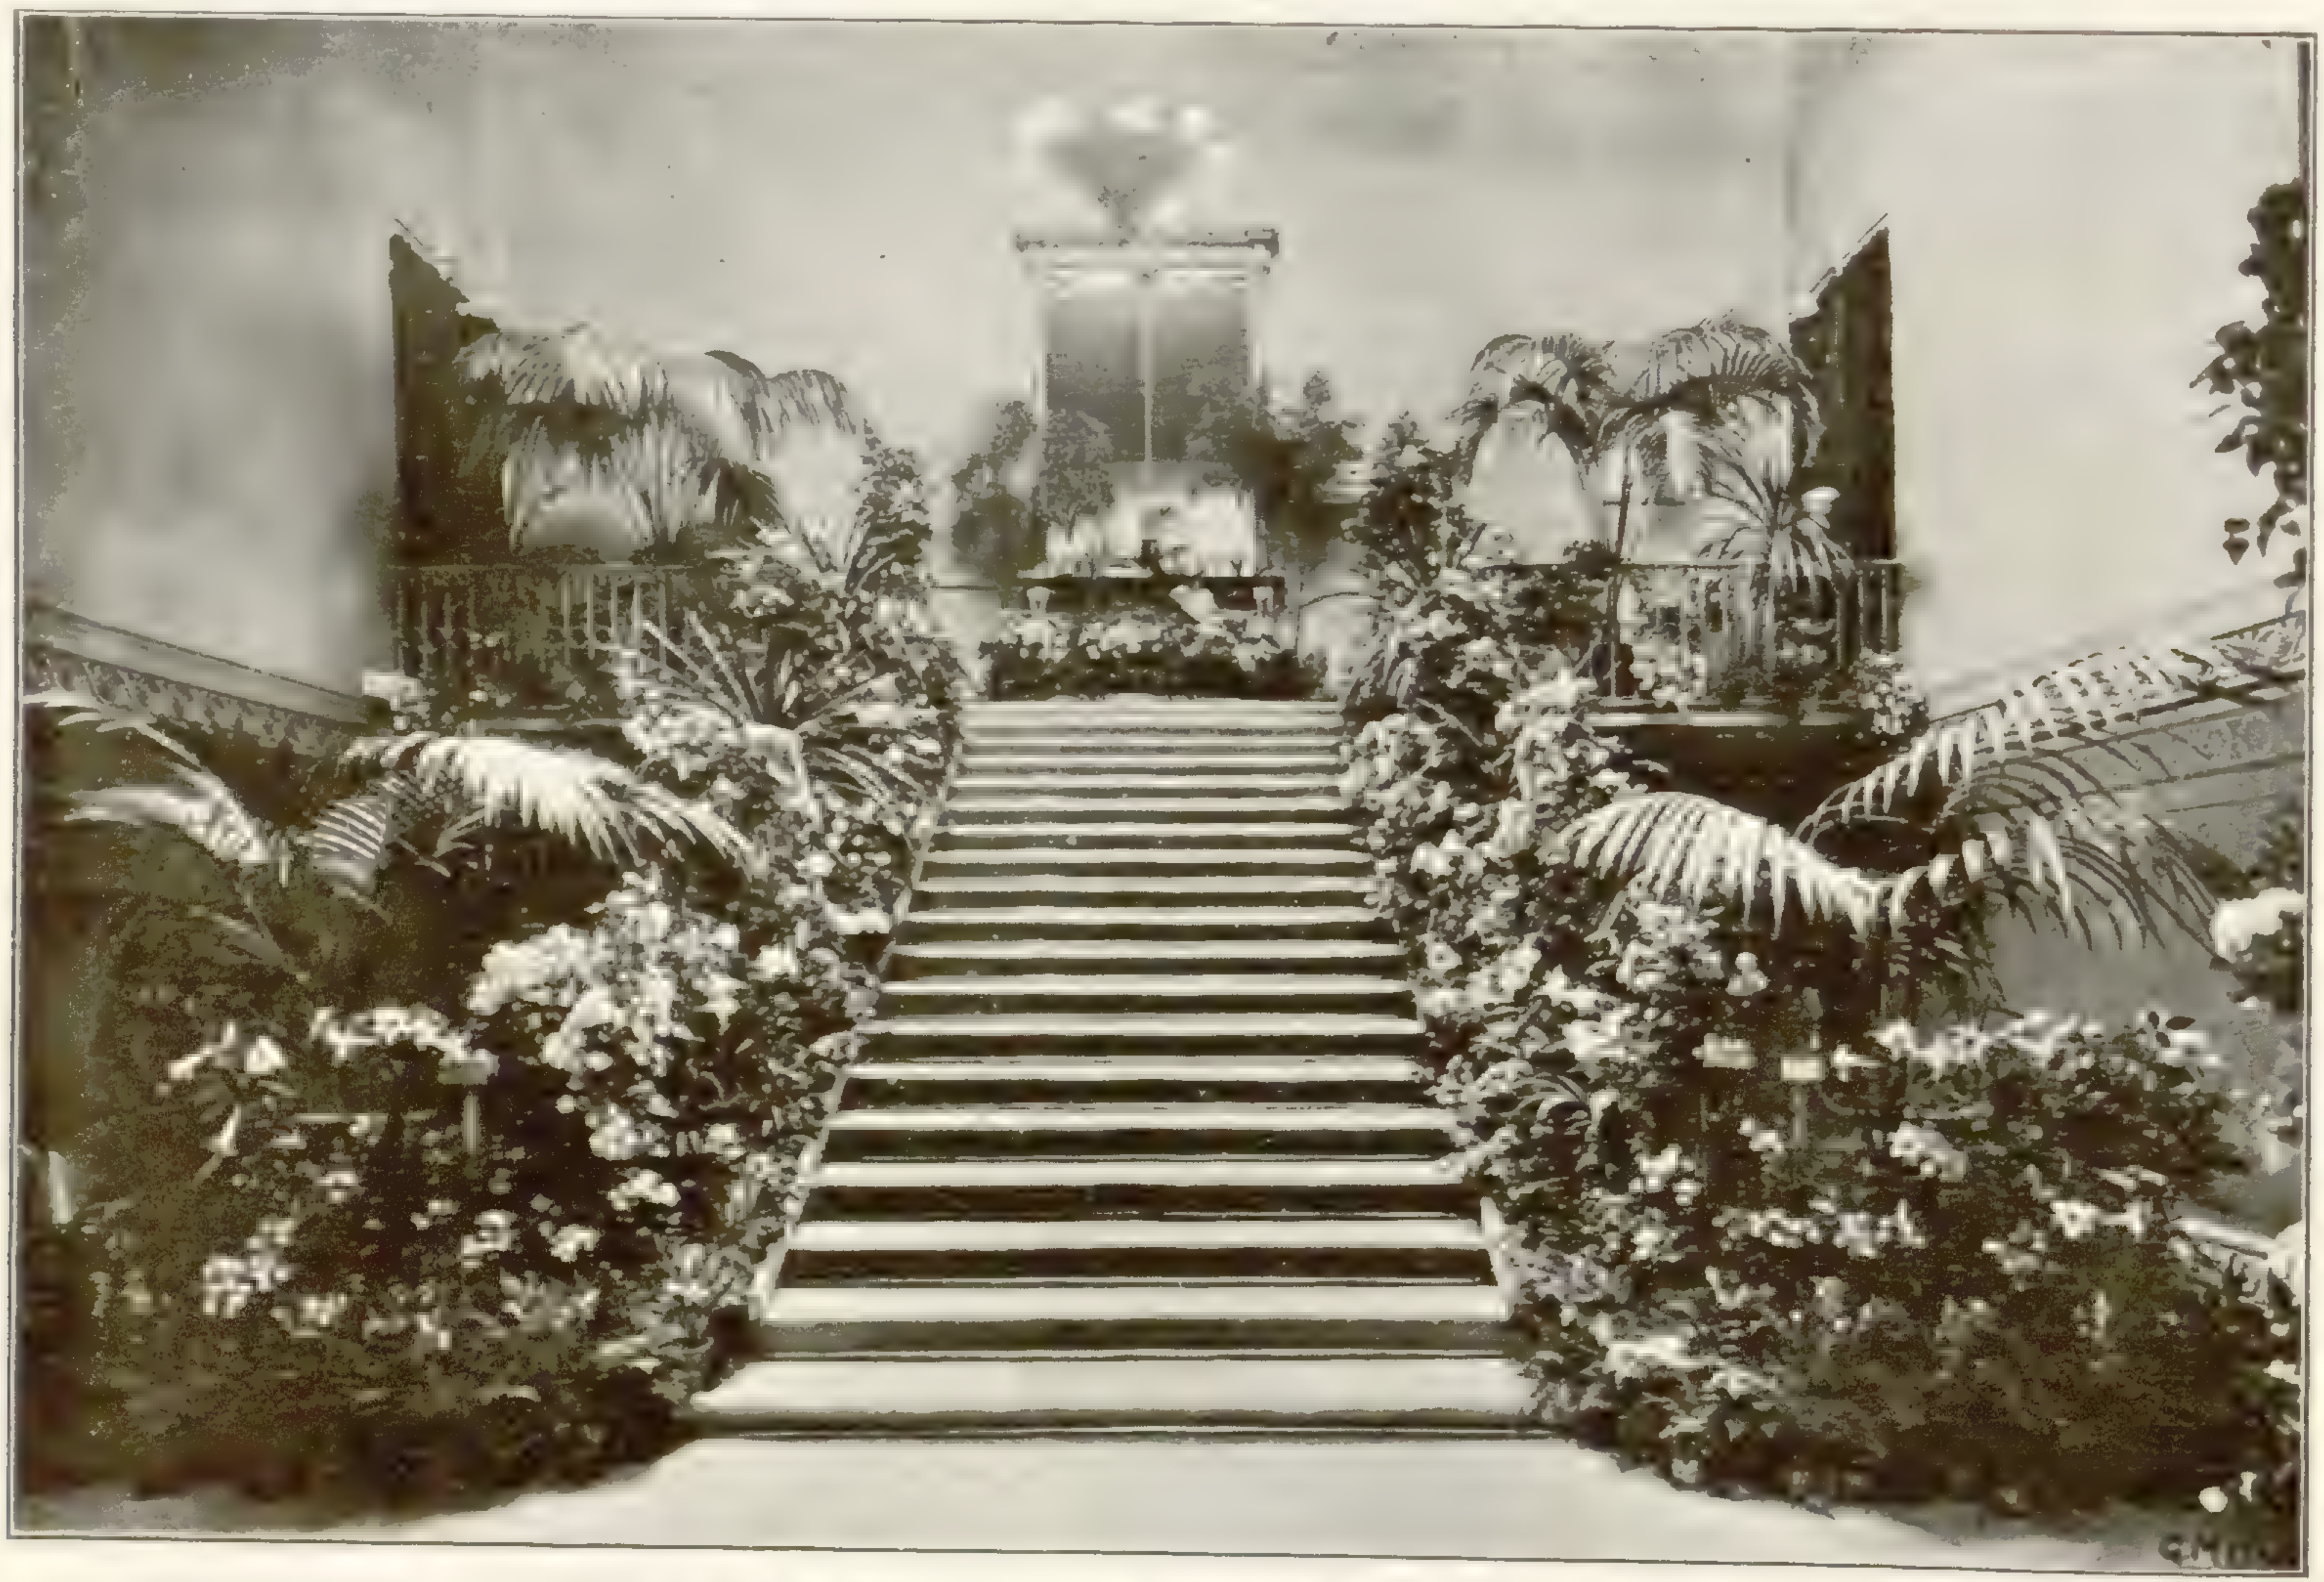
FLORAL DECORATIONS AT DRURY LANE THEATRE.

The attractions at Drury Lane Theatre on Wednesday night, on the occasion of the gala performance given by command of the King in honour of the Kaiser and Kaiserin, were many, and certainly not the least important was the remarkable demonstration of floral art by Messrs. W. Cutbush and Son, of Highgate and High Barnet. The decorations of the grand entrance, the rotunda, the rotunda gallery, the King's staircase, the retiring rooms, the balcony, and some other parts of the house were entrusted to this well-known firm, and it is not too much to say that in the execution of their commission they surpassed themselves, a feat not easy of accomplishment having regard to the high position they occupy as floral decorators. The general scheme was characterised by lightness and softness of colouring; but, soft as were the colours of the flowers of the various kinds of plants employed, they were sufficiently bright to produce a rich and tasteful effect. The chief flowers employed by Messrs. Cutbush in carrying out the scheme of decoration were rambling and dwarf roses, the pure white Lilium Harrisi, bright pink hydrangeas, white marguerites, and rich red rhododendrons, and in association with them were graceful palms in variety and bamboos.

The grand hall was richly embellished with rambling roses and hydrangeas, and gave an excellent foretaste of what was to follow. The rotunda was remarkably attractive, the plants being arranged to form a series of four bold groups in which large specimens of finely-flowered rambling roses, white lilies, and white marguerites, relieved by tall feathery palms, such as Cocos flexuesa and Acer negundo variegata, the white variegation of which produced a delightful contrast as seen under the influence of the electric light, to the pink, rose, and red hues of the rambling roses. Ascending to the rotunda gallery there are a dozen or more alcoves, all of which were filled with rambling roses grown in pillar form, and white lilies set in a groundwork of dwarf polyantha roses which were splendidly flowered, and contributed in no small degree to the general effect. Between each alcove was a well-developed specimen some 7ft. or 8ft. high of the elegant Cocos flexuosa. From the cluster of electric lights depending from the roof were festoons formed with Dorothy Perkins roses and trails of smilax, and these caught up and the lower ends secured to the balustrade, produced a distinct and extremely beautiful effect.

Leading from the rotunda gallery is the King's Staircase, and this Messrs. Cutbush were successful in embellishing in a manner that, if not beyond praise, was such as to deserve the heartiest commendations. Rambling roses were used trained as specimens, chiefly in pillar form, and also for clothing the balustrades with foliage and flowers. At the base of the roses was a fringe of flowers, chiefly dwarf roses and white lilies. The floral decorations in the large apartment set apart for the King and Queen, the Kaiser and Kaiserin, and their suites were characterised by simplicity; and, while these were remarkably beautiful, the chief effect was produced by the tall, finely furnished kentias, of which there were a dozen or more. In the grand circle brightness was given by festoons of pink roses and smilax and asparagus, and over the stage were bold festoons of laurel.

It may be of interest to add that in carrying out the decorations which we have thus briefly described, Messrs. W. Cutbush and Son utilised 2,000 pot roses, 1,000 palms, 400 marguerites, 250 hydrangeas, 2,000 ferns of various kinds, and 250 Lilium Harrisi. The principal roses were Dorothy Perkins, Electra, a scarlet polyantha of much merit, Hiawatha, Mrs. F. W. Flight, and Crimson Rambler. In addition to the decorations Messrs. Cutbush supplied 105 bouquets of carnations, each consisting of twelve blooms arranged as posies with their stalks in silver hardles. With the exception of two, the variety used was the rich pink Winsor, and in these two, which were presented to the Queen and the Empress of Germany, the rich pink Malmaison Princess of Wales was used. The task undertaken by Messrs. W. Cutbush and Son on Wednesday was a heavy one, and the success achieved was so complete that they may be heartily congratulated on the results of their efforts.



THE KING'S STAIRCASE, DRURY LANE THEATRE.
As Decorated by Messrs. W. Cutbush and Son, on Wednesday last.

NOTES OF OBSERVATIONS.

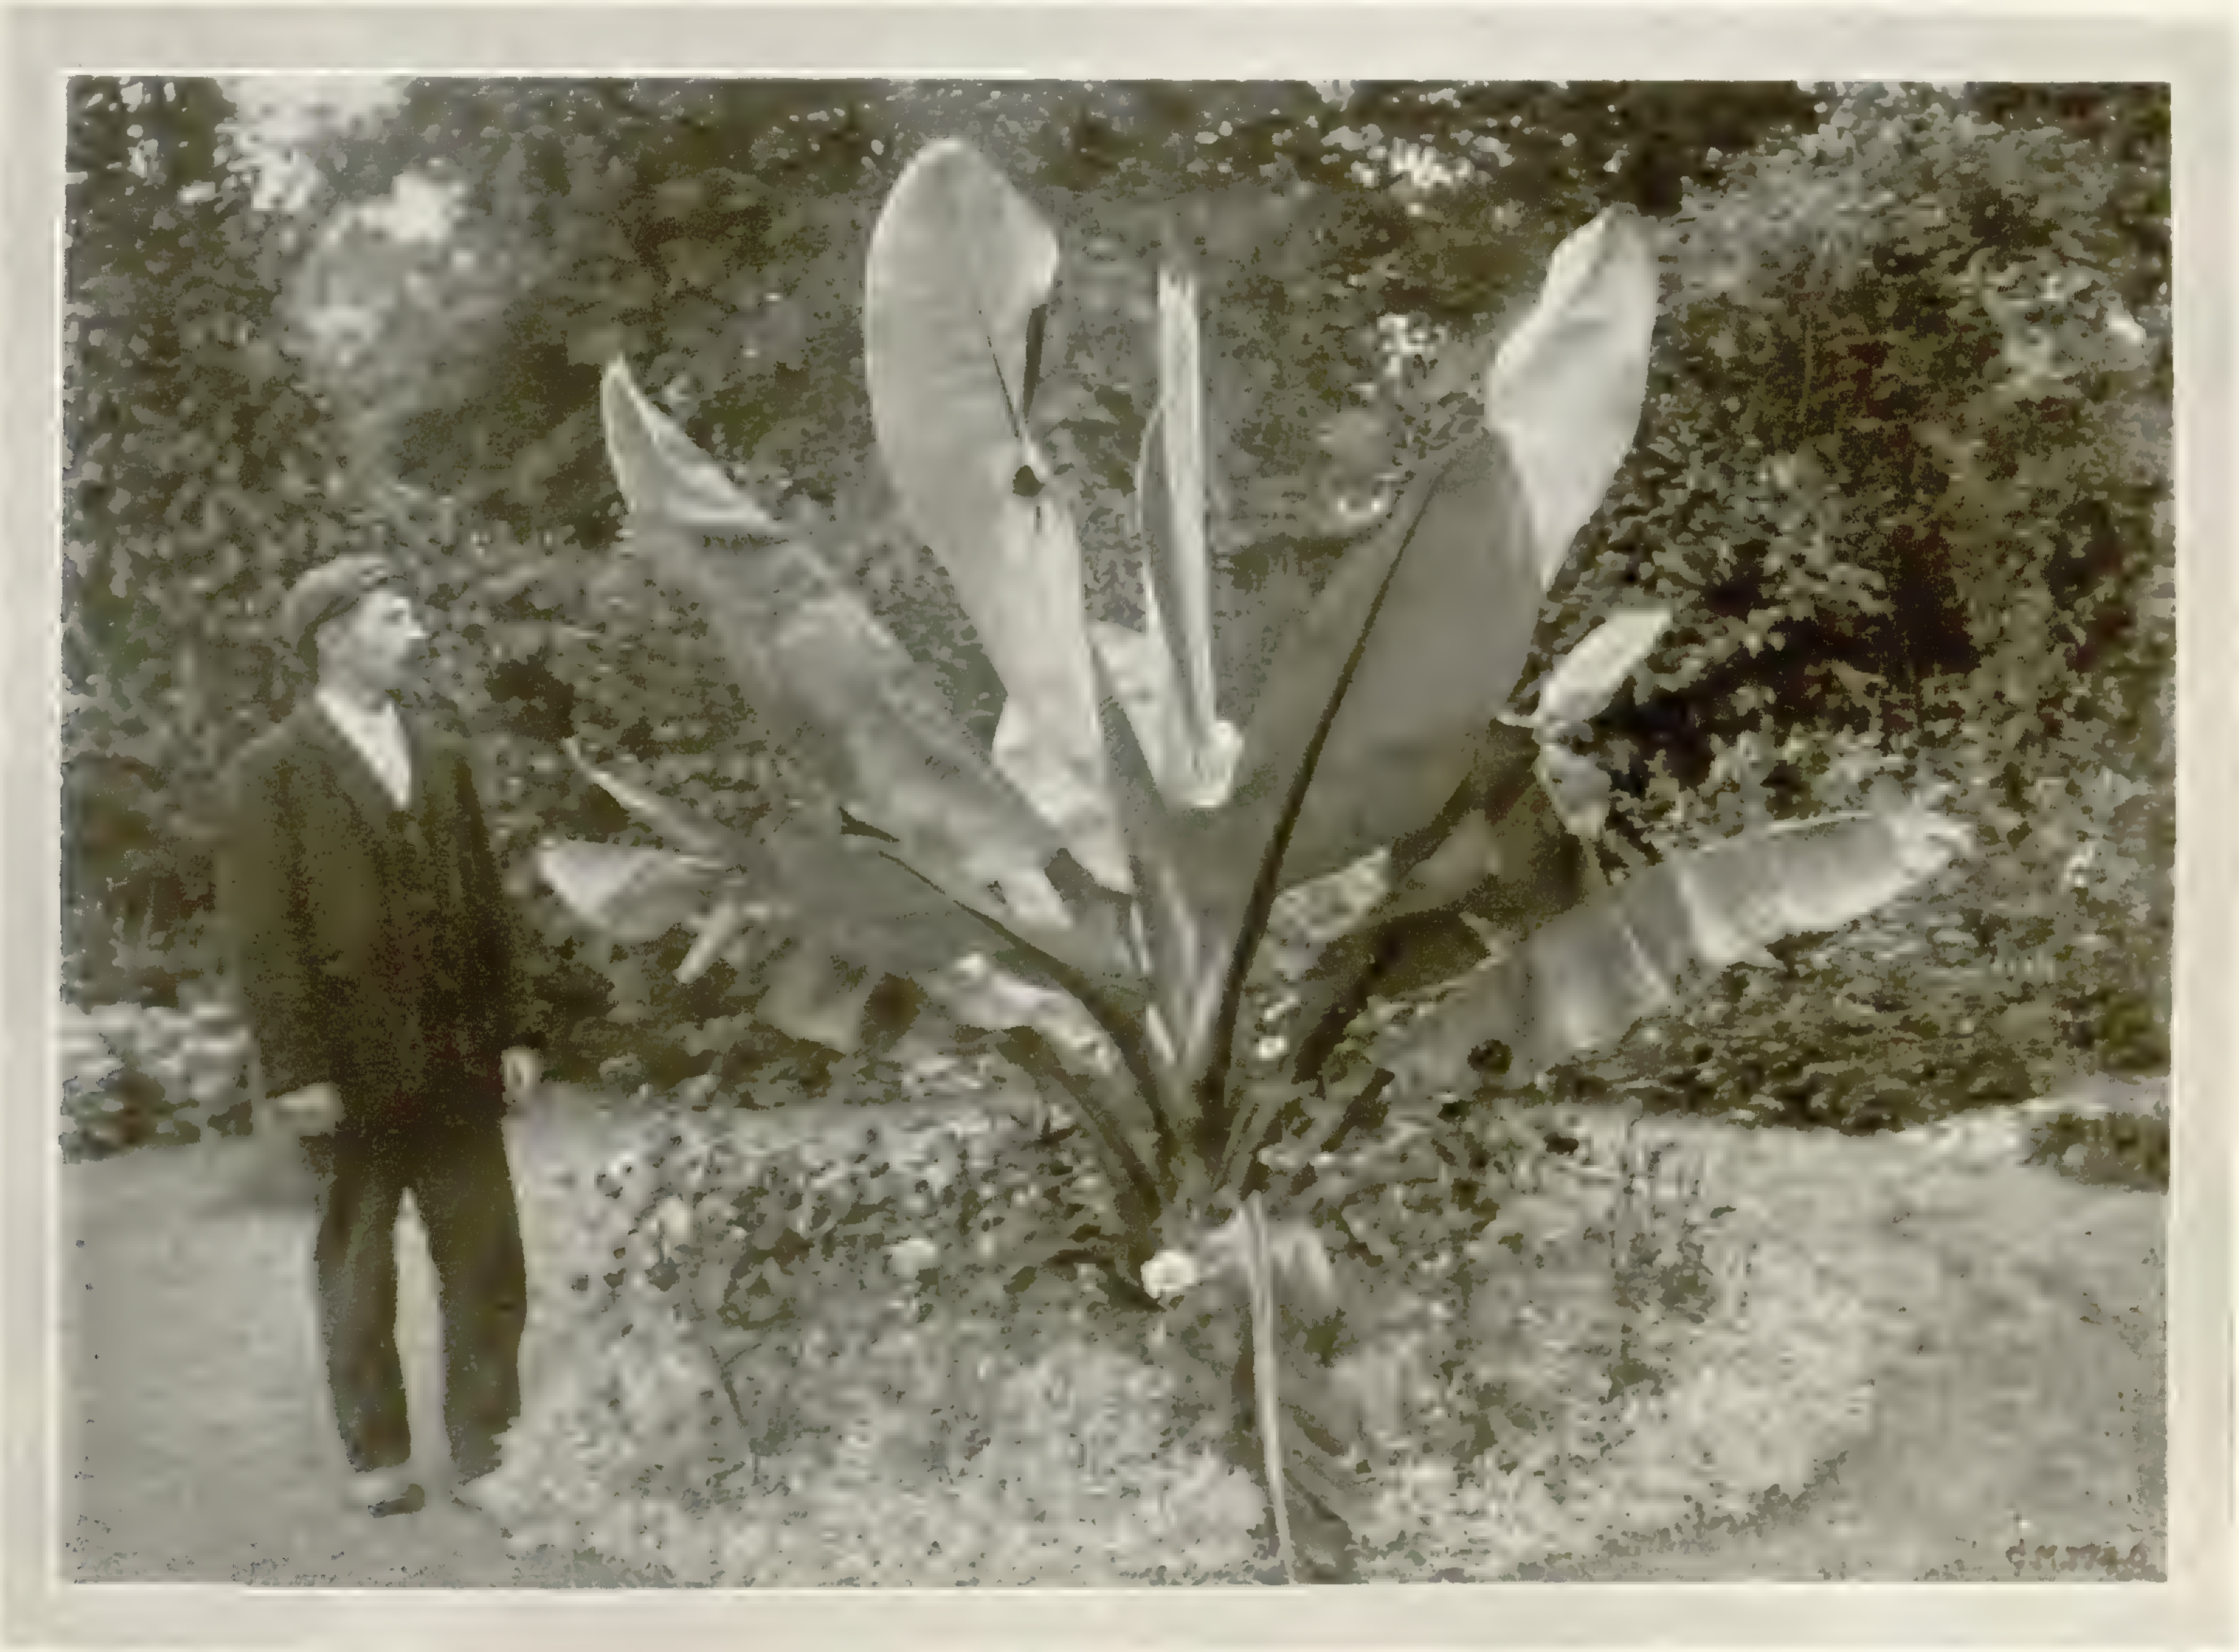
The Judas Tree (Cercis siliquastrum).—This is so distinct from any other shrub or tree, and so pretty withal that one wonders it is not more often planted. It is a native of the Mediterranean region, and is seen at its best in warm, well-drained soils where it has plenty of sunshine. The pea-shaped flowers are of a pretty reddish tint, a peculiar feature being the manner in which they are borne from all parts of the stem, even on the old wood. The Judas tree forms when old a very picturesque specimen. There is a white-flowered variety and other species, natives of North America and China, but the common kind is, as far as its ornamental qualities go, quite the equal of any of them.—W. T.

Cytisus scoparius pallidus.—This, to which the popular name of the Moonlight Broom has been applied, is a very distinct form of the common broom (Cytisus scoparius), but instead of the blossoms being of a golden hue, as in the type, they are in this variety of a pale sulphur tint. Viewed in a subdued light the popular name of Moonlight Broom is a very appropriate one. Beside this, there is the variety Andreanus, which may be said to have bounded into popularity after its introduction, and of which several forms are now grown. The weeping variety, too, is very pretty either on a stem, when its drooping character is shown, or as a prostrate plant on the rockwork.—W. T.

Forsythia intermedia spectabilis.—It is now many years since Forsythia intermedia, a hybrid between F. suspensa and F. viridissima was raised, and later on several forms of F. intermedia were distributed by Continental nurserymen. As far as these varieties have come under my observation by far the best is F. intermedia spectabilis, which differs from the typical kind in the blossoms being of a richer yellow, while it is also more floriferous. It is indeed a very beautiful forsythia, and well worthy of a place among the best of little-known shrubs, for it is certainly at present uncommon. I have not met with it in English lists, though in some Continental ones it is quoted at a comparatively cheap rate.—W. T.

MUSAS IN THE SUMMER GARDEN.

The practice of relying almost entirely on flowering plants for a display during summer generally prevails in gardens, and while such plants must always predominate in bedding and other arrangements, yet the value of good foliage plants should not be overlooked, as they introduce a distinct feature, and are capable of producing very bold and striking effects when suitably placed. Among tender foliage plants that succeed out of doors during summer, musas occupy a foremost position on account of their great size and the noble character of their leaves. Only two species have the slightest claim to hardiness, and although these stand the winter in a few favoured spots in the south-west, in all other parts of the country they must be housed indoors during the winter.



MUSA ENSETE IN A LINCOLNSHIRE GARDEN.

Musa japonica (Basjoo), sometimes, so far stands the winter as to send out suckers in spring, but this belated growth is not to be depended upon, and cannot compare with specimens that have been forwarded under glass.

Musa japonica is readily propagated from suckers, which are freely produced from old plants, and are best severed in autumn and potted up in light sandy soil, placing them in a warm greenhouse or stove, in order to stimulate root production before winter. It is unnecessary to subject them to a high temperature during winter, and, as a rule, an intermediate house will give the best results. By February they should be placed in the warmest position available, and every means adopted to induce rapid growth, and as each pot becomes filled with roots one of larger size should be provided, using a compost of loam and old rotted manure, in equal parts, with the addition of a small quantity of sand. By May the plants will stand much cooler conditions, and if gradually hardened off in a cold greenhouse or orchard house they will bear placing in their summer quarters by the middle of June.

The other species employed out of doors in summer is Musa ensete (Abyssinian), which is propagated by seeds sown either in autumn or spring, the former season being advisable in order to secure large plants for the following summer. The seeds are sown singly in 60-sized pots, filled with light sandy soil, and plunged over a brisk bottom heat. Once the seeds germinate and the pots are filled with roots, transplant the seedlings into a larger size, using soil as previously advised for M. japonica. Plants raised from seeds sown in autumn are best kept growing throughout the winter in a stove or forcing pit, their subsequent treatment being in all respects similar to that described for M. japonica.

Plants of one or several years' growth may be lifted in autumn, reducing the foliage to the centremost undeveloped leaves, and treating the roots in a similar drastic manner; they are then placed in the smallest receptacle that will hold them, and given a position in a house having a minimum temperature of 50 degrees during winter; water must be sparingly applied until fresh roots are formed, and repotting should, in this case, be deferred till March or April, unless unlimited space is available for producing large specimens. In northern districts it is only these two-year-old plants that develop the rich tropical luxuriance for which the banana is noted.

Apart from the system of planting out in summer, both species are extremely effective as tub plants, and where such treatment can be afforded them a ready means of securing two-year-old plants is obtained by wintering these in tubs intact, and planting them out in the open the following year.

Musas produce leaves having unbroken margins, and, owing to their great size, it is imperative to employ them where they receive shelter from rough winds. Local conditions must in every case govern the actual date for placing them in their summer quarters, but, as a general rule, it is not advisable to put them out earlier than the middle of June.

Thomas Smith.

THE RUSSIAN ALMOND.

The above is the popular name applied to a pretty little species of prunus, i.e., P. nana, a plant which might well be said to be a common almond in miniature, for the foliage and flowers of the two species have many points in common, though there is, of course, a great difference in size. P. nana is by no means a new plant, although uncommon, for it was introduced from its home in Southern Russia very many years ago. Under cultivation it may be found at almost any height between one and three feet, its slender branches forming a rather loose bush with small almond-like leaves.

The flowers are borne in April from axillary buds, and are from half-an-inch to three-quarters of an inch across, the colour being very similar to that of the ordinary almond. Several variations from the type may be obtained, the two most important varieties being alba with white flowers, and Gessleriana with deep red blooms. The latter is a particularly handsome shrub, and worthy of extended cultivation. The probable reason for Prunus nana being uncommon is that it is very difficult to propagate from cuttings. It may, however, be increased without any great amount of trouble by layering. Branches pegged down in spring in the ordinary way root during summer, and by early in the autumn may be severed from the parent.

D.

THE GLORY OF RICH COLOUR

A great writer has said that the face of Nature could not be beautiful without colour; the mere shape and outlines of hills and dales, forests and plains, would sadden and torment us by their monotony and barrenness if they were not clothed, not only in lovely hues, but in every imaginable shading, from darkness to light. In order to make the surroundings of our dwellings happy in their loveliness, we are constrained, therefore, to mass colour in them. It is true that

> "A garden in a garden, a green spot,
> Where all is green."

may delight by its rarity as a cool glade for summer, but even green is a colour, and we should weary of that if it were not relieved by the contrast of blue, gold, and roseate skies, brown trunks of trees, yellow and orange of foliage tints, silver of bark and leaves. The secrets of successful gardening are many, but most important of all to learn is the use of colours, so as to appreciate them individually, to combine them into fairest harmonies, and to blend them sympathetically with their environment.

MUSA JAPONICA IN TUBS.
Plants raised from suckers of the previous autumn.

Summer is the canvas on which the gardener-artist must chiefly use his paint brush; if he misses this great opportunity he must wait for the next year to offer him another, but the one that he neglected will be irretrievably lost. To make a good picture at the precious exhibition season it is essential for him to set his palette early and work hard in spring—the late spring of May and the first week of June.

Most landscapes, whether of open country, woodland, or cultivated pleasure grounds, lack a sufficiency of rich hues, that is why we wait impatiently for autumn tints, or exclaim in rapture if our eyes witness a flaming field of poppies, or a glade of warm blue Scilla nutans. On our lawns we do well to mass the scarlet of geraniums, but it is a mistake to let their value as colour producers blind us to their defectiveness in the matter of grace; we can build up a perfect bed only by adding to these plants others that will soften the effect of their rigid outlines; for example, by giving scarlet dahlias and cannas the centre space, ranging scarlet salvias against the stiff geranium stems, finishing off with pegged-down scarlet verbenas, and, even then, the appearance will be infinitely redeemed in character if we plant Gypsophila elegans alba among the taller vermilion flowers, and scatter seed of the elegant grass, Agrostis nebulosa, between the lower verbenas. At a distance a bed such as this will show as a wholly beautiful colour mass, without a single harsh outline.

Scarlet flowers and red brick are usually accounted sufficiently harmonious, yet it is worthy noting that brick shades vary, and the vermilion of dwarf nasturtiums and single begonias, in which there is a distinct orange, may prove quite unlike the red of the house; a little care in selecting varieties will prevent a discord; blood-red nasturtiums are easily obtainable. Scarlet King is quite distinct from the vermilion Fire King, for example, while Empress of India, with its crimson-scarlet blossoms among dark leaves, can scarcely be rivalled for attractiveness.

The copious use of white flowers will do a great deal to introduce a light effect into rather sunless gardens, and the result will be to remarkably intensify the colour value of such red, blue, gold, rose, carmine, mauve, or purple flowers, as accompany them; best of all for the purpose are white blossoms, that are gold blotched, or have yellow prominent centres: Gilia nivalis Snow Queen, single asters and dahlias, single chrysanthemums, violas and large pansies, Iceland poppies, Linaria bipartita alba, salpiglossis, Schizanthus retusus albus, Erigeron Coulteri, Michaelmas daisies, and single begonias in white, are very valuable.

Lilac-lavender and blue violet give a welcome effect near red brick or red flowers, but are in need of white ones as neighbours; mauve and red-purple should be avoided as carefully as rose and carmine in such situations, while a grand shaded scheme can be created out of gold, orange, salmon, vermilion, and deeper scarlet; the hues of orange sweet peas have a great merit in garden paintings, and they may be carried out on a lower level by many snapdragons that are blended, streaked, or blotched, of yellow and red.

Where to successfully place the most vivid blue was a problem that perplexed gardeners a few years ago; it was found that it gave a crude effect near red brick except of the antique, weather-beaten kind, and the happy idea was hit upon of using crimson-bronze bedding plants also to soften the too sharp contrast. A bed or border of Phacelia campanularia, delphiniums, tall cornflowers, and lobelia, in which ruddy-foliaged trees exist at intervals, will be quickly perfected by adding Dell's crimson-leaved beet, crimson alternantheras and cockscombs, coleuses, iresine, etc., even if the building near is of the newest of scarlet brick.

Pinks, magentas, carmines, and maroons are probably the fairest of all colour masses upon green lawns and turf-edged banks, but too many gardeners employ them in beds that are cut out of bright gravel, the orange hue of which is in utter discord. A white house climbed by roses of these tints will be yet more pleasing if some vivid green climber is added, or if such a boldly verdant feathery tall annual as Artemisia annua is sown in the immediate borders. For a carpet or edging the Liliput nasturtium White Queen, with its pea-green leaves and lemon-white blossom, behind a row of Silene pendula compacta or rose begonias, will prove satisfactory. Against a grey or dun-coloured house, on the contrary, green will be little needed as a relief to pink and carmine roses, but the heaviness of effect must be relieved by the introduction of cream-yellow, such as that of variegated euonymus, cream-blotched ivy, the Japanese golden honeysuckle, Lonicera reticulata aureum, with variegated abutilons bedded out in borders edged by Mesembryanthemum variegatum. Cream-primrose violas will also prove useful.

The violent gold of the calceolaria ought probably to be more or less isolated; it can never look really well near scarlet flowers, rich blues, purples, mauve, rose, or crimson, though for brilliant bedding schemes we often admit it into their company; it is the colour beyond all others for brightening up shady glades and the borders of evergreen shrubberies, or, used only with white and pale blue flowers, or else with lavender and blue-violet, it can make a splendid front garden for an old red brick, ivy and Virginian creeper covered mansion. The gold of the sunflower is toned down by the rich brown discs and the multiplicity of silver-green giant leaves; wherever an aged grey fence stands there should be rows and groups of helianthuses of many different statures, and rockeries of grey stones be trailed over by creeping jenny, to follow the yellow alyssum and wallflowers, daffodils and crocuses of spring.

Let us not be sparing of rich colours, for they gladden the eye first, and then the heart, but the best glories are gained by lavish employment of a single, or a couple of hues of perfect suitability, not by spreading broadcast all the tints of the floral palette.

M. H.

SPRING FLOWERS IN THE BOURNEMOUTH PUBLIC GARDENS.

Every year fresh features are to be seen in the bedding at the Bournemouth gardens both in spring and summer time. The flower beds are this spring charming, and Mr. J. B. Stevenson, the energetic superintendent, is to be complimented on the results he has achieved, especially in the face, as it were, of such unfavourable weather obtaining during the past few months.

I have lately closely noted the condition of the flower beds, and I do not think there are any bad plants in them. The tulips were weather-beaten a little, but not enough to spoil their beauty. Through the main portion of the gardens a broad, gently curving path leads to the entrance to the pier from the centre of the town. There are ten pairs of beds, all round, and very large, bordering this path, and cut out on the beautifully green lawn. These beds are planted in pairs to match, and I have never yet seen one bed distinctly better than its neighbour, which proves at once how skilful the general treatment is.

The following arrangements were very noteworthy: Tulips, with pansies as a groundwork; tulips, and polyanthuses as a groundwork; pheasant's eye narcissus and dark wallflowers mixed, with an edging of yellow wallflowers; crimson tulips over double white arabis, and an edging of aubrietias; yellow tulips, aubrietias as a groundwork, and a broad edging of double white daisies.

The polyanthuses in these beds were exceptionally well flowered; indeed, some of the trusses of blooms were so weighty that a light shower of rain caused them to topple over a little, notwithstanding their strong flower stalks. Wallflowers had a charming effect massed round the large ornamental fountain. Rhododendrons and camellias in the shrubberies made splashes of colour in the background, over which loomed the blue-green pines, mingled with the light green tints of the young leaves of deciduous trees, all adding charm to the scene.

Hyacinths in distinct colours filled a number of beds cut in the grass and partially shaded by younger pines near the sea entrance to these gardens.

In the Boscombe gardens the spring flowers are equally lovely, full of health and vigour: in small enclosed spaces throughout the town Mr. Stevenson has also left his mark in the form of bright flower borders. About a year ago he planted a number of climbing roses close to the boundary fence of the central gardens; neat iron arches were fixed for the rose branches to be trained on in due course. All are in full view of the public thoroughfare, which is one of the busiest in the town, and divides the gardens into two parts. The festoons of rose blossoms, in due time, will be a delightful acquisition to the central gardens.

Geo. Garner.

American Gooseberry Mildew. The Board of Agriculture and Fisheries inform us that they have received information that the summer stage of American gooseberry mildew (Sphærotheca Mors uvæ) was discovered in two Cambridgeshire gardens on Monday last. All gooseberry-growers are advised to examine their bushes carefully and, should any sign of disease be found to spray them with a solution of liver of sulphur (one pound to 32 gallons of water). Growers are reminded that by Article 3 of the American Gooseberry Mildew Order of 1909 they are required to report the presence of this disease on their premises to the Board or the clerk of the local authority for the district, either directly or through an inspector, and that the failure to report is punishable by a fine.

PENTSTEMON CÆRULEUS.

Of the many beautiful members of this family this species may be considered one of the most desirable, and at the same time it is one of the rarest. Other inferior kinds are often substituted for it, and it is seldom that the true plant can be obtained. A native of the Western United States, it is found on the plains at the base of the Rocky Mountains. It is of sub-shrubby habit, quite dwarf, seldom exceeding nine inches to one foot in height, with long, narrow, glaucous leaves. The stems are erect and unbranched, well covered with foliage, and bear on the upper half an inflorescence of closely set flowers. These are produced in June and July, and on opening are of a pretty mauve shade, but eventually assume a beautiful blue colour that is very pleasing. The plant shown in the illustration was grown in a sunny position in the rock garden in sandy loam. At the time of flowering it was about eighteen months old from seed. It is a perennial, but, like many other pentstemons, suffers much from cold and wet during the winter, and therefore should have a sheltered and well-drained position. Seeds were sparingly produced, but P. cæruleus can be increased variety to plant at the entrance to a per- by means of cuttings taken as soon as the plant has finished flowering. These should be potted off as soon as rooted, and kept in a cold frame during the winter. W.

PENTSTEMON CÆRULEUS.
A dwarf-growing beautiful species bearing blue flowers.

IVIES IN GARDEN DECORATION.

Mr. Field does well to draw the attention of readers to the value of ivies in garden decoration. I am sure they are not nearly enough employed as specimens in many parts of the garden, where they would create a pleasing, as well as a useful, effect, especially in winter. At Aldenham the Hon. Vicary Gibbs employs them as specimens 12ft. high in the shrubberies, both gold and silver varieties, and there they add colour, especially during the winter, when they are much appreciated. The variety dentata, by its drooping habit of leaf, is quite the right gola, on an arch, or similar structure. In summer its deep green massive leaves give a cooling effect to the surroundings, but in winter they are especially attractive. Quite one of the best of sorts to grow as a specimen is Hedera helix atropurpurea, its foliage reminding one much of the purple-coloured vine in the autumn. For covering walls or screens quickly no variety is equal to Rægneriana for fast growth: it is not unusual for this variety to make six feet of growth in one season.

E. M.

THE GARDEN OF SHADE.

It is probably in London and other towns that gardens shadowed by walls and trees are chiefly left unbeautified, the ground allowed to become damp and unhealthy, weeds and rank grass permitted to struggle together for existence; the place, in fact, given up to the use of the animal and insect pests that never fail to adopt it. Why should there be ugliness, the squalor of decay, where a little culture could create a floral and foliage Eden?

Among the shrubs that will make coverts of real beauty under tall trees Berberis aquifolium ranks high in order of merit, the glossy foliage resists London smuts, and turns to glorious ruddy hues each autumn, the yellow blossom is showy, early, and continues long, the blue-purple berries are charming out of doors or in the home vases. To cover a waste of ground with a shrubbery of this costs but little, no frost of winter will destroy it, no atmospheric conditions rob it of attractiveness. There are other berberises that can rise above this one here and there, form a high background, or hedge at the sides, notably Berberis Darwini and Berberis stenophylla, both spring bloomers, and the latter an elegant grower that attains large dimensions. Berberis Thunbergi offers a change, as its blossom includes red among the yellow petals, its berries are crimson, and the leaves take on extra rich tones late in the year. As a foreground to this shrubbery, under the plane or lime trees down the long side of a garden maybe, can live and thrive the spreading low-growing rock sprays or Cotoneasters Simonsi, microphylla, and rotundifolia, all giving white flowers followed by coloured berries. The final edging to the ground may be a wide belt of London pride, that glossiest and most vigorous of all the saxifrages, so pleasing to the eye after every washing by the rain, so fairy-like when sending up its early summer forest of long-stemmed miniature pinky-white flowers.

Cold shaded alleys between houses need not be left unadorned; the green euonymus, that furnishes so many house-fronts in Brighton and other seaside towns, will flourish in almost any city or situation; it can be planted as a hedge jutting out across the chief width of the alley, leaving only a path, if needed, for tradesmen, which itself can be simply arched over by ivy, supported on two upright poles eight feet high nine inches apart on either side of the walk, and a single cross bar a foot from the summit. Down the border space against the house wall let a narrow border be dug and enriched, planted with variegated Irish ivy, a row of summer and autumn-blooming tall phloxes, and an edging of the mossy saxifrage, Saxifraga hypnoides; the last gives velvety green cushions of foliage that are permanent, and has white bloom in early April or March that continues until July. Across the path, in the wide border of the alley, a background of Rosa rugosa, the hardy Japanese rose, should be tried, choosing the red, white, or pale pink varieties in preference to the ordinary purplish-pink that is a dull heavy tone. These vigorous, tall rugosas are so accommodating that they can be used to form coverts in woods. In addition to the buds and flowers of summer and autumn, they offer gold and red streaked leaves in the wane of the year, and their large bright fruits appear in profusion, often remaining on the branches until spring calls forth the tender green again upon the myriad-spined boughs.

There is no lack of herbaceous plants to arrange as tall groups here and there in this shadowy, cool border. Golden Rods can bud and bloom as profusely without sunshine as with it; indeed, the late spikes of amber, feathery and deep, are of extra value when they come later, reluctantly maybe, after warmth has faded the plumes of their sisters in the open parts of the garden. Common tall lavender, and rosy-red Michaelmas daisies may also be relied upon, and the stately snow-white Aster Novæ Belgæ alba will begin in August and be still a floral mass in October. Day lilies will succeed nearer the middle of the border, for they bloom in dense copses in the country, or amidst all the evil climatic conditions of smoky towns; Hemerocallis flava, clear yellow, and Hemerocallis fulva, coppery-orange, look well in groups together. Then the old-fashioned form of Moon Daisy, plain Chrysanthemum maximum, will be found willing to yield a harvest of its often ill-shaped, but bold yellow-eyed blossoms on two to three foot stems, clothed in the glossiest of gay green leaves; foxgloves, rose or white, may be safely introduced, woodland denizens by nature though they are, and stately mulleins, Verbascum Chaixi, and Verbascum pannosum may accompany them where pyramidal spires of yellow, six to eight feet high, will be suitable. Then, for a bright lavender-blue flower to give a pleasing contrast, may be chosen Campanula latifolia macrantha, whose bells are set closely up long stems, above tufts of evergreen foliage that has itself a real value for border furnishing in winter.

In front of all these, between them, too, since the giant plants look so much more artistic in clumps at varying distances instead of in formal rows arranged according to their heights, may appear carpets, relieved by groups of innumerable plants of noted hardiness. St. John's Wort alone is sufficient to brighten and cover many yards; although not actually evergreen, there are few years in which it is not always possessed of some leaves from January to January, while those gardeners who care to keep the handsome golden flowers from ever developing into seed pods, will be rewarded by a succession of them during nine of the twelve months.

Wallflowers sometimes fail, but it is worth while to put out sturdy small plants, for even if the leaves become blasted by nipping east winds, the new growth in spring will probably give us lemon, apricot, amber, copper, rose, crimson, brown, and purple blossom trusses to harmonise with similar tints in the polyanthuses and primroses. White arabis will make an excellent edging, improved by single plants here and there of the twelve-inch Megasea cordifolia, with tall pink-lilac trusses and large leaves, bronze-shaded. Then is there not the yellow or common stonecrop to be spread out in formal lines or over banks; may the woodland primrose not be used as a carpet even in city gardens; and can we ever be really excused if we neglect to fill the best places with daffodils, large and small, single and double?

A neglected waste of land around any home is a reproach to the occupier; better a field of hart's-tongue fern, or an expanse of pegged-down ivy, in the shadow, than a barrenness of lonely earth.

M.

Raspberries.—Raspberry suckers may now be thinned, leaving three or four of the strongest. The next season's crop depends entirely on the strength and ripeness of this year's growth, so that every encouragement should be given, letting the growths have all light and air possible to ensure well-ripened canes.—J. W.

RHODODENDRON KÆMPFERI.

Though this plant is usually spoken of as a form of the Indian azalea, R. indicum, and was, in fact, classified as a variety of that species by Maximowicz, other people are inclined to accept Planchon's determination, and keep it up as a distinct species. For garden purposes the latter determination would appear to be most appropriate, for it is abundantly distinct from the numerous varieties of R. indicum, which are such familiar objects in conservatories during spring. Its nearest well-known relative is R. amœnum, which, by the way, has been made a variety of Kæmpferi, instead of indicum, by some authorities.

R. Kæmpferi is a native of Japan, and the mountains of Hokkaido and Hondo are said to be made brilliant by its flowers during June and July. It is quite as hardy, if not hardier, than R. amœnum, and grows quite well out of doors in the neighbourhood of London. Unfortunately, the flowers commence to expand early in the spring, and are well advanced by the second week in May, consequently they sometimes fall a prey to late spring frosts. Under normal conditions it grows freely, but where it is liable to be cut by late spring frosts it forms a dense bush of small twiggy growths. Though it cannot be said to be strictly deciduous, neither is it truly evergreen, for, though the majority of the leaves are lost during winter, a few about the extremities of the shoots are usually retained.

The flowers are upwards of one inch across, and they vary in colour from orange-red to pink. Some forms are particularly showy, and these are worth propagating for grouping in conspicuous positions. In those gardens where collections of rhododendrons are grown, a number of plants of this distinct kind might be included with advantage. Like other small-growing rhododendrons, it may be readily increased from cuttings of half-ripe wood in summer.

W. Dallimore.

Leschenaultia biloba major.—Since the dispersal of the collection of hard-wooded plants which used to be cultivated with so much success by Messrs. Balchin, we see very little of this charming blue-flowered Australian shrub. When specimen hard-wooded plants were extensively grown, it used often to occupy a prominent position, the rich blue of its flowers being so distinct from most other plants grown for the same purpose. Even when met with now the flowers seem to lack the colour of those which used to be sent up from Hassocks, where the pure clear air of the Southdowns imparts a richness of colouring to flower and foliage alike. The red-flowered Leschenaultia formosa seems to be even scarcer than the blue one above referred to.—W. T.

The Double Furze.—The double-flowered variety of our native furze or gorse presents when at its best a mass of gold, which for richness of tint is approached by very few of our hardy shrubs. What is more, no elaborate preparation of soil is necessary to its well doing; indeed, like its common relative, it will both grow and flower well on dry, stony soils. The double-flowered furze cannot be increased by seeds, but it is readily propagated from cuttings, which should be taken in August and inserted into sandy soil in a frame kept close and shaded. These cuttings will produce roots by the following spring, when they should be potted off into small pots. From these they must be planted into their permanent quarters, as the double furze, like some other leguminous subjects, can only be transplanted with great difficulty.—W. T.

NEW PLANTS, ETC.

ODONTOGLOSSUM ILLUSTRISSIMUM QUEEN MARY.

A richly coloured and handsome hybrid, derived from O. Lambeauianum and O. ardentissimum. The blooms are of good size, but might be of better shape; the colouring is rich deep purplish-maroon, with white and gold markings on the lip. F.C.C., R.H.S., May 9. W. Thompson, Esq. (gardener, Mr. W. Stevens), Walton Grange, Stone, Staffs.

ODONTIODA ROSEFIELDIENSE.

An attractive newcomer, the parentage being Cochlioda Noetzliana and Odontoglossum triumphans, the latter probably one of Mr. Crawshay's fine varieties. O. Rosefieldiense has bright orange-coloured flowers with a golden glow over the orange lip. A.M., R.H.S., May 9. De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.

ODONTOGLOSSUM HARVENGTENSE CRAWSHAYANA.

A very showy form of the hybrid between O. crispum and O. triumphans. The flowers are of considerable size and excellent shape, the ground colour is soft yellow, and on this are numerous bright brown blotches and spots, the lip being chiefly brown margined with white, and with a golden crest. A.M., R.H.S., May 9. De Barri Crawshay, Esq., Rosefield, Sevenoaks.

MILTONIA BLEUANA HYEANA INVERSA.

This variety has particularly large flowers, and these are of delightful pink shade, with a deep magenta purple blotch at the base of the lip. A.M., R.H.S., May 9. F. M. Ogilvie, Esq., The Shrubbery, Oxford.

NARCISSUS POETICUS SOCRATES.

A fine and beautiful poeticus daffodil, shapely, substantial, and late flowering. The rounded perianth segments are well placed, and the crown, rich red, is very effective. A.M., R.H.S., May 9. Mr. F. Herbert Chapman, Rye.

ASPLENIUM DECORUM.

A very beautiful and graceful fern that is a sport from the popular Asplenium bulbiferum. It is of compact habit, and its rich yet light green colouring renders it very attractive. It was greatly admired by all who saw it, and the generally expressed opinion was that it has a great future as a market plant. A.M., R.H.S., May 9. Messrs. H. B. May and Sons, Edmonton.

ASPARAGUS.

Two varieties out of many grown under trial at Wisley have received awards because of their earliness and productiveness. These are Barr's Green Canadian, A.M., R.H.S., May 9, Messrs. Barr and Sons, Covent Garden; and Veitch's Earl Giant French, A.M., R.H.S., May 9, Messrs. James Veitch and Sons, Chelsea.

RHODODENDRON DAWN'S DELIGHT.

A large-flowered rhododendron, that appears to belong to the Pink Pearl group. The pink and white colouring is very beautiful, and as trusses and flowers are alike large, the variety is most effective. A.M., R.H.S., May 9. Miss Mangles, Seale, Surrey.

KALE THE LABRADOR.

This useful hardy and freely sprouting kale is of proved merit, and thoroughly deserves recognition. A.M., R.H.S., May 9. Messrs. Laxton Brothers, Bedford.

CABBAGE SUTTON'S HARBINGER.

This variety occupies a high position among spring cabbages, for its hardiness, earliness, and its freedom from that bane of so many early varieties—bolting. A.M., R.H.S., May 9. Messrs. Sutton and Sons, Reading.

VIOLA MOSELEY PERFECTION.

A most effective rich yellow viola, with large flowers of deep hue, and fine form and substance. If the habit of growth is good then the variety has a great future for bedding purposes. A.M., R.H.S., May 9. Messrs. Bakers, Wolverhampton.

H.T. ROSE MRS. GEORGE SHAWYER.

This very fine hybrid tea rose has unusually long or deep blooms, and very broad fleshy petals. The colour is rather deep rose-pink. The variety appears to be excellent for forcing, having long stiff stems, and considerable freedom. It was finely shown by Messrs. Mount and Sons. A.M., R.H.S., May 9. Messrs. Lowe and Shawyer, Uxbridge.

THE ORLEANS ROSE.

A new polyantha rose of considerable promise; it is of dwarf habit, and bears large trusses of bright pink flowers that are individually of good size. This vigorous variety should be a very popular bedding and pot rose. A.M., R.H.S., May 9. Messrs. William Paul and Son, Waltham Cross.

THE ORLEANS ROSE.

A fine polyantha variety of dwarf habit, bearing trusses of large, rich pink flowers. A.M., R.H.S., May 9. Messrs. Wm. Paul and Son, Waltham Cross, Herts.

CORYLOPSIS VEITCHIANA.

This bushy shrub has reddish branchlets, and its leaves are reddish-purple when young, changing to dark green. The little nodding flowering branches carry a number of small primrose-yellow flowers, each with prominent red-brown anthers. April is the time of flowering, and the attractiveness of this hardy Chinese shrub is enhanced by the fragrance of the flowers. C. Veitchiana was found by Mr. E. H. Wilson when collecting for Messrs. James Veitch and Sons. "Bot. Mag.," t. 8,349.

PINUS ARMANDI.

A new pine from South-western China, where it grows to a height of 60ft. Its needles are in tufts of five, and the cones are of considerable size. P. Armandi promises to be a very useful and ornamental conifer. "Bot. Mag.," t. 8,347.

NEOGLAZIOVIA CONCOLOR.

This Brazilian bromeliad is an erect grower, with long stoutly spiny leaves, and carries a long raceme of violet flowers, each bloom with a scarlet calyx. It needs stove treatment and plenty of sunshine. "Bot. Mag.," t. 8,348.

AQUILEGIA FLABELLATA NIVEA.

This is a whitish-flowered variety of a Japanese species that, according to some authorities should be included under A. glandulosa. Others regard it as a form of A. sibirica, but even so it has to be regarded as distinct, from a garden point of view. May is the flowering time of A. flabellata nivea, and the solitary three-flowered stems rise only from six to ten inches high. The nodding whitish flowers are two inches long, and each has five short strongly curved spurs. "Bot. Mag.," t. 8,354.

JACOBINIA SUBERECTA.

An Uruguayan species, introduced to cultivation in 1899 by Mr. Sallier, of Neuilly, is of somewhat prostrate habit, but sends up erect spikes of bright scarlet flowers that are admirably set off by the velvety grey-green of the foliage. It is a stove plant that appears to need frequent propagation from cuttings, and to be cultivated in small pots. "Bot. Mag.," t. 8,350.

TULIPS IN REGENT'S PARK.

As in other of the public parks and gardens in the Metropolis, early-flowering bulbous plants are freely used in Regent's Park for beautifying the enclosures during the spring months, and of the several classes of the more popular kinds the tulips greatly predominate. The preference that is given to the early tulips in the production of displays of colour on a large scale are not difficult to understand. The bulbs are inexpensive, the flowers graceful and refined, and the colours varied and immensely attractive; three strong points in their favour. Hyacinths are of course, largely planted, and are much admired by the visitors, but they are more expensive than the majority of the tulips. To what extent those responsible for the management of open spaces are influenced in the selection of spring-flowering bulbs by the question of cost, we are not in a position to say. That they are influenced to some extent may be safely assumed, but the chief question that has to be considered is the production of a bright display that will extend over a considerable period, and this can be more readily ensured by a judicious combination of hyacinths and tulips. As in the case of the other open spaces in London, there were, earlier in the season, numerous beds of hyacinths in which the best of those suitable for outdoor culture were planted. As the flowers of these lost their freshness, they were quickly followed by the tulips, and during the past three weeks or so, the gardens that flank the chestnut avenue have been aglow with their brilliant colours. The most noteworthy of Mr. A. D. Webster's efforts in the utilisation of early tulips was the large bed near the northern end of the avenue. This bed, which is usually devoted to tropical plants during the summer months was, as will be seen from the accompanying illustration, filled with tulips arranged in small blocks consisting of different colours. The marginal band was formed with a dwarf pink variety, and within this were groups representative of the various colours found in the early tulips, and so arranged as to produce a harmonious effect. It will be seen that the handsome Keizers Kroon was well represented, and asserted its attractions, but it was by no means overdone. Very effective towards the south end of the garden was the rich orange-coloured Prince of Austria.

AN EFFECTIVE ARRANGEMENT OF EARLY-FLOWERING TULIPS, REGENT'S PARK.

NOTES FROM SCOTLAND.

Hardy Fruit Crop Prospects.

Following upon an unusually mild winter the weather during the spring months has not been particularly unfavourable to the earlier blossoming trees. Cold winds and occasional frosts were experienced in April, but as this month and the one immediately preceding it were abnormally dry, not much harm appears to have been done. It is, perhaps, needless to say that it is yet too early to anticipate later results, especially so with the larger kinds of fruit, as in the past an abundance of embryo fruits have not always been true precursors of heavy crops in autumn; nevertheless, the prospects of the season are at the present very encouraging.

Pears, plums, and cherries are all well set with fruits, and the copious rains of late and the more genial atmospheric conditions now (May 10) prevailing, afford grounds of much promise. Apples, except on walls, are not yet in bloom, but the amount of this all over assures a fine display in course of a few days. Gooseberries are very heavily cropped, and the fruit being now so well protected by the foliage the event of a late severe frost would scarcely do much damage. This fruit generally does well in Scotland, but the greatly increased number of house sparrows in recent years renders futile the labours and hopes of the cultivator in very many instances, despite the fact that frequent dressings of unpalatable compounds are applied to the bushes at varying intervals throughout the winter and early spring months. In others the mischief done and loss of crop, more particularly in gardens adjacent to farm steadings is put down to the effects of frost, the owners apparently having no suspicion that the little marauders are capable of such complete destruction. Currants of all varieties are equally satisfactory, and the same remark may be applied to strawberries and raspberries. The former are now in flower in sheltered positions, and have received some little protection from possible injury by having a double fold of herring net suspended over the plants, this simple contrivance has in the past proved helpful, if not quite effectual, in preserving the blossoms from early morning frosts and one may be pardoned for expressing surprise at the damage caused by very slight visitations of frost after a short period of warm and moist weather.

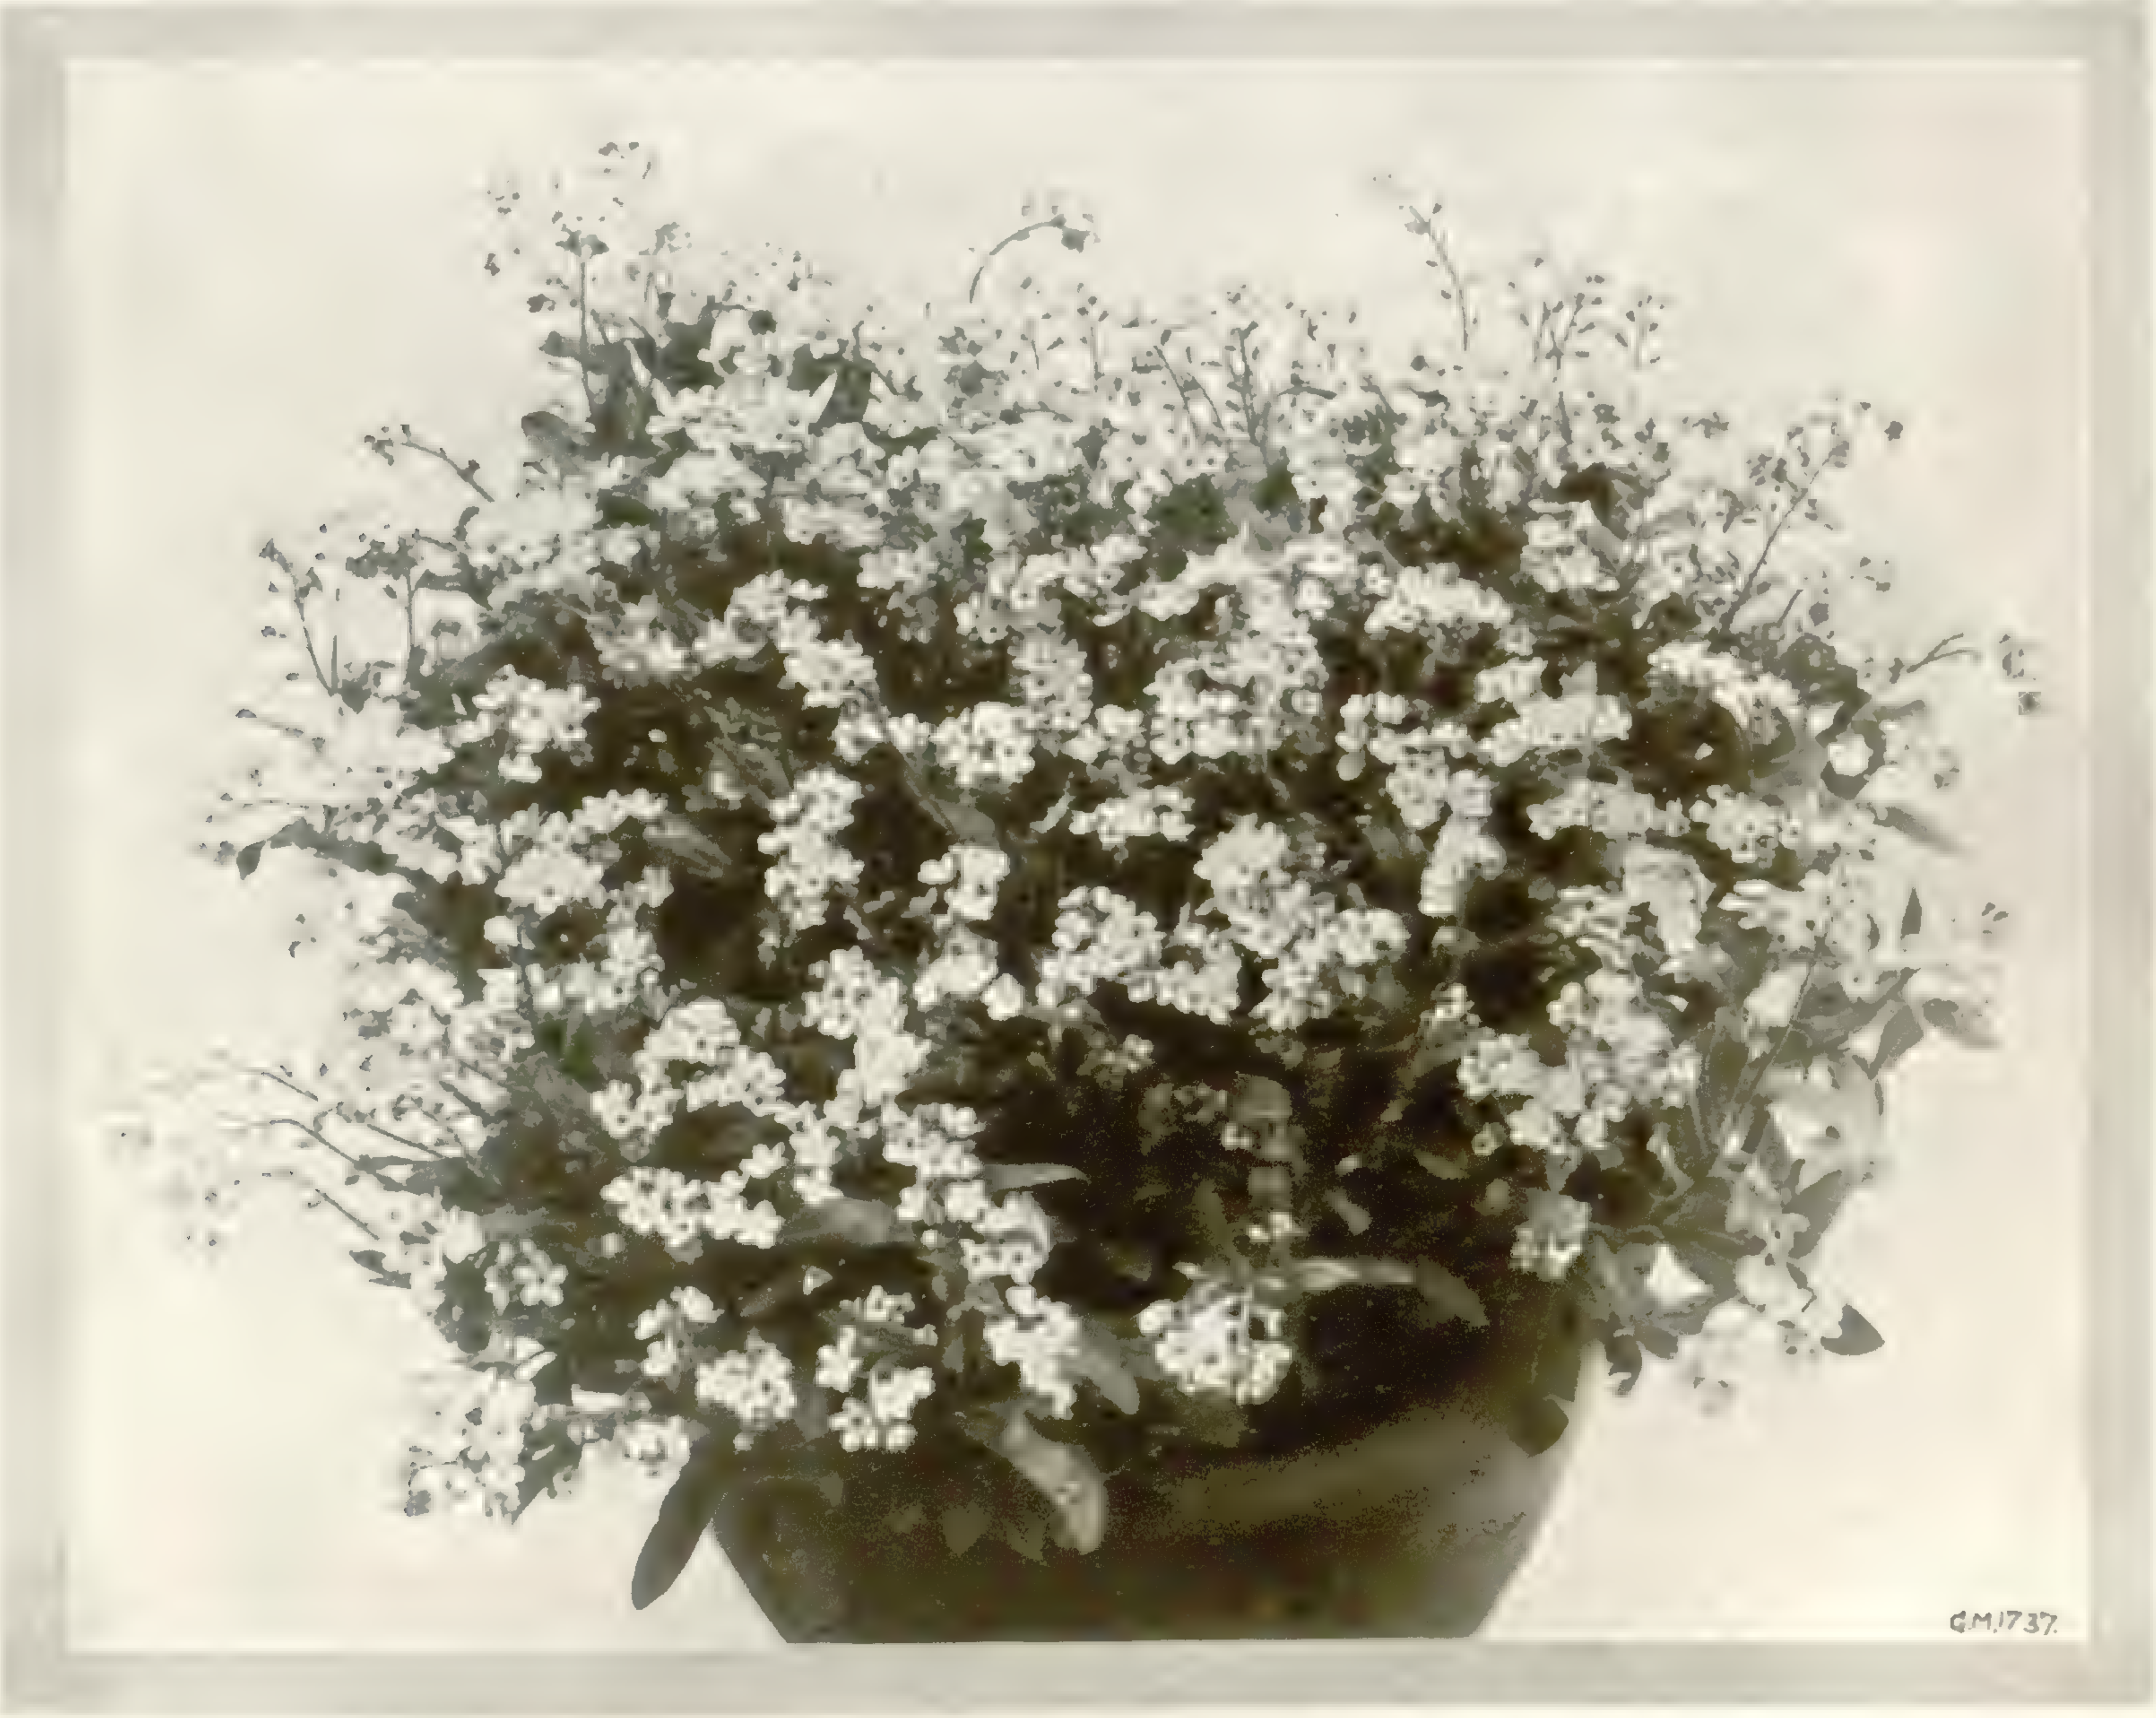
JAMES DAY.

Frame Melons.—As soon as pits are cleared of bean and potato crops they may be utilised for melons, and I find these invaluable in the late summer. Their use also gives one a chance to clean and paint the early houses, which can be utilised for late crops again. In preparing the pits and frames it is necessary that a small quantity of fermenting material be used to give the plants a start, after which the heat can be husbanded by shutting up early or late according to the weather. Two or three plants should be put in each light. If the nights are cold mats should be put over the lights to keep up the temperature.—W. A. COOK.

SUBTROPICAL GARDENING.

In gardens where a suitable position lends itself subtropical gardening can be made a pleasing feature, and, when well arranged and cared for it forms one of the most interesting parts of the pleasure grounds. It is important that such a garden be well sheltered from high winds, or many of the large-leaved tender foliage plants are liable to suffer a good deal. A sunny position is also essential, and a site facing south-west may be considered an ideal one.

The beds should be deeply cultivated and manured during the winter months, and finally made ready for planting by the end of May, at which time it will be safe to plant out most of the subjects employed. Many of the plants used require to be raised in heat during March, and are grown near the glass and hardened in cold frames ready for planting out. The plants should be so arranged in their permanent quarters as to produce a natural, and, at the same time, bold effect. Boldness can be obtained by massing some of the more vigorous kinds in groups, and by placing those subjects with ornamental foliage in prominent positions, the general effect will be very fine.



MYOSOTIS ALPESTRIS MAGGIE RAPHAEL.
An attractive Forget-me-not with blue flowers striped with white.

Copious supplies of water are essential during dry weather, and until well established a light spraying over every evening will prove beneficial to many subjects, as they suffer more from a dry atmosphere than from lack of heat.

Among the numerous plants suitable for the subtropical garden the canna is perhaps the most beautiful. There are now some lovely varieties with gorgeous flower spikes, and their handsome foliage is not the least commendable point in their favour. Beta cicla variegata, a showy variety, with glossy leaf stalks, varying in colour from orange-yellow to purplish-crimson, is very effective amongst other foliage plants, and should be given a prominent position near the front of the border. The Fishbone Thistle, Chamæpeuce casæbone, and C. diacantha, are very striking, and are suitable for edging beds of larger subjects.

Eucalyptus globulus is most useful for planting-out purposes, and it prefers a sunny situation. Marvel of Peru, which may be raised from seed, or taken up and treated like the cannas, is a pleasing addition. Melianthus major is an effective half-hardy plant, and it should be lifted in the autumn, and stored in a cold frame for the winter. The tobacco plants make very effective beds and groups. Nicotiana affinis, with white fragrant flowers; N. sylvestris, a sturdy species, with pyramidal racemes of long white flowers; N. colossea, a vigorous kind; and N. Sanderae, with pink flowers, are some of the best. The Castor-oil Plant, ricinus, is very handsome, and often attains a height of fully eight feet; three good ones are R. Bronze King, Gibsoni, and africanus.

Various solanums are handsome foliage plants, eminently adapted for the sub-tropical garden. S. atropurpureum, S. callicarpum, S. pyracanthum, and S. robustum are some of the most attractive. The wigandia is largely grown for its fine foliage, and, indeed, its leaves are quite gigantic, often being three feet in length, and of proportionate width. The well-known maize, or Indian corn, is a highly ornamental plant, and Zea gracillima and Z. quadricolor are both handsome. Phormium tenax is often employed, and among other subjects its erect sword-like leaves are very telling. Daturas are very picturesque, and grow rapidly when planted out; their large pendulous white, yellow, or crimson flowers are produced freely throughout the season. Abutilons are often employed, and amongst them Boule de Neige, Fire King, Thompsoni, Sovitzi, and vexillarium variegatum are some of the most showy.

Sunflowers in variety, especially the large-flowered forms, are very effective. Cordyline australis and several palms are well adapted for this form of bedding: Trachycarpus excelsa is a perfectly hardy species, and succeeds well planted in the open garden. In warm localities specimen crotons can be plunged out in the open: in Regent's Park, London, they seem quite happy outside for a number of weeks. Agave americana and various cacti are also well suited for a garden of this description.

J. Gardner.

A NEW FORGET-ME-NOT.

A charming little forget-me-not, and one that is quite distinct, is the variety of Myosotis alpestris named Marie Raphael. The habit of the plant is dwarf and bushy, and the deep blue flowers are freely produced in the springtime. The striking feature of this new variety lies in the white band down the centre of each segment. This little band is slightly feathered. The box and pan of plants shown at the recent meeting of the Royal Horticultural Society had any number of admirers. Mr. W. H. Honess, gardener to W. Raphael, Esq., Hopedene, Dorking, was the exhibitor, and is, we believe, the raiser.

TREE CULTURE ON LINKS.

A report on tree growing on links which should prove very interesting to local authorities and others having charge of those stretches of waste land which fringe our seaboard, has just been prepared for the Aberdeen Town Council by Mr. William Dawson, lecturer on forestry in the Aberdeen and North of Scotland College of Agriculture. Aberdeen, be it noted, is possessed of a magnificent "lung" in the form of a wide expanse of links, stretching from the mouth of the Dee to the mouth of the Don, and how best to utilise and beautify this fine asset is one of the chief questions in local politics. A fine bathing station has already been erected, and an esplanade, which when completed will be two miles in length, is being run along the ridge of the sand dunes, but the City Fathers think much more might yet be done in the way of making the people's playground more attractive.

With this end in view the advice of Mr. Dawson was requested, and that gentleman has responded with a very interesting report on tree growing on the links. The conditions prevailing at the links, Mr. Dawson says, are particularly unfavourable to the growth of trees and shrubs. In the first instance, there are the continuous salt-laden winds, which exercise an adverse influence on the growth of most trees. This difficulty can be so far got over by planting in large blocks, so that the trees naturally shelter one another, but at the links the blocks can never be large enough, and each individual tree stands exposed, and gets no shelter from those surrounding it. Further, the trees which are influenced in the least degree by the salt winds are the conifers, mountain pine, Corsican pine, and White American spruce, but, on the other hand, these are the least able to withstand the second hostile influence, namely, the smoke and fumes coming from the factories bordering on the links. Then there is the further difficulty that the trees are continually liable to be damaged by children. This damage is all the more real, because, to give the trees a chance to establish themselves in the unfavourable conditions, only young material should be planted. The ordinary type of street tree, with a big top and a small root, is unsuitable, being exposed in the greatest possible degree to all the natural dangers. The type of trees best adapted for the purpose is the young, small-topped tree, with a specially large and well-developed root system. Such a tree can grow up, adapting itself to its circumstances. It would, however, be impossible to grow such trees till the areas were fenced off in such a way that people were excluded, and kept out for a period of ten or twelve years. It is thus clear that the matter would be very troublesome, while the results would be by no means certain, as it is impossible to predict how far the smoke of factories in the neighbourhood will affect the growth. Low-growing shrubs, like the creeping variety of the Mountain Pine (Pinus montana, var. pumila) would grow on the slopes, and would not interfere with the general character of the links. The sides of the embankments facing the sea would be greatly improved if sown with grasses better adapted to seaside conditions. At present the grass which is sown on the slopes is largely rye grass, which is short-lived, and has not the binding qualities so necessary in these circumstances. Sheep's fescue, crested dog's-tail, and Bent Grass (Agrostis vulgaris) would do much better. Those banks facing the sea might also be improved by growing creeping shrubs. The mountain pine already mentioned might do in some places. Other hardy shrubs of this kind are Juniperus nana and Salix repens. Juniperus nana is evergreen, and grows flat on the ground, and is accustomed to grow in a salt-laden atmosphere. It is found on the rocky shores of Aberdeenshire in the neighbourhood of Slains Castle. Salix repens is also to be found wild locally. It also grows flat on the ground, and would bind and protect the slopes. Sufficient supplies of these, together with the creeping mountain pine, can easily be secured in time for planting out this season. Experiments should be made on a small scale in specially selected places just now.

Dealing with sand dunes, and how these can best be permanently fixed, and all danger of sand-blowing done away with, Mr. Dawson advocates the planting of the sand grasses, Elymus arenaria, Psamma arenaria, and Festuca rubra var. arenaria. The fixing of sand dunes proceeds best by the transplanting of bunches of the grasses with roots. These are set in rows two feet or so apart, and rapidly spread over the whole area.

AMONG THE ALPINE FLOWERS.

> "And the spring arose on the garden fair,
> Like the spirit of love felt everywhere;
> And each flower and herb on Earth's dark
> breast
> Rose from the dreams of its wintry rest."
> —Shelley.

Here we have had a dry spring until the last few days, and, in consequence, we have not had our usual enjoyment of the early days of April. Even the daffodils seemed arrested in their onward course, and many of their flowers awaited the coming of the "tears" of April longingly. Now that they have come—accompanied, however, by but few of the "smiles" of the month—we begin to see more of the advance of spring, and to realise once again the beauties it brings in its train. Shrub, tree, and lesser plant all join in welcoming the milder days and the softer breath of the season calling upon them to awake. And how they respond! Buds are bursting into flower or leaf. Verdure is everywhere, and the growth of the plants gives us all sorts of tints to attract us to watch their opening leaves. They seek, but seek in vain, to rival in their colouring the charming flowers which adorn the garden, and we have thus a double pleasure in looking at our plants in these April days. Let us see what the rock garden brings us now!

Arenaria balearica.

Novelties are not always the most desirable, and we should not forsake the cultivation of such well-proved plants as the Balearic Sandwort, Arenaria balearica, for other and less useful things. It is almost incontestable that we have no other plant in our gardens—old or new—which can oust this arenaria from its place. One can think carefully over all the creeping plants one knows without recollecting any flower which can supplant it, and even a careful study of books and catalogues but confirms us in this opinion. I do not think that anyone can suggest a flower of this character which will even rival our little sandwort, whose close carpet of tiny green leaves is so pretty growing over a stone or clambering up a shady wall. Then when this little close carpet is spangled all over with tiny white stars, it is impossible to pass it without a feeling of keen joy—a feeling which is only within the ken of the true lover of flowers.

But to enjoy Arenaria balearica to the full it must have its tastes considered and supplied, and this is where the beginner is liable to go astray in attempting its cultivation. Long years of acquaintance with this little plant confirms the general experience that it loves a shady place, and a moist stone up which to creep and which it delights to veil with its greenery. In a moist fernery it will flourish, and on a shady wall it will thrive amazingly. There is in this garden a test planting on a shady and a sunny stone on either side of [illegible], and the difference between the two carpets is literally amazing. The one is growing fast; the other little more than holds its own, and when it does creep up a little higher the sun appears to make it shrink back again. We have no more fairy-like flower than the Balearic sandwort, and those who have not yet found a place for it in their rock gardens will do well to order it now and plant it as suggested.

Viola gracilis.

We have reason to appreciate this little viola, which has in the past attracted so much notice at the shows and elsewhere. It has come into flower early this season, and in the beginning of April, in a far from kindly season, has opened to our admiring eyes its intense violet-blue flowers. This earliness is not its chief merit, however, as it is a long bloomer, and we can have a supply of its pretty flowers all summer, so that the spot it occupies need not be long without its dainty little blossoms. Its true perennial habit is a point of great value, so that lovers of the viola may well keep it in view, and add it to their gardens as soon as possible. A little group in the rock garden here is very pretty now. It is fast finding its way into all good collections of rock plants, numerous as are the flowers which are claiming an entrée there nowadays.

Saxifraga Bathonensis.

Mossy saxifrages with crimson flowers, or at least approaching that hue, are now plentiful enough, and the difficulty evidently lies in selecting from among the many aspirants to our favour. It seems but yesterday that we had only the tiny (and not very bright) Saxifraga muscoides atropurpurea, which, by the way, has had several names. Then followed S. m. Rhei, its variety superba being among the next to follow. But now they are to be counted by the score, and many are vast improvements so far as regards depth of colour upon those already named. I have come to like S. Bathonensis in everything save its name, which does not in the least appeal to me. But, as a plant it is beyond praise, with its nice mossy growth and its glowing scarlet flowers. As a mound of foliage and flower, reaching a height of about nine inches, it is a gem of the first order indeed.

Erythronium giganteum.

One of the finest of the lovely American dog's-tooth violets, or erythroniums, is E. giganteum, a species of much beauty and also one which is very reliable in a suitable position. I observe from my garden book that a little clump here which is now in flower was the produce of one bulb, which was planted in 1906, my former bulbs of the same species having been lost during removal from another home. After a year or two, during which it flowered, it has taken to spreading a little, so that the one bulb has become a little family, and the group is certainly more beautiful than a single individual. This handsome species gives from one to ten flowers on a stem, the blooms being of a very light yellow with orange or brighter yellow markings at the base. The leaves are beautifully mottled, and the whole appearance of the little clump in the garden is very beautiful. I find these American Dog's-tooth violets like a light, well-drained soil, but that they thrive better at or near the base of the rock garden than higher up. A small collection of these flowers forms an interesting feature to one's garden, and none will be found more worthy of growth than E. giganteum.

S. Arnott.

FLAG IRISES.

The flag, or German irises will succeed in the most diverse soils and situations, flowering well in deep, moist soils beneath deciduous trees, while they will flourish and bloom with equal freedom on shallow hard-baked railway embankments. In fact, they will flower anywhere and everywhere. One of the finest colonies of the old purple flag iris that I have ever seen was growing beneath a large standard apple tree in a cottage garden, a breadth of deep purple, set off by a few golden doronicums in the forefront, and the white-washed cottage in the background.

The beautiful flag irises are amongst the loveliest of our early summer flowers, but nowhere are their charms displayed to such effect as in the untrammelled freedom of the wild garden. Here are no stiff lines, no evidence of the foot rule or of the study of geometrical design, but the informal grouping of flower and foliage that creates a picture infinitely beautiful, since in its composition Nature has not been bound hand and foot, but has been permitted to exercise, within due limits, her beneficent sway. The sword-shaped leaves of the irises curve boldly out, their tall flower heads, with heavy drooping falls, standing boldly against the crimson blossoms of the great leafy pæony. In the background beneath a tree stands another group of irises, a breadth of white, whilst fine form is present in the cordate leaves of the funkia, and in the thin, rush-like leafage of the bulbous irises that are thrown into high relief by the distant greenery. Irises always appear to the best advantage when planted in fair-sized clumps and groups of one variety, as they then show, when in flower, a broad colour effect.

A wide selection of beautiful tints may be obtained from the flag irises, flowers that, while individually as lovely as those natives of the tropics that can only be looked upon in this country in the steamy confines of the hothouse, possess the additional charm of being associated with other, and natural beauties—the fresh green of the grass, the full-foliaged trees in the zenith of their loveliness, the shifting lights and shades of the ever-changing skies, and the sense of atmosphere that softens the blue distances and limns with a tenderer hue the colours of the flowers of the open air.

No more effective arrangement of flag irises can be adopted than that of planting large clumps of the different varieties in long borders on either side of a grass walk, for in this way charming vistas of tender colour gradations are formed which the eyes rest on with absolute content. Iris pallida and I. pallida dalmatica, with their faint tints of lavender, are seen to the best effect when a clump of I. flavescens, with its pale yellow blossoms, adjoins them. The dark purple of I. atropurpurea, is accentuated by the white of I. Princess of Wales, while I. florentina, I. Madame Cheréau, I. Victorine, I. Queen of the May, and I. Celeste are all well worthy of a place in such a border. Here, between the clumps of iris, grows Papaver pilosum, and during the morning the impression rendered is exquisite. The indescribable tint of the poppy flowers, an apricot-buff, with, at times, the suspicion of a pink flush, is just the hue to set off to the best advantage the shades of the irises. By midday every poppy petal will have fluttered earthward, to be renewed each morn by a fresh breadth of fleeting colour long after the beauty of the irises has waned and departed.

Flag irises should not be planted in the autumn, as if this is done they make but little root growth before the following spring, and do not become established by the winter, and their flowering the following season naturally suffers. The best time to transplant is immediately after they have finished flowering, and if put into good soil, without allowing their roots to become dry, they should succeed. It is important, however, that they should be well looked after in the matter of watering during hot weather, so that the roots may be kept in a moist condition, as, unless this is seen to, the rootlets will not take hold of the fresh soil, and, failing this, the plants will not be able to establish themselves until the autumn. The sooner the plants can be shifted after flowering the better will be the chance of a satisfactory flowering season in the following year.

As cut flowers the flag irises are very valuable, the blossoms, if brought into the house before they are fully open, expanding well in water.

Wyndham Fitzherbert.

A BEAUTIFUL BANK OF FLAG IRISES.

GARDEN WALKS.

Scarcely anything conduces to greater comfort, efficiency, and the general appearance of a garden than clean, dry, firm rolled walks, the realisation of which redounds to the credit of the gardener. The old-time practice of hand-weeding and hoeing is now obsolete; it had the disadvantage of loosening the surface of walks, thereby detracting from their appearance and entailing increased labour before the normal firm surface was again secured. The use of an approved weed-killer in liquid form and of sufficient strength to destroy all vegetative growth on walks is sound in practice, being alike efficacious and economical in working; it leaves the walks firm and passable as before, while the gravel retains its bright and clean appearance always. T. S.

Pieris (Andromeda) japonica.—It is not every spring that the blossoms of this delightful shrub pass unscathed, but when they do they are very beautiful. The urn-shaped flowers are of a white waxy nature, and are borne in long pendulous racemes in such a manner that the entire bush is quite veiled with them. Added to this quite a distinct feature is apparent later on, when the young shoots first make their appearance, as they are then of a rich crimson tint.—W. T.

NOTES ON ONION CULTURE.

A point that often comes under discussion in the cultivation of vegetables for show purposes is how far size should govern quality. Extremes are not uncommon in both respects, but the standard type of vegetable should, without doubt, be one equally well adapted for table use and for exhibition purposes. Now the standard type of onion may be represented by exceedingly large, heavy, and well-ripened bulbs, displaying in every respect the many characteristics of the particular variety they represent. These are invaluable for a great number of purposes in the kitchen, and are at the same time splendid epitomes of good cultivation and high quality. Not the least advantage enjoyed by this crop is that it may be grown several years in succession on the same piece of ground, provided the necessary condition of soil fertility is maintained, or until such time as an attack from mildew or maggot makes it imperative to give a complete change.

Large and Medium-sized Bulbs.

There is one point which every onion grower should study. He will be well advised to determine beforehand whether it is his wish to produce a large and heavy yield of medium-sized bulbs, or whether abnormally large individual specimens are to be preferred. One may be excused for remarking that the former is by all means the most profitable and rational method to adopt; but, at the same time, it must be remembered that the large-sized bulbs have a sole object to fulfil. They must be grown for the exhibition table alone, although, as a rule, some use can be made of them in the kitchen. Their cultivation must, of course, be pursued with this object in view, and not a little importance will be attached to the natural capabilities of the soil and climate of the district for the development of large-sized bulbs. If the latter cannot be secured, it is best to leave the culture of exhibition onions well alone, for disappointments are bound to ensue. The so-called secret of how to grow large onions is a part of every gardener's knowledge, but few are able to secure the best results unless particular attention is paid to the deep and thorough trenching and working of the soil before the plants are put out. The seedlings must, of course, be well grown and hardened off, and, after planting, little attention is required beyond stirring the soil occasionally and keeping the surface free from weeds. Stimulants of any kind must be very carefully administered, especially as the season advances, for excessive nourishment at this stage may often kill the plants entirely. The best and largest bulbs are usually harvested in a good drying autumn.

Main Crop and Other Varieties.

The best main crop varieties of onions are Improved Reading, Improved White Spanish, Brown Globe, Bedfordshire Champion, and Giant Zittau. A good pickling variety is the Silver-Skinned, which should be sown not earlier than May, so as to prevent the bulbs becoming too large. The latter must also be sown in the poorest soil in the garden, and they require no singling or thinning, as a rule. For autumn sowings for transplantation in February or March, seed should not be sown before September, and Trebons, Danver's Yellow, and Giant Zittau are three good varieties for this purpose, being especially valuable as regards keeping qualities. They are to be preferred, as a rule, to the Tripoli onions, which are usually too soft, and lack keeping qualities. For exhibition purposes I have secured many perfect types of Ailsa Craig, turning the scale at 2, 3, or 4oz. above 3lb. Other good exhibition onions are Magnum Bonum, Cranston's Excelsior, and Rousham Park Hero. The potato, or underground onion is deserving of a little more attention than it actually receives; its culture is especially suited to cottage gardens and allotments. As a rule, the smallest bulbs are selected and planted almost on the surface of the soil as early in the spring as the weather will permit. They may even be planted in December if the bulbs then commence to push. The rows should be set 15in. apart, and the bulbs 10in. apart in the rows. An old Devonshire custom is to plant potato-onions on the shortest day of the year, and harvest the crop on the longest; but the winters in this district are comparatively mild. As the bulbs push, the plants are earthed-up like potatoes, and in this way they form large clusters. Another method is to clear away all the soil from the bulb as soon as the latter begins to get a little brown on the top, and the moisture which collects around the ring from which the fibres of the root proceed induces the growth of new bulbs on the old ones; these form a cluster of onions above the surface of the ground.

Commercial Onion Culture.

There is no doubt that a large and steady demand exists for home-grown onions. Spanish or Portuguese produce the bulk of the total market supplies, but one cannot help feeling that if market gardeners, small-holders, and farmers were to devote a little attention and a few acres to this crop under a system of intensive culture, the returns would be quite satisfactory, even if not out of the ordinary. Commercial growers, as a rule, swear by the Ailsa Craig type, which, where the ground is deeply worked and liberally manured, may yield a crop weighing quite 200lb. per rod. About 270 bulbs per rod would be needed, the onions being planted 12in. each way; and 2lb. of seed, sown early in February in frames, would furnish sufficient plants to plant an acre of ground. Expenses of cultivation, manuring, sowing, and planting would not amount to more than £30, harvesting and marketing £10; and if the crop realised, say, at a minimum estimate, 8s. per rod, the return per acre would be £64, thus leaving a profit of £24. The introduction of a suitable catch crop would considerably lessen the burden of rent, salesmen's commissions, and other incidental expenses.

J. C. N.

Cytisus racemosus.—It would be impossible to even guess as to the number of cytisus grown by some of those nurserymen who supply Covent Garden Market, for it is there offered for sale in very large quantities. Neat bushy plants laden with blossoms can be purchased at a very cheap rate, in proof of which one has but to note the numbers that are now being offered for sale by the costermongers in the streets of London. Though the above is the correct botanical name, this member of the broom family is always referred to in the market as a genista. Apart from their richness of colouring, and profusion in which they are borne, the blossoms of this cytisus have a pleasing fragrance. It is a native of the Canary Islands, and there are several forms of it; but a good type of the ordinary kind is grown more than any other.—W. T.

PLANTING TOMATOES OUTDOORS.

The tomato is one of the easiest plants to grow and one of the most rampant, but the better the soil conditions, according to the standard applied to the cultivation of most plants, the less is it inclined to fruit, and it is no uncommon thing to see plants three or four feet high with scarcely any fruit upon them. This is not the way plants grow in a state of nature, but is, in fact, contrary to the course of nature; and the explanation must be sought mainly in wrong feeding, even though this consists in putting the plants where they have the run of a store of plant food in the wrong proportions—in other words, an ill-balanced diet.

Assuming we have obtained good plants—sturdy and well hardened—we need to give them such conditions that they will continue in that strong short-jointed growth which is conducive to fruitfulness rather than the rank growth which leads to still ranker growth, so that the energy of the plant is drawn away, as it were, or diverted, from the lateral flower trusses to the more vigorous growing points. The first condition necessary to success, that is, a good set of fruit from the first two or three trusses of blossoms, is a sufficiency of sun and air, so that all the leaves may be of a stout, rather than of a watery character. Therefore close planting should be avoided. Of almost equal importance—for though we may possibly succeed in any soil, no success is possible without abundance of sun and air—is the preparation of the soil, so that from the beginning the plants may have as much phosphate in an available form as they can absorb—this being the element of plant food which more than any other makes for fruitfulness—instead of an excess of nitrogen, which induces rankness of growth. As in the human body health begets health, so in plant life strength leads to still greater strength, every lead adding to the vigour of the roots, and, unless fruit is formed in the comparatively early life of the plant to absorb some of its energies, matters going rapidly from bad to worse. Hence the importance of early fruiting, not only for the sake of the earlier ripening, but for the better-balanced growth of the plant. When preparing the soil for tomatoes no animal manure should be applied, as this is largely nitrogenous, but a phosphatic manure should be used, more especially one of a non-acid character, such as basic slag or bone meal, the latter being an especially good manure to mix with the soil some time previous to planting. Both help to keep the soil sweet and lessen the chance of the plants being attacked by disease.

An important feature to be considered in the planting of tomatoes outdoors is the kind of root system encouraged. It is a matter of common observation that when a plant makes long and vigorous roots the growth of the top is somewhat similar in character, and, conversely, when the growth of the roots is compact and fibrous the top is of a short-jointed and sturdy character. The difference is in part owing to the fact that the nitrate in solution in the soil—generally considered to be the only form in which the tomato plants absorb nitrogen to any extent—can be taken up by comparatively few roots in a given quantity of soil, whereas the phosphate is not so much diffused in solution in the soil as dissolved by the root sap at the growing points of the numberless root hairs, or ultimate rootlets, of which the root system is composed. Hence the greater the number of roots formed the greater will be the chance of the plants getting a sufficiency of phosphate proportionate to the amount of nitrogen absorbed. One way to ensure this is to make the soil firm at the time of planting, stamping on it, or ramming it, if it is not too damp, as this induces the fibrous rooting system we want.

There is no doubt that, as in fruit trees, surface rooting conduces to fruitfulness, though this may not be the only explanation of the fact that good results follow from putting in tomatoes in an almost horizontal position, so that three or four inches of the stem are covered with soil, and the whole ball of roots is near the surface. The buried portion of the stem will at once emit roots, which will ramify in the surface soil all round the plant, much to the increase of its sturdiness and fruitful vigour. The border will need mulching with strawy manure, which should be added to occasionally during the summer to keep these roots feeding near the surface, and help to support the plants as they become laden with fruit. Those well established in this way will not need that watering which is often recommended for getting the first trusses of blossom to set, but generally results in a watery growth which is quite opposed to fruitfulness. Unusually dry spells may necessitate watering, but in a normal season, when the plants have got established, with the added root system from the stem, a mulch properly applied and attended to will keep them from suffering.

Alger Petts.

PROTECTING STRAWBERRIES.

Where strawberries are grown on a large scale boys are engaged to keep off the thirsty birds, but where small plots are devoted to their culture such labour cannot be afforded, therefore some simple and inexpensive means must be adopted. Wire netting, properly fixed, is a very effectual guard against the birds, but this material is expensive in the first place. The majority of cultivators use nets, and when sound and well fixed they serve the purpose well. But I have seen so many nets badly fixed, laid flat on the plants and soil, or roughly propped up on forked sticks with the edges pegged to the soil—where they quickly rot—that I would like to very briefly describe my own method.

A number of stakes are driven into the ground about seven feet apart in rows the same distance asunder. On the top of each stake a ball of hay is made secure. Around the sides small-meshed wire netting is fixed to stout stakes, the netting being 2ft. 3in. high. Then strong nets are spread over the top of the hay-bound stakes, the edges being made secure to the wire netting, and lapping over it several inches. The balls of hay on the top of each stake prevent the tearing of the net, and the height of the latter from the ground enables a person to creep underneath the net quite comfortably to gather the fruits. No part of the net touches the soil, and, with ordinary care, it will last in good condition for many years.

No doubt many readers of the Gardeners' Magazine protect their strawberries in a similar way, but many cultivators do not, to my knowledge.

A neat packing of clean straw under the plants serves two purposes, namely, the prevention of soiled fruits, and the protection of the roots from the drying influence of the sun.

G. B.

HALF-HARDY PLANTS.

The month of May is generally regarded by gardeners as a favourable season for placing out in permanent positions such plants and shrubs as are of questionable hardiness in our climate. Several reasons may be adduced in support of this practice; the soil temperature at this season rises appreciably under the influence of increased sunheat, so that, as a rooting medium, the soil offers conditions to which roots readily respond. Frost has still to be guarded against, but, provided the plants have been carefully hardened off, the addition of some light protective material will safeguard them from all danger on this head; this need only be applied during nighttime. Of greatest moment is the prospect of securing uninterrupted growth throughout summer and autumn, thus securing the maximum period wherein plants may become acclimatised before they are subjected to the ordeal of a British winter.

In the case where it is only possible to start with pot-grown plants, and frequently only small specimens, no amount of care and attention expended on the choice and preparation of the site can be regarded as fruitless, when it guarantees establishing a plant that for many years must add distinction and character to the garden.

Many herbaceous perennials, chiefly of a bulbous character, give the best results when planted at this season; commelina, roscoeas, crinums, gerberas, ixiolirion, watsonia, tigridias, gladioli, and hyacinthus are representative kinds of conspicuous merit to which the above conditions apply.

The general run of half-hardy plants succeed best in a medium loamy soil that is thoroughly well drained; soils of a heavy nature require special preparation, ample drainage must be provided, and the soil lightened by the addition of a liberal quantity of leaf-soil, sand, or road grit; to this a dressing of very old decayed farm manure should be added previous to planting.

T. C. L.

LAWNS.—Those who desire to make a new lawn or bowling green, or to renovate and maintain existing ones in good condition, can have no better guide than "Lawns and Greens," by T. W. Sanders, price 1s. net, by post 1s. 2d.; bound in cloth 1s. 6d., by post 1s. 9d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

A NEW SPRAYING PLANT.

An interesting demonstration with the Merryweather patent portable spraying plant, manufactured by Messrs. Merryweather and Sons, Lim., 63, Long Acre, W.C., took place last week on Mr. Harlow's plantation at Orpington. A number of students from the Imperial College of Science were present, together with Mr. Lefroy, the famous entomologist, who is now home from India, and is giving a course of lectures on the subject at the college. The Merryweather system comprises a portable steam or petrol pump, which delivers the spraying mixture through a series of pipes. These pipes can be readily transported from one area to another when required. The system claims to possess numerous advantages over other spraying methods, its chief features being economy in working and the rapidity with which a large area can be efficiently sprayed. The steam-driven plant belonging to Mr. Harlow was shown at work, and this was followed by a demonstration with a little petrol worked pump conveniently arranged for transport on a two-wheeled barrow. Mr. Harlow was spraying young apple trees with nicotine, using a very fine spray, and great surprise was evinced by the spectators at the amount of work performed by this machine in comparison with its diminutive size. It should prove a most useful plant for tea and other plantations abroad, which are frequently situated on steep hill sides.

MESSRS. MERRYWEATHER AND SONS' PATENT PORTABLE SPRAYING MACHINERY.

Hippeastrum pardinum.—This is in general appearance widely removed from the popular garden varieties of hippeastrum, which have gained many admirers of late years. Compared with the novelties of this class the flowers of H. pardinum are smaller and much more shallow. They are of a bright cream colour, freely dotted with crimson. There is a certain amount of individual variation to be found in flowers of H. pardinum, and that known as superbum is so closely freckled with red that little of the ground colour is to be seen. This hippeastrum has been but little employed by the hybridist in the production of new varieties. It was introduced from Peru by Richard Pearce when travelling for Messrs. Veitch, and was distributed by that firm in 1867.—W. T.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

PHAIUS.—The hybrids belonging to the group that have P. simulans (tuberculosus) as one parent will now be advancing their new growth to that stage when new roots are emitted, and it is at this time that potting should be attended to. In the case of average sized specimens, it is desirable that they should have an annual repotting. Turn them out of their pots with as much care as possible, so as to avoid damaging active roots. It is not an easy matter to detach the roots from the sides of the pots, but if the plants are well watered a few hours previously we find that they are more readily moved than is the case when the compost is in a dry state. Carefully remove the old potting compost, and cut away any dead and decaying material. Where there are several old or back pseudo-bulbs attached to the rhizome they should be cut away at about the second bulb from the lead. These old bulbs will, in most cases, have dormant eyes, which are capable of producing young growth, but they rarely produce a growth break unless they are severed from the main stem; they may be taken away from the old plant and potted for the purpose of increasing the stock, or if again potted with the other portion of the plant they may increase the size of the specimen. See that the pots used are thoroughly clean, and fill them to about one-third their depth with clean drainage. In selecting pots for the reception of vigorous healthy plants, the fact of their being strong-rooting subjects should not be overlooked, and a liberal amount of pot room may be given. The compost we have found most suitable for these hybrids consists of one part fibrous loam, two parts peat, and the remainder chopped sphagnum moss, coarse sand, and broken crocks, sufficient of the latter being added to render the compost free and porous. Make the material reasonably firm about the roots of the plants, and cover the surface of the potting compost with a thin layer of finely chopped sphagnum moss.

OTHER HYBRIDS.—Those belonging to the section which have P. Humbloti as one parent, are now in flower, and the annual repotting must be delayed for a few weeks until after the flowers have faded. These hybrids require practically the same treatment as those mentioned above. I may say that we have found it a good plan to place them under cooler and drier conditions while the flowers are open, as this not only increases the durability of the blooms, but also affords them a beneficial rest. Keep all newly-potted phaius in a well-shaded position, and a brisk warm moist atmosphere; the house should be kept reasonably close until the roots are running freely in the new compost.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CAMPANULA PYRAMIDALIS.—Being of easy cultivation this bell-flower deserves to be extensively grown in pots. Where a large conservatory has to be kept furnished they will be found very useful, the colours, blue and white, blending readily with the other occupants of the conservatory. Plants which have been wintered are now growing freely, and must be frequently fed with weak liquid manure. As soon as the flower spikes begin to develop they should be loosely tied to a neat stake placed in the centre of the pot. If the earlier flowers are picked off as soon as they fade, others will come on in succession, and so prolong the flowering period. Seeds may be sown now for next season's plants; no heat is necessary, a cold frame being a good place in which to raise them.

TUBEROUS BEGONIAS.—When repotting these begonias a rich compost should be used, made up of good fibrous yellow loam, leaf-soil, and sand, with a liberal addition of dry cow manure or old mushroom bed material. See that the pots are clean and well drained. Grow the plants on as cool as possible, and shade from hot sunshine. For basket culture Marie Bouchet is one of the finest of the many summer-flowering varieties of the present day. It is one of the first to flower, and is very free and graceful. The tubers should be started in boxes in early spring. When growth has commenced they may be planted permanently in the baskets in which they are to flower, the baskets having previously been made ready by being lined with moss. The compost used may be similar to that used for other fibrous begonias. Liberal supplies of water should be given when in full growth, with an occasional application of liquid manure. Fumigate at intervals to keep down the mite, which causes much havoc on the foliage of begonias.

CYCLAMEN.—These are now ready for shifting in 48 and 32-sized pots, in which they will be allowed to flower. After potting, replace them in the house. Avoid overwatering at the start, but syringe the plants twice a day. When nicely rooted they can be removed to a cold frame, but where the space is available in a convenient house it is advisable to grow them inside, where all cultural points may be more easily attended to. Cyclamen require plenty of light, but they must be shaded in the hottest part of the day; allow ample room between the pots for the air to circulate freely, and keep a check on green-fly and thrip. Damping between the pots is a preventive against thrip.

GENERAL NOTES.—Cuttings raised in the spring will need regular attention in regard to potting. Do not allow plants to become root bound before potting them, as this causes a severe check. Pay careful attention to shading and airing, keeping up a free circulation of air without causing draughts. Watering is best done if the plants are examined at least twice a day.—A. Grubb, Porter's Park Gardens.

THE KITCHEN GARDEN.

TOMATOES.—If the plants have been hardened off as advised, in most counties not too far north it will be safe to plant them out against south walls or warm buildings. Should any lights from frames be at hand, and placed for protection over the plants for a week or two, it will assist them into growth. It is not wise to make the soil very rich, or the plants may romp away into strong and unprofitable growth. Grow the plants as cordons by removing all side laterals, to expose the fruit and trusses of flower to air and full sunshine.

BRUSSELS SPROUTS.—In cases where Brussels sprouts are expected early in September, and the seed was sown with the view of obtaining early plants, they should now be planted out in permanent quarters. Deeply dug and richly manured ground is essential for this crop, with ample space to give light for development of the side sprouts, or dwarf leafy produce is the result. Two feet six inches should be the minimum distance allowed between the plants. When planting secure a good ball of earth to the roots, and make the soil firm by treading round each one to encourage sturdy growth.

PEAS.—Important sowings now should be made in prepared trenches to give plentiful supplies of this much appreciated vegetable during the end of August and through September. It is not advisable to sow thickly, but allow space between the plants for light and air to play through them. The early peas growing on south borders will, now that they are filling their pods, be much assisted if a good watering with liquid manure is given once a week, and during hot days a syringing is applied to the foliage late in the afternoon. Give timely attention to sticking successional crops before being damaged by wind.

MULCHING.—Where time can be spared, and materials are at hand, the mulching of many crops will amply pay for the labour and time expended upon it, and will often enhance the value of the crop by one-third, especially on a light quick soil. Old mushroom beds, grass from lawns, or any partly decayed manure, are suitable for this purpose, the main object being to conserve the moisture at the roots. Cauliflowers, peas, beans, lettuce, marrow, and cabbage are a few plants that can be profitably dealt with to advantage during the summer months.

PARSLEY.—From the early sowing young plants will be of sufficient size for transplanting. Make the bed on sweet rich ground, and mix a good dusting of soot into the surface soil. Give a distance of twelve inches from row to row, and the same between the plants in the row, so that sound hard growth is made; drawn up foliage is of little value for garnishing purposes, and parsley grown thickly gives way under extremes of weather.

THINNING AND HOEING.—The young crops of parsnips, onions, carrots, etc., will require prompt attention to thinning. At this stage the crops are much benefited by having the Dutch hoe frequently worked through them on fine days, which is also an economiser of labour, by destroying weeds before they reach the seeding stage.—C. Flack, Cholmondeley Castle Gardens.

HARDY FRUITS.

GOOSEBERRY MILDEW. — The much talked of American gooseberry mildew makes itself evident this month, and may be easily recognised by the white powdery appearance at the tips of the young growth, the fungus at the same time producing quite a nettled and stunted appearance on the trees affected. The more popular market varieties appear to be the most susceptible to the attack of this mildew, and where there are plantations of many varieties, as is often found in private gardens, it will be noticed that Crown Bob and Lancashire Lad—two varieties that are grown more than any other in this district for market purposes, may be badly infected, while others standing around them will show little, if any, signs of the disease. Cutting away all diseased wood early in winter has been recommended, which is very sound advice, although it decreases the next season's crop considerably, as practically the points of all shoots have to be cut away. Liver of sulphur is also recommended as a wash to keep the summer attack in check: this may be used at the rate of one ounce to three gallons of water; the trees should be thoroughly drenched, using the wash with force.

CODLIN AND WINTER MOTH.—Apples should be sprayed against the codlin and winter moth as soon as the blossom has fallen. The acetate of lead wash recommended in the calendar on Hardy Fruit on May 6, will be found very efficacious in dealing with these destructive pests; one application, in most cases, is all that will be necessary. If very heavy rains are experienced a second spraying may with advantage be given, thereby keeping the poison for at least a month on the young fruit and foliage, to be taken by the caterpillars in their daily wandering after food, to their destruction.

WALL FRUITS.—Material that has been used for protection may be removed now that practically all danger of frost is over. Peach and nectarine trees should be syringed freely with soft water, if possible, early in the afternoon on fine days; all borders of wall fruits should be examined to see that they do not lack moisture, as the failure of wall crops may often be traced to the borders not having sufficient water, stone fruit especially requiring abundance of water through the swelling period. Liquid manure should be used freely after a good soaking of clear water has been given. Keep the borders well mulched to save labour in watering. A sharp look out must be kept for aphis, and on its appearance quassia, soft soap, or nicotine wash must be used at regular intervals until the trees are quite clean.—J. Whittle, Cheveney Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, May 9.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Sir Everard im Thurn, Dr. A. Voelcker, Messrs. W. E. Ledger, W. Cuthbertson, C. E. Shea, W. W. Fowler, J. T. Bennett-Poë, W. Hales, R. H. Pearson, J. Douglas, J. O'Brien, A. Worsley, and F. J. Chittenden (hon. secretary).

GONGORA TRACYANA.—This plant, shown at the last meeting by Messrs. Tracy and referred to Kew, proved to be an undescribed species, to which the name of G. Tracyana Rolfe has been given. It was unanimously resolved to recommend the award of a Botanical Certificate to it on the ground of its novelty.

ONCOBA ROUTLEDGEI.—The plant recommended for a Botanical Certificate under the name of Oncoba spinosa var. Routledgei at the last meeting had been further examined at Kew, and it has now been made a separate species and named O. Routledgei.

MALFORMED ODONTOGLOSSUM. — A spike of a form of Odontoglossum crispum from Sir Julius Wernher, of Luton Hoo, having several flowers malformed upon it, as well as others of a normal character, was referred to Mr. Worsdell, who reports as follows:—"The balance of the spike is quite upset. Most of the flowers are quite normal, however. The peculiar structure present is due to a compromise between two tendencies (1) that making for reduction or fusion, and (2) that making for multiplication of parts. There is no evidence at all for actual synanthy or for the "passing of one part of a flower into the next," as the spatial distribution of the flowers on the spike appears to be quite normal. On the other hand, there is an equal absence of evidence that an increase in the number of flowers on the spike is occurring. In one flower there is a remarkable case of 'positive dedoublement'; four sepals, uppermost (posterior) forked; four ordinary petals (which might have resulted from forking of the lateral ones); one of these four lies exactly in the median plane (anterior); two labella forming with the column a whorl of three within the four ordinary petals; the column is double below, but triple above (there being three anthers). One anther is becoming petaloid. Owing to the causes above mentioned the flower comes to have a larger number of members than usual, and the composition of the whorls is altered, owing to the fact that, under the circumstances, the members must be more or less re-arranged, so as to obey the law of alternations. In the second flower there were three normal sepals, but the anterior one is in structure and appearance intermediate between a sepal and a petal, as it has the brown blotches of the former; but it is lighter in colour than the sepals, and has a slight tendency to be fringed at the margin like a petal; there is no present evidence as to its origin, but it perhaps arose by division of the normal sepals, two labella forming with the double column a whorl of three. In the third flower the reductive or fusion tendency has overpowered the other (or multiplicative). The two lateral sepals have fused into a single one in the anterior median plane, but this sepal is triple, and the middle lobe may represent the third sepal-like petal of the second flower referred to, and this is very likely, in which case it would not be accurate to speak of fusion of two sepals. Two labella, one of which is much smaller than the other, and has its stalk completely fused with the column. The column is double, but the anthers are much more closely approximated than in the last two flowers (an interesting fact as showing the fusing process). The sepals are more petal-like and larger than usual, as is natural. In the fourth flower the reduction and fusion tendency is all-potent; the flower is 2-merous. It has two sepals (antero-posterior), the anterior one being very large, owing to fusion of the two normal lateral ones; two lateral petals larger than normal, doubtless correlated with the complete absence of the labellum. The absence of the latter must be attributed either to abortion or to congenital and intimate fusion with the column (an analogy for such a fusion exists in the third flower, and the column has its lateral petaloid appendages larger than usual). The ovary appears to be normal. A very interesting fact is that the bracts subtending, two or three of the flowers showing positive dedoublement, are double, having two tips and two midribs. In such cases the splitting tendency is very powerful, and if it went further would result in the formation of two flowers side by side; these then might become spatially separated in a vertical direction on the axis of the spike. The structure of the dimerous flower has probably, from a morphological point of view, nothing whatever to do with the other malformations, but, physiologically, there may be a connection. Exigencies of nutrition may demand that, if some flowers have an extra number of organs to be fed, other flowers must not be supplied with so many organs, economy in the spike-household being thus maintained."

FASCIATED ASPARAGUS.—Canon Fowler showed a fasciated and contorted stem of asparagus about one and a-half inch in diameter.

TULIP DISEASE.—He also contributed specimens of tulips with numerous brown patches upon their leaves. This disease appears to be caused by the botrytis form of a species of sclerotinia. When the attack is a bad one, the fungus forms black sclerotia near and about the top of the bulbs, between them and the soil, and by these the disease is continued into the next year. The spread of the disease may be checked by spraying with potassium sulphide, but it is well to completely remove and destroy badly-diseased plants, to plant in fresh soil, and to discard any bulbs showing traces of the sclerotia (which vary in size from a pin's head to a pea) when planting is done in the autumn.

TWIN-FLOWERED DAFFODILS.—Mr. Shea showed several varieties of narcissus having two flowers in place of the normal one, and a specimen was sent from Darlington of a form of N. poeticus with three flowers. Several members remarked upon the common appearance of this phenomenon this season.

NEW PLANTS.—Messrs Veitch submitted specimens of Viburnum Davidi, an evergreen viburnum with large, glossy leaves and corymbs of small, whitish flowers, and Rhododendron concinnum and R. rufescens, the latter a dwarf species, about six inches in height, with white flowers about half an inch in diameter, and having somewhat the habit of R. intricatum.

HYMENOCALLIS x FESTALIS.—Mr. Worsley showed spikes of this hybrid raised by him between Ismene calathina ♂ and Elisena longipetala. The hybrid is remarkably vigorous in habit.

Horticultural Club.

GLIMPSES OF MOROCCO AND THE CANARY ISLES.

On Tuesday, the 10th inst., at the Hotel Windsor, this club held its usual monthly dinner, under the chairmanship of Mr. Harry J. Veitch, V.M.H., and after it Mr. T. Ernest Waltham gave a very interesting lecture entitled as above, and illustrated by about a hundred lantern slides of great beauty and clearness. Commencing with a number taken in Madeira, Teneriffe, and elsewhere, depicting the peculiarities of the inhabitants, the vegetation and the scenery, which in its subtropical aspect was often of great beauty, involving plantations of bananas, date palms, etc. Morocco next appeared upon the scene, local colour being supplied in the foreground by the lecturer himself being clad in a typical burnous and fez, and armed with a native gun, which was probably far more formidable in appearance than effective at long range, while a curved dagger added materially to the warlike effect. The numerous slides, while, by their excellence giving a vivid idea of the picturesqueness of the native costumes and the generally arid nature of the country, also conveyed a conviction that the natives themselves were of a very debased order of civilisation, the treatment of the women and their general intolerant behaviour towards foreigners demonstrating clearly what a terrible bar to true progress and humanity is the Mohammedan religion in places where other influences are debarred from working. So much is this the case that even in these days travelling in the country is attended with innumerable risks, owing to the hostility of the natives to the Christians, or indeed all foreigners, and the risk these latter run of unwittingly infringing some religious restriction and of consequently being stoned or even murdered. In a country where to be merely mad is to be deemed a saint, the vicinity of whose tomb, or even of a tree under whose welcome shades it lies, no Christian is permitted to approach, it is obviously difficult for common-sense to obtain a foothold. Sanitation is absolutely unknown, and progress through the narrow, evil-smelling gangways, which do not merit the name of streets, means practically shouldering one's way through a crowd of beggars. In short, the more this state of things was brought before the audience the more one marvelled at the boldness of travellers who persist in traversing such inhospitable countries both in pursuit of knowledge and in the desire of, in some way, ameliorating the conditions they find there. Here and there, thanks to such, a ray of light had penetrated, and groups of cheerful little pupils of established missions gave evidence of some success. As, however, our friends the French are now experiencing, attempted civilisation is bitterly resented, and no opportunity is lost of what the natives doubtless consider as a religious crusade or "Jehad" against the infidel, too often with most tragic results. Following the Moroccan views Mr. Waltham supplemented his lecture with a number of others, depicting home scenes and Alpine and other flowers in their native habitats, many of them in their natural colours.

Mr. Harry J. Veitch, in conveying a hearty vote of thanks to the lecturer, adverted to his own visit to the East, not indeed to Morocco, but to Palestine, where similar patriarchal conditions prevail, on somewhat milder lines perhaps, but still based upon an intolerance which renders the visitor subject to insult and even injury.

Dundee Horticultural Association.

The ordinary monthly meeting was held in the Technical College, on the evening of 11th inst. The president, Mr. Wm. Christeson, presided, and introduced the lecturer, Mr. James Murdoch, Cliffside, Stirling, who had for his subject "Flowering Shrubs." Confining his remarks to those that are quite hardy, the lecturer graphically described their introduction, and use in the adornment of the flower garden and pleasure grounds. Where Nature and art went hand in hand in arrangement, a pleasing scene could be created, whereas often the reverse was the case. In this connection he mentioned public parks and cemeteries for special criticism, while for utter neglect to make use of shrubs in beautifying their premises, among other concerns he held up to ridicule the railway companies, who are not doing their duty to the public who travel by their lines in failing to beautify even the railway stations.

In submitting practical details, and giving a descriptive list of shrubs which flower from "early spring to late autumn," the lecturer gave in illustration vivid pictures as he had seen them in Nature's wilderness amid the gorges of the Rockies and Alpine glaciers; sometimes, too, he referred to the beautiful effects he had seen in Golden Gate Park, San Francisco, or in Kew Gardens, where he had made many pilgrimages in seeking knowledge of his hobby. In advising what to plant he urged his audience not to forget berry-bearing shrubs, and those with ornamental foliage or bark, like salix and dogwood, rubus, Rosa rugosa, etc., to brighten up the garden scene in winter. The lecture was enhanced by mounted specimens, which the lecturer referred to as he described them.

A profitable discussion ensued, Messrs. Reid, Grant, Campbell, and Bethel being the principal speakers.

Croydon Gardeners' Society.

This society's usual fortnightly meeting was held at the Sunflower Temperance Hotel, and the members were well entertained with a practical address on the "Cultivation of Michaelmas Daisies and Phloxes." Mr. Frank Brazier, Caterham, who has for several years made a special study of these late summer and autumn flowers, generously gave to his audience a summary of their cultivation as exhibition plants and their decorative utility in the herbaceous borders.

The treatment for both plants is very similar in character, and the grower's first consideration must be given to the ground wherein the plants are to grow. Mr. Brazier's soil is of a very clayey nature, and he finds it best to trench in the early spring, exposing the under soil to drying winds and sun. When the upper crust is worked down to a fine tilth the rooted cuttings are inserted and grown on as much as possible without check. To obtain his cuttings he lifts his old plants about December and brings them into the greenhouse, where they quickly show signs of growth, and cuttings are taken. From the greenhouse they are transferred to cold frames, and hardened off ready for planting out in the open ground. When the young plants are established attention is paid to the soil surrounding them, and the hoe is kept constantly at work. In the summer months a mulching of fresh manure that has been exposed to the air a little is placed round the roots. This helps to keep moisture around them, and feeds and encourages surface roots. A great mistake often made is leaving them in the soil they are planted in without further attention, and when the flowers begin to open the roots have almost exhausted their food supply, so that when they are required to make their greatest effort there is nothing left to stimulate growth

Mr. Brazier gave many useful hints to the exhibitor.

A very hearty vote of thanks was conveyed to Mr. Brazier when he had concluded his subject, and to this he briefly replied.

An attractive group of rhododendrons, acers, etc., was put up by Mr. T. Butcher, Mr. R. Cleveland staging three vases of daffodils.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall, Westminster, on Monday evening, May 8. Mr. Charles H. Curtis presided. Three new members were elected, making a total of thirty-nine this year so far. A lapsed member having reached 60 years of age, withdrew the sum of £11 11s. 8d. standing to his credit. Several members over 60 drew the interest on their account. The amount paid out in sick benefit since the last meeting was £51 15s. The secretary will be pleased to send a few copies of the report for 1910 to any member wishing to distribute them.

East Anglian Horticultural Club.

There was a good gathering at the May meeting of this club, held at the Boar's Head Hotel, Norwich. Mr. F. W. E. Shrivell gave a most interesting discourse upon the uses of chemical manures in the garden. He remarked that for seventeen years the experiments at Golden Green, Kent, had been carefully noted, and it was proved that in most cases chemicals, plus a small quantity of dung, yielded the best results. The address was followed by a good discussion.

The exhibits greatly brightened up the room, special mention being due to Messrs. Daniels Bros., Ltd., Norwich, for pots of liliums and azaleas; Mr. W. Laws, gardener to G. E. White, Esq., for his group of Marmion carnations; and to Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., for a nice piece of Cypripedium barbatum.

Ivies in Pots or Tubs.—The various uses to which ivies may be put were recently enumerated in the Gardeners' Magazine, but apart from those mentioned, they form, when grown in pots or tubs, and trained to a flat trellis, good screens to shut off any unsightly feature. In the courtyards of towns they are often valuable in this way, and where general decoration is carried out on a large scale, screens of ivy may, from their hardiness, be used where more tender plants would suffer.—W. T.

VIEW IN MESSRS. W. BULL AND SONS' WINTER GARDEN.

JUBILEE OF A CHELSEA FIRM.

During the week now ending Messrs. William Bull and Sons, King's Road, Chelsea, have been celebrating their jubilee, and it is because of this that they will probably not be exhibiting at the forthcoming Temple Show. Not that there has been excessive jubilation, and a resultant need for recuperation. That is not the point. Orchids, amaryllis, and other flowers of the season have been timed as far as possible for this jubilee display, instead of being prepared for the Temple Show.

During the half century that has elapsed since the late Mr. William Bull set up in business for himself, the firm has introduced many new, rare, and beautiful plants to cultivation. Orchids, stove plants, pelargoniums, and even sweet peas, have been distributed from the establishment in all their newness, and sweet pea readers will perchance remember that Henry Eckford's first new sweet pea was sent out by Mr. William Bull.

The fine winter garden that fronts on to the King's Road has been made quite gay and beautiful for this jubilee occasion. Giant palms were arranged over smaller ones, and above groups of handsome foliage plants of many kinds, including the celebrated Dracæna Victoria. On either hand down the central avenue were tall pillar roses representing such beautiful varieties as Tausendschon, Hiawatha, Philadelphia, and Mrs. F. W. Flight, with groups of Verbena Miss Willmott, unusually fine pink and blue forms of Hydrangea Otaksa, the latter carrying five to seven huge heads of bloom in a 32-sized pot; Lilium auratum, L. speciosum, and L. longiflorum were also effectively grouped among the foliage plants.

Two semicircular paths, one to the right and one to the left, cut through the great groups of elegant leafage, and each revealed new beauties. On the left were amaryllis in large numbers and a great range of colouring. The majority were of excellent form. White, blush, pink, rose, red, orange, vermilion, blood-red, and deep crimson were colours to be seen in these big and glorious blooms. The lighter shades of pink and rose and salmon were notably beautiful, and such varieties as Aviator, Blush Queen, and Sunbeam were exceptionally good.

Down the other path the orchids were arranged on both sides, and these looked particularly well among the surrounding foliage. One great piled-up mass of dendrobiums included D. Wardianum, D. Devonianum, and D. primulinum. Lælio-cattleya Baden Powell formed another group, and the numerous free-flowering plants of this hybrid between L. tenebrosa and C. Skinneri were most effective. Vanda suavis towered behind Renanthera Imschootiana and such odontiodas as O. Bradshawiæ and O. Chelseaensis. Brasso-cattleya Thorntoni and Brasso-lælia Helen were conspicuous by reason of the fringing of the lip in each case. Cattleya Mendeli and C. Mossiæ were present in quantity, and one variety of the latter, named Duchess, of light hue, and bearing four or five closely-set flowers on a spike, attracted attention. The Butterfly orchid—Oncidium Papilio, was a source of interest. As also was Maxillaria Sanderiana with a pair of its blood-stained flowers coming out between the bars of the hanging basket.

The seedling odontoglossums were good and interesting, and some of these were from a cross between two fine forms of O. crispum, i.e., O. c. Alfonso and O. c. Franz Mazerell. Among the several resulting from this cross one stood out pre-eminent, and it was named O. c. Coronation. In form and colour it commends itself to the connoisseur, while to the man in the street its rounded outline, deep red-brown markings, blush ground colour, and fringed petals appeal none the less strongly. O. Pescatorei was well represented, and there was one particularly fine white variety.

We peeped into a few of the houses behind the winter garden and saw minute odontoglossums from seeds sown last September, growing by the hundreds, while tiny plantlets were present by the thousands, and houses were filled with interesting cypripedium and cattleya and lælia hybrids. One odontoglossum that should become popular is the result of crossing O. Edwardi and O. ardentissimum; this blooms at a very early stage, and in many cases the first flowering bulb was pushing a pair of sturdy spikes. The latter are long, and carry flowers of great beauty, and in which the characteristics of the two parents are very evident.

NEW BOOKS.

AUSTRALIAN PLANTS.

By W. R. Guilfoyle. Whitcombe and Tombs, Lim., Melbourne and London.)

This important work is from the pen of the late Director of the Melbourne Botanic Gardens, and in the introduction he informs his readers that the principal feeling which has inspired the preparation and publication of the book has been a desire to arouse increased enthusiasm in regard to the Australian Flora, which, in his opinion, is the most varied, wonderful, and beautiful in the world. The grandeur of the trees, and the exquisite beauty of the shrubs that are met with in all the States of the Commonwealth are generally admitted, and the author is strongly of the opinion that the many kinds which are capable of adapting themselves to the climatic conditions that obtain in the several States should be taken full advantage of in the planting of parks and gardens. He directs attention to the fact that there are many hundreds of kinds, at once interesting and beautiful, that can be successfully grown in any of the States, and he naturally regrets that so many of them should be so often neglected in the planting of parks and gardens, in favour of exotics, which in the majority of cases are less picturesque, and not so well adapted to the soil and climatic conditions that obtain. Upwards of 2,000 species are enumerated and briefly described under their scientific names, and the popular names given in connection therewith, and a section of the book is devoted to the latter, these being arranged in alphabetical order, and accompanied by the scientific names. There are several hundred photographic reproductions of specimens of the more notable kinds, and these add much to the value of the work, which should be in the hands of all who are interested in the ornamental plants that have a place in the Australian Flora.

THE BEGINNER'S BOOK OF GARDENING.

By Harry Roberts. (John Lane, The Bodley Head, London.) Price 2s. 6d. net.

This volume of the series of "Handbooks of Practical Gardening" "aims," we are told in an introductory note, "at providing a sufficiency of accurate information to enable the gardening beginner to grow ordinary flowers, fruits, and vegetables with understanding and success." In his endeavour to accomplish his object, the author has written a series of short articles on the various subjects to which those who would achieve success in gardening must give attention. These articles are instructive, pleasantly written, and of value for their suggestiveness, but it appears to us that it would have been an advantage to the beginner had the cultural requirements of some of the subjects been set forth in greater detail.

RHODODENDRONS AND AZALEAS.

By William Watson. (T. C. and E. C. Jack, 14, Henrietta Street, London.) Price 1s. 6d.

As observed by Mr. F. W. Moore in the admirable preface he has contributed to this work "it is difficult to understand why a book on rhododendrons, within the means of ordinary garden folk, has been so long in making its appearance." The reason may or may not be that the number of persons qualified to perform the task is comparatively few, but with this point we need not greatly concern ourselves. We know that Mr. Watson's knowledge of the history and development of rhododendrons and azaleas is at least unsurpassed, and that he is fully acquainted with all that relates to their propagation and cultivation. It is well known that he is equally familiar with the large number of species and hybrids that are now in cultivation, and the book affords ample evidence, if such was wanted, that he has the facility in a marked degree of conveying to others the remarkable store of information at his command in a clear and highly interesting manner. In a series of twelve chapters Mr. Watson deals with the botanical characteristics of these two important classes of shrubs, rhododendrons, hybrids, famous collections, cultivation, Ghent and Mollis azaleas, Indian azaleas, Javanicum hybrid rhododendrons, rhododendrons for cool houses, miscellaneous hybrids, and cultivated hybrids.

The book is illustrated with eight coloured plates.

THE FEEDING OF CROPS AND STOCK.

By A. D. Hall, M.A. (John Murray, Albemarle Street, London). Price 5s.

This work forms an admirable companion to Mr. Hall's books on "The Soil" and "Fertilizers and Manures," and cultivators who possess the three volumes which, it may be mentioned, are uniform in price and style, will have equipped themselves for dealing with the various problems associated with the soil and its cultivation as they arise. As the Director of the Rothamsted Experimental Station Mr. Hall is in a position to draw upon the results of a very number of experiments, both in the laboratory and in the field, and thus present to his readers first-hand information relating to the feeding of crops, the feeding of stock, and the relative value of the residual products of the various kinds of food utilised in the feeding of stock. Although the title of the book suggests that it is more immediately concerned with agriculture than horticulture, ten of the fourteen chapters contain information that is of equal importance to both gardeners and farmers, and in the remaining four there is much that the gardener may study with advantage. It is no dry-as-dust statement of great scientific truths relating to the food requirements of crops and stock that Mr. Hall presents to his readers, but a work not less remarkable for its interest than for its scientific value.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

SKIN DISEASE AND PRIMULA OBCONICA.—C. R., Hampstead: We know of no special specific for the alleviation or cure of the rash produced by contact with Primula obconica foliage. Your best plan will be to consult a doctor, and tell him what you consider the cause of the skin eruption; you should also most carefully avoid contact with the primula. Some people are very susceptible to the acid poison contained in the hairs of P. obconica leaves; others handle the plants and leaves with impunity and suffer not the slightest irritation; we ourselves have never experienced the slightest trouble, and we frequently handle our modest stock of two dozen plants, and potting is done without any protection to hands or arms. If any of our readers who are liable to suffer from handling Primula obconica have found a special cure for the trouble, we shall be glad to hear from them.

SPENT HOPS AS MANURE.—M. H. D., Maidstone: Spent hops have practically no value as manure, but are nevertheless useful in the garden, where they can be obtained for carting. By their decay they add humus to the soil, and a good application, an inch or more thick, makes a capital mulch for nearly all flower and vegetable crops. The material should be put on the soil at the end

The Spray is broad and fine as a mist.

The double delivery nozzle of the Pine Spray Syringe bends up or down, this way ‿ or that ⌝ on a joint that is as soundly made as a high pressure steam cock. And delivery of the fluid can be made through an insecticide spray as fine as a mist, or through an ordinary watering rose, by merely half turning the syringe bodily in the hand. Every spraying combination required in Greenhouse or Garden can be obtained instantly without the removal or addition of a single fitment.

You can see it before you buy.

By writing to us, your ironmonger or seedsman can obtain a syringe for your inspection. Neither he nor you are under any obligation to buy if you are not satisfied that it is the most convenient, effective, and best made syringe you have ever seen.

ROBINSON'S PATENT
PINE SPRAY SYRINGE 10/6
(GUARANTEED)

Send for illustrated list to ROBINSON BROTHERS, Ltd. 20 'est Bromwich

of the present month, after a good rain or a good watering.

APHIS ON PEACHES.—J. C., Haileybury: Forcibly wash the trees by means of a hose or garden engine, and the following day spray the trees with a solution of quassia and a little soft soap. Within a week use the engine or hose again, and mulch the root area with half-decayed manure, provided the soil is comfortably moist.

PLANTING OUT FORCED DAFFODILS.—W. M. S., Harlow: If the plants have been placed in a cold frame, or given some protection from cold weather, they may be at once planted out in shrubbery borders, the semi-wild garden, or other places where flowers will be effective and welcome another spring. Plant each potful as it is, and do not attempt to part the bulbs one from the other; give a good watering after planting, and do not remove the foliage until it has quite died down. By the exercise of a little care and forethought many parts of the garden may be made bright in spring time at little expense if the bulbs flowered in pots are saved.

DEFECTIVE APPLE BLOSSOM.—D. N. M., Halstead: On the shoot sent we found evidence of the work of the apple blossom weevil, and there were aphis and looper caterpillars present. Under the circumstances you should spray the tree with a nicotine or quassia solution at intervals, as necessary, and next winter give it a winter dressing.

BLISTERED PEACH LEAVES.—M. E. J., Ross: The curling of the foliage is due to the action of a fungus known as Exoascus deformans. Where the leaves are very badly affected cut back the growth bearing them and burn at once. If the attack is light, remove and burn the curled leaves and encourage the tree to grow by syringing it freely, and paying prompt attention to watering, thinning, and disbudding.

BEST DOZEN DARWIN TULIPS.—B. W. S., Buxton: You have set us a very difficult task, because there are so many things to be considered before making a selection of the best dozen Darwin tulips. There are such matters as expense and taste to be kept in mind. We gather, however, that you want a really good selection of twelve varieties, and if that is so we can recommend the following: Clara Butt, salmon-pink; Erguste, heliotrope; Mr. Farncombe Saunders, crimson; King Harold, ruby crimson; La Candeur, creamy-white; Leonardo da Vinci, deep maroon; Mdme. Krelage, rosy-pink; Margaret, soft rose; Millet, crimson-maroon; Pride of Haarlem, rich red; Suzon, pink, shading to silvery pink; and Van Poortvleit, deep rose. To these you should add such bright May-flowering tulips as Bouton d'Or, Gesneriana lutea, Golden Crown, Inglescombe Pink, Inglescombe Scarlet, Jaune d'Oeuf, La Merveille, Mrs. Moon, Parisian Yellow, Picotee, Scarlet Emperor, The Fawn, and Vitellina. Pay a visit to a nursery where tulips are grown, or to the Temple Show, where, if the weather is not too bright and hot meantime, many of these grand May-flowering tulips will be on view.

SPORT FROM PELARGONIUM CLORINDA.—A. W. A., Hungerford: The sport is a very beautiful one, and the colour of the flowers should make it at least as popular as its parent. Under "Forthcoming Engagements" you will see the dates of the meetings of the Royal Horticultural Society, and you can decide at which one you will show your plants, previously notifying the secretary of the R.H.S., at Vincent Square, Westminster, S.W., of your intention to exhibit. If June 6 would suit the plants that would be a good day to show them for an award at Westminster.

NAMES OF PLANTS.

A. R., Clifton.—Pæony mollis.

A. M. R., Cirencester.—1, Viburnum Tinus lucidum; 2, Alyssum saxatile citrinum.

S. F., Ely.—1, Trillium grandiflorum; 2, Anemone alpina; 3, Cerastium alpinum.

F. N. J., Bletchley.—1, Arenaria balearica; 2, A. montana; 3, Phlox subulata; 4, Iberis sempervirens.

G. M. W., Lechlade.—1, Cattleya Skinneri; 2, Viola gracilis; 3, Pyrus Schiedeckeri; 4, Stylophorum diphyllum.

F. G. W., St. Austell.—1, Rhododendron Falconeri; 2, Andromeda cassinefolia; 3, Kerria japonica; 4, Magnolia Soulangeana nigra.

NOTE OF THE WEEK.

◆

The Temple Show.

As we write, the early summer exhibition of the Royal Horticultural Society is being held in the historic gardens of the Inner Temple, and the enormous display of ornamental plants, cut flowers, and other products of the garden that are available for exhibition at this season, and the immense concourse of visitors testify in no uncertain manner to the continuation of the popularity which these great gatherings have enjoyed during the past twenty odd years. The present show suggests an increase rather than a diminution in popularity, and it would appear that it has created more interest in the minds of horticulturists, and indeed of all who take an active interest in gardening from the fact that it completes the first series of exhibitions held on lines wholly different from those which were previously followed. Horticulturists, knowing how great is the value of the work these shows have accomplished, have not unnaturally been anxious to see the last of the first series, and many visitors are asking each other when and where the second of the series will be commenced. There, however, does not appear to be any cause for anxiety upon either of these two points. We know the splendid work the present Council has accomplished during the past two decades, and with this knowledge we may well rest content, with the assurance that whatever the Royal Horticultural Society can do for the advancement of gardening the Council will enter heartily into the task of accomplishing. The fact that there will be no Temple Show in 1912, is, as many of our readers are aware, due to the holding of a great International Horticultural Exhibition at Chelsea in May of next year. The Council is giving this project substantial financial support, and, to still further assist in making it a complete success, have decided not to hold the usual Temple Show, and thus leave the International Exhibition Committee in possession of the field. That this was a wise decision there can be no doubt, and it is all the more worthy of commendation from the fact that it was made before the scheme was submitted to public notice. Two decades is not a long period in the life of a nation, or, indeed, in that of a society whose centenary was celebrated six years ago. Yet the advances that have been made in horticulture during this period, as exemplified by the annual exhibitions in the gardens of the Inner Temple, are little less than marvellous. Some classes of ornamental plants that could not well be spared have, as the result of a change in public taste, practically passed out of cultivation. For example, the highly attractive show and fancy pelargoniums, the elegant heaths, and many hard-wooded plants on which past generations of cultivators lavished their skill and attention, no longer grace the Temple Shows, and are but seldom seen at the exhibitions in the provinces. In their place, we have new races of orchids of abounding interest and wondrous beauty that have been created by the skill and painstaking endeavour of the hybridists, and for a long number of years orchids have contributed a feature equally remarkable for its extent and surpassing beauty. These fascinating plants have, as usual, been staged in immense numbers, and, as the art of arranging orchids at exhibitions has been highly developed within recent years, visitors have had an opportunity of enjoying the diversity of form and colour of their flowers under the most favourable conditions. The perpetual-flowering carnations, which also were splendidly shown, practically belong to the period over which the Temple Shows have extended, and, as one admires the collections of finely developed flowers, the mind is filled with admiration of the skill and painstaking effort by which such splendid results have been obtained. Roses also have been greatly increased and improved, and their cultivation so modified as to enormously extend their usefulness for exhibition purposes and house decoration, and the numerous collections that are now annually contributed to these exhibitions add greatly to their interest and attractiveness. The groups of formally trained plants that were usually shown in pre-Temple Show days were such as to evoke considerable admiration, but the effect they produced fell far short of the delightful arrangement of ramblers and dwarf plants. Moreover, the specimens that delighted rose lovers in bygone days could only be seen at a few of the more important exhibitions, and some of the principal nurseries; but the specimens that find favour at the present time are just as useful for house decoration as for exhibition, and they are now largely grown in gardens and nurseries for that purpose. Their cultivation for commercial purposes has indeed attained such proportions as to constitute a considerable industry, and it may be assumed that some thousands of specimens of the various ramblers will be used for decorative purposes in London alone during the next few weeks. We have special pleasure in mentioning these facts, because while the Temple Shows have afforded full opportunities for demonstrating their usefulness, the GARDENERS'

SIR MARCUS SAMUEL, BART.

Magazine published the first article in which attention was directed to their value, and directions given for their production. Equally as remarkable as the advances in orchids, perpetual carnations, and roses has been the progress with hardy flowers which are now shown more largely than was previously the case, and in a really tasteful manner. It was for a considerable period a reproach that plants from the border and rock garden were so crowded together on the stages as to afford an indifferent idea of their distinctive characteristics or charms. But now we see them arranged on rockeries or in groups according to the positions they occupy in the garden, and while producing an effect that at once attracts attention, visitors have an opportunity of formulating an opinion as to their merits. The methods of staging cut flowers of hardy plants have undergone considerable improvement within recent years, and there is now less crowding in the vases and in the collections, and exhibitors appreciate the importance of eliminating flowers and varieties that are second rate. It would be interesting to refer to the fine displays of hardy trees and shrubs that now form so distinct a feature, as at the earlier shows they were practically unrepresented, and to the several classes of soft-wooded plants requiring glass culture that have been created. Our present object, however, is to briefly direct attention to a few advances that have been made, mainly through the influence of the first series of Temple Shows, to express the hope that the next series of similar shows will be not less prolific of good results, and to heartily congratulate all concerned on the splendid results that have been obtained by their efforts during the past two decades.

Sir Marcus Samuel, Bart., who presided so ably at the festival dinner of the Gardeners' Royal Benevolent Institution on Tuesday, has a great love for horticulture, and is the happy possessor of a fine garden at The Mote, near Maidstone, in Kent. In the world of finance, and of commerce, Sir Marcus Samuel has an unique reputation for rapid decisions and cash payments. He has travelled widely, and his knowledge of Japan and the Far East is peculiar and extensive, and here, as elsewhere, he has been quick to grasp the possibilities of new countries and the advance of civilisation. Many honours have fallen to him, both for his commercial integrity and astuteness, and for his benevolence. As Alderman and Sheriff of the City of London he did excellent work, and as Lord Mayor of our great capital in 1902-3 he set his successors to that high office a splendid example of devotion to duty. Sir Marcus is a Freeman of Sheffield and Maidstone; he was knighted in 1898 for services rendered to H.M.S. "Victorious," and created a baronet in 1903. He has also been honoured in other lands, and is Commander of the Order of Leopold of Belgium, a Grand Officer of the Legion of Honour, and a Knight Commander of the Order of the Rising Sun of Japan. It was a distinct innovation to hold the festival dinner of the senior gardening charity in the heart of the City of London, and this was due to the efforts of Sir Marcus Samuel, who secured the famous Grocers' Hall, belonging to the Worshipful Company of Grocers, for the occasion.

New Superintendent of Greenwich Park.—We learn that Mr. Thomas Hay, head gardener to the Marquis of Linlithgow, at Hopetoun House, has been appointed Superintendent of Greenwich Park, and will enter upon his new duties about the middle of June. This important position is held under his Majesty's Office of Works. Mr. Hay is an accomplished gardener, as these pages have shown on many occasions, and in our issue of October 2, 1909, we presented our readers with his portrait. Mr. Hay will be greatly missed in the Edinburgh district, as he has ably supported the Royal Caledonian Horticultural Society and the Scottish Horticultural Association, and has been a member of the council of each body. We congratulate Mr. Hay on his appointment, and, knowing something of his work at Hopetoun, we feel sure he will fill his new position with credit to himself, and advantage to the famous old park he will control. As evidence of the excellent relations which exist between Mr. Hay and his noble employers, it may be mentioned that he was entrusted with the task of selecting his successor. His choice fell upon Mr. John Highgate, head gardener to the Marquis of Tweeddale, Yester, Haddington, and there can be no question as to his judgment, for Mr. Highgate is a gardener of great ability.

Chestnut Sunday in Bushey Park.—Notwithstanding the dull and rather cool weather experienced on Sunday, May 21, very large numbers of people, largely Londoners, paid a visit to Bushey Park to see the horse chestnut trees in bloom. The trees are finely in flower this year, and will be worth a visit any time during the coming week, unless a severe wind storm should arrive meanwhile. The famous avenue, which is a fe wyards over a mile in length, was planted by the famous architect, Wren, for King William III., in 1699, at a cost of £3,300, while access to the park itself is said to be due chiefly to the efforts of Timothy Bennett, a shoe maker, who, "unwilling to leave the world worse than he found it, by a vigorous application of the laws of his country obtained a free passage" through it.

North of England Horticultural Society.—This society has a series of reviews of the horticultural journals in its "Magazine" for April, and the Gardeners' Magazine receives an especially favourable notice of its interesting and instructive articles during April. The reviewer concludes, "We tender our heartiest thanks to the Editor and staff of the magazine, which they so thoroughly deserve, for the able and timely assistance they so willingly rendered our society throughout its initial stages of progress." A list of the officers and committee of the society, and also of the Fellows and Associates, are given in this issue; there appears to be about 258 subscribers so far, evidence of good progress, but also evidence of the need for plenty of steady spade work to place the society on a proper foundation.

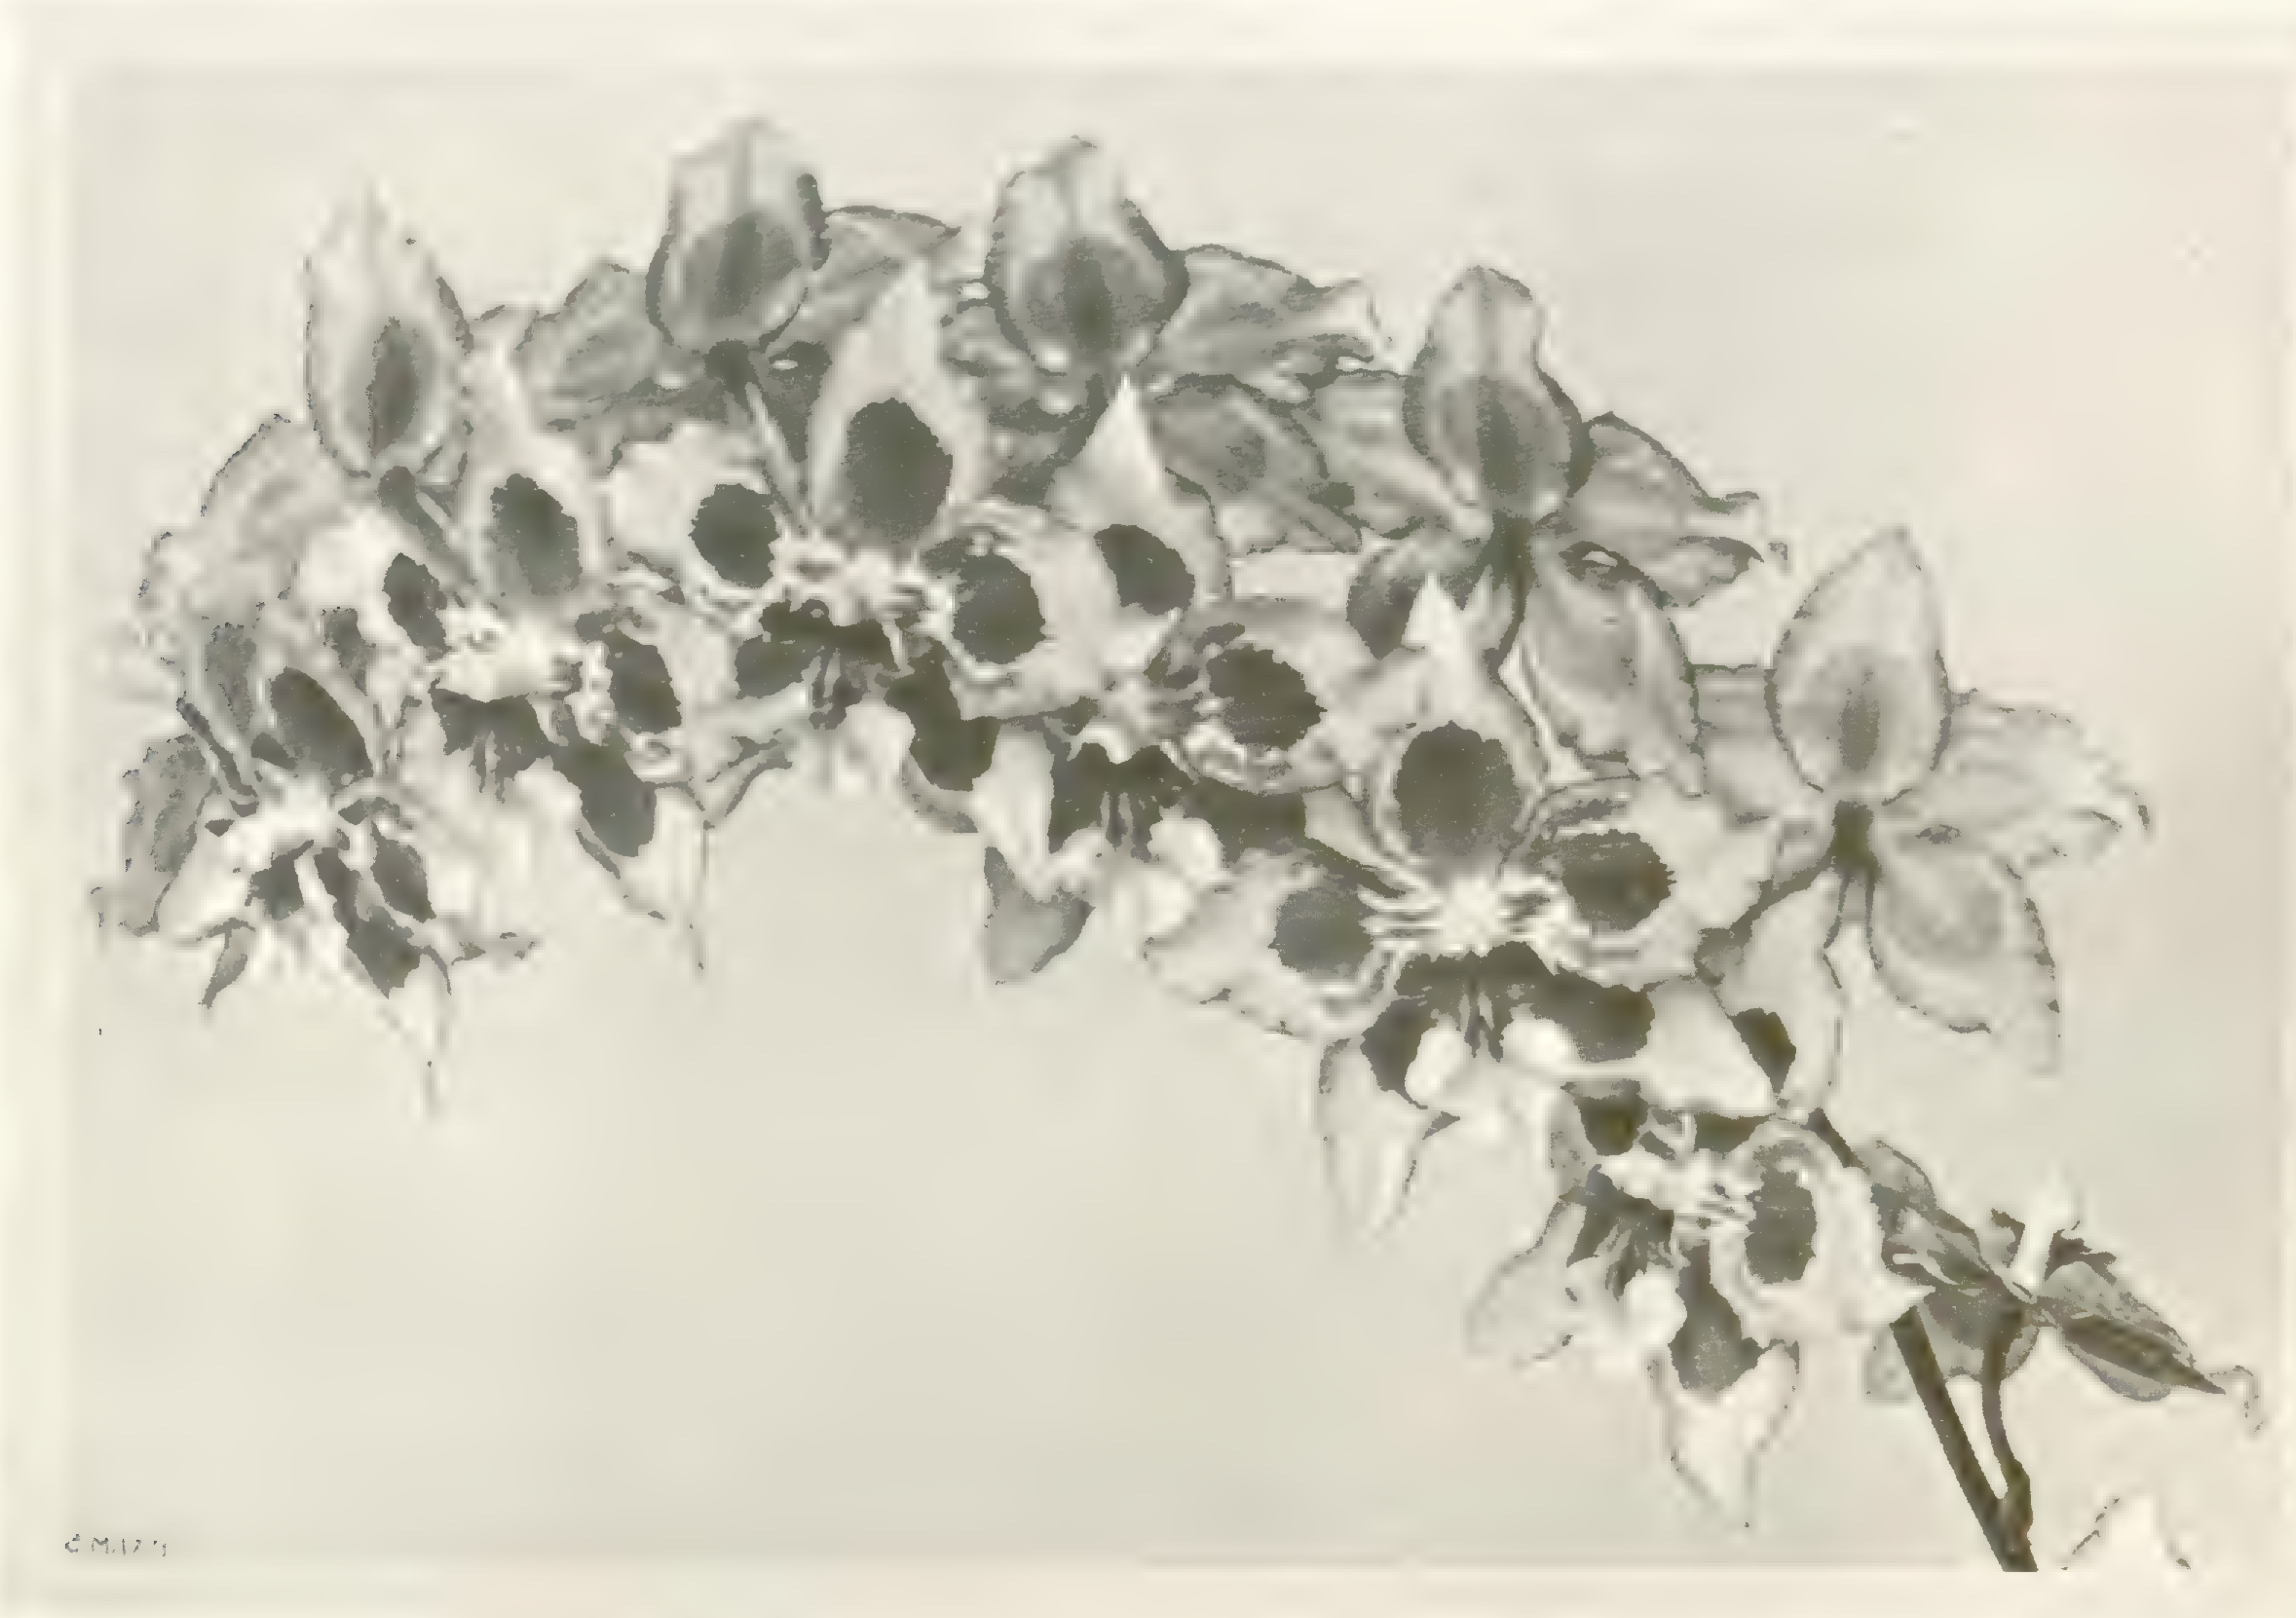
Perpetual-flowering Carnations.—Mr. Laurence J. Cook asks the question: "Do exhibitors carefully read their schedules?" and adds that in order to make the exhibition of the Perpetual-flowering Carnation Society as universal to members as possible, a new section was opened for the last display, allowing those residing over fifty miles from London to send their blooms to the show, when the society undertook to stage them. The classes in this section might be described as "soft things" for anyone growing fairly good blooms had a good chance of success, but such a few entered that a comparatively small number of members could have noticed the innovation. It is interesting to notice that one competitor, sending a few flowers from as far as Lancashire, managed to secure five first prizes in this section. The same classes are open for competition at the December show, and no doubt, when better known, there will be good and instructive competition in this section.

Wye College. — The half-yearly meeting of the Governors of the South-Eastern Agricultural College was held at Wye, on Tuesday, May 16, the right Hon. Lord Ashcombe presiding. The Principal reported that 124 students were in residence, and that since the January meeting five old students had received appointments at home and abroad. Ten students entered for the Professional Associateship of the Surveyors' Institute in March, and the following nine were successful: W. Adam, W. B. Barling, R. Edwards, R. A. Hay, C. G. Kibler, F. W. Page-Roberts, L. H. Pyke, A. L. Tate, and W. T. Trench. An increased grant from the Board of Agriculture, and a grant for research work from the Development Commissioners, were reported, and it was decided that it would be necessary to erect further temporary buildings for the accommodation of students until the formalities for the erection of the permanent new block were completed.

Variation in the English Climate.—To the recent monthly meeting of the Royal Meteorological Society Mr. W. Marriott contributed a highly interesting paper on the variation in the English climate during the thirty years ended with 1910. Mr. Marriott stated that in 1874 the Royal Meteorological Society commenced the organisation of a series of "second-order stations," at which observations of pressure, temperature, humidity, rainfall, and wind are made twice a day—viz., at 9 a.m. and 9 p.m. In addition to these, another class of stations, termed "climatological," at which observations are made once a day—viz., at 9 a.m.—was organised in 1880. The monthly results from all these stations have been recorded, and Mr. Marriott has taken the general monthly means of these results as representing the means for England and Wales, and these general means were exhibited in the form of a series of diagrams, in which the variations of the various elements for each month were shown in red when above the average, and in blue when below the average, for the thirty years. The warmest months were August, 1899, July, 1900, and July, 1901, while the coldest months were February, 1895, January, 1881, and December, 1890. During the last fourteen years the temperature in October was above the average, with only one exception, viz., 1905. The years with the highest mean temperature were 1898, 1893, and 1899, and the years with the lowest temperature were 1892, 1888, and 1887. The month with the highest mean pressure was February, 1891, and that with the lowest pressure was March, 1909. On the average, April is the month with the least rainfall, and October the month with the heaviest rainfall, while June has the least number of days of rain. The wettest months during the thirty years were October, 1903, and October, 1891, and the driest months were February, 1891, and April, 1893. The years with the heaviest rainfall were 1903 and 1891, and the years with the least rainfall were 1887 and 1893. The wind diagrams showed that the prevailing winds were from the south-west and west, but that in April, May, and June north-easterly winds were more pronounced than in the other months of the year.

Outdoor Trials of Perpetual-flowering Carnations. — During the past two years the Perpetual-flowering Carnation Society conducted trials of a considerable number of the perpetual-flowering varieties in the gardens of the

Royal Botanic Society, Regent's Park, with a view to determine their relative merits for outdoor culture. In the trial conducted in 1910 three sets of plants were grown, the first comprising those rooted in May, 1909, planted out in June, lifted in October, wintered under glass with a temperature ranging from 40 to 50 degrees, and planted out again in May, 1910. The second set consisted of plants raised from cuttings in October, 1909, and grown under glass, and finally shifted into 48 size pots, stopped once, and bedded out in June, 1910. The third set consisted of plants that were raised from cuttings rooted in January, 1910, grown on, and finally put into 60 size pots, and stopped once. The plants belonging to the first section being well established and full of buds, and planted in May at once became effective, and flowered freely throughout the summer. The report which is published in the society's "Year Book" does not refer to the second and third sets of plants, except that the plants were inspected late in September by the committee, "when they were in a healthy condition, full of bud, and the majority having a good number of blooms." Thirty-four varieties were included in the 1910 trial, and the following were the most effective: Britannia, Fair Maid, Fiancée, Helen M. Gould, Jessica, Lady Bountiful, Mrs. H. Burnett, Pink Imperial, Rival, Superior, White Perfection, and Winsor.



TEMPLE SHOW—ODONTIODA VUYLSTEKEI CORONATION.

The flowers are large, richly coloured rose-red on a light rose ground. F.C.C., R.H.S., May 23.
Exhibited by Mr. Ch. Vuylsteke.

A Flower Show on the Thames.—The Thames Valley is well known for its beauty, but this year a grand floral and dramatic fête is to be added to the many other attractions. The River Thames Flower Show, to be held on Tagg's Island, close to Hampton Court, on June 7 and 8, promises to be a great success. It is to be opened by H.R.H. the Duchess of Albany, and there is a lengthy list of patrons. Although only fifteen classes have been arranged, the prizes are sufficiently substantial to attract the best growers. Carnations, sweet peas, and roses are the flowers chiefly catered for, but there are classes for a rock and water garden, for a group of hardy flowers, and also for floral designs, while in the class for nurserymen only, where an area of 200 square feet will be provided, and this may be filled as the skill and taste of the exhibitor dictates, the premier award is a £20 cup. In addition, there are prizes for the best decorated houseboat moored to Tagg's Island and for the best decorated craft. The proceeds of the show and dramatic fête will go to the funds of the League of Mercy. Mr. C. W. Kent is the flower show secretary, and his address is Fête Office, Tagg's Island, Hampton Court.

The Age of Trees, as estimated from the number of concentric rings shown in a section of the trunk, is not easily determined in Queensland. Mr. F. A. Bailey, the Government botanist at Brisbane, recently stated that the usual method of calculation by means of these rings could not be relied upon in Queensland, because in certain seasons more than one ring may be formed, and on the other hand, one ring might under certain conditions take more than a year to form.

Club Root Disease.—The prevention of club root in turnips and other crops subject to the disease has been fully investigated at the West of Scotland College Experiment station, and the recently issued report confirms the conclusions arrived at from earlier experiments that the disease can be checked by liberal dressings of lime. The lime was found the most effective when applied to the land in the autumn preceding the cropping of the land, and lime slaked in the ordinary way gave the best results, and was cheaper than ground lime.

BRYANTHUS EMPETRIFORMIS.

This pretty little ericaceous plant grows into a low bush scarcely more than six inches high, but it spreads horizontally to form a good-sized patch. Either on rockwork or growing as an ordinary border plant it is equally effective, and during late April and early May forms a charming feature when covered with its reddish nodding flowers. It is an American plant, being found from British Columbia to California, and has long been in cultivation in British gardens, though it does not appear to be common. Like other plants belonging to the same family, it thrives most satisfactorily in peaty ground, though good results may be obtained from loamy soil, providing lime is not present in any appreciable quantity.

Propagation may be effected by means of cuttings of young shoots an inch or so long, taken in July or August, and inserted in pots of sandy peat in a close frame. Roots ought to be formed in from six to eight weeks, and the young plants prove most satisfactory if kept in a cold frame through the winter, planting them in a well-prepared border, either outside, where shade from bright sun can be given, or in a cold frame the following spring. B. Breweri and B. taxifolius are two other desirable species, while B. erectus is a showy and rare hybrid between B. empetriformis and Rhodothamnus chamæcistus. D.

Aubrietias are usually in great demand for the spring beds, and to maintain a good stock of plants, cuttings should be rooted annually. These should be taken immediately the plants finish flowering. The young growths provide the most suitable material, and these should be dibbled into sand in a cold, shady frame, and kept moist and close.—E. C. Pooley.

ROYAL GARDENERS' BENEVOLENT INSTITUTION.

The seventy-second festival dinner of the above institution was held at the famous and splendid Grocers' Hall, Princes Street, City. There was an unusually large company, under the presidency of Sir Marcus Samuel, Bart., who was supported by Sir J. Colman, Sir Edward Stern, Rt. Hon. Colonel Lockwood, M.P., Sir G. Wyatt Truscott, Sir Chas. C. Wakefield, Sir Albert Rollit, Mr. Harry J. Veitch, Mr. L. Solomons, Mr. W. Fremlin, Mr. Oscar Berry, Mr. Ebblewhite, Mr. W. Cobb, Mr. J. G. Veitch, Mr. W. A. Bilney, Mr. W. Poupart, Mr. W. Iceton, Mr. Jas. Hudson, Mr. W. Y. Baker, Mr. W. Ingamells, Mr. H. B. May, Mr. J. Rochford, Mr. Alderson, Mr. Alderman Piper, Mr. G. H. Barr, Mr. W. Barr, Mr. G. Mowis, Mr. Hiehle, Mr. Segar, Mr. A. Watkins, Mr. A. J. Wood, Mr. N. F. Barnes, Mr. A. McKellar, Mr. Owen Thomas, Mr. J. McLeod, Mr. W. Cull, Mr. C. R. Fielder, Mr. A. Bedford, Mr. Leopold Salomons, the Rev. Boscawen, etc.

The Chairman had a hearty reception when he proposed "Success to the Gardeners' Royal Benevolent Institution." He referred gracefully to the presence of the ladies, and to the Grocers' Company for so kindly placing the hall at their disposal, and thanks for the presence of the Master of the company. He hoped all present understood the objects of the meeting, and the work of the institution among necessitous horticulturists and their widows. There were 246 pensioners in all, and the annual expenditure of £4,500 was incurred in their support. In addition to permanent benefits, the institution made grants from its Good Samaritan and Victoria Era Funds, which assisted those approved candidates awaiting election. The regular income amounted to about £1,000 a year, hence the great need of large donations. He referred to the great International Exhibition of 1912, and said it would not look well if, while entertaining our foreign guests royally, we omitted to care for needy horticulturists. He hoped the ladies present would induce the gentlemen to give liberally to the funds. The Chairman set a fine example in brevity, and he concluded by expressing regret at the absence of Mr. A. W. Sutton, Mr. R. Sydenham, and Mr. G. Monro, and by appealing strongly for a bumper donation list.

The response to this toast was once again in the hands of Mr. Harry J. Veitch, the treasurer, who received a particularly hearty reception. He very cordially thanked Sir Marcus Samuel for presiding in a year when everyone was so busy and had so many calls. He also thanked the chairman for obtaining the Grocers' Hall, and for his suggestion that ladies should grace the proceedings. Further thanks from the gardeners of England, their wives and sweethearts, were accorded to the Grocers' Company. Mr. Veitch said this was his twenty-fifth year of office as treasurer, and he pointed out how great had been the advance of the institution during that period, an advance due to the hard work of a very excellent committee, and the hard-working secretary, Mr. G. J. Ingram. The institution was essentially a benevolent one, and not a benefit society. There were no costly buildings to maintain, and, with the exception of the amount needed for management expenses in the London office, all the money went to the support or assistance of the needy. Mr. Veitch referred to the advantage obtained by those who have subscribed before the evil days come, and also pointed out other leading points in the rules of the institution, such as that a candidate might have an income of not more than £30 a year, and so not be absolutely destitute. The work of the Good Samaritan and Victorian Era Funds was reviewed, and it was pointed out that in 1886, when Mr. Veitch became treasurer, there were 118 pensioners, and now there were 246 on the funds, 192 of whom were widows of gardeners. The pensioners usually lived with their relatives, and therefore the £20 or £16, as the case may be, came as a great help to the family. The oldest pensioner was a widow, 97 years of age, her husband and she had received altogether £394 in return for a donation of 25 guineas made long years ago. He maintained that the institution was doing a grand work, and a necessary work. The invested funds amounted to £50,000, an amount quite necessary in view of the liabilities now incurred. Mr. Harry Veitch praised the work of the auxiliaries, and he suggested that the ladies might form an auxiliary among themselves, and so enable all the approved candidates to be elected at the next election.

"The Ladies and Visitors" was admirably proposed by Sir Albert Rollit, who made an excellent and humorous speech, and the response was in the able hands of Sir George Wyatt Truscott, Bart.

The subscription list included such donations as 100 guineas from the chairman, 100 guineas from Messrs. de Rothschild, £150 from Mr. N. N. Sherwood and his sons,; Messrs. Sutton and Sons, £100; Mr. A. W. Sutton, 20 guineas; Mr. Salamans, 20 guineas; Mr. L. Sutton, 20 guineas; Sir G. W. Truscott, 20 guineas; Sir Ed. Stern, £20; Mr. H. J. Veitch, 20 guineas; Sir J. Colman, 20 guineas; Mr. J. Hudson, £27; Mr. Lane, £15; Messrs. Wood and Sons, £35; Mr. A. MacKellar, £20; Mr. A. Waterer, £25; and Mr. McLeod, 10 guineas. Then followed a long list of subscribers of 10 guineas and downwards until the whole magnificent total came to the splendid sum of £2,400. The Covent Garden friends were again to the front; Mr. Ingamell's table realised £100, and Mr. Rochford's table £209.

Mr. N. N. Sherwood proposed the health of the Chairman in very kindly and pleasing terms, and the toast was honoured in a most enthusiastic manner, and with cheers for Sir Marcus and Lady Samuel.

Sir Marcus Samuel briefly responded, and expressed his pleasure that so fine a record of subscriptions had been established. He concluded with thanks to all who had contributed flowers and plants to the decoration of the hall, and which had been so beautifully arranged by Mr. Leopold de Rothschild's staff of gardeners at Gunnersbury, led by Mr. Bedford, the foreman under Mr. Hudson, at Gunnersbury House.

The musical arrangements were once more in the able hands of Mr. Herbert Schartau.

The Grocers' Hall was built in 1427, destroyed by the Great Fire of London, 1666, except the garden turret, in which were preserved the records and muniments of the company. It was rebuilt in 1668, the third hall was erected in 1802, and the present beautiful one in 1893.

TEMPLE SHOW—GOLD MEDAL COLLECTION OF HERBACEOUS CALCEOLARIAS, STAR CINERARIAS, ETC.
Exhibited by Messrs. Sutton and Sons.

SOME OF THE NEWER ROSES.

It is not always safe to write much in favour of new roses until they are thoroughly tested, but the following are undoubtedly good varieties, or they would not have proved so satisfactory last autumn, winter, and the present spring under glass. Short as this test has been in several cases, I have no hesitation in giving the accompanying notes:

Miss Alice de Rothschild.

This variety is growing very freely, and certainly promises to be a good bedder, if one is to judge from its habit and freedom in blooming. The buds in the open stood the weather equally with the majority of other roses, and this alone is much in its favour. The flowers have been a strikingly clear citron yellow. This has been described as a dwarf Maréchal Niel; but, unlike that grand old favourite, it is evidently a continuous bloomer.

TEMPLE SHOW—ROSE A. R. GOODWIN.
An effectively-coloured variety belonging to the Pernetiana group. The flowers rich cream colour with orange-red centre. Exhibited by Messrs. Paul and Son.

Beaute de Lyon.

A variety that has been very good this spring. Although a very globular flower, it has opened better than most varieties, and its globular form does not seem likely to detract from its usefulness in the open. The flowers are coral-red, shaded with old gold and yellow. It is quite distinct, and with much of the growth and deep green foliage so characteristic of Soleil d'Or, from which it descended. I am afraid, however, it will be troubled with the blackish-brown spots too often found on Soleil d'Or, as some have appeared among our batch of pot plants. The flower lasts well, and the variety is good for pot culture.

Miss May Kenyon Slaney.

A variety that has large and particularly well-shaped blooms. Blush-pink, with rich creamy ground, the shades blending in a very pleasing manner. It has the peculiarity of bronzy-coloured thorns and deep green foliage. Such thorns are almost always accompanied by bronzy-coloured or reddish foliage. This has been really good, and is exceptionally sweet-scented.

Mrs. Herbert Stevens.

This rose resembles the Maman Cochet class in size and exquisite form. That it is a really good grower I am already convinced, and it seems destined to become one of our all round varieties, i.e., good for exhibition, garden, or pots. White, shaded with fawn and peach in the centre. Very large petals, and each one faultlessly arranged.

Mrs. Arthur Coxhead.

Another rose that promises to be useful in all forms, except as a climber. It blooms very freely indeed. Of a peculiar colour, and quite distinct; claret-red, shaded with vermilion, and does not fade quickly. Most of the flowers are borne singly, and they stand up well.

Mrs. Philip le Cornu.

A very well built-up flower of the Mrs. W. J. Grant type—from which it claims parentage—and promises to be a much better grower, and more hardy. A somewhat weak constitution is the only fault Mrs. W. J. Grant possesses, and here we have an improvement without losing any of the other good qualities. It may best be described as a clear cerise-crimson form of the old favourite.

Ethel Malcolm.

This variety has not produced a flower yet which I did not admire. It seems to be the best white hybrid tea we have for open-air culture, and is also grand under glass. Of good substance, size, and form. I mentioned this variety in a former note, so will only say that, if possible, I have formed a higher opinion of it since.

Mrs. Walter Easlea.

The flowers of this variety stand up well, and its buds are long, opening into large flowers of fairly good form. A deep crimson-scarlet, with satiny-crimson on back of petals.

J. L. Mock.

This variety will be exceptionally useful to cut from, as it is so vigorous and free, each flower carried stiff and erect. Colour, carmine, changing to imperial pink. The flowers are of similar form and substance to the well-known La France; large enough for show, and yet a good bedding and garden rose.

Mrs. Foley Hobbs.

Probably one of the best of the ivory-whites, with a clear tinge of pink on the edges. A grand rose for exhibition, and, withal, a free bloomer, while the growth is both robust and vigorous.

Viscount Carlow.

This variety gives us a peculiarly shaped flower among roses when it is expanded, camellia-formed, and rather taking in that stage. Carmine, pink, and cream are all to be found in this rose. A good grower, and likely to be good as a decorative rose only.

RHODODENDRONS.

The excellent article by "G.," in the issue for April 29 (pages 324-5) should do much to increase the popularity of these noble evergreen flowering plants. I was pleased to note the reference to the "general belief that rhododendrons, other than the pontic varieties, could not be successfully grown without the aid of peat." They certainly can be very well grown without its aid, though, as "G." advises, some should be used in districts where it can be readily obtained. In a garden overlooking Morecambe Bay, in Lancashire, I saw rhododendrons flourishing in a thin layer of shingle and yellow loam, overlying solid rocks. Many seedlings were growing on the bare rocks with their roots tightly wedged in the crevices. In another garden, also in Lancashire, hybrid rhododendrons were grown as standards on both sides of a long winding path through the pleasure grounds. Here the rooting medium was composed of gravel and rich loam, no peat or leaf-soil having been used. These standards looked charming when in full bloom, and really very ornamental when not in flower, as a healthy specimen has always a substantial and attractive appearance.

In Hampshire there are rhododendron forests—so-called on account of the immense size of the plants (chiefly ponticum varieties), and the large area covered by them, on the Earl of Malmesbury's estate near Heron Court. Here peat, loam, and gravel obtain. In another part of Hants a friend of mine commenced the formation of another forest, but the choicest varieties and hybrids were used. Some portion of this vast plantation was situated on high ground, where the soil was a natural deep loam; the other parts were situated on low hillsides and in valleys where the rooting medium was very moist, bog, peat, gravel, and a clayey subsoil obtaining. Large beds, containing one variety only, were planted, and as all the plants were well cared for during the first few years of their growth, they made good progress. It has been difficult since then—twenty years back—to tell which have done best, those on the high ground or those in the moist valleys.

I know that many persons believe it to be harmful to apply organic manures to these plants, but some of the finest specimens grown are annually top-dressed with well-rotted manure and fibrous loam mixed.

Geo. Garner.

TEMPLE SHOW—HARDY LADY'S SLIPPERS.

As shown by Messrs. T. S. Ware, Lim.

CARNATION DISEASE.

I was naturally somewhat flattered when I saw Mr. P. S. Hayward's remarks regarding my views of the carnation disease, stigmonose, because he is a cultivator of standing, and his words have considerable weight. We cannot too fully appreciate the fact, as Mr. Hayward makes plain, that these yellow marks in the leaves of our carnations, which are perpetuated in the race, are there through weakness of constitution, and are invariably the first signal of the inevitable destruction of the variety. Apparently those varieties which have a light green foliage are more prone to the ravages of stigmonose than those of a deeper and bluer shade, as are also the white and pink-flowering varieties, than those of a red and crimson colour.

That stigmonose is present through weakness is apparently undoubted. This fact was proved to me last season, when my brother came over from America and settled at Haywards Heath, in Sussex, where he founded a wholesale cut flower carnation nursery. Whilst in America he had for years held the view that all and everything in growing perpetual-flowering carnations depended upon the constitution of the stock, and so, with this idea in view, he took the greatest possible care in selecting his stock, obtaining it, in the majority of cases, from the actual raisers of the variety concerned, many of whom were his personal friends. He happened, however, to be short of a few hundred plants to fill one of his houses, and these he purchased haphazard; the difference between the two grades of stock was such that they appeared almost as distinct varieties. The foliage of the selected stock, even in such varieties as Enchantress, is perfectly clear and healthy, and the flowers have much stronger stems and calyces, also are of a deeper shade of colour. Before Christmas he had destroyed the hundreds of plants that he had bought haphazard to complete his stock.

In my opinion the main reason why there is so much inferior carnation stock about is that so many growers over-propagate by removing the tops of the young plants and inserting them as cuttings. It is wholly unnecessary for me to point out the absurdity of this act, because it must be obvious to every intelligent grower who stops to think that nothing could be more weakening to the plant. It is like a human being undergoing two serious operations within a few weeks of each other. Yet the desire of some men for a quick return is too strong for them to resist the temptation of temporary gain. The use of improper fertilisers, as Mr. Hayward points out, also plays its part.

Montagu C. Allwood.

Look Around You.

This is the simple suggestion that occurs to anyone visiting the magnificent displays the Temple Show affords, just as it is the intimation, graven in stone, that greets the visitor to St. Paul's, who stands wondering at the architectural triumph of Sir Christopher Wren.

Looking around at the Temple Gardens there is the profusion of bloom, the abundance of fruits—"the wealth" of the Dutch farmer that we translate into the desirable word *wealth*. There is dazzling radiance of colour, too, kaleidoscopic in the variety and change of its hues, that is the potent charm attracting in every direction. A look around will awaken every artistic impulse, as it will please every sense we possess.

What would the population of horticulturists do without its Temple Show, or its international equivalent? Is it affectation to add—What would the world of gardeners do without its CLAY'S FERTILIZER?

Such floral beauties as are lavishly exhibited have been fed and sustained by—have been very literally brought up upon—the Plant Food of Renown that everyone who loves and cultivates a garden is so familiar with. Eulogistic correspondents call it "CLAY'S, TRIUMPHANT CLAY'S"; others, grateful for its timely help, find it "guide, philosopher, and friend." Kindly writers they are, surely, but they simply express the thoughts of many others who rely upon this standard plant diet to furnish their plants with material for growth and power for producing flowers and fruits in due season.

These use it in their gardens and in their cultivation under glass, and so it comes to pass that when the exhibition stage is reached, when the prize is to be gained and the victory won, you have but to look around you, as you have done at the Temple Show, and, lo! you will see the results of using CLAY'S.

At this famous exhibition it is always in evidence. At the Festival of Empire it will also be seen, for its proprietors are presenting a fine artistically-designed cup, recently figured in this journal, for the premier horticultural exhibit; and there will be a remarkable competition, to judge by arrangements already in hand. Equally true will this be also at every local show where nurserymen, professional gardeners, and amateurs congregate, as even the most casual visitor will observe, if he but look around.

A more accurate description of this most useful manure could hardly be given than appears in the latest edition of "Cassell's Dictionary of Gardening," page 217, as under:—

Clay's Fertilizer.

> A perfectly safe and useful manure, containing the three chief elements of plant foods, viz., nitrogen, potash, and phosphoric acid. It is a proprietary specific in general use, adaptable to all forms of soil preparation, and is applied with advantage to plants in pots, and for the production of flowers, fruits, and vegetables grown in the open.

If the reader of these lines has not a copy of "CLAY'S SUCCESSFUL GARDENING" in his possession he will do well to obtain one. This interesting book contains contributions by the best-known horticultural writers: its speciality subjects are full of information, much of it exclusive, that is eminently practical, and for the ninepence charged for it, the cost is simply nominal. It includes a supplementary chapter entitled "CLAY'S MANURES, How to Use Them," that is of value to users of this preparation. Four complete editions of the work have already been sold; indeed, so well-sustained and rapid has been the demand for the last edition that a large second reprint is now on sale. It may be had post free from the publishers, Messrs. CLAY AND SON, STRATFORD, LONDON, E.

PERPETUAL FLOWERING CARNATIONS: Britannia, Rose Dorée, White Perfection, Black Chief, Fortuna, Mrs. Barnett etc. 3s. per doz., strong plants; post free. Ask list. C. F. A. VAN DER SLUYS, F.R.H.S., Rames, Guernsey.

By Appointment.

NEW ROSES.

WM. PAUL & SON, WALTHAM CROSS, Ltd.,

beg to call attention to their extensive collection of New Roses, including Rambling varieties, good plants of which, in pots, will be ready for delivery early in June and throughout the summer months.

WM. PAUL & SON'S New Varieties:

Florence Haswell Veitch (H.T.), **7/6.**
Frances Charteris Seton (H.T.), **7/6.**
Lady Downe (H.T.), **7/6.**
Sylvia (Hybrid Wichuraiana), **7/6.**
Alice Cory-Wright (H.T.), **3/6 to 5/-.**
Elsie (Hybrid Wichuraiana), **2/6 to 5/-.**
Juliet (Hybrid Briar), **3/6 to 10/6.**
Portia (H.T.), **3/6 to 5/-.**

New British and Continental varieties of other raisers, **2/-** to **10/6** each.

Priced Descriptive Catalogue Post Free on Application.

Also a large general collection of Roses in pots for filling vacancies in rose gardens and for pot culture, **12/-** to **42/-** per dozen; Climbers and Ramblers, **12/-** to **60/-** per dozen.

PAULS' ROYAL NURSERIES, Waltham Cross, Herts.

GERANIUMS.—Paul Crampel, large plants, 3s. doz. King of Denmark, 2s. 6d. doz. Hydrangeas 3d. each. Calceolarias and Marguerites, 1s. 3d. doz. HEAD GARDENER, 22, Charlton Rd., Blackheath.

Royal Botanic Gardens,
REGENT'S PARK, LONDON.

JOHN WATERER & SONS, Ltd.,

GREAT

EXHIBITION of RHODODENDRONS

will be opened on

TUESDAY, JUNE 6th, at 3 p.m.

BAND and PIPERS
of
H.M.'s SCOTS GUARDS.

(By permission of Colonel P. J. CUTHBERT.)

Cards of Admission to be obtained from

John Waterer & Sons, Ltd.,
American Nursery,
Bagshot, Surrey.

A Magnificent New

Zonal Pelargonium

"His Majesty." **Award of Merit, R.H.S.**

Of perfect habit, producing flowers of immense size, pips three inches across, trusses sometimes twenty-four inches in circumference.

Its Colour is a Glorious Royal Scarlet.

Plants now ready at 3/6 each in 3in. pots.

Being convinced that this is a real advance in Zonal Pelargoniums, I am offering a Silver Cup, value five guineas, a Silver Medal, and a Bronze Medal in open competition for three plants, and also similar awards for twelve trusses, to be exhibited at the National Chrysanthemum Society's November Show.

All the best English and American **Perpetual Carnations.** **Rambler Roses in Pots** in large quantities. **Liliums** of the finest quality.

LISTS FREE.

For Particulars, see Society's Schedule, or write

W. H. PAGE,
Tangley Nurseries, HAMPTON, Middlesex.

Telegrams. "Page, Hampton."
Telephone: P.O. 166 Molesey.

FERNS, FERNS, FERNS, etc.—Foliage and Blooming Plants for stove, greenhouse, and garden. 100,000 large garden Ferns, 20s. 100. 5,000 cases sent off yearly. Amateur Catalogue free. J. E. SMITH, London Fern Nursery, Loughborough Junction, S.W.

BEGONIAS.

NOW IS THE TIME TO BUY GOOD LARGE PLANTS.

Choice large-flowered Doubles, in nine separate colours, strong plants, splendid for pots or bedding, **4/6** per doz

Large-flowered Doubles, strong plants, mixed colours, **3/6** per doz

If you have never tried Double Begonias for Bedding, don't be afraid to try some. They are sure to please.

Frilled Singles, very pretty, large plants, **3/-** and **4/6** per doz.

Send for Free List of Choicest Named Begonias, Carnations, Delphiniums, etc., to:

BLACKMORE & LANGDON, Bath. AWARDED 24 GOLD MEDALS.

THE WATERSIDE IN MAY.

A survey of the conditions prevailing among the pools and watersides during May is fraught with the greatest interest to garden lovers. Just at this season, when blossoms are plenteous and growth is at its full, the water garden is worthy of the closest attention.

Nymphæas are rapidly pushing up new leaves and flower buds, and all who contemplate further plantings of these desirable subjects should carry out the work without delay, for the water is now thoroughly warmed, and growth is correspondingly responsive. There is no need for ornate planting baskets. A few discarded wicker fruit baskets, or box-like structures made from rough laths, with plenty of space between them, will be sufficient for the purpose of planting and sinking the nymphæas.

Protection should be given to the many forms of life found in the pools, for, apart from plant life, there are a host of aquatic creatures which assist materially in purifying and cleansing what would otherwise develop into stagnant water. Spare them all, as far as possible. Newts and water snails, beetles and fishes, water boatmen, and a host of others, including the wriggling tadpole, so dear to schoolboy's heart. All assist to maintain an efficient service of cleanliness, and any attempt to destroy these agents is a blow to the purity and sweetness of the water pools.

Plant life, too, is very necessary, both in the water and by the margins, the constant growth, bringing its supply of oxygen, and its constant work in drawing impurities from the pond base, and using them in the upbuilding of leaf and blossom, will be very apparent to all save the most casual beholder.

Now for the plants themselves. Calthas, which give such a glowing display of golden blossom, are now passing from beauty. Varieties of C. palustris are usually grown, some, including the double forms, being very attractive. The newer C. Tyermanni is good, and when a little lower in price will be greatly sought for. C. polypetala is a general favourite, and is now found in many gardens.

Camassias are now in bloom. Though the beauty of these subjects is not long-lived, yet a few groups of these light-stemmed starry flowers is of decided interest. C. esculenta is usually grown, but it is well to include also C. Cusicki, and the various forms of C. Leichtlini, which give shades of blue through to deep violet, and also good whites.

Primula pulverulenta is even better than the favoured P. japonica for waterside massing, though the latter, of course, gives such a wide range of colouring, so as to be practically indispensable. P. cortusoides is very effective in moisture, especially the second year from seed, giving a selection of light, graceful flowers over a good period. The pretty little P. involucrata, with its snowy blossoms, which, in the case of the varietal form Monroi, are lightly stained with blue, is deserving of note, and as a companion to it may I suggest the pretty Siberian Primrose, P. siberica, which, following the general formation of involucrata, gives two or three pleasing forms, of which the dominant colours are mauve and white. P. sikkimensis, the graceful golden-yellow primula, is just showing the colour in its buds, and will soon be delighting us once again with its beauty.

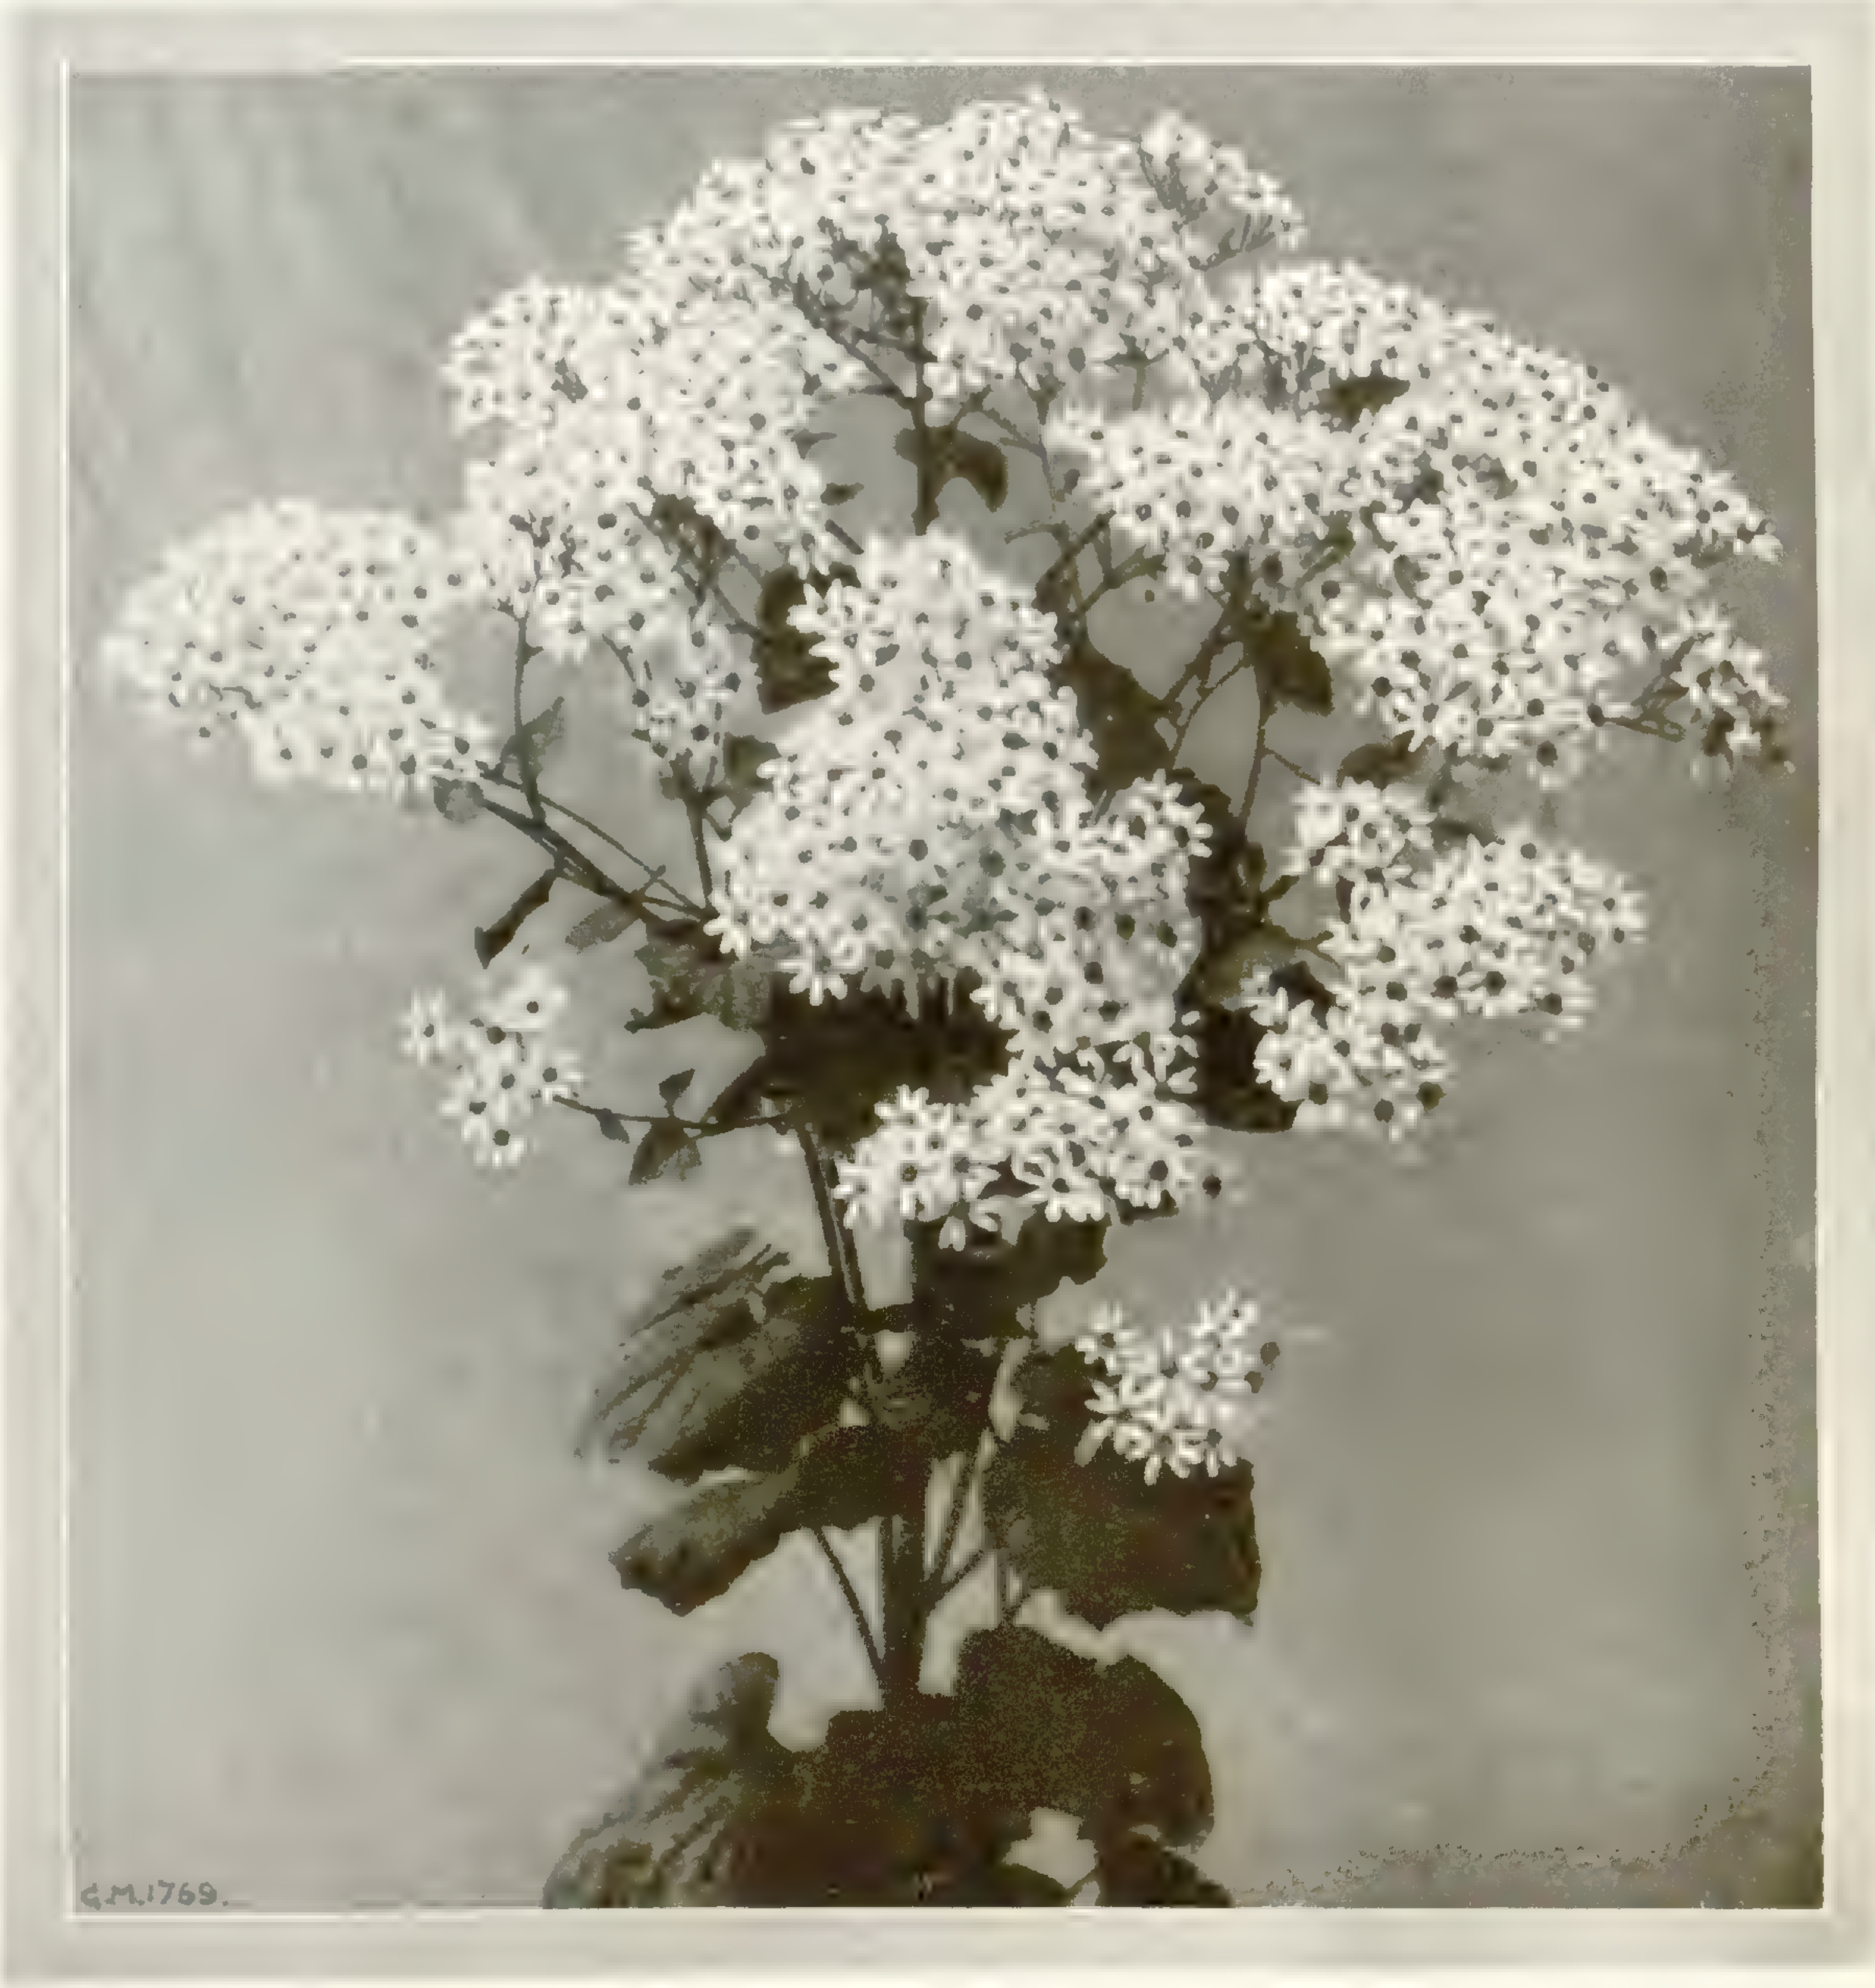
Many of the grassy cyperacæa are showing their tasselled flowers, and near by the Bog Bean (Menyanthes trifoliata) is noticeable by its white-fringed blossoms. Saxifraga peltata is also in full flower, the pinkish blossoms always coming in advance of the foliage.

The promise of myosotis and mimulus is as rich as ever. The newer forms of Myosotis palustris are better than the type, and, to my mind, Siren Eye is about the pick of the group. Mimulus are represented by various hybrid forms, of which Brilliant and Crimson Queen are well known. The species, luteus, an old English plant, which will rove through any ordinary pond, and the tall-growing cardinalis, so useful for the pond sides, are now in full vigorous growth.

Irises are coming on apace, and the blossoms of the delicate-hued I. missouriensis are open. Following rapidly one notes the rising stems of such gems as aurea, Monnieri, monspur, mon-aurea, orientalis, and the many forms of siberica. The interest attaching to an iris garden in spring and early summer is very great, and a large number of delightful species are eminently suitable for waterside adornment. In connection with this let me note the value of Iris virginica and its varieties for growing in shallow water, thriving in such a position better than they do above the water line. It is also feasible to grow Iris Kæmpferi perpetually submerged at the root, plants in such a position doing well year after year.

Astilbes and spiræas are full of promise, while asphodels, lythrums, lysimachias, epilobiums, and the host of summer-flowering waterside plants, are growing apace, and as a word of advice to late planters who have still undeveloped watersides to plant up, I would draw attention to the fact that many herbaceous plants commonly grown in the borders will do infinitely better by the water margins. Phloxes of the decussata type are notable examples, and others are sidalceas, cimicifugas—of which the Japanese Simplex is a notable example; senecios in many forms being valuable for their golden colourings; golden rods, aconitums, ranunculus, montbretias, pyrethrums, and many others. Trollius are just now at their best, and give splendid touches of colour to the scene. From white and palest yellow to the deepest orange we get a wealth of charming shades, and the delightful freedom of these globe flowers well repays the seeker after effects. In places where the depth of soil is limited a mulch of decayed manure will work wonders. No matter whether the subjects are irises, or hemerocallis, or primulas, or any of the thousand and one waterside subjects, they will be greatly benefited by this cooling, strengthening top-dressing. In this section of the garden (as in the rock garden) artificial manures are not needed; indeed, in few cases, except what we term "catch crops," are artificials worthy of note, but are more often the primary agents in undermining the constitution of plants.

P. S. Hayward.



TEMPLE SHOW—A FINE TYPE OF STAR CINERARIAS.

Colours various. Exhibited by Messrs. E. Webb and Sons.

Fabiana imbricata.—If considered only as a curiosity, from the great resemblance that it bears both in foliage and in flower to a member of the Heath family, this fabiana would be well worth growing, for in reality it belongs to the same order as the potato, namely, Solanaceæ. As a flowering shrub it is, however, delightful, forming as it does a specimen of somewhat upright growth clothed with small, crowded leaves, while the white tubular-shaped flowers are borne in great profusion.—W. T.

STAKING SWEET PEAS.

Where sweet peas were sown in the open last September or October they will have made considerable headway during the bright hot weather of the past fourteen days or more, and in many instances they will have been staked. Generally speaking, these early-sown sweet peas will be grown chiefly with the object of obtaining early flowers for decorative purposes, and where large quantities of cut bloom are required, and the soil and locality favour these early sowings, the flowers will come in very useful at a time when the principal bulbs have lost their beauty.

For general exhibition purposes these sweet peas are usually a little early, but they are most useful for staging at such shows as Windsor, Richmond, or Norwich, which are held in June; but the greater proportion of sweet peas are raised in pots, and planted out, or sown in the open ground during March, and these will now be in about the right condition for having permanent stakes put to them, and this is a matter worthy of considerable attention. In the case of sweet peas grown for the supply of cut flowers for ordinary purposes the matter is very simple, and, with plenty of good hazel boughs, they may be staked in just the same way as the culinary varieties, inclining the stakes outward at the top to save the haulm falling or being blown through.

Where the sweet peas are grown for the supply of exhibition flowers, and are encouraged to make very strong growth, the matter is more serious, and very seldom can one obtain stakes of sufficient length to carry them the season through, as in many instances they require to be quite ten or twelve feet in length. When these cannot be obtained it is wise to put up posts, and run a couple of wires from end to end of the row, and in this way the stakes may be carried up to the desired height, tying some nice light stakes to the two wires; this entails considerable labour, but it is well worth the trouble when good flowers are wanted over a long season. Where neatness is considered wire netting is also recommended for the purpose, but, personally, I do not like it, except when growing for ordinary cutting.

Bamboos tied to wires in the way suggested for the hazel stakes have proved very satisfactory, and where one does not mind the extra labour involved in training and tying, I would strongly recommend this method of supporting the haulm, the plants keeping wonderfully stocky, and the flowers coming very clean on good hard stems. At the Sweet Pea Conference last autumn this method did not meet the views of some of our friends, but I particularly noted that these gentlemen were not exhibitors in the competitive classes at the N.S.P.S. shows.

Whatever method is employed for supporting the plants, it should be done thoroughly well, as it is most annoying later on in the season to find the plants, and, in some instances, also the stakes, blown down by the force of the wind.

After staking, the ground between the rows or clumps should be lightly forked over, giving a dusting of soot among the plants as work proceeds, this latter keeping them free from slugs, while the forking over makes everything look tidy, which is a point that should not be overlooked.

T. Stevenson.

TEMPLE SHOW—TULIP MOONLIGHT.

A handsome May-flowering tulip with large flowers of a soft yellow colour. Exhibited by Messrs. Barr and Sons.

THE JUDAS TREE.

Cercis siliquastrum, a small tree or large shrub, familiarly spoken of in gardens as the Judas tree, is both showy and interesting, while its legendary associations appeal to the imagination of many people. The common name has been given on account of the tree being credited with being the one on which Judas Iscariot hanged himself after betraying the Saviour, and through this story it has come to be known to people who would not give it a second thought otherwise. It is, however, wonderfully effective when in blossom, for [illegible] pea-shaped flowers are rosy-purple [illegible] colour, and borne from all parts of [illegible] tree, even from buds on the older branches and some parts of the trunk. The species is readily distinguished amongst other trees by reason of its rounded, or almost reniform, leaves, which are from two [illegible] three inches across. Under normal conditions it may be met with as a bush fifteen feet high, and as far through, branching to the ground, or as a tree thirty [illegible] high, with a trunk nine to twelve inches in diameter. Like other leguminous subjects it likes a moderately light, [illegible] soil, and though it gives better results [illegible] rich, deep loam, it thrives fairly satisfactorily in that of a poorer nature.

W. D.

Habrothamnus Newelli.—Of [illegible] red-flowered forms of Habrothamnus I prefer this to any other, the flowers being of a clear, decided tint. It is an old kind, [illegible] been given a first-class certificate by [illegible] Royal Horticultural Society in [illegible] [illegible] met with so frequently as H. [illegible] H. fasciculatus. Though the generic [illegible] as above, commonly used in gardens, [illegible] plants are now included in the genus [illegible]trum. To those just mentioned may [illegible] added aurantiacus, whose orange flowers [illegible] borne in autumn, and the comparatively [illegible] Smithi, with pink blossoms.—W. T.

THE COMPLETION OF BEDDING OUT.

When bedding out has been done it may be found that some of the effects most aimed at prove unsatisfactory, either by reason of miscalculation of distances, crudity of colour mixtures, too uniform a level of flower or foliage, or an insufficiency of soil covering. The gardener would do well to complete his work by additions or alterations at once, rather than remain displeased with his efforts; all defects can be remedied, and often the loveliest results proceed from what may be described as amended bedding out arrangements.

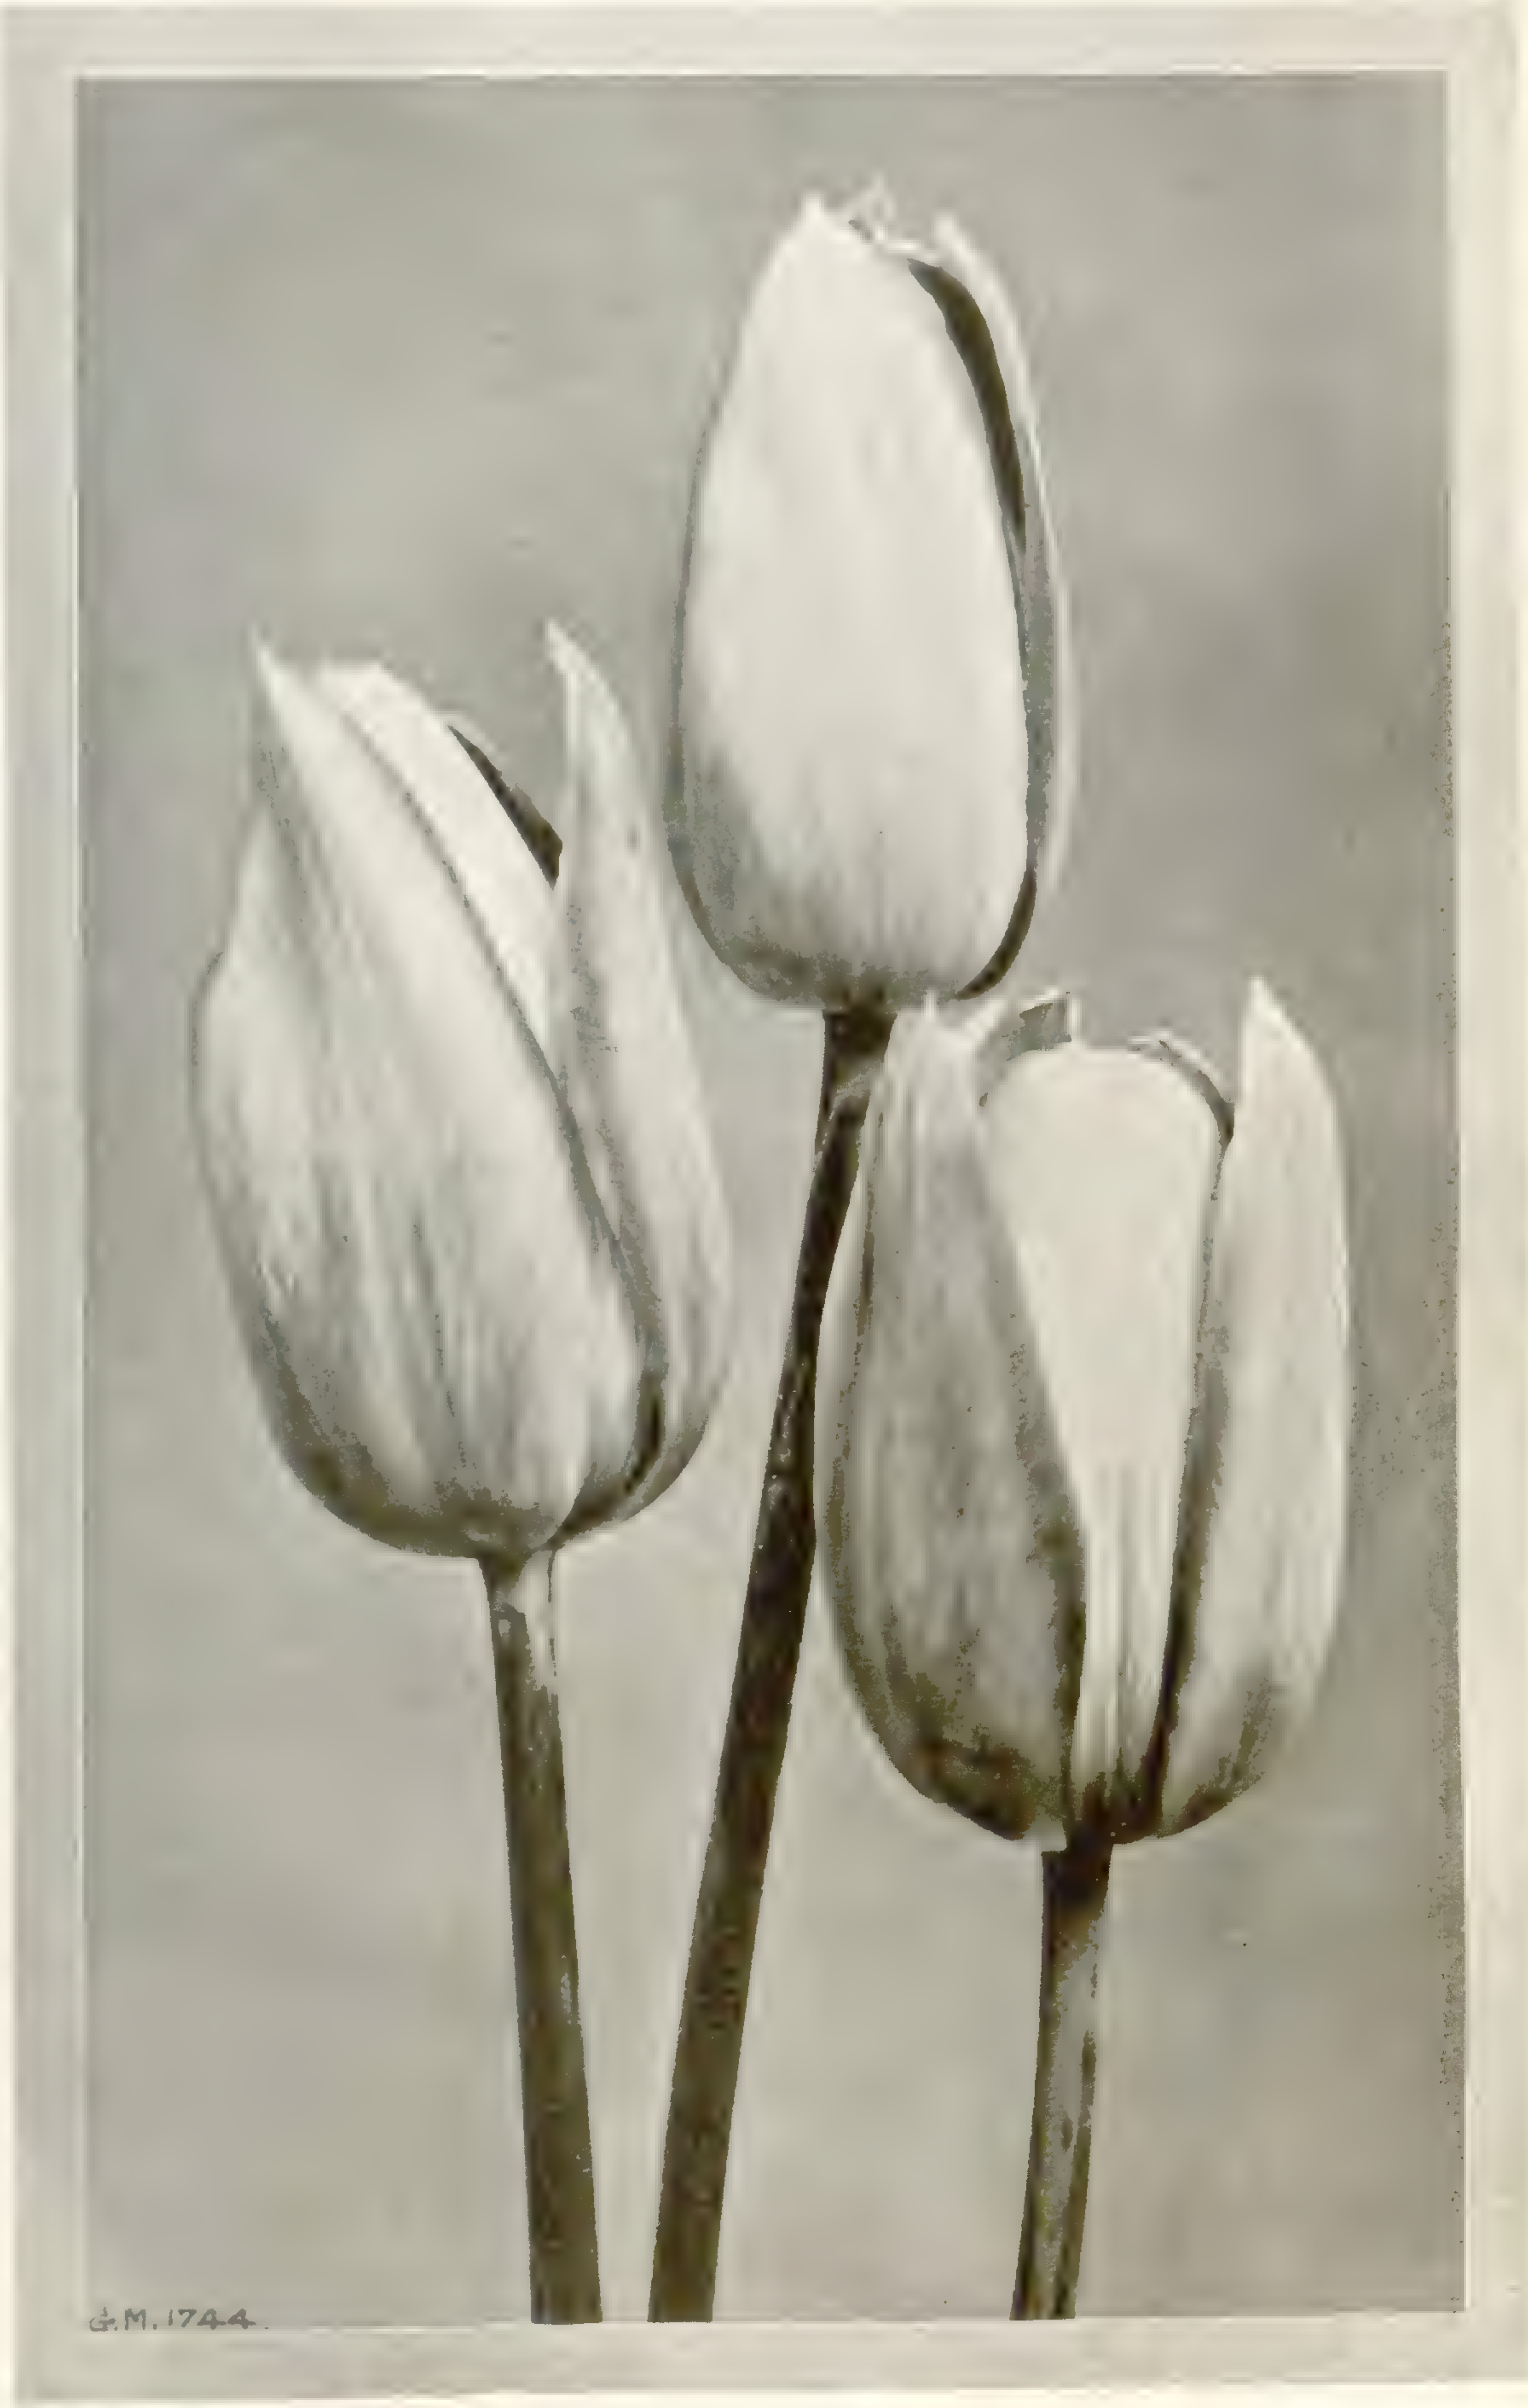
Unskilled labour may have set plants unsymmetrically, leaving unequal spaces between them, whereas those spaces were intended to be of precise dimensions; to lift the plants again would be to give them a check which some, notably begonias, would probably not survive. The true remedy for the evil appearance is to sow, or plant, seedlings of light-stemmed annuals in these spaces, introducing in a few weeks by that means an elegant grassy undergrowth that springs up around the more solid plants, veiling them partly in delicate foliage and florescence, while, at the same time, blurring the outlines of the unequal gaps. Among tall subjects the annual Gypsophila elegans, either in its pinky-white form or the pure white grandiflora alba, is excellent; there is not much leaf, and that on a low level, while the masses of miniature white star blossom will but enhance the beauty of gay and bigger flowers. There is also Gypsophila elegans carminea, a deep rose, and the pale pink G. e. rosea. Among dwarf plants, near the edge of the beds, Gypsophila muralis, a pink, six-inch species, can be employed. Those gardeners who prefer a perennial species will find Gypsophila Rokejeka, pinky-white, three feet tall, and Gypsophila venusta, white, eighteen inches high, admirable for the purpose; plants put out in June blossom freely later, and provide seed which, if sown on a sunny bed under a wall as soon as ripe, will give numerous specimens for removal into permanent quarters in March next.

A white annual, with forget-me-not-shaped flowers, on stiff branching stems, and lightest of grey foliage, is Omphalodes linifolia; this, among stiff scarlet or rose geraniums, vastly improves spaces, whether irregular or well-measured. Varieties of Michaelmas daisies, with myriads of minute blooms, can be well used, and will not fail to flower before winter; other suitable hardy annuals, however, are numerous, including the red, rose, blue, and white viscarias; blue, scarlet, and rose flax, or linum; the vermilion or yellow tassel flowers, or cacalias; and the lovely grasses, Briza maxima and gracilis, Agrostis nebulosa and minutiflora, and Eragrostis elegans and maxima.

Crude colour mixtures may generally be dealt with by introducing grey-foliaged plants; Cineraria maritima, C. m. Diamond, and C. candidissima; the glistening Ice Plant, Mesembryanthemum crystallinum; acanthuses, Achilleas Clavennæ, ægyptiaca, and clypeolata; Alyssum argenteum, Anthemis Biebersteini, Bocconia cordata, Centaurea candidissima, Sedum album, and the cerastiums, offer a variety. In colour mixtures that are too cold the use of crimson foliage plants will prove of value, while gold foliage is a safe remedy where heavy shades, such as purple, crimson, and violet have been over-employed.

A monotonously level bed ought to be improved by lifting a few of the plants and by the introduction of others of superior height; the striped maize, or zea, the handsomely variegated Tree Mallow, Lavatera arborea variegata; cannas, sweet peas grown singly against lofty sticks, standard fuchsias, or heliotropes, or palms, can be recommended.

When the soil shows too much among plants that will be sure to spread over it in autumn it is possible to contribute greatly to the summer beauty by putting out lobelia, in white, if colours are not required, small portions of divided stonecrops, or Mesembryanthemum variegatum, cerastiums, or iresine; these can, if desired, be cleared away later when no longer needed for their softening and furnishing effect.



TEMPLE SHOW—TULIP BEAUTY OF BATH.

A distinct variety; the flowers pale-yellow, suffused on the back of the petals with red-purple. Exhibited by Messrs. R. Wallace and Co.

Sometimes an ineffectively filled bed can be redeemed in character by having two or three centre plants removed, and a large palm, eucalyptus, or plumbago, from the greenhouse, inserted as a middle ornament.

M. H.

Gloriosa Rothschildiana.—The introduction of this species a few years ago gave a great stimulus to the culture of the gloriosas, one of which—G. superba—is said to have been sent here as long ago as 1690. The strange flowers and their bizarre colouring always attract attention, but it is not met with as often as one might expect, when the cheap rate at which it can be purchased, and its simple cultural requirements, are taken into consideration. Gloriosa Rothschildiana is, of course, more expensive, but its richly-coloured flowers and broad segments go to form a very striking flower. Owing to their long, often bifurcated tubers, these gloriosas are, as a rule, seen to greater advantage when planted out in a small prepared borders than when confined in pots.—W. T.

NOTES FROM KEW.

Tricuspidaria lanceolata.

This South American shrub, which is also known as Tricuspidaria dependens, Tricuspidaria hexapetala, and Crinodendron Hookerianum, forms a charming feature in the cool division of the Temperate House. A specimen some eight feet high, or thereabouts, is thickly studded with its bright red urn-shaped blossoms, which, hanging suspended as they do on long stalks, are somewhat suggestive of cherries. It is a beautiful, but by no means a common shrub, being, in some districts, not quite hardy. Under conditions favourable to the Himalayan rhododendron this tricuspidaria is just at home. It was first introduced by William Lobb in 1848, but it would appear after that to have become lost, till reintroduced by two other of Messrs. Veitch's collectors, namely, Richard Pearce and Downton. There is also a white-flowered tricuspidaria in cultivation under the name of T. dependens, over which a most unfortunate confusion has arisen. It is in this way: The red-flowered species, with drooping blossoms, had long been grown as T. dependens (a most appropriate name), till about ten years ago the white-flowered species was introduced, and, being then compared with herbarium specimens, was proved to be the true T. dependens, the red form being T. lanceolata. Our botanical authorities are not always such sticklers for priority as this, and it was a pity to uphold the mistake of the original authority, for the name of dependens is now applied to a plant whose flowers are much less drooping than those of the other species.

TEMPLE SHOW—BEGONIA MISS ETHEL GILL.
A fine variety with large, well-formed blooms of a rich rose colour. Exhibited by Messrs. Blackmore and Langdon.

Impatiens Herzogi.

This very striking member of the balsam family is flowering freely in the greenhouse. It is of sturdy growth, somewhat suggesting Impatiens Hawkeri, but the individual flowers are larger and more rounded, while they are of a distinct orange-salmon shade with a small violet eye. It is certainly a balsam of considerable promise, and will no doubt soon become popular.

Lantanas.

At Kew the different garden forms of lantana are regarded as but varieties of Lantana camara, the original species from whence these forms have sprung. A group of a particularly bright-coloured kind shows well the value of these lantanas for greenhouse decoration. It is of a fairly compact, but not lumpy, habit, and the freshly expanded blossoms are in colour rich orange, changing to deep scarlet. The plants of this lantana are at Kew alternated with flowering examples of Saxifraga sarmentosa, whose more sober tints serve as a foil to the vivid hues of the lantana, which, considering their easy culture and continuous flowering qualities, one might reasonably expect to find more often employed for greenhouse decoration.

Begonia coccinea.

For grouping purposes plants of a loftier stature than the general run of decorative subjects are often in demand in the greenhouse or conservatory. Such a one is this begonia, of which there are numerous examples from four feet to six feet in height, and all freely laden with their clusters of bright-coloured blossoms. It is a very old species, but at the same time one whose merits might be more often recognised than they are at the present day.

Primula Forbesi.

The charm of novelty or rarity cannot be claimed for this pretty little Chinese primula, as it is now, and has for a long time been, well known. For all this, it may be said to form one of the most pleasing features in the greenhouse, and one that directly appeals to those who can see beauty in small, as well as in large blossoms.

Two Beautiful Everlasting Peas.

Two charming members of the pea family, too tender for general cultivation in the open air, are now flowering in the greenhouse. They are Lathyrus pubescens and L. splendens. The first-named—L. pubescens—is a native of Chili, and though introduced a long time ago, has only been grown more or less within recent years. This, which is noticeable for the pubescent character of its leafage, has clusters of bright lavender-blue flowers. Lathyrus splendens, the second to mention, is a native of California, and was first sent out by the late Mr. William Bull, of Chelsea, about a quarter of a century ago. It, however, soon disappeared, probably owing to its being treated as a hardy plant. From seeds sent later on to Kew it flowered, I believe, there for the first time in 1897, and has been occasionally noted since then. The flowers are in colour a kind of carmine-red, a tint difficult to define. Anyone in search of uncommon greenhouse climbers might do well to take a note of these charming peas.

Begonia undulata, or B. glaucophylla.

This begonia is one of the best of all this extensive genus for growing in suspended baskets, that is, where large ones are desired. It is a free-growing plant, from whose long branching stems aerial roots, after the manner of the ivy, are produced. The foliage is very ornamental, the leaves when mature being of a deep green tint, with rose-coloured veins, while when young the entire leaf is suffused with rose. The salmon-coloured flowers are borne in dense drooping clusters for some months. This begonia is a native of Brazil, but it will flourish in the greenhouse during the summer. Good examples treated as basket plants are to be seen both in the greenhouse and in the Temperate House.

Pelargoniums.

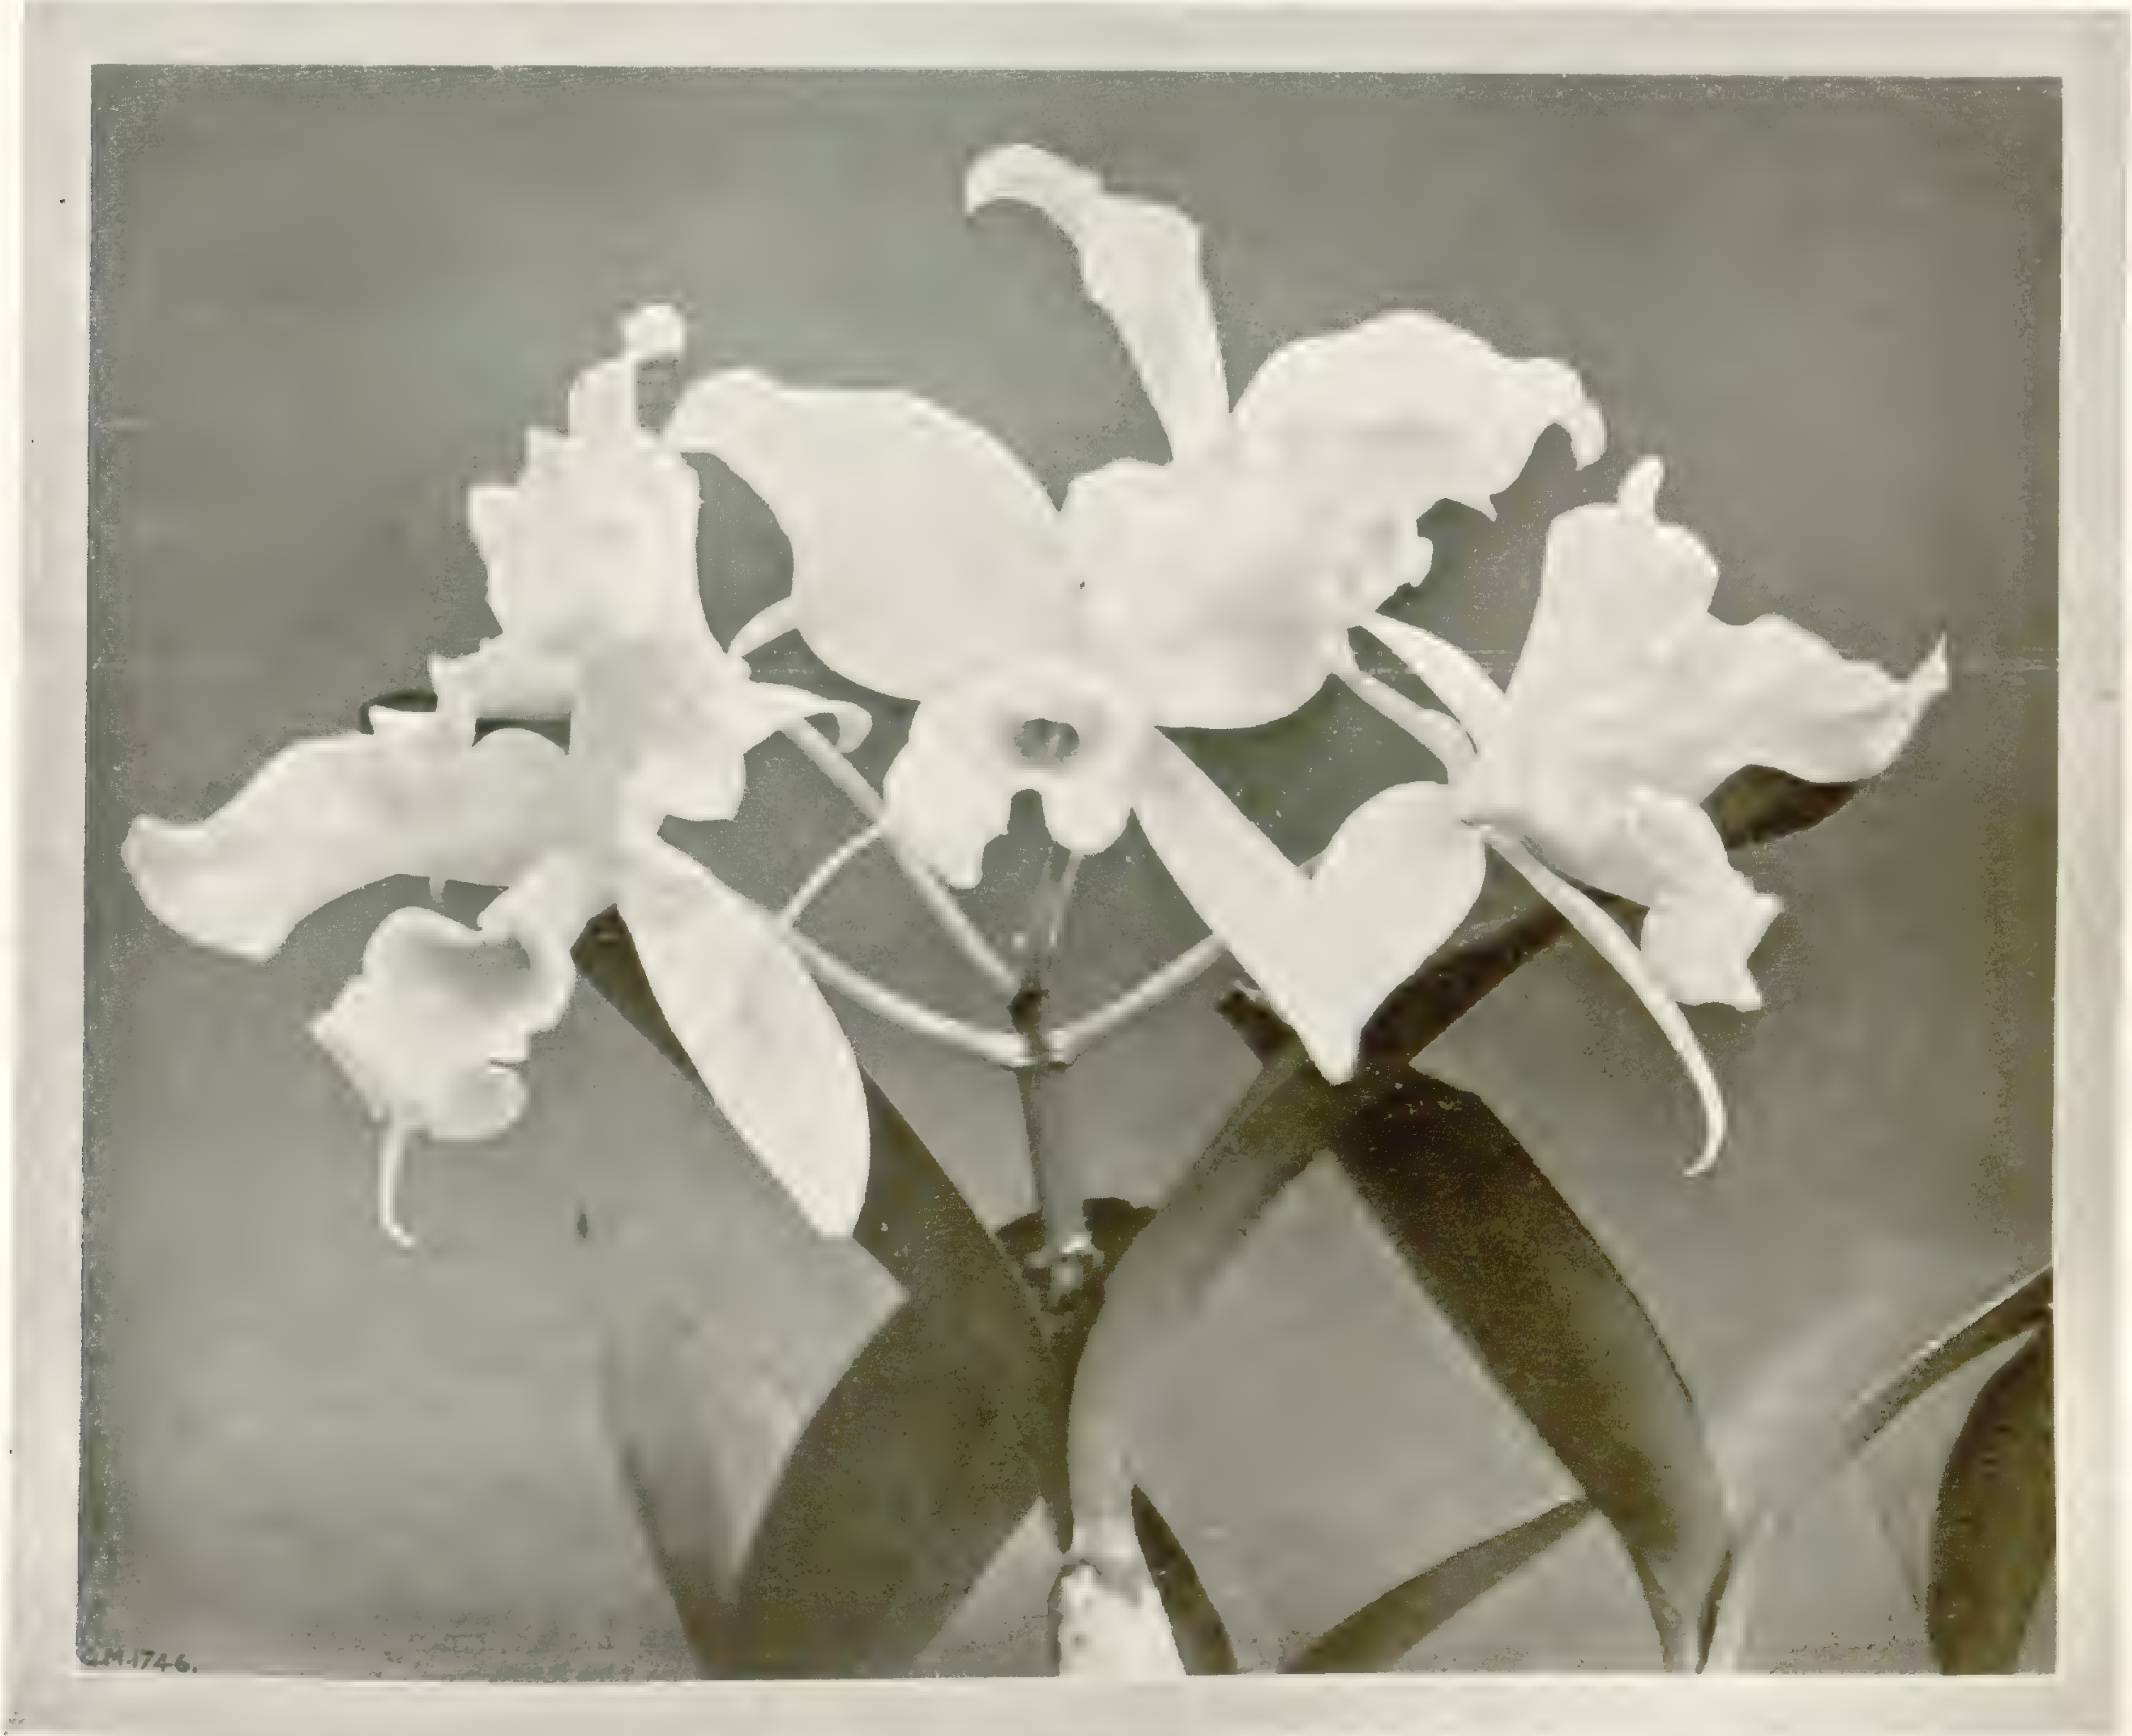
In the cool portion of the T range a most interesting collection of the different species of pelargonium is brought together, their diversity in habit, foliage, and in flower being remarkable. Both in the shape of the leaves and the fragrance thereof an extensive variety prevails, while the flowers of some of them, though small, are very pretty. One cannot but note Pelargonium echinatum, whose clear white flowers have each two distinct blotches of crimson, with a slight feathering of the same tint; P. altum, of a brilliant scarlet, veined with black; and P. citriodorum, white, with a large purple blotch.

Eranthemum Teysmanni.

A group of this eranthemum shows it in the light of a valuable decorative subject for the intermediate house at this season. It forms an upright, slender-growing plant, clothed with long narrow leaves. The flowers, which are loosely disposed in a terminal spike-like head, are of a pleasing shade of very pale mauve, while the centre of the comparatively large lip is almost white. It is certainly very pretty, and quite distinct from the eranthemums usually grown.

Ixora congesta.

The "Dictionary of Gardening" gives the date of the introduction of this species as 1845, but it is seldom seen, though it forms a very striking stove plant. It is apparently a strong grower that does not branch out freely as many of the garden forms do. The leaves are large, and pointed oblong in shape, while the flowers are borne in a massive terminal head or cluster. They are a kind of orange-buff in colour, an uncommon tint even in a genus where so many have flowers somewhat in the same way. A plant is now in flower in the stove portion of the T range.



TEMPLE SHOW CATTLEYA SKINNERI ALBA.

A pure white variety of Skinner's Cattleya, exhibited by Messrs. J. Cypher and Sons.

Episcia fulgida.

A hanging basket of this pretty South American gesnerad in the Nepenthes House shows it in a very favourable light. When growing freely it produces runners that each bear a young plant at their tip, while if grown in pots, and these runners are kept pinched off, it forms a gloxinia-like plant, pretty both in foliage and in flower. The leaves, the blade of which is roundish oblong in shape, and from six to eight inches in length, have their surface puckered in a peculiar manner. They are dark metallic green in colour, with the midrib and principal veins marked out with silver, these showing up conspicuously against the rest of the leaf. The flowers, which are little more than an inch across the expanded mouth, are of a bright rosy-scarlet colour. Under the generic name of Cyrtodeira it was sent home from Columbia nearly forty years ago.

Columnea glabra major.

This gesneriaceous plant, which was introduced from Costa Rica three or four years since, is now in flower in the intermediate portion of the T. range. In its partially woody growth and general appearance it bears a good deal of resemblance to an æschynanthus, none of which are, however, now in bloom. The flowers of the columnea, which are freely produced, are long, somewhat tubular in shape, and of a bright scarlet colour. This columnea was, a few years since, put into commerce by M. Lemoine, of Nancy. A second species also in flower at Kew is Columnea Tulæ, with yellowish blossoms, but it is much less showy than the other.

Eulophiella Peetersiana.

A very fine example of this eulophiella is now in bloom in the warmest portion of the orchid house. In general appearance it suggests one of the lissochilus, but the rhizome is of a decided creeping nature. The plant is nearly six feet in height, the upper part of the sturdy spike bearing from two to three dozen of its thick, wax-like rose-coloured blossoms. It is considered to be a native of Madagascar, and requires a warm moist structure for its well-doing.

Clematis montana rubens.

The specimen of this clematis which was so well illustrated in the GARDENERS' MAGAZINE as recently as March 4 of this year, is now again at its best, and a charming feature it makes. Apart from the rich rosy colour of its blossoms, this variety is also remarkable for its extreme floriferousness, far surpassing in this respect the typical Clematis montana close by. Of the many good things we have of late years received from China this is certainly among the very best.

Clianthus Dampieri.

At Kew the difficulties that used to attend the culture of this clianthus have for some years now been cleared away, and good flowering examples are always to be seen there in the season. The cultural difficulty is, I believe, overcome by grafting the clianthus on to Colutea arborescens, both stock and scion being seedlings. K.

Melons.—Cut melons as soon as the stem is leaving the fruit. The stems should at all times be preserved, as a melon appears wanting if the stem has gone. When cut, place the fruits upon wood wool, and convey to the fruit room to await its turn on the table.—W. A. Cook, Leonardslee Gardens.

WHITE EVERLASTING PEA.

The useful Lathyrus latifolius albus is becoming more generally grown, and it deserves its popularity. It has a great advantage over the so-called crimson and rose-coloured perennial peas—though L. grandiflorus is a fine flower in size and form—in that it does not clash with anything else, whereas the others are rather hard to place in this respect.

The removal of established plants is not to be lightly undertaken, as they suffer more from removal than almost anything else in the garden, the roots being very long, fleshy, and fibreless; so that one should consider well before putting a plant in a given place. Ordinary plants, as bought from a nurseryman, must be allowed two years to produce any effect, and sometimes even longer; but when once established they will go on for years without cultural attention of any sort as regards the soil. They should be allowed to grow as naturally as possible, any tying up to pillars, arches, pergolas, etc., marring their effect unless very judiciously done. They are well suited for rough places and for running over bushes, tree stumps, and the like. One admirable use for this pea is to plant it near delphiniums, so that when these latter are cut down to two or three feet after flowering, some twiggy sticks can be put amongst them, and the pea allowed to scramble over them, and so hide their untidiness. This is merely an illustration of the use to which it may be put. Slugs are fond of the young shoots in the spring, and a heap of cinder ashes should be put over the roots in the autumn. It provides excellent material for cutting during a good part of the summer, pieces from one to two feet in length producing a capital effect in large arrangements.

Propagation may be effected by division in the autumn or spring, but only large plants should be subjected to the treatment or flowering may be sacrificed for a couple of years. A better way is to remove shoots in the spring with as much root attached as can be obtained without unduly disturbing it. Such pieces, if well started in a frame, will make nice, though not large, flowering plants the following year. Stock may also be raised from seed, and will come fairly true, but it is not always a quick way, as seed sometimes does not germinate the year it is sown.

Alger Petts.

TEMPLE SHOW GLOXINIA HER MAJESTY.

A remarkably fine variety with large pure white flowers. Exhibited by Messrs. Sutton and Sons.

EVERGREEN MAGNOLIAS.

The magnolias, like the figs, live to a great age. I lately had charge of a garden in which there were about eighteen very fine specimens growing; some were trained on walls, but the majority were grown as standards, and one or two as bushes, their huge limbs branching out from the main stem just above the surface of the soil. In the Midland and Northern districts some protection is necessary during very severe winters. But in the south, taking my own case, I never saw a leaf damaged on the fully-exposed standard and bush trees during those two extremely severe winters that occurred about twelve and sixteen years ago respectively. Plants trained on walls did suffer a little. The new shoots on the wall trees were always longer jointed than those on the standards in the open. This was natural, of course, and it was to be expected that the shoots on the former were not as well matured as those on the more exposed trees, and bore fewer flowers in consequence. But nearly the whole side of one dwelling-house was covered by the healthy, glossy leaves of two specimens, and even where no flowers were borne the plants were worth growing, and caring for, on account of their magnificent leaves. I am, of course, referring to M. grandiflora.

I know of some very fine specimens trained on walls in London gardens; they are lightly protected during severe frosts, and rightly so, as the clear, glossy leaves are so highly appreciated in the gardens I refer to at South Kensington. Now, I find that some cultivators are loth to plant magnolias in any but a naturally dry soil. In my own case I had trees growing in very dry borders on steep slopes, and others in a long border through which water from a pond 20ft. away percolated constantly owing to the fact that the magnolia border was 2ft. lower than the water in the pond. The trees, however, did remarkably well, lost few leaves, and bore the largest blooms.

If I had to choose, I should select a medium, moist soil, well drained; one that was a deep loam, not too retentive. When the trees are well established annual top-dressings of fibrous loam, leaf-soil, and rotted manure in equal proportions are, I find, very beneficial, and tend to keep the roots near the surface.

G. B.

KOCHIA TRICHOPHYLLA.

This charming annual, commonly know as the Summer Cypress, is one of the mo distinct and indispensable subjects in t garden during the summer months; th erect, columnar habit, and delicate green leafage render it a conspicuous ject, either by itself, or when in contra or harmony with other plants.

Fortunately its cultivation is of easiest description, as it succeeds in a ordinary garden soil that is well work moderately rich in character, and of a lig nature. As a pot plant it develops superb specimens even when given but stricted root room.

Kochia trichophylla is readily raised fr seeds, and although frequently reco mended to be sown early in the year und glass, this is by no means the best tr ment, as far better plants result from later sowings, grown as cool as possible from th commencement. The best specimens kochia I have ever seen were from s sown seedlings in the open, these being transplanted to their permanent posit in May.

Thomas Smith

THE GREAT TEMPLE FLOWER SHOW,

MAY 23, 24 and 25.

The latest of the long and unbroken series of splendid exhibitions held by the Royal Horticultural Society in the gardens of the Inner Temple, on the Thames Embankment, was probably the finest of them all, having due regard to extent, culture, colour, splendour, and arrangement. To the Treasurer and Benchers of the Inner Temple thanks are due for permission to hold this show in their gardens, and though nowadays it would be a quite easy matter to fill double the space available, it must not be forgotten that the site of the exhibition is a particularly good and convenient one. About 11,000 square feet of staging were filled to the utmost in the fine huge tents provided, while outside the tents not less than 40,000 square feet were occupied.

Orchids, roses, choice hardy flowers, gorgeous calceolarias, beautiful carnations, handsome clematis, rock gardens, vivid tulips, and artistic Japanese gardens, and full-bloomed rhododendrons, were among a few of the great attractions, though the pot fruit trees and the choice vegetables must not be omitted.

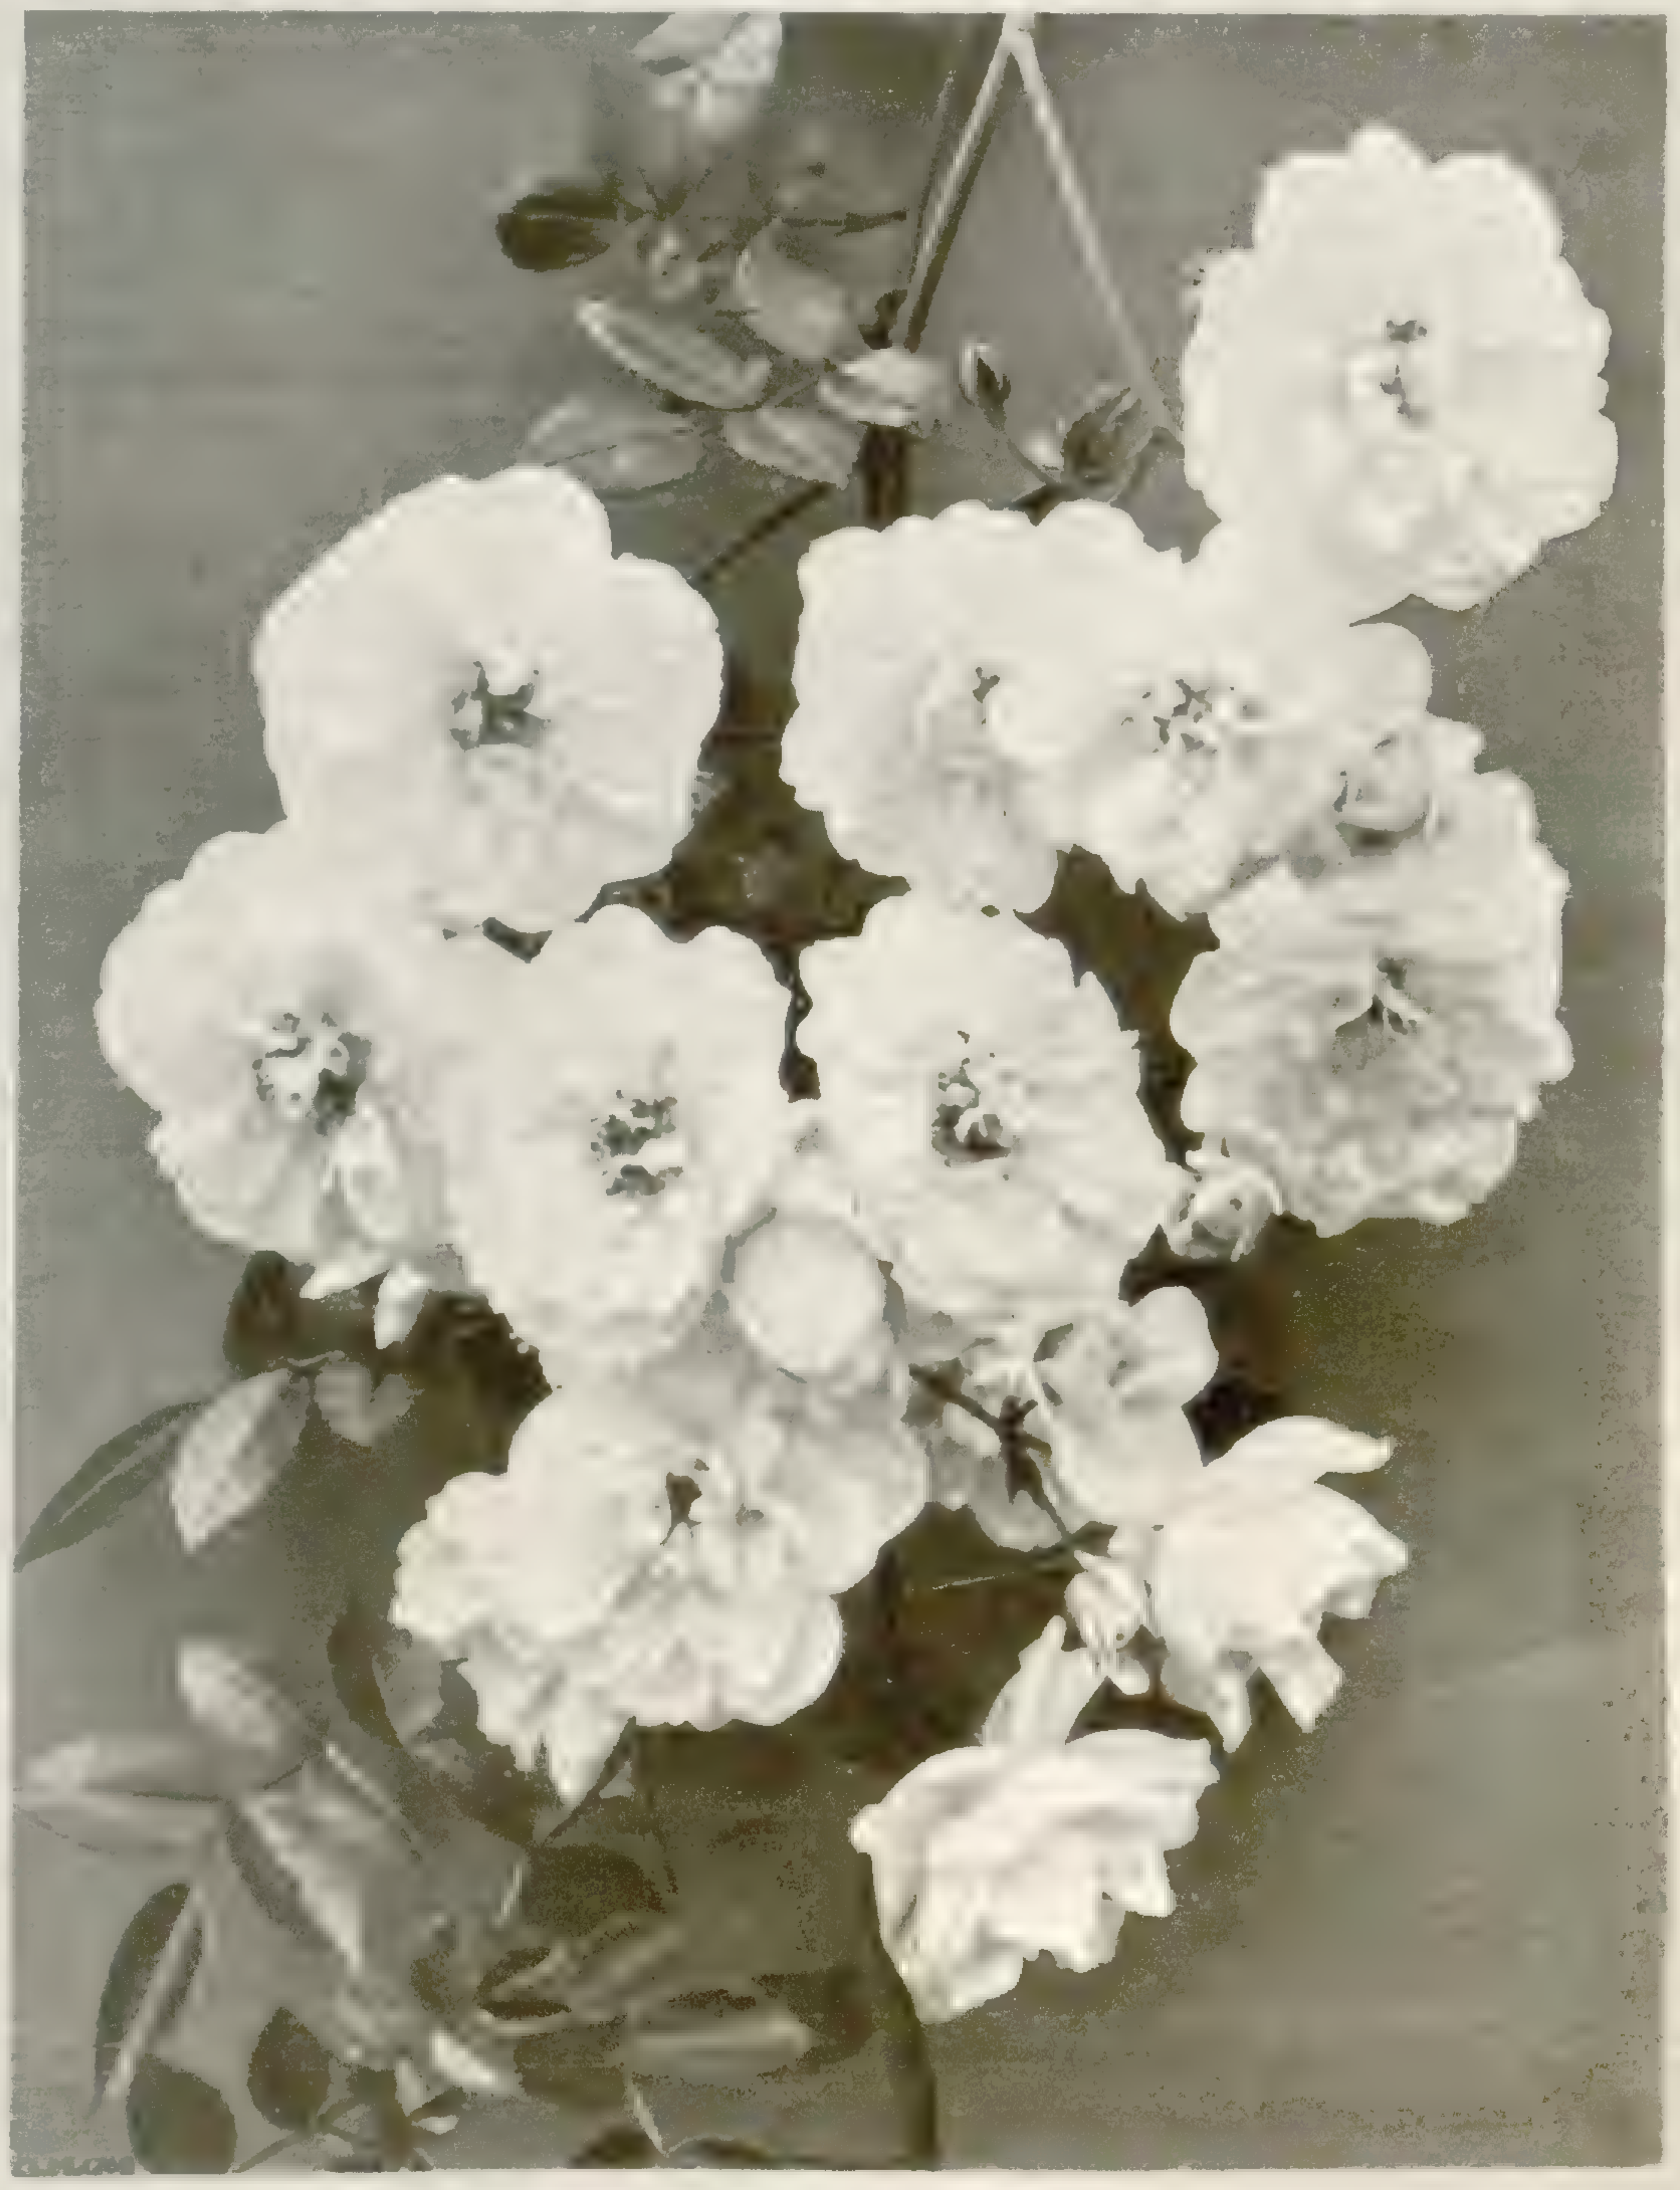
About ten o'clock in the morning, while judging was proceeding, their Majesties the King and Queen visited the exhibition, and stayed some considerable time inspecting the flowers and plants. They appeared to pay special attention to the orchids, the roses, the fruit, and the carnations, and were evidently delighted with their visit. Sir Trevor Lawrence, the president of the society, with the Rev. W. Wilks, secretary, and Sir George Holford, conducted their Majesties through the tents.

We would add a well-deserved word of praise to the Rev. W. Wilks, Mr. Gaskell, Mr. S. T. Wright, Mr. Reader, Mr. May, Mr. Gurney Fowler, and Mr. H. J. Veitch, and others who gave their time and skill to the arrangements that must precede such a huge exhibition, and one that is the finest of its kind in the world.

ORCHIDS.

Once again orchids occupied the place of honour, and they were shown even more largely than usual, filling the centre of the huge marquee with intense, brilliant colour, and amazing interest.

Entering from the Embankment end and turning to the right, the first exhibit was that staged by Messrs. Sander and Sons, St. Albans. The arrangement was delightful, and consisted of two deep bays with a central forward group and flanking ends. The central grouping was composed of glorious forms of Cattleya Mendeli, Lælia purpurata, and fine examples of Brasso-cattleya Digbyano-Mossiæ, Odontoglossum Cooksonæ, the brilliant O. Meteor, and the wonderful and curious Bulbophyllum virescens. To the left in the back of the bay were arching spikes of Phalænopsis Rimestadiana, Oncidium splendens, O. macranthum, and the vivid Renanthera Imschootiana. White forms of Odontoglossum crispum appeared on every hand rising from more richly coloured orchids. Odontoglossum amabile Empress of India, O. Black Douglas (Wilckeanum x Vuylstekei), and O. McNabiana were fine here, and so also were Odontioda Lambeauiana, O. Bradshawæ luminosa, and the free-branching O. ornata (Odontoglossum Pescatorei Lindeni x Odontioda Vuylstekeæ). In the right-hand part of this superb exhibit phalænopsis and oncidiums and odontoglossums were very much in evidence. Among the latter the chief subjects were O. Memoria King Edward VII., heavily blotched with reddish purple; O. amabile King George, red spotted on rosy ground; and O. King Arthur with big red-brown spotted blooms. Right in front was a delightful group of Miltonia St. Andre, with the lovely Cattleya Schroderæ Queen Mary just behind it. Oncidium Muelleri, with white rosy-lipped flowers, and somewhat the habit of O. macranthum, was a very distinct and novel orchid in this grand collection.



TEMPLE SHOW—ROSE SYLVIA.

A beautiful rambling variety, bearing large clusters of pure white flowers. A.M., R.H.S., May 23. Exhibited by Messrs. William Paul and Sons.

The very large contribution tastefully arranged by Mr. W. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, was greatly admired. The striking feature of the group was the large number of graceful spikes of Odontoglossum Thompsonianum, arching over a light arrangement of pale cattleyas; there were nearly thirty plants of this purple-coloured hybrid. Finely grown examples of Miltonia vexillaria, Cattleya William Murray, C. Mendeli, Cymbidium eburneo-Lowianum, and C. insigne made a grand background, and in front of these was a host of good and interesting plants, such as Odontioda Bradshawiæ in variety, O. Vuylstekæ, Odontoglossum Lady Roxburgh, O. Lambeauianum, the deeply hued O. crispum Sir Richard Knight Causton, O. The Kaiser, a finely marked Gatton seedling, and O. King George V., a rich yellow flower. Somewhat smaller, less showy, but not less interesting were Oncidium pulchellum, Masdevallia Chimæra, Oncidium Clæsi, Cœlogyne Parishi, Cochlioda Noetzliana, and Bulbophyllum Lobbi Colossus.

Messrs. Jas. Cypher and Sons, Cheltenham, had a bold and beautiful group, and, as usual, they made special features of their finely grown and beautiful forms of the good old Lælia purpurata and Miltonia vexillaria. The arrangement was charming, ferns, palms and moss being used to show off the flowers to advantage. Phalænopsis Rimestadiana, and good forms of Cattleya Mendeli made up a graceful centre, with a few long branching sprays of Odontoglossum Clytie. In addition to colour and design, the group had other features of interest, and a close inspection revealed Cypripedium callosum Sanderæ, C. bellatulum, Maxillaria Sanderiana, Masdevallia Harryana, the erect Phaius Norman, Odontioda Cooksoniæ, O. Bradshawiæ, and O. Vuylstekæ, Dendrobium Dearei, Cattleya citrina, with pendant flowers of gold.

Messrs. Mansell and Hatcher, Rawdon, Yorkshire, put up a large and very delightful exhibit, the plants carefully disposed over moss and ferns, and so set out that each plant was distinct from its neighbour. The central part of the group was composed of Dendrobium densiflorum, Renanthera Imschootiana, white forms of Odontoglossum crispum, and golden sprays of Oncidium Marshallianum; it was a charming arrangement, and at the base were Odontioda Bradshawæ, O. Vuylstekæ, and O. Cooksonæ. Cattleya Mossiæ, C. Mendeli, Miltonia vexillaria, Dendrobium nobile virginale, D. McCarthiæ, Odontoglossum Vuylstekeanum, O. crispum Leonora, Miltonia phalænopsis, and Cypripedium Queen of Italy, were other choice subjects.

Mr. Harry Dixon, Spencer Park Nursery, Wandsworth Common, presented a small collection of orchids, that included fine examples of the graceful Cœlogyne Dayana, Odontoglossum Pescatorei, with odontiodas and odontoglossums in great variety.

Messrs. Charlesworth and Co., Haywards Heath, presented one of their marvellous contributions of well grown and finely arranged orchids. They filled a large space, and filled it grandly, as usual. In the middle was a lovely mound of Phalænopsis Rimestadiana and Miltonia vexillaria, and standing well out from the base of this mound were numerous plants of Odontioda Charlesworthi. Right along the back were Oncidium Marshallianum, Lælia purpurata, Renanthera Imschootiana, and Odontoglossum crispum. Miltonias and odontoglossums formed flanking groups, and Cattleya Mossiæ and C. Lawrenceana and C. Mendeli formed a background in the bays for the newer things, that included Lælio-cattleya Dominiana, L.-c. Fascinator King George V., L.-c. Wellesleyana superba, L.-c. Golden Glory, L.-c. Dora, Miltonia Bleuana, Miltonioda Ajax—a very rare hybrid, Odontioda Lambeauiana, Cattleya intermedia Acquini, Brasso-cattleya Vilmoreana, Odontoglossum eximium Prince of Wales, with deep crimson blotches; O. illustrissimum, almost wholly maroon-red; O. eximium The Kaiser, finely marked; O. percultum Blue Bird, a curious shade of colour; O. Jasper, red spotted on rosy-purple; Sophro-cattleya Chamberlainianum, Zygocolax Charlesworthi, Cypripedium bellatulum Queen of Spain, and a large number of other choice and beautiful subjects.

Messrs. J. and A. McBean, Cooksbridge, had a large and effective group that was strong in Odontoglossum crispum, and notably in white and shapely forms of this charming species. Cattleya Mendeli and C. Mossiæ were superbly shown. In the centre were a few very choice things, such as odontoglossum hybrids, and finely marked forms of O. crispum. The background was composed of Cymbidium Lowianum and Miltonia vexillaria.

Messrs. Armstrong and Brown, Tunbridge Wells, contributed a light and elegant exhibit of orchids, and they set out their plants somewhat thinly over green moss and ferns. Their central feature was composed of Odontoglossum crispum, Renanthera Imschootiana, Cœlogyne pandurata—very fine; Lælio-cattleya Aphrodite, and Miltonia vexillaria. The flanking ends were somewhat similarly composed, and in the two bays were hosts of cypripediums, notably C. Rothschildeanum, C. glaucophyllum, C. Goweri, C. callosum Sanderæ, C. Victoria Moriæ, and many unnamed hybrids. Brasso-cattleya Veitchi, Brasso-lælia Veitchi, and fine forms of Lælio-cattleya Aphrodite, occupied points of vantage. Some fine masdevallias were also included.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, occupied a prominent position near the end of the big tent. In the middle odontoglossums, odontiodas, and golden oncidiums were piled up to form an imposing feature. On either hand gorgeous cattleyas, notably C. Mossiæ, C. Mendeli, and C. Empress Frederick, were effectively grouped, and near at hand were Lælio-cattleya Fascinator, Cattleya Parthenia Prince of Wales, Renanthera Imschootiana, and the pretty Oncidium pulchellum.

Mr. Edward V. Low, Vale Bridge, Haywards Heath, showed the pale-lipped Lælia purpurata Lowi, L. p. Ashtoni, and L. p. Lewisi, Cattleya Skinneri alba, Cypripedium Beekmani, C. callosum Sanderæ, and the pretty Odontoglossum crispum Jeanette.

Mr. Hale, gardener to Samuel Larkin, Esq., Ridgways, Haslemere, Surrey, put up a pleasing exhibit, and bedded all the plants in maidenhair ferns. Cattleya Mossiæ, Phalænopsis Rimestadiana, Renanthera Imschootiana, various richly-hued odontiodas, and graceful odontoglossums, Cypripedium concolor, and Anguloa Clowesi were the prominent kinds of orchids displayed.

Mr. John Robson, Altrincham, had a lovely lot of Renanthera Imschootiana, and a number of superb unnamed odontoglossum hybrids rising out of a groundwork of cattleyas. Mons. Chas. Vuylsteke, Loochristy, Ghent, submitted a few glorious hybrid orchids; he brought up Odontioda Vuylstekeæ Coronation, a superb large-flowered form, with scarlet markings on a rosy ground; Odontoglossum cæruleum, a bluish flowered hybrid from O. gandavensis and O. ardentissimum; O. Grand Monarch with vivid blood-red marks and shadings; O. crispum His Majesty King George V., crimson with white edging; and O. Loveliness, with bluish-purple blotches on a white ground.

Mr. Shiel, gardener to Baron Bruno Schröder, The Dell, Egham, exhibited Odontoglossum Black Prince, Dell variety; this had a spike of fifteen grand flowers almost wholly of deep rich red-brown colouring.

Cœlogyne Burfordiense, a very distinct and pretty cross between C. asperata and C. pandurata; this is very like C. pandurata, but the green is paler, and the petals reflex distinctly. Mr. H. S. Goodson, Putney, brought up Odontoglossum amabile Fredericki, red spotted on a white ground.

Mr. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, staged the very bright yellow and ruby-crimson Lælio-cattleya C. Graham White, and the handsome large-lipped Lælio-cattleya Morningtoniæ.

In the splendid group of stove and greenhouse plants submitted by Messrs. Jas. Veitch and Sons, Chelsea, there were three mounds of orchids, and here the chief subjects were Cattleya Mendeli, Renanthera Imschootiana, Disa Veitchi, Cattleya Mossiæ, Odontoglossum Clytie, O. Felicity, O. crispum, Odontioda amabile, Brasso-catt.-lælia Veitchi, Oncidium Marshallianum, Cattleya Dusseldorfi Undine, and the beautiful Disa Luna.

ROSES.

We have come to look upon roses as one of the leading features of the Temple Show, and it seemed fitting that a special effort should be made with the National flower in Coronation year. Entering the big tent, the first thing to meet the eye was the group of roses in pots set up by Messrs. Paul and Son, of Cheshunt, and we are safe in saying that the firm has never made a finer display. Weeping standards of the rambler type, including Dorothy Perkins, Excelsa, Lady Gay, White Dorothy, and Lady Godiva, stood up above a groundwork of dwarf plants, amongst which were represented Marquise de Sinety, Cardinal, Etoile de France, Freda, George C. Waud, Elizabeth Barnes, and a host of others.

The outstanding feature of the group of roses staged by Mr. Charles Turner, Slough, was the weeping standards. Beautiful indeed were the examples of the popular Dorothy Perkins, Lady Gay, Hiawatha, the old Crimson Rambler, and others, while in amongst the ramblers we noticed specimens of the Lyon Rose, Lady Ashtown, Queen of Spain, and Florence Pemberton, all in good form.

Magnificent was the expression we heard in connection with the exhibit of roses sent from the nurseries of Messrs. William Paul and Son, Waltham Cross, and it was quite justified. We can imagine nothing more beautiful than the gloriously-flowered specimens of American Pillar, Tausendschon, Lady Gay, Excelsa, and the Lyon Rambler, and the well grown and finely flowered specimens of dwarf plants which formed the ground looked as fresh as paint. All the best varieties were represented, and in every case the blooms were in the pink of condition.

A good deal of taste was displayed in the arrangement of the interesting collection of roses set up by Messrs. Frank Cant and Co., Colchester. Perhaps the most striking thing in the exhibit was the beautifully-formed crimson buds of the variety Richmond, but the old William Allen Richardson did not suffer by contrast, and on orthodox show boards were to be seen numerous blooms of many well-known varieties. To complete the exhibit were a few weeping standards of Hiawatha, Minnehaha, and others.

Messrs. H. Cannell and Sons, Eynsford, had a bank of roses which would have been more effective if it had looked a bit less solid. American Pillar figured conspicuously in the centre, and we also noticed Lyon Rambler, Veilchenblau, which is something approaching a blue; The Light Star, Aennchen Muller, and White Dorothy.

Weeping roses, including Blush Rambler, Mrs. F. W. Flight, Dorothy Perkins, and American Pillar, formed the background of the wonderful groups set up by Messrs. W. Cutbush and Son, Highgate, and as a groundwork in amongst the carnations were beds of polyantha roses, including Mrs. W. H. Cutbush, Jessie, Madame N. Levavasseur, and others. Indeed, it is rarely that one sees roses and carnations blended together to better advantage.

Messrs. B. R. Cant, of Colchester, sent a fine collection of rambling roses, but the position was not good for staging roses of this kind to the best advantage. Indeed, the space was inadequate for the group, and, consequently, there was some suspicion of overcrowding; but, nevertheless, the finely-flowered specimens of Dorothy Perkins, Tausendschon, Minnehaha, and Mrs. F. W. Flight did not fail to attract attention. The novelty in the collection was the so-called blue rose Veilchenblau.

Ramblers again were the feature of the rose group set up by Messrs. Prince, of Oxford, and here also were finely-flowered specimens in weeping standard form of Lady Gay, Dorothy Dennison, Hiawatha, Delight, White Dorothy, and the old Crimson Rambler. In the front was a beautiful box of roses of the variety Mrs. Longworth, which is described as a striped Caroline Testout, and the Lyon Rose was also well shown.

Messrs. George Mount and Sons, Canterbury, added further lustre to their fame by exhibiting a wonderful collection of roses. At the back were tall standards of Dorothy Perkins and Crimson Rambler, and below were beautiful banks of Mrs. John Laing, Lady Hillingdon, Frau Karl Druschki, Mrs. Geo. Shawyer, and Ulrich Brunner. The Richmond and the Lyon Rose were highly attractive, and every flower in this magnificent collection was stamped with the brand of high-class quality.

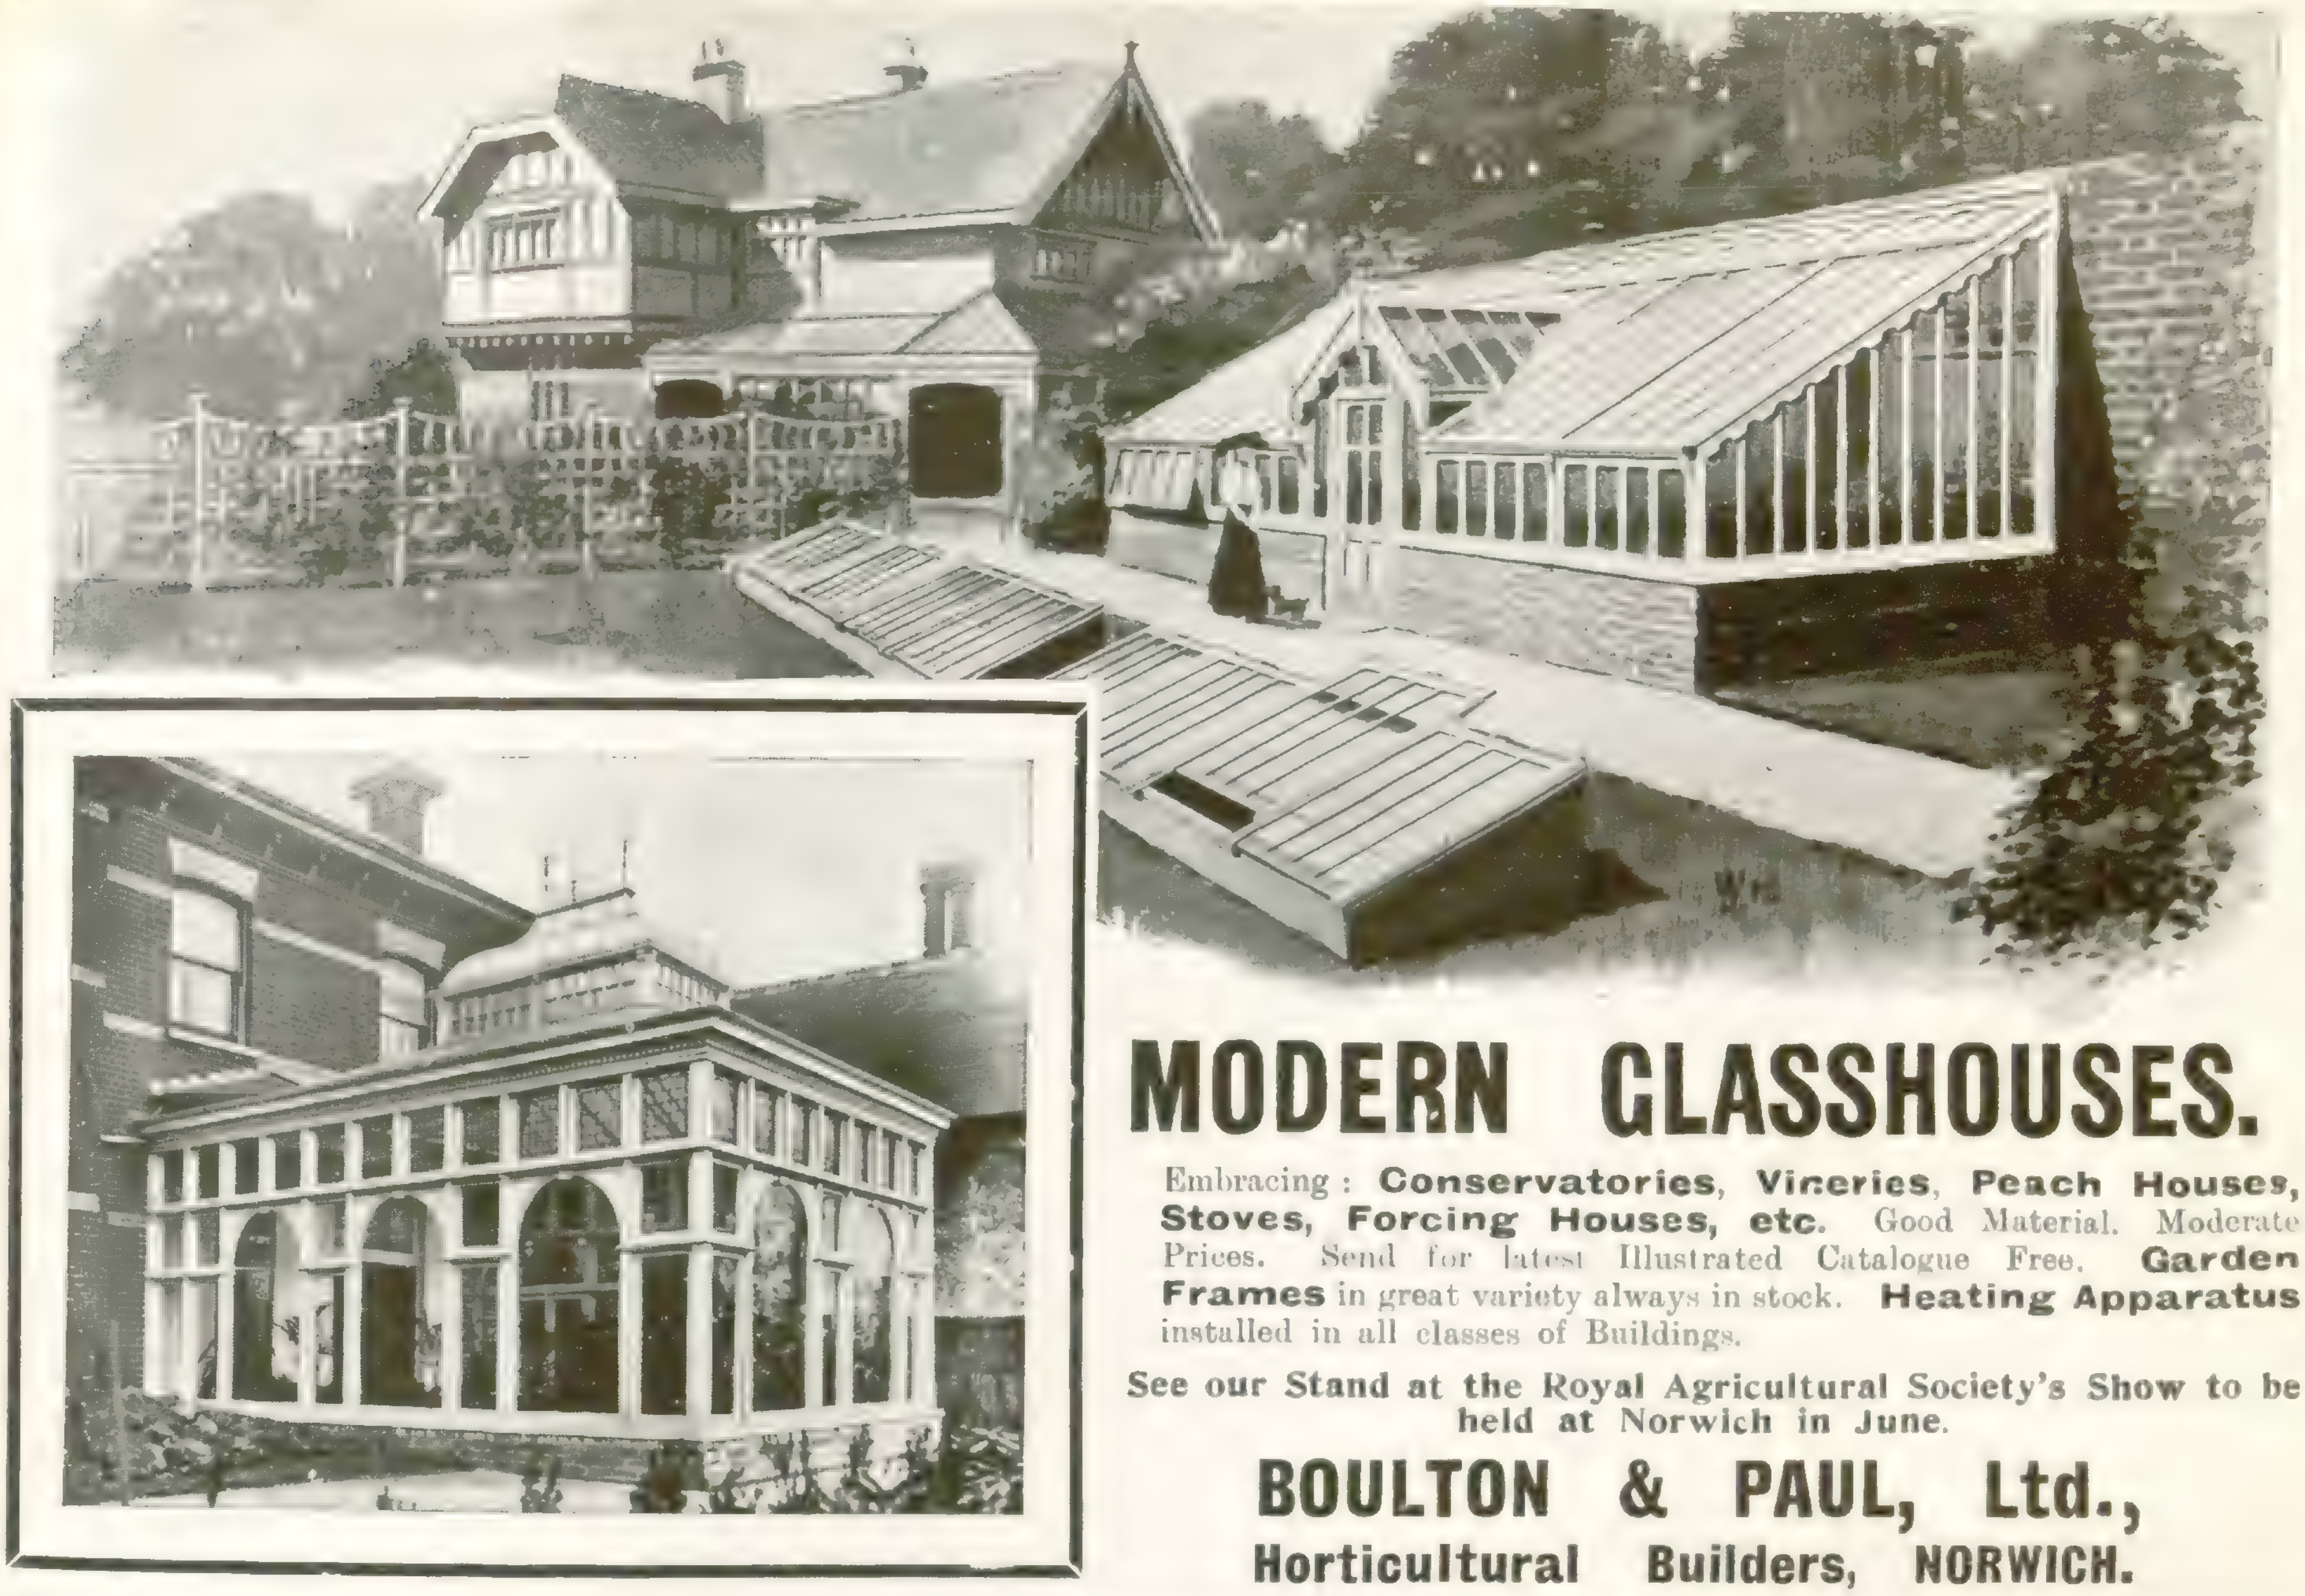
One end of the long tent was occupied by roses sent by Messrs. Hobbies, Lim., Dereham, and a fine collection it was. The conspicuous feature was the weeping standards of Excelsa, Minnehaha, American Pillar, and Lady Gay, and mixed in with the above were roses of numerous other varieties. Perhaps the group was a little overcrowded, but, nevertheless, it was very fine.

Messrs. Alexander Dickson and Sons, of Newtownards, set up a small, but choice collection of roses in bamboo stands. Amongst the varieties were fine flowers of Mrs. Walter Easlea, Mrs. Fred Straker, Mrs. Cornwallis West, and Mrs. Gordon Sloane.

BEGONIAS.

We have seen more tuberous begonias at previous Temple Shows, but we question if a finer lot of plants and flowers have ever been staged than those which came from Messrs. Blackmore and Langdon, Bath. There was a bewildering variety of colour, the flowers were magnificent in size and form, and the leathery foliage bore traces of rude health and good cultivation.

Mr. A. L. Gwillim, Sidcup, Kent, staged some good tuberous begonias, but the arrangement of the plants was rather flat and uninteresting.



MODERN GLASSHOUSES.

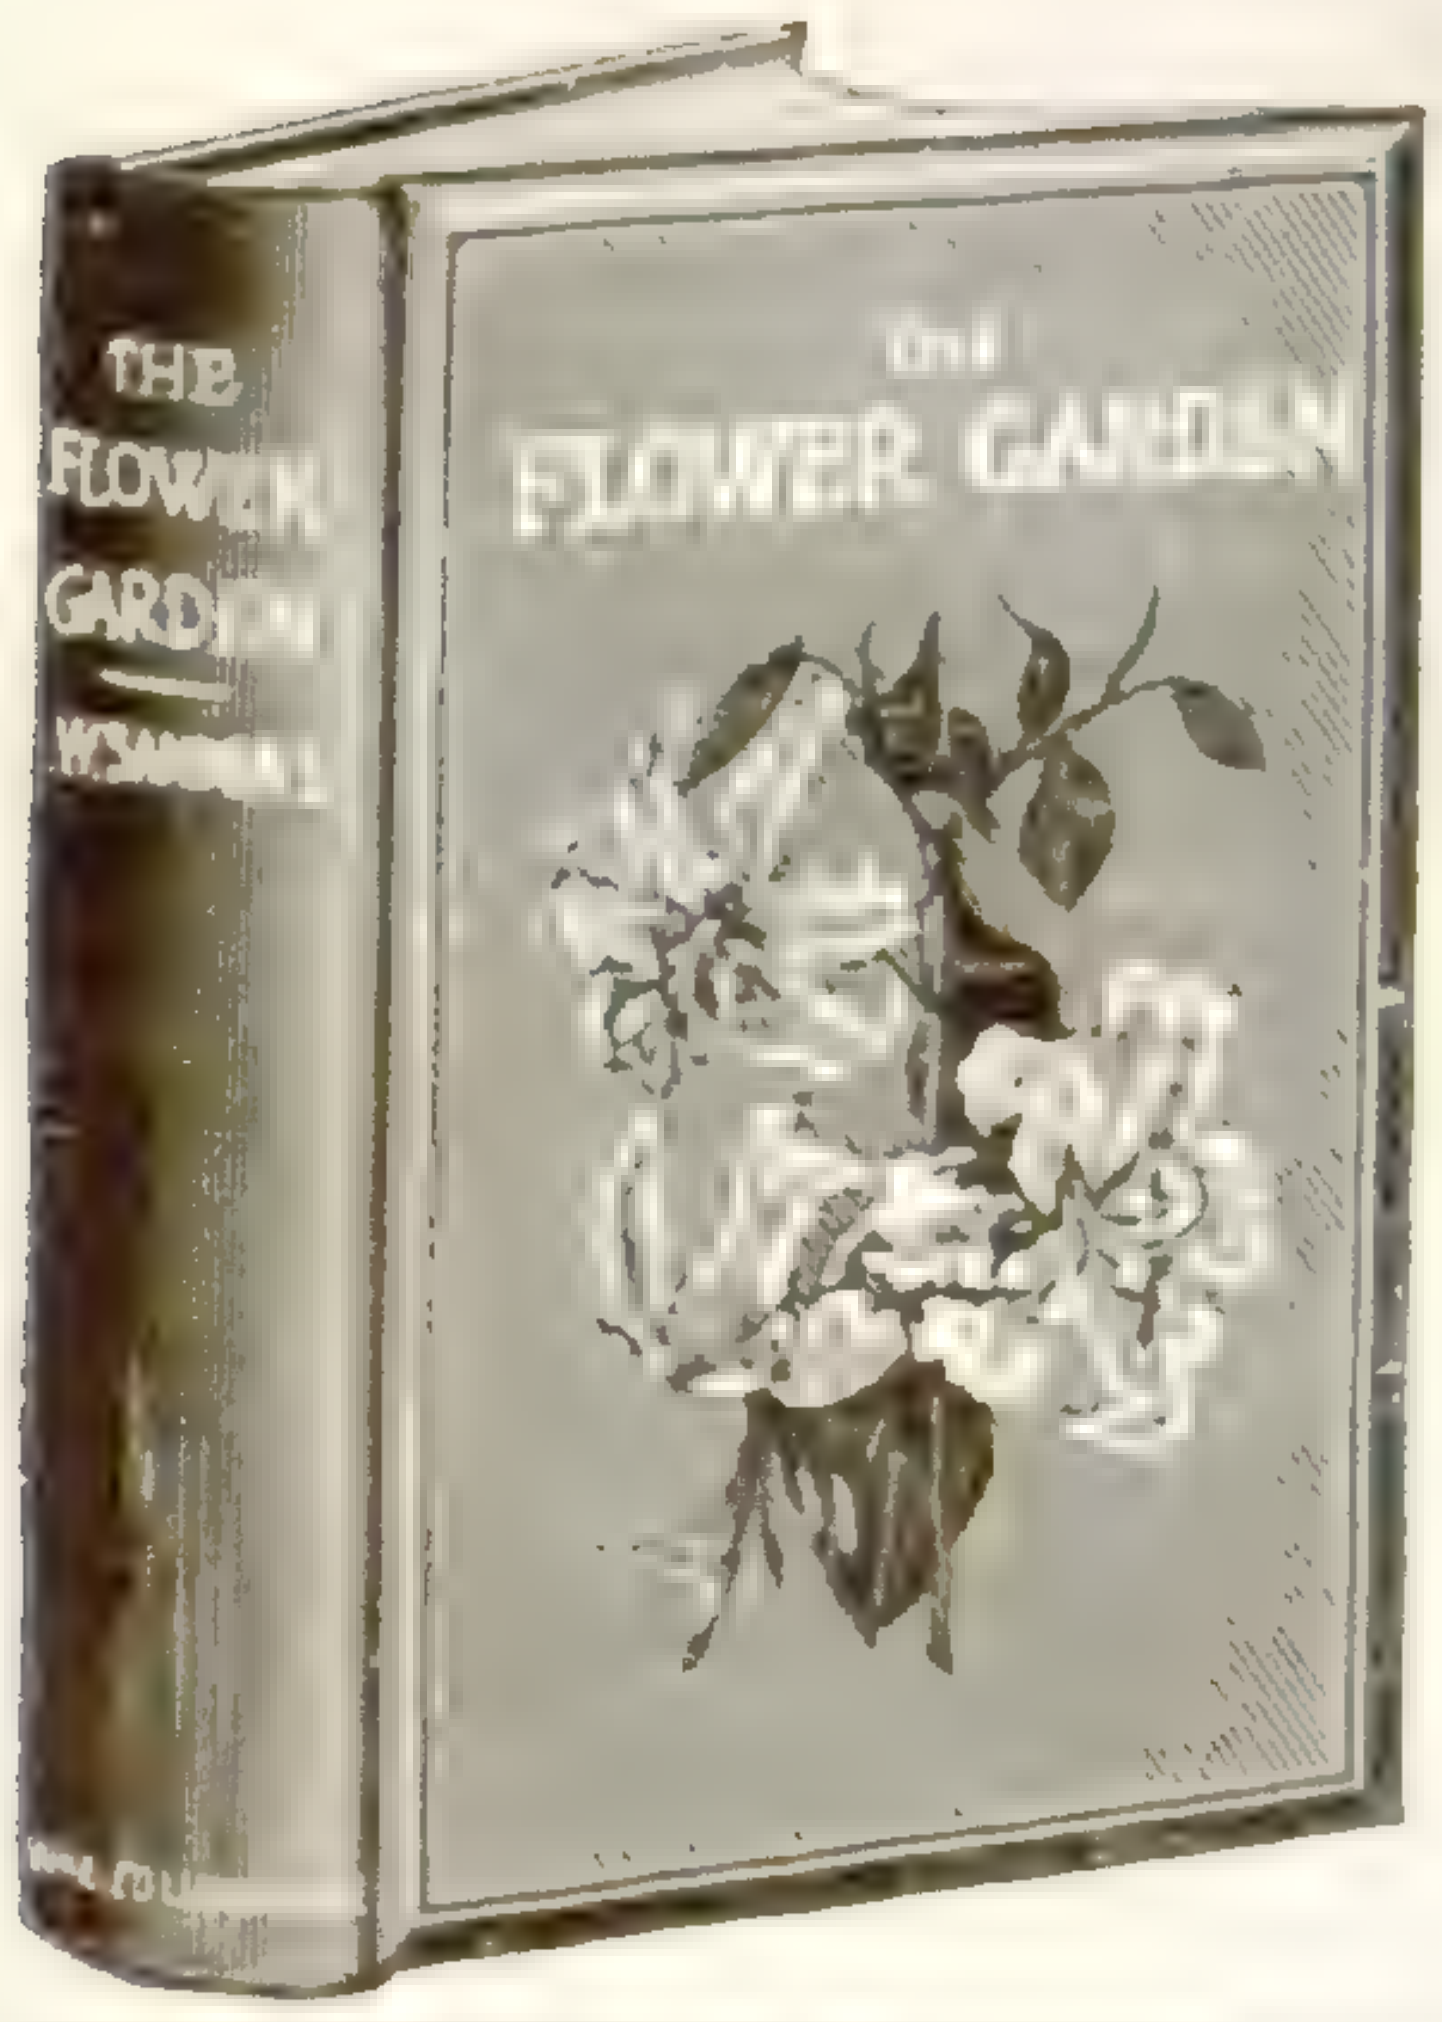
THE FLOWER GARDEN,



By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

A Complete Guide to Planting and Management of the Flower Garden and the Cultivation of Flowers, Plants, Trees, &c., adapted for Outdoor Culture.

THE CONTENTS INCLUDE—

- Fashioning the Garden.
- Beds and Borders.
- Walks and Paths.
- Lawns and Tennis Courts.
- Rockeries and Ferneries.
- Arbours, Summerhouses, Arches, and Pergolas.
- Edgings.
- Walls and Fences.
- Garden Practice.
- Propagation.
- Colour Arrangement.
- Bedding.
- Annuals and Biennials.
- Bulbs.
- Hardy and Tender Border Plants and Flowers.
- Climbing Plants.
- Trees and Shrubs.
- Pests and Diseases.

480 PAGES, ILLUSTRATED BY 64 PLATES OF BEAUTIFUL GARDEN SCENES, PLANTS AND FLOWERS, AND MANY EXPLANATORY DIAGRAMS.

Name ....

Address...

The size of many of the tuberous begonia flowers staged by Messrs. Ware, of Feltham, was extraordinary, and altogether the group was a highly attractive one. There were many varieties, but the one which attracted most attention was Lady Cromer, a charming flower of salmon-pink shade.

SWEET PEAS.

Sweet peas at the Temple Show are now quite an ordinary feature, and the flowers prepared for the occasion seem almost as good as those seen at the summer shows later on. Messrs. Robt. Sydenham, Lim., Birmingham, were represented by a fresh-looking lot of flowers, amongst which we noticed Zarina, Thomas Stevenson, King Edward VII., and other well-known varieties, all of which were staged in pleasing form.

Mr. W. E. Alsen, Denmead, Hants, put up a fresh-looking collection of sweet peas, conspicuous amongst which were Sterling Stent, King Alfonso, and Moneymaker.

Mr. Breadmore, of Winchester, staged a choice collection of sweet peas, and amongst the varieties we observed Sterling Stent, Dazzler, Charlie Irving, George Herbert, and King Alfonso. The flowers were tastefully arranged with asparagus foliage.

Mr. J. Stevenson, Wimborne, had an interesting collection of sweet peas, and included amongst the varieties we noticed vases of The King, Flora Stevenson, Asta Ohn, etc.

Sweet pea flowers, with some of their own foliage, were shown in variety by Messrs. E. W. King and Co., Coggeshall, and perhaps the most attractive varieties in the collection were Anglian Orange and Rosabelle. An air of novelty was introduced by Mr. H. J. Jones, of Lewisham, in the arrangement of his sweet pea flowers, and the elegant grasses used amongst the spikes were very pleasing. The varieties included, amongst many others, Nancy Perkins, Thos. Stevenson, Helen Lewis, Stirling Stent, Doris Burt, and Moneymaker. No exhibit of sweet peas in the tent was more attractive than this.

The outstanding feature in the exhibit of sweet peas from Miss Hemus, Upton-on-Severn, was the white flowers of Zero, raised from seed sown in an open field exposed to the east, last September. The flowers were very fine, and full of substance.

A very fine lot of sweet peas were set up by Messrs. Dobbie and Co., Edinburgh, the blooms being fresh, and borne on long footstalks. The varieties which attracted most attention were Mrs. Cuthbertson, Elfrida Pearson, Ivanhoe, Cherry Ripe, White King, and Sunproof Crimson. Considering the time of the year, this was really a wonderful lot of peas.

Messrs. Stark and Son, Great Ryburgh, had a pretty little collection of sweet peas, in which the varieties Lord Northcliffe and Hercules were mostly conspicuous.

FERNS.

Cool and fresh looking was the bank of ferns set up by Messrs. Hill and Son, Lower Edmonton, and amongst the different forms displayed were Nephrolepis Whitmani, Davallia robusta, Lomaria attenuata, Polypodium Mayi, and others. Everything about the appearance of the plants indicated signs of good cultivation.

Densely green was the big bank of ferns set up by Messrs. H. B. May and Sons, Upper Edmonton, and the plants which comprised the group were magnificent. Nephrolepis Marshalli compacta attracted much attention, and there were also some finely-grown examples of Davallia solida superba, Platycerium alcicorne, Polypodium Mayi, and others. The graceful Lygodium microphyllum exhibited in this collection was favourably commented upon.

Mr. H. N. Ellison, West Bromwich, set up a nice collection of mixed ferns. Amongst them, arranged with asparagus, were the bright orange flowers of Gerbera hybride.

Mr. A. A. Fabius, Emsworth, staged a novelty in the way of ferns called "The Glory Fern," which is very pleasing in appearance, and well suited to cool house culture.

GREENHOUSE PLANTS.

Across the top of the largest tent Messrs. Sutton and Sons, Reading, displayed one of their magnificent collections of flowers, and again they did themselves great credit. The group was a feast of rich colouring and grace, while the central mound of elegant stellate and cactus-flowered cinerarias lent fragrance to colour. On either side of the cinerarias were glorious groups of superb herbaceous calceolarias in glowing colours and rich and varied spottings, and every plant a perfect specimen; gloxinias were used with nemesias to edge the groups of calceolarias. At one end was a mound of schizanthuses, and at the other end schizanthuses were associated with brilliant begonias. The bright Firefly variety of Clarkia elegans was also a feature of this grand effort.

TEMPLE SHOW—CARNATION LADY ALINGTON.

A beautiful perpetual-flowering carnation, with blooms of a pleasing colour.
Exhibited by Messrs. S. Low and Co.

Indian azaleas and Malmaison carnations from Mr. Charles Turner, Slough, filled a corner with beauty and fragrance close to the side entrance to the big tent; the pyramidal azaleas towered up above the carnations, and were a reminder of old-time shows.

Greenhouse plants in great variety were staged by Messrs. Stuart Low and Co., Enfield. This firm showed heaths, anthuriums, blue hydrangeas, Hydrangea Madame Moulliere, gerberas, and acacias.

Mr. A. Bruce, Chorlton-cum-Hardy, again brought up an exhibit of interesting insectivorous plants, and showed sarracenias well, placing these amid moss and grasses. There were good specimens of S. flava gigantea, S. Farnhami, S. flava maxima, S. Drummondi, S. Willmottæ, the splendid new S. Sir Frank Crisp, and the dark crimson-hooded S. Watsonia, S. Chelsoni, S. Swaniana, etc., and also pans of Dionæa muscipula—the Venus fly trap—a very interesting group that was pleasant to look upon after the richer hues of other things.

Messrs. H. B. May and Sons, Edmonton, put up a few dozen bunches of double and semi-double pelargoniums but rather crowded the flowers; they had a fine new clematis of the lanuginosa type named Queen Mary.

Sweet heliotropes from the King's Acre Nursery Company, Hereford, attracted all the ladies, especially as the plants carried fine heads, notably in the case of Lord Roberts, Favourite, and Dr. Jewlin.

Zonal pelargoniums were contributed in large bunches by Messrs. Carter Page and Co., London Wall, but they soon suffered from the heat of the tents.

Amateurs' exhibits were few and far between, but Mr. Wickam Noakes, Selsdon Park, Croydon (gardener, Mr. Howarth), came up with a brave little show of herbaceous calceolarias, and staged well-grown and brilliant plants of a fine strain.

Zonal pelargoniums were brilliantly shown by Mr. R. J. Fry, Abbott's Leigh, near Bristol; the plants of Fiat, Abbot's Pride, Mentmore, and Miss G. N. Fry carried very large trusses.

Mr. W. H. Page, Hampton, had three grand new zonal pelargoniums in his varieties, His Majesty, Fiscal Reformer, and Winter Cheer.

Vivian Phillipps, Esq., Crofton Court, Orpington, was another amateur who came forward with herbaceous calceolarias, staging compact, freely-flowered plants. Mr. Vincent Slade, Taunton, Somerset, contributed cut zonal pelargoniums, and had excellent flowers of Ascott, Blenheim, and Mentmore.

Messrs. Webbs, of Wordsley, Stourbridge, made a big display on one side of the central tent. The exhibit was a very diversified one, and groups of bright calceolarias rubbed shoulders, as it were, with old-fashioned clarkias, new hybrid schizanthuses, Cineraria stellata, and calceolarias. The greenhouse cinerarias were very bright, and the arrangement of the whole was not wanting in taste.

THE LYON ROSE AND ORANGE-RED GERBERAS.
Artistically arranged by Messrs. R. Felton and Son.

Messrs. Sander and Sons, St. Albans, were represented by sturdily-grown plants of the new double white marguerite Mrs. F. Sander.

Messrs. R. Sydenham, Lim., Birmingham, staged some beautiful valley lilies in pots without drainage, as well as specimens of Spiræa Queen Alexandra, and Lilium auratum.

Messrs. H. Cannell and Sons, Swanley, made a brilliant display, first with a collection of superb cannas, then a bank of gorgeous calceolarias, followed by a little break of fancy pelargoniums; further on a group of interesing cacti, and then a brilliant show of zonal pelargoniums. The pretty little Myosotises pyramidalis Pink Gem and White Gem were much admired, and altogether this was one of the most interesting and superb groups of greenhouse plants in the show.

Graceful and effective are the adjectives which best describe the collection of hybrid schizanthuses exhibited by Messrs. Garaway, Bristol, and the well-grown plants attracted much attention.

Messrs. Godfrey and Sons, Exmouth, had a fine collection of their quaint Oriental poppies in different varieties, and they also made a bright show with fancy pelargoniums, but the bunches of flowers were rather overcrowded.

Nothing in the show was more effective than the exhibit at the main entrance, from Messrs. Carter and Co., Holborn. The baskets of schizanthuses were worth going some way to see, and specimens of the same flower in pots were highly effective. Petunia Queen of Roses made a bright show; carnations and sweet peas were good, and the display of gloxinias was extremely brilliant. Greenhouse cinerarias were shown in bank-like form, and the varied coloured petunias were much admired, as also was the pink stock Empress Elizabeth. Unfortunately the crush at the main entrance prevented many of the visitors from seeing the full beauty of this exhibit.

A stamp of quality, as well as extreme beauty, characterised the exhibit from Messrs. J. Veitch and Sons, Chelsea. The new hybrid gerberas staged by the Chelsea firm were a study in themselves, and Gloriosa Rothschildiana attracted much attention. Beautiful and varied to a degree was the bank of streptocarpus, while the plants of Kalanchoe flammea, Begonia Lucerna, Calceolaria Clibrani, Cinerarias Langley Red and Decorator, the pretty little Saxifraga sarmentosa tricolor, and Veitch's Snow Queen geranium, were much admired. It would be difficult to overpraise this interesting collection of plants.

Gloxinias in great variety came from Messrs. John Peed and Son, Norwood. Perhaps the prettiest of the named varieties was Queen Alexandra, but many of the others were very attractive.

CARNATIONS.

In their usual corner in the big tent Messrs. William Cutbush and Son, Highgate, put up a very effective display, consisting chiefly of roses and carnations. Tausendschon, Dorothy Perkins, American Pillar, and Hiawatha roses, combined with palms to make a background, except where in the angle of the tent there was a bank of Pink Pearl rhododendrons. The groundwork was composed of dwarf roses, such as Mrs. William Cutbush, White Pet, and Madame N. Levavasseur. Tall vases of carnations towered over everything, and the varieties Rose Doré, Queen Mary, Lady Hermione (the variety that is to form the Queen's Coronation bouquet), Mrs. Fortescue, and White Enchantress. Lower down were smaller vases and groups of other fine perpetual carnations, notably King Arthur, Mercia, Winsor, May Day, Lady C. Waring, The Queen, Lady Coventry, and Baldwin. The display was a large and also a magnificent one in every respect.

Mr. C. H. Herbert, Acocks Green, Birmingham, put up a lovely group of the fragrant perpetual-flowering pink named Progress; this has big blooms of a lovely rosy-heliotrope shade.

Messrs. Young and Co., Hatherley, Cheltenham, put up a very pretty display of well-grown carnations, setting up the flowers in goodly bunches, with asparagus fronds. Duchess of Devonshire, J. Whitcombe Riley, Cecilia, Mikado, Golden Glory, Enchantress, Rose Pink Enchantress, Winsor, and the fragrant Cheltonian, were the leading varieties on view.

The carnation exhibit arranged by Messrs. Stuart Low and Co., Enfield, was a novel one. Baskets of flowers were suspended high over a base of vases of various heights, and with a few palms, ferns, and smilax sprays a good effect was produced. Prominent varieties were the pink Lady Allington, Marchioness of Linlithgow, Royal Purple, Rival, Roseate Dawn, Enchantress, Marmion, the blush Baroness de Brenen, and the new pink shaded Gloriosa pink.

Mr. C. Engelmann, Saffron Walden, presented his big crimson carnation, Carola, in fine condition again, and also put up his vases of Sunstar, Rosa, White Enchantress, Rex, and the curious heliotrope and red variety named La Mode.

Mr. Bertie Bell, Castel Nursery, Guernsey, was a large exhibitor of beautiful carnations, and set up a fine group of bright blooms of Marmion, The President, Judith, Winsor, Rose Doré, Enchantress, Bay State, and the bright scarlet Beacon.

From the Thatcham Fruit and Flower Farm, Newbury, came a few large vases of such good carnations as Mrs. H. Burnett, Mikado, Victory, Beacon, and Rose Doré.

Mr. S. Mortimer, Farnham, had a goodly exhibit of popular perpetual carnations, but his few dozen vases of the sweet All the Year Round stock attracted even more attention than the carnations.

Messrs. Jones and Son, Shrewsbury, associated carnations with sweet peas, and of the former they showed Britannia, Enchantress, Rosea, Rise Pink Enchantress, Harlequin, and Mrs. Lawson.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

ROYAL SHOW

NORWICH,
June 26th to 30th, 1911.

President—HIS MAJESTY THE KING.

72ND ANNUAL EXHIBITION of HORSES, CATTLE, SHEEP, PIGS, POULTRY AND FARM PRODUCE; JUMPING, HORSE-SHOEING AND BUTTER-MAKING COMPETITIONS, AGRICULTURAL EDUCATION, FORESTRY AND HORTICULTURE.

HORTICULTURE

ENTRIES CLOSE MAY 31st.
(Live Stock Entries Close May 20th).

Prize-sheets and Entry Forms will be forwarded on application to

THOMAS McROW, Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND,
16, Bedford Square, W.C.

Under the immediate Patronage of H.R.H. the DUCHESS OF ALBANY.

IN AID OF THE FUNDS OF THE LEAGUE OF MERCY.

THE RIVER THAMES GRAND FLORAL AND DRAMATIC FETE,
to be held on Tagg's Island, Hampton Court,
WEDNESDAY and THURSDAY,
JUNE 7th and 8th, 1911.

£120 IN CUPS AND PRIZES.

Schedules and full particulars of the Joint Secretaries, Fête Office, Tagg's Island, Hampton Court.

SHREWSBURY GREAT FLORAL FETE.
AUGUST 23 and 24, 1911.

£1,200 in Cash Prizes.

Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs.,
Shrewsbury.

WOLVERHAMPTON GREAT FLORAL FETE,
JULY 11, 12, and 13, 1911.
£900 in PRIZES.
Schedules on application to the Secretary.

CHESTERFIELD FLOWER SHOW,
WEDNESDAY, 2nd August, 1911.
Affiliated with the National Rose Society.
Special large Marquee for staging Roses.
Schedules on application.
CHAS. WM. HADFIELD, Secretary.

GRAND YORKSHIRE FLOWER SHOW AND GALA,
JUNE 14th, 15th, and 16th, 1911.
£800 Offered in PRIZES.
£275 for Orchids, Stove and Greenhouse Plants.
£175 for Pelargoniums, Carnations, Begonias, etc.
£225 for Roses, Cut Flowers, etc.
£125 for Fruit and Vegetables.
FOUR GOLD MEDALS and PREMIER PRIZE FOR TRADE EXHIBITS.
Entries close 7th June. For Schedules, apply to
FRED. AREY, Secretary, Davyhall Chambers, York.

HANLEY PARK, STAFFORDSHIRE.
JULY 5th and 6th, 1911.
FIFTEENTH GREAT
ANNUAL FLORAL FETE.

£650 in Prizes, Silver Cups, Gold and Silver Medals.
Silver Challenge Cup, value £10 10s., offered for TRADE EXHIBIT.
(For particulars see page 8 in Schedule.)
Valuable Special Prizes offered by the Principal Firms in England.
Schedules post free on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

HARDY FLOWERS.

Hardy flowers were exhibited in various ways, and in groups of various sizes, but beyond a few special displays this section proved very monotonous, and provided little in the way of noveity.

The large and very interesting exhibit of hardy plants and flowers from Messrs. R. Wallace and Co., Colchester, was so full of good things that folks lingered long around it. Irises were charming, both the germanica varieties, I. Susiana, Spanish irises, etc.; Habranthus pratensis was very gay, and the liliums—L. umbellatum, L. tenuifolium Golden Gleam, L. excelsum, L. Hansoni, L. venustum, L. japonicum Colchesteri, L. martagon, and L. Browni—were lovely. Eremurus Elwesianus made a fine central group, while May-flowering tulips, pæonies, poppies, Incarvillea Delavayi, Allium Rosenbachiana, the lovely little ixias, gladiolus of the Colvillei section, and a group of Orchis foliosa and Cypripedium spectabile all went to make up a beautiful feature.

Mr. Howard Crane, Highgate, presented a charming exhibit of sweetly fragrant violas and violettas, setting the flowers in little bowls; of the small varieties Flora de Pinna, Jean, White Empress, Lorna, Claribel, Purity, Butterfly, Miss Jekyll, Rock Yellow, and Eileen were all very lovely, and attracted quite as much attention as the larger violas.

Choice hardy flowers were staged in quantity by Messrs. B. Ladhams and Son, Shirley, Southampton; pyrethrums were very effective, and so were the white and blue long-spurred aquilegias and the bright Primula Cockburniana and P. pulverulenta.

Messrs. Dobbie and Co., Edinburgh, are great on long-stemmed aquilegias, and on this occasion they showed a great range of colours in these lovely garden plants. Pansies and violas from the same firm were a great success, and here again the range of colour and the size and form of the flower merited all the praise bestowed upon them.

Among the hardy flowers submitted by Mr. A. J. Harwood, St. Peters, Colchester, the selected forms of Primula japonica were very good, and so were the lupins. A small exhibit of violas from Messrs. Wm. Artindale and Son, Nether Green, Sheffield, included V. gracilis, Darkey, May Burnie, Ajax, Addie Elsden, Moseley Gem, and Mary Hamilton.

The pyrethrums raised at Langport by Messrs. Kelway and Son are beautiful and popular herbaceous plants, and the firm showed a few of the best on this occasion, notably Passion Flower, Decoy, Lord Milner, Firefly, and Jas. Kelway; Queen Alexandra, silvery-white, was a conspicuously good tree pæony, while the lupins, aquilegias, and herbaceous pæonies all made a good show.

The leading subjects exhibited by Mr. Maurice Prichard, Christchurch, were pæonies, Hemerocallis Gold Dust and H. Aureole, verbascums, Eremurus himalaicus, pyrethrums, Embothrium coccineum, and a particularly fine selection of German and other irises.

An effective contribution of hardy flowers from Messrs. G. Jackman and Son, Woking, included Gladiolus The Bride, the scarlet Delphinium nudicaule, Saxifraga longifolia, Incarvillea grandiflora, Cypripedium pubescens, and Perry's variety of Phlox canadensis.

Long-spurred aquilegias, the scarlet anemone Rouge Ponceau, double ranunculuses, and poppies were pleasingly set up by Mr. Jas. Box, Lindfield.

Tulips and violas, the latter in vases arranged on arches, formed the exhibit from Messrs. Rich and Co., Bath, but the monster double white daisies attracted quite as much attention.

The golden trollius were splendidly shown by Messrs. Harkness and Son, Bedale, and the pick of several fine varieties would be His Majesty, Boule d'Or, Elsie Harkness, Orange Crest, Triumph, and Derby Day. Violas were nicely shown by Messrs. Seagrave and Co., Gleadlees, Sheffield.

Messrs. Storrie and Storrie's polyanthuses, cowslips, and auriculas for the garden border were very charming, and the deep giant yellow polyanthuses were very fine; while the fragrant sweet-scented yellow alpine or border auriculas were a feature of great beauty and interest.

Messrs. Fred Smith and Co., Woodbridge, had an elegant contribution of heucheras, eremurus, aquilegias, poppies, and trollius.

Messrs. Ware, of Feltham, filled up a small space with hardy flowers, which early in the afternoon felt the heat of the tent. The feature of the exhibit were some fine spikes of Eremurus Nimrod, a fine form of this showy flower.

A golden-yellow exhibit, made by the flowers of Trollius Springhill Beauty, Lemon Queen, Queen Mary, Aberdonian, and others, was set up by Messrs. J. Cocker and Son, Aberdeen, and striking by contrast in this exhibit were the blue flowers of Gentiana acaulis.

Mr. H. Hemsley, Crawley, exhibited a bank of Myosotis alpestris Marie Raphael that was much admired.

Viola cornuta purpurea was the outstanding feature of the floral exhibit staged by Messrs. Gunn and Sons, Olton, Warwick, but Viola gracilis also attracted attention.

Mrs. Lloyd Edwards, Bryn Ocrog, near Llangollen, staged a pretty collection of Saxifragas Lady Northcliffe and Rose Beauty, and Aubrietia Lloyd Edwards, very beautiful, in baskets.

Dr. Macwatt Morelands, Duns, N.B., staged some beautiful flowers of Primula obconica; white obconica in the same exhibit was also much admired.

Mr. John Forbes, Hawick, made a fine display with violas in variety, streptocarpus, and a fine pink stock called Beauty of Nice.

A long length of tabling was occupied by Messrs. Bakers, of Wolverhampton, who had tall-growing plants, including spiræas, irises, etc., as a background, and in front a bewildering selection of alpine flowers. Included in the exhibit were some very effective hardy cypripediums, violas, incarvilleas, saxifragas, and phloxes. Few exhibits in the tent attracted more attention than this one.

Messrs. Jones and Jones, Shrewsbury, made an interesting display with irises and violas shown in shallow dishes.

In the group which came from Mr. Amos Perry, Enfield, were a number of different varieties of trollius, Eremurus Elwesianus albus, and phloxes in variety. Pretty little primulas were accommodated in a rockwork arrangement, and another interesting section of the exhibit was that devoted to various forms of iris. Ramondia pyrenaica purpurea, growing amongst stones, was much admired, and specimens of the tree pæony Mountain were very effective. Tiarella unifoliata was very well shown in this collection, Daphne Cneorum was much admired, and the herbaceous poppies attracted much attention.

In the exhibit sent by Mr. T. Jannoch, Dersingham, lilacs vied with lilies of the valley in sweetness, and both were much admired.

Messrs. Barr and Sons, Covent Garden, London, had an interesting exhibit, in which Gladioli The Bride, cardinalis elegans, and Ackerman were conspicuous. Ixias, aquilegias, German and Spanish irises, were also very attractive.

Messrs. Lilley, of Guernsey, set up Iris filifolia, Gladiolus Lord Byron, Ornithogalum arabicum, and German iris in bamboo stands, and the effect was very pleasing.

Conspicuous in the varied exhibit from Mr. G. Reuthe, Keston, was a wonderfully fine white rhododendron called Loder's White, but many other fine rhododendrons were included, as well as azaleas, a few tulips, and a number of hardy alpine plants. A plant that attracted some attention in this exhibit was the curious Crinodendron Hookeri. Taste in arrangement was a characteristic of this exhibit.

Messrs. G. Gibson and Co., Bedale, showed a bank of hardy flowers, in which most of the usual subjects were represented.

Queen Mary is the name of a pretty new pyrethrum shown by Mr. G. W. Miller, of Wisbech, and the flowers were much admired. Anemones in charming variety were shown by Messrs. Reamsbottom and Co., King's County, Ireland, and the bright colours were very attractive.

CHOICE FLOWERING TREES AND SHRUBS.

Messrs. Jas. Veitch and Sons, Chelsea, had a very bold and glowing exhibit of choice flowering trees and shrubs in the big tent. The fine mollis azalea Anthony Koster, and the lovely Pink Pearl rhododendron gave splendid colour, and the tree pæonies were also splendid. Magnolia parviflora, Olearia stellata, blue hydrangeas, the soft yellow Rosa Hugonis, Rhododendron Smithi aureum, Nandina domestica, Clematis montana rubens, the white wistaria, and the graceful Styrax japonica were, with Vitis Henryana and V. heterophylla variegata, notably interesting and beautiful plants.

A big bank of clematises from Messrs. George Jackman and Son, Woking, again demonstrated the value of these fine climbers. Some were on pillars and others were trained to form low bushes, but all were grandly flowered, especially the varieties Blue Gem, Lady Northcliffe, Nellie Moser, The President, Jackmani rubra, Ville de Lyon, and Mrs. Hope.

Messrs. J. Piper and Sons, Bishop's Road, Bayswater, put up a big sloping bank of the fine Pink Pearl rhododendron, but somehow the group was not a success, probably because so many flowers were as yet unopened.

Mr. L. R. Russell, Richmond, contributed a small group of clematises, and exhibited the leading varieties.

Messrs. John Waterer and Sons, Bagshot, showed the most beautiful of rhododendrons, and they presented their Pink Pearl in beautiful form and delicious colour. Without crowding their plants, they grouped Doncaster, Alice, Mrs. Holford, Mrs. Wm. Agnew, Prometheus, Frederick Waterer, and Cynthia in fine style around the pink of hardy varieties.

The brilliance of the Ghent and Mollis azaleas exhibited in quantity by Messrs. R. and G. Cuthbert was quite dazzling; they had more standard plants than usual, and many of these were soft primrose and white varieties, and they showed up beautifully over the group of such gorgeous kinds as Alphonse Lavallée, Anthony Koster, Comte de Quincy, Prince of Orange, Bismarck, etc The smaller flowered Ghent varieties were well represented by freely flowered, compact bushes in various shades of colour. Altogether it was a most gorgeous display, and one that even outvied the colouring of the orchids.

Lilacs were extensively exhibited by Messrs. W. and J. Brown, Peterborough, and their fragrance filled the air; particularly good were Souv. de Louise Spathe, Charles X., Negro, Dr. Von. Regel, M. de Bassompierre, and the double white Mons. Lemoine.

Shrubs and hardy flowers were combined by Mr. R. C. Notcutt, Woodbridge; Azalea Bungiri, Helianthemum formosum, Andromeda cassinefolia, Carpenteria californica, and the new pink Azalea sub-lanceolata (A.M.), were the chief among the shrubby subjects, the latter being a very handsome plant that proved hardy at Woodbridge during last winter.

Lilacs were famously shown in large bunches by Messrs. Paul and Son, Cheshunt, who presented splendid spikes of Jeanne d'Arc, President Carnot, Souv. de Leon Späthe President Grevy, Marie Legrave, alba grandiflora, Belle de Nancy, and Arthur W. Paul.

Rhododendron Keyesi, R. Gill's Goliath, R. Falconeri, with several great trusses of creamy flowers; R. campylocarpum, R. Aucklandi—superb in truss and bloom, and the scarlet Embothrium coccineum, were all shown by Messrs. R. Gill and Son, Falmouth. The new Primula Winteri was also shown, but not in flower.

TULIPS.

Brilliant in colour, and almost bewildering in variety, were the tulips staged by Messrs. R. H. Bath, Lim., Wisbech. The flowers were nicely staged, and varieties which attracted much attention were Mr. Farncombe Sanders, Prince of Orange, Cupid, Clara Butt, and Maiden's Blush. It was easy to observe from the remarks of visitors that they were keenly interested in these May-flowering tulips.

Nothing could be more beautiful than the display of May-flowering tulips staged by Alex. Dickson and Sons, Newtownards. The variety was bewildering, the flowers wonderfully fine, and amongst those which attracted much attention were Prima Donna, Clara Butt, Gesneriana lutea, Sunset, Enchantress, Sensation, King's Court, Dom Pedro, Rev. Harpur Crewe, Duchess of Westminster, Flora's Ornament, and the black tulip, La Tulipe Noire.

The tulips staged by Messrs. George Bunyard and Co., Maidstone, made a bright show, but they would have looked better if they had been less crowded. Most of the best varieties in the May-flowering section were included.

Needless to say, Messrs. Barr's display of tulips was a glorious one, and almost everything good amongst May-flowering tulips was represented. The colours were delightful, the flowers fine, and the remarks made by the visitors were evidence that the Covent Garden firm's effort was appreciated. It would be unfair to make invidious comparisons, and the Cottage tulips, Darwins, and others struck us as being equally effective.

A rather closely-packed, but otherwise fine and bright display of May-flowering tulips was made by Messrs. Jefferies and Son, Cirencester; Columbus, Loveliness, Bouton d'Or, Edmée, Hecla, and Corot were notably good.

Messrs. Hogg and Robertson, Mary Street, Dublin, brought over a fine set of Irish-grown tulips, in which the colours were particularly bright; Gesneriana lutea, Rev. Harpur Crewe, Henner, Mrs. Kerrell, Quaintness, elegans lutea, and Beauty of Bath were notably good varieties presented.

A large bank of glowing tulips put up by Messrs. Sutton and Sons, Reading, contained a large collection of fine substantial flowers, set up in big bunches; Thorback, Margaret, Picotee, Golden Goblet, Ellen Willmott, Clara Butt, Prince of Orange, Louis XIV., Mrs. Cleveland, Columbus, and Jaune d'Œuf were a few of the best varieties.

CERTIFICATES AND AWARDS.

Floral Committee Awards.—First Class Certificate to Davidia involucrata, from Messrs. J. Veitch and Sons, Chelsea.

Award of Merit, to Haberlea Ferdinand Coburgi, from Mr. G. Reuthe, Keston, Kent; to Lewisia cotyledon, from Mr. G. Reuthe, Keston, Kent; to Azalea Duchess of Portland, from Messrs. Cuthbert, Southgate; to H.T. Rose Portia, from Messrs. W. Paul and Son, Waltham Cross; to perpetual-flowered Rambler Rose Sylvia, from Messrs. W. Paul and Son; to Azalea sublanceolatum, from Mr. R. C. Notcutt, Woodbridge; to Rhododendron Corona, from Messrs. J. Waterer, Bagshot; to Lilium tenuifolium Golden Gleam, from Messrs. Wallace and Co., Colchester; to Rhododendron Loder's White, from Mr. G. Reuthe, Keston, Kent; to Rhododendron Littleworth Corallina, from Miss Mangles, Seale, Surrey; and to Rhododendron Glory of Littleworth, from Miss Mangles, Seale, Surrey.

Orchid Committee Awards.—First Class Certificate to Oncidium Mulleri, from Messrs. Sander and Sons, St. Albans; to Odontioda Lambeauiana, from Messrs. Sander and Sons; to Odontioda Bradshawiæ, from Sir J. Colman, Bart.; to Odonticda Vuylstekeæ Coronation, from M. Ch. Vuylsteke, Loochristy; to Odontoglossum Black Prince, The Dell var., from Baron Bruno Schröder, Englefield Green; to Lælio-cattleya Morningtoniæ, from F. A. Wellesley, Esq., Woking.

Award of Merit—to Odontoglossum amabile var. Empress of India, from Messrs. Sander and Sons, St. Albans; to Lælio-cattleya germanica, from Messrs. Charlesworth and Co., Haywards Heath; to Oncidium Claesi, from Sir J. Colman, Bart.; to Cattleya Mossiæ G. N. Hale, from S. Larkin, Esq., Haslemere; and to Cœlogyne x Burfordense, from Sir Trevor Lawrence, Bart., Dorking.

Cultural Commendation to Messrs. Charlesworth and Co., Haywards Heath, for Odontoglossum hastilabium Charlesworth's var.

GOLD MEDALS.

To Sir Jeremiah Colman, Bart., Reigate, for orchids; Hon. Vicary Gibbs, Elstree, for vegetables; Messrs. Charlesworth, Haywards Heath, for orchids; Messrs. Sander and Sons, St. Albans, for orchids; Messrs. T. Rivers and Sons, Sawbridgeworth, for fruit trees in pots; Messrs. R. and G. Cuthbert, Southgate, for azaleas; Messrs. W. Cutbush, Highgate, for carnations with roses; Messrs. Sutton and Sons, Reading, for flowering plants; Messrs. Geo. Mount and Sons, Lim., Canterbury, for roses; Messrs. Paul and Son, Cheshunt, for roses; Messrs. W. Paul and Son, Waltham Cross, for roses; Messrs. J. Veitch and Sons, Chelsea, for foliage plants; Messrs. H. B. May and Sons, Upper Edmonton, for ferns and flowering plants; Mr. Amos Perry, Enfield, for herbaceous plants, etc.; Messrs. R. Wallace and Co., Colchester, for flowering plants.

SILVER CUPS.

To Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; Samuel Larkin, Esq., Haslemere, for orchids; Messrs. Mansell and Hatcher, Lim., Rawdon, for orchids; Messrs. Alex. Dickson and Sons, Lim., Belfast, for tulips; Messrs. Jas. Veitch and Sons, Lim., Chelsea, for herbaceous and flowering plants; Messrs. W. Cutbush and Son, Highgate, for rock, alpine, and herbaceous plants; Messrs. Barr and Sons, Covent Garden, for rockery, tulips, pigmy trees, etc.; Messrs. James Carter and Co., Raynes Park, for Japanese garden and flowering plants; Mr. Charles Turner, Slough, for azaleas, carnations, and roses; Mr. L. R. Russell, Richmond, for ornamental trees and flowering plants; Messrs. T. S. Ware, Lim., Feltham, for begonias, etc.; Messrs. H. Cannell and Sons, Swanley, for calceolarias, pelargoniums, etc.; Messrs. J. Cheal and Sons, Crawley, for rock garden and group; Messrs. G. Jackman, Woking, for clematis; Craven Nursery Company, Clapham, York, for rock garden; Mr. Clarence Elliott, Stevenage, for alpines; Messrs. Ben Cant and Sons, Colchester, for roses; Messrs. W. Fromow and Sons, Chiswick, for Japanese maples; Messrs. Laxton Bros., Bedford, for strawberries; Mr. H. Burnett, Guernsey, for carnations; Messrs. Dobbie and Co., Edinburgh, for sweet peas and violas; Messrs. Hobbies, Lim., Dereham, for roses; Messrs. Blackmore and Langdon, Twerton-on-Avon, for begonias; Messrs. J. Waterer and Sons, Lim., Bagshot, for rhododendrons; and to Messrs. R. P. Ker and Sons, Liverpool, for amaryllis.

SILVER-GILT FLORA MEDAL.

To Messrs. James Cypher and Sons, Cheltenham, for orchids; Messrs. J. and A. McBean, Cooksbridge, for orchids; Mr. Maurice Prichard, Christchurch, for [illegible] garden; Messrs. Stuart Low and Co., Enfield, for orchids, etc.; Messrs. Bakers, Codsall, for rock garden, herbaceous and [illegible] plants; Messrs. J. Backhouse and Sons, Lim., York, for Alpines and herbaceous plants; Mr. G. Reuthe, Keston, for herbaceous and alpine plants; Messrs. John Peed and Son, [illegible] Streatham, for caladiums; Mr. R. C. Notcutt, Woodbridge, for flowering shrubs, etc.; Mr. A. J. A. Bruce, Manchester, for sarracenias, etc.; Messrs. Frank Cant and Co., Colchester, for roses; Messrs. J. Hill and Son, Lower Edmonton, for ferns; Mr. Charles Blick, Hayes, for carnations; Mr. Frank Lilley, Guernsey, for gladiolus and iris; Messrs. Pulham and Son, Oxford Street, for rock garden.

SILVER-GILT BANKSIAN MEDAL.

To Messrs. J. Piper and Son, Uckfield, for rhododendrons and box trees; Guildford Hardy Plant Nursery, for alpine and rock garden; Mr. Bertie Bell, Guernsey, for carnations; Mr. C. Engelmann, Saffron Walden, for carnations; Messrs. Hogg and Robertson, Dublin, for tulips and bulbous plants; Messrs. John Jefferies and Son, Ltd., Cirencester, for tulips and to Messrs. Jones and Sons, Ltd., Shrewsbury, for carnations, sweet peas, etc.

SILVER KNIGHTIAN MEDAL.

To Mr. A. J. Harwood, Colchester, for asparagus and primulas; Thatcham Fruit and Flower Farm, near Newbury, for carnations and vegetables.

SILVER FLORA MEDAL.

To Mr. J. Robson, Altrincham, for orchids; Messrs. R. and G. Cuthbert, Southgate, for tulips; Messrs. Sutton and Sons, Reading, for tulips; Messrs. R. H. Bath, Ltd., Wisbech, for carnations and tulips; Messrs. G. Bunyard and Co., Lim., Maidstone, for tulips and herbaceous plants; Messrs. G. and A. Clark, Lim., Dover, for alpines and herbaceous plants; Mr. Howard H. Crane, Highgate, for violas and violettas; Messrs. Artindale and Son, Sheffield, for rock garden and herbaceous plants; Mr. H. Hemsley, Crawley, for alpines and herbaceous plants; Mr. G. Prince, Longworth, for roses; Burton Hardy Plant Nurseries, Christchurch, for alpines; Messrs. B. Ladhams, Lim., Southampton, for hardy flowers; Mr. John Macwatt, Duns, N.B., for primulas and auriculas; Mr. C. F. Waters, Balcombe, for carnations; Messrs. E. Webb and Sons, Stourbridge, for calceolarias, etc.; and to Mr. C. Breadmore, Winchester, for sweet peas.

SILVER BANKSIAN MEDAL.

To Mr. Robert Stevenson, Cambridge, for asparagus; King's Acre Nurseries, Lim., Hereford, for heliotropes and herbaceous plants; Mr. A. F. Dutton, Iver, for carnations; Messrs. H. J. Jones, Lewisham, for sweet peas and pelargoniums; Messrs. Kelway, Langport, for pyrethrums and pæonies; Messrs. Fred Smith and Co., Woodbridge, for herbaceous plants; Messrs. Storrie and Storrie, Glencarse, for polyanthus and auriculas; Messrs. J. Cocker and Son, Aberdeen, for herbaceous flowers; Messrs. John Forbes (Hawick), Lim., Hawick, for delphiniums and pentstemons; Messrs. Gunn and Sons, Olton, for herbaceous flowers; Messrs. Heath and Son, Cheltenham, for rock garden; Messrs Harkness, Hitchin, for trollius; Misses K. and E. Hopkins, Shepperton, for rock garden; Mr. Reginald Prichard, West Moors, for alpines; Messrs. Bees, Lim., Liverpool, for new primulas and alpines; Mr. H. Correvon, Geneva, for alpines; Messrs. G. Gibson and Co., Bedale, for herbaceous and alpines; Mr. A. L. Gwillim, Sidcup, for begonias; Mr. W. H. Page, Hampton, for zonal pelargoniums; Messrs. Robt. Sydenham, Lim., Birmingham, for sweet peas and lilies; Messrs. Young and Co., Cheltenham, for carnations.

BRONZE FLORA MEDAL.

To Mr. E. V. Low, Haywards Heath, for orchids; Mr. H. Dixon, Wandsworth Common, for orchids; Messrs. Carter Page and Co., London Wall, for flowering plants; Messrs. Godfrey and Sons, Exmouth, for poppies; Mr. John E. Knight, Wolverhampton, for violas; Mr. J. Stevenson, Wimborne, for sweet peas; Mrs. Edward Lloyd, [illegible], for saxifrages and alpines; Messrs. Seagrave and Co., Sheffield, for violas; Messrs. W. Wells and Co., Merstham, for carnations, etc.; Vivian Phillips, Esq., Orpington, for calceolarias; and Wickham Noakes, Esq., Croydon, for calceolarias

---

[Owing to the pressure on our space we are compelled to leave over the remaining sections until our next issue.]

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SUMMER - FLOWERING CYPRIPEDIUMS.—Such species as C. barbatum, C. Curtisi, C. callosum, C. ciliolaris, C. Lawrenceanum, and the various hybrids that have been derived from them will now be producing their flowers. In the majority of cases the blooms are exceedingly durable and remain a long time in good condition; but the future of the plant should have some consideration, and the flowers should be cut after they have been expanded for a reasonable time. Where we have plants of this kind that are both useful for exhibition and decorative purposes alike, there is generally a tendency to permit the flowers to remain as long as they will last good, but it will be found that even the most vigorous and robust kinds are not improved by over-flowering, and a great strain should not be placed on them. Perhaps most of the albino or green forms of the coloured species are the most liable to suffer, and, as in the majority of cases the albino form is less vigorous in constitution, it is more desirable that the flowers should be removed as early as possible.

POTTING.—These, without exception, are shallow-rooting plants, and do not require the depth of potting compost necessary for the winter-flowering section. The pots should be clean, and filled to about half their depth with broken crocks. The compost we find most suitable for all the section with variegated-foliage, consists of two parts fibrous peat to one of finely-chopped sphagnum moss, and sufficient broken charcoal, small crocks, and sand to render the whole porous. Practically all these cypripediums make a continuous growth on a single rhizome, and, unless from injury or some other cause, the leading growth fails to break, back growths are rarely produced, and as living roots are rarely attached to them to assist in their support, they must of necessity gain their sustenance from the front of the plant, which naturally detracts from the vigour of the new growth. It is a good plan to examine the plants a few weeks before they are repotted, and if the rhizome is cut through the old growths usually start into growth from dormant eyes, and may be removed at the time of potting to increase the size of the specimen, or give stock as the case may be. Keep all freshly-potted plants carefully shaded from strong light until the roots get hold of the fresh compost. The atmosphere about the plants should also be kept in a humid state at all times.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

BEGONIA GLOIRE DE LORRAINE.—Further batches of cuttings may now be selected and rooted in the way previously advised. Now that the earliest rooted plants will be growing freely, it is advisable to repot them, using pots three to four inches in diameter. When preparing the potting compost, preference should be given to the moist fibrous loam used in a lumpy state, and well-decayed oak leaf soil, both of these may be used in equal parts; but in cases where the loam is not of the best quality, an equal amount of fibrous peat should be added, and sufficient lumpy charcoal, Bedfordshire sand, and lime rubble to keep the compost porous and sweet. Pots must be dry, clean, and provided with ample drainage. Extreme care must be exercised when handling the roots, as they are easily damaged by careless potting, and it is advisable to dispense with the use of the potting stick, as this begonia will succeed best when provided with a somewhat loose rooting medium; and on no account should the compost be pressed too firmly around the roots. With many years' experience of this useful winter flowering subject, and careful observation of its progress under different treatment, I have arrived at the conclusion that providing careful attention is paid to watering immediately after repotting, abundance of heat and moisture is afforded, with a spraying overhead several times daily, and thorough shade from the hot sunshine is given, then the conditions are provided for the successful culture of this begonia.

BOUVARDIAS which have been raised during the early part of the year for providing a floral display for autumn will now be ready for their final repotting. The pots may be from four to five inches in diameter, according to the size and strength of the batch to be treated. They may also be prepared for their summer quarters by gradually hardening off in pots or frames. If the plants are not disposed to branch freely the tips may be removed to counteract their straggling habit. Syringe the plants twice daily, during the early morning and again early in the afternoon after closing the frames. Immediately after repotting, thoroughly shade from the sun; and as root action is again restored, a lighter shading only will be needed during the hottest part of the day. To insure success bouvardias must be kept clean from attacks of aphis and red spider by frequent syringings with insecticide.—John Donoghue, Bardon Hill Gardens.

THE FLOWER GARDEN.

SUMMER BEDDING. — Planting the flower beds for the summer display may now be proceeded with, commencing with the hardiest subjects, and leaving the more tender plants until last. During late years the style of bedding has undergone a great change, and the change is certainly one for the better. In place of the formal designs of earlier years, a more natural effect is aimed at, and numbers of plants are now brought into use which were not thought of then. The scheme of planting for this season should have been decided on last August, when the necessary plants could be propagated in sufficient quantities to allow the new ideas to be carried out. When this method is followed, planting is an easy matter, for one only has to consult the plan to discover what is to occupy each bed. To those who have not decided how to plant, a few suggestions are offered. In dealing with some plants, edgings may be dispensed with altogether, as being quite unnecessary. Antirrhinums, begonias, heliotropes, etc., provide a much better effect when planted close to the grass without edging plants, allowing the growths to hide the straight lines of the beds entirely. Again, excellent effects are obtained by using specimen plants over a carpet of a dwarf-growing subject. Fuchsias, heliotropes, Humea elegans, Calceolaria Burbidgei, ivy-leaved pelargoniums, Grevillea robusta, and many others all lend themselves to this kind of planting. The fibrous-rooted begonias may be used for ground work to specimen plants, according to taste, whilst the tuberous-rooted ones should occupy beds to themselves and be kept in separate colours. Calceolaria amplexicaulis mixed with Heliotrope Lord Roberts, allowing the growths of each to intermingle, make a pretty bed. Standard plants of the same calceolaria dotted among Salvia patens look fine and make a pleasing contrast. Abutilon Savitzi may be mixed with Paul Crampel pelargonium when the latter is considered too showy by itself. For large beds, Humea elegans is excellent for dot plants, the large brown plumes looking exceedingly graceful, and a ground work of Souv. de Charles Turner ivy-leaved pelargonium might be used to advantage. Salvia splendens vars. Pride of Zurich and Fireball, are both useful for bedding purposes, and where bright colours are needed are indispensable. Mad. Crousse pelargonium is very free flowering and of a popular colour; beds planted with this variety, having a few tall plants of the same to relieve the flatness, are very pretty. There are a number of combinations, yet in many cases the planting rests with individual taste, for what pleases the eye of one annoys that of another. It is important that the plants should be in a moist condition when put out, and if the weather is dry, it will be necessary to water the beds after planting.

DAHLIAS.—Providing the plants are properly hardened off, and the ground prepared, they may be put out next week. After planting in completed the permanent supports should be afforded the plants. Old roots which have been started into growth under glass should have a few of the growths cut out, where they are very numerous, two or three shoots being quite sufficient to form a large bush.

SEED SOWING.—Sow seeds of myosotis, silene, etc., required for autumn planting; also the seeds of various biennials.—E. C. POOLEY, Gnaton Gardens.

FRUITS UNDER CLASS.

EARLY BLACK HAMBURGH GRAPES.—These will now be ripening apace, and are putting on a good colour, therefore more air must be allowed both top and bottom, and it would be well to leave a little on all night so that the berries do not get covered with moisture. On warm days open the house freely, so long as the temperature can be kept at 70 deg.; do not let it fall much below 70 degs. until the grapes are thoroughly ripe. When Foster's Seedling is grown in the early house this will take a trifle longer to reach really good condition. Water thoroughly, but the floor, etc., may be kept somewhat drier, though on hot, dry days, the interior should be damped several times or red-spider will put in an appearance. There is now on the market a little sulphur fumigator, which is an excellent means of dispersing red spider and mildew; it is made to vaporise a small quantity of sulphur over a long period, and if used carefully and according to instructions, cannot fail to be of great assistance in keeping down these dreaded pests. Continue to stop lateral growths as occasion requires, or the vines soon become a thicket of growth. Along the South Coast, where hot sunshine prevails, if the sun is found too powerful, no harm is done by shading lightly to prevent burning or scorching of the foliage. That excellent grape, Madresfield Court, should not have too much water during its later stages of development, but plenty of air must be afforded, and when the grapes are really ripe the heat may be reduced to a minimum, only using a little at night or on wet days to dispel damp.

EARLY PEACHES AND NECTARINES.—Peaches that are ripe and ripening may be kept much cooler; examine the trees every morning, remove fruits that are ripe, and lay them carefully in a basket or box on a layer of fine wood wool. Peaches require to be handled very carefully. It is a mistake to take them before they are really ripe, as the flavour is not fully developed, and near the stone and stem there will be a hard portion of fruit. Nor should they be allowed to become too ripe, so that they drop. If the fruits are ripening fast enough fire heat may be dispensed with, excepting on dull days or cold nights. Keep the floors and borders damped down to prevent attacks of insects, and as soon as the fruits are all gathered start syringing the trees again. The second or succession crop should be brought along in time to meet the first, so that no gap exists in the supply. Syringe well twice daily, and shut up with a good temperature. Give liquid manure at alternate waterings, and keep the branches tied in, and expose the fruit to sunshine in order to get good colour.

CHERRIES.—As soon as these are gathered open the ventilators to the full top and bottom, and give the borders a good soaking, and syringe the trees with an insecticide. Cherries when shaded and protected will keep a considerable time, and late varieties are all the better for being kept and thoroughly ripened.

ORCHARD HOUSE.—Give plenty of air on all occasions, and give copious supplies of water. Pinch the shoots of pears, plums, and apricots as often as they may require it. Fumigate for aphis, and now and again give a washing with quassia extract, which is a fine medium for keeping trees clean. Thin peaches and nectarines as soon as possible, and regulate the shoots that they be not overcrowded.—W. A. COOK, Leonardslee Gardens.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

NEMESIAS.—H. J. G., Havant: Sow the seeds at once, thinly, on light, well-worked soil, in a shady position, out of doors. The seeds will probably germinate readily and quickly here if just covered with soil; germination is often very erratic when the seeds are sown under glass.

NATIONAL SWEET PEA SOCIETY.—M. E. B., Goole: We believe this society has between twelve hundred and thirteen hundred members. The minimum annual subscription is five shillings, and no floricultural society gives a better return for the subscription paid. The secretary is Mr. C. H. Curtis, Adelaide Road, Brentford.

CYPRIPEDIUM CALLOSUM.—F. S., Chippenham: You will find just the information you need respecting this and somewhat similar cypripediums under the heading of "Orchids" in our "Work for the Week" columns in the present issue.

MOWING MACHINE.—R. S., Oxted: You cannot do better than apply for catalogues and particulars to the several firms who make a speciality of mowing machines, and who advertise in our columns. With the lists before you, you can make your selection readily.

UNSATISFACTORY VINES.—W. P., Cardiff: So far as we can gather from your letter, it would appear that the vines have not had a proper opportunity of ripening their wood, hence the lack of bunches on the new growth of this year. If the vines are cared for this season, laterals pinched back, growths tied in, and watering and ventilation provided efficiently, then there ought to be a great improvement another year. The somewhat small border is no disadvantage if feeding is done in due course. You do not say what the aspect of the vinery is, and, of course, the position may be as much answerable for the failure as is the neglect of the past few years.

ASPARAGUS BEDS.—I., Fareham.—You should have been able to cut asparagus from your beds at or about the date of your letter, and cuttings could continue until about June 16 or 18, certainly not beyond the end of June. You may cut all the heads that are of sufficient size to use as fast as they appear. Well made asparagus beds should continue in good bearing for at least a score of years, provided ample manurial dressings are given, chiefly in liquid form, soon after cutting ceases, and when growth is free. Asparagus should not be cut from a bed until the second year after planting. The quantity of asparagus obtainable from a given bed depends chiefly on the preparation of the bed and the after culture.

EXHIBITION STANDS FOR CHRYSANTHEMUMS.—E. W. T., Chesterfield: The following regulation of the National Chrysanthemum Society gives the sizes of the stands: Exhibitors must have their stands made of the following dimensions, viz., stands for twelve incurved blooms to be twenty-four inches wide from left to right, and eighteen inches deep from back to front, with holes six inches apart from centre to centre, to stand six inches high at back, and three inches high in front. Two "twelve-boards" may be used for twenty-four blooms, three for thirty-six blooms, and so on. The stands for six incurved blooms to be twelve inches wide from left to right, and eighteen inches deep from back to front; for twelve Japanese blooms to be twenty-eight inches wide from left to right, and twenty-one inches deep from back to front, the holes seven inches apart from centre to centre. Stands for six Japanese blooms to be fourteen inches wide from left to right, and twenty-one inches deep from back to front. The height at the back to be seven inches and four inches in front.

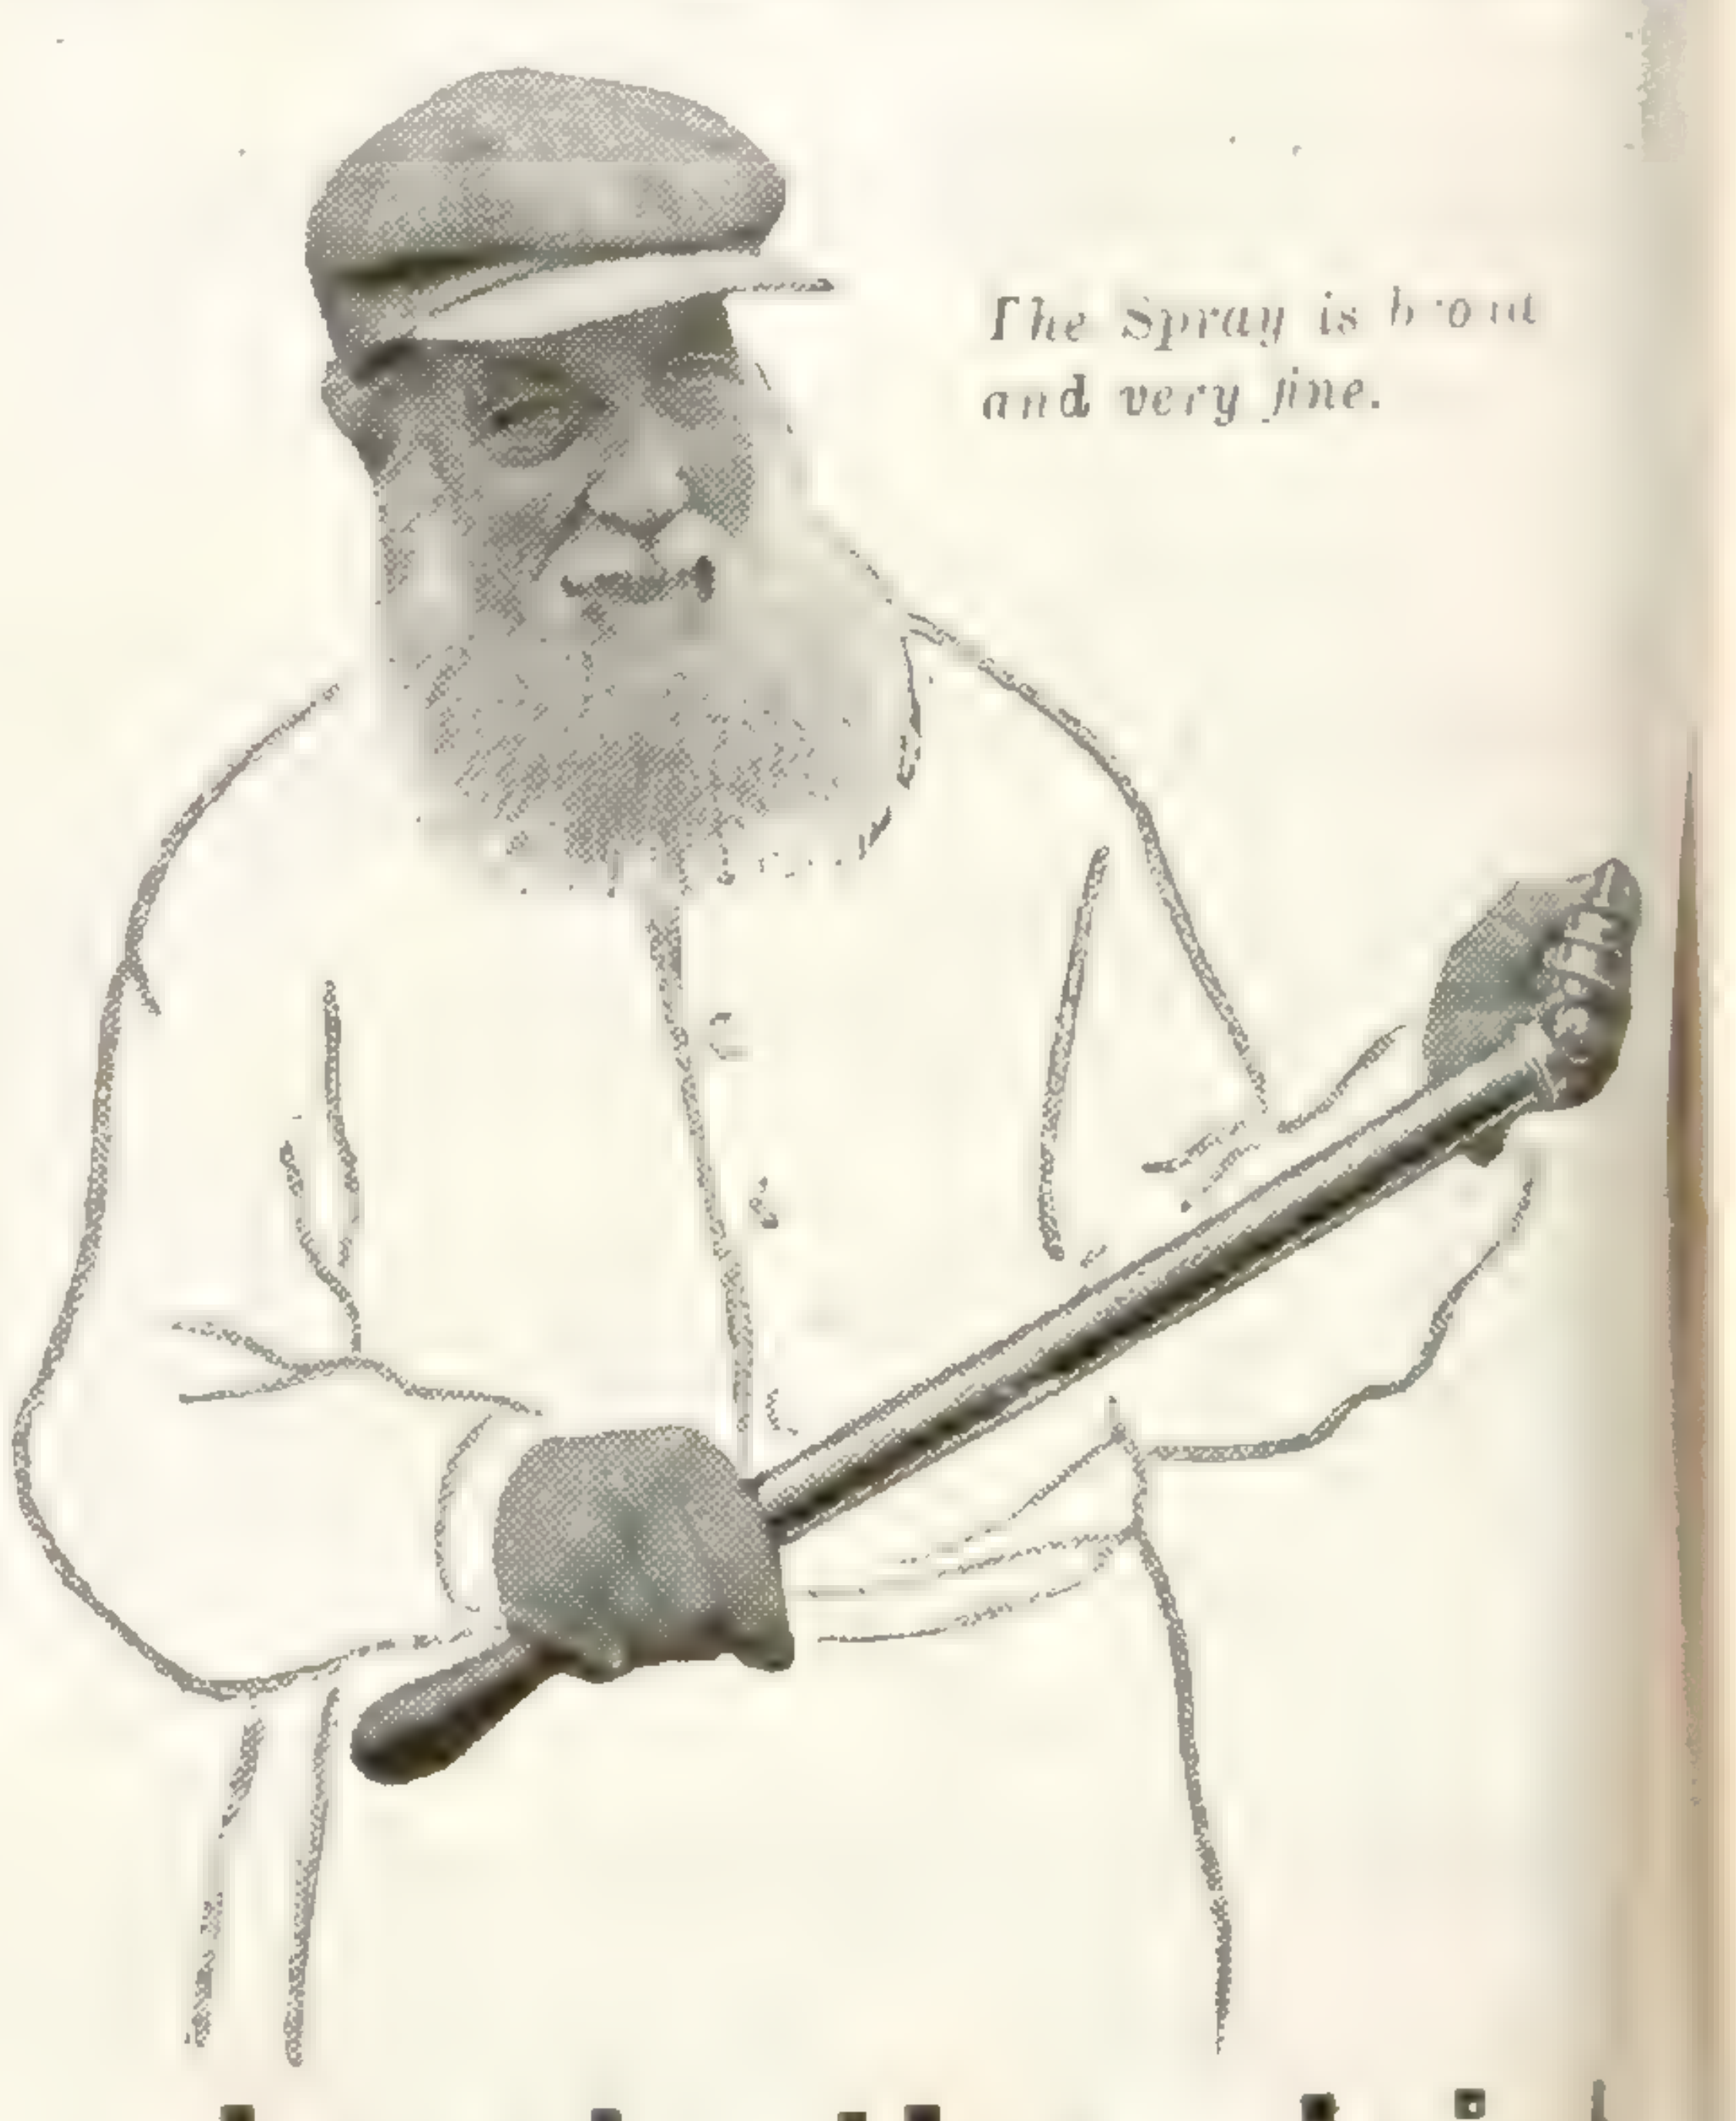
NAMES OF PLANTS.

W. J., Nottingham.—1, Saxifraga granulata fl.-pl.; 2, S. Camposi; 3, Veronica gentianoides.

L. S., Ipswich.—1, Berberis stenophylla; 2, Cytisus albus; 3, C. scoparius Andreanus; 4, Uvularia grandiflora.

R. B. M., Matlock.—1, Renanthera Imschootiana; 2, Miltonia vexillaria; 3, Cypripedium Lawrenceanum.

Superintendent of Finsbury Park. The Parks Committee of the London County Council have appointed Mr. Frank Wright to succeed the late Mr. Melville as superintendent at this popular northern park. Mr. Wright is widely known and respected as an able horticulturist, and his excellent work at the Victoria Embankment Gardens and elsewhere has attracted much attention.



—bend the joint

to spray the undersides of foliage, and half turn the syringe bodily in the hand to change from 'rose' to 'spray'

¶. The Pine Spray Syringe provides every spraying combination of 'rose' and bend or 'spray' and bend, instantly, without the addition or removal of a single fitment.

¶ To appreciate it fully, you ought to see it. Ask your ironmonger or seedsman to obtain one for your inspection—neither you nor he will be asked to buy unless you approve of the Syringe entirely.

THE BEST REMEDY for MILDEW, GREENFLY, and all forms of INSECT BLIGHT, is

Jeyes' Horticultural Wash,

As used at the Kew Royal Botanic Gardens.

This liquid form of Cyllin Soft Soap has been placed on the market in response to the numerous requests from prominent rosarians and gardeners, to obviate any labour involved in preparing the stock solution incidental to the use of soft soap.

Jeyes' Horticultural Wash destroys greenfly and other aphides, red spider, rose hopper, gooseberry caterpillar, black-currant mite, American blight, mildew, etc., etc. It is non-poisonous, and will not injure the tenderest vegetable shoots when diluted as recommended.

Pint tins 1/-, quart tins 1/9, also in drums.
Full directions with each package.

CYLLIN SOFT SOAP may still be obtained in its original form. Prices: 1 lb. tins **9d.,** 3 lb. tins **1/9,** 7lb. tins **3/-**; also in wooden kegs.

Jeyes' Horticultural Sprayer, complete, £1 5s.

JEYES' SANITARY COMPOUNDS CO., Ltd.,

MESSENGER & Co. Ltd.
HORTICULTURAL BUILDERS & HEATING ENGINEERS
LOUGHBOROUGH LEICESTERSHIRE
London Office 122 VICTORIA St. S.W.

MODERN GLASSHOUSES

as supplied by MESSENGER and CO., Ltd., are made of the best materials, and only capable and reliable workmen are employed in the erection thereof.

The following letter was recently received by us on the completion of a contract for a well-known Member of Parliament.

February, 1911.

"I should not be doing my duty to your workmen if I did not at once tell you, on the completion of your work, how pleased I have been with each and all of them.

"They have been most obliging throughout the whole job, and have endeavoured to do everything in an efficient and thoroughly workmanlike manner, and I must congratulate you upon having such capable employees."

THOUSANDS NOW IN USE. HUNDREDS SOLD MONTHLY.

PRICE, PACKED & CARR. PAID.
17/6 each.

"ALPHA" KNAPSACKS GUARD THE NATION'S FRUITS.

"ALPHA" SPRAYERS SAVE ITS FLOWERS.

Have only to be introduced to be adopted, having won 15 Gold and other Medals and Diplomas in about as many months.

"ALPHA" SPRAYERS are well finished with 2 coats of "Aluminium" upon heavily lead coated strong steel plates.

WEDNESDAY NEXT, June 7th, at One o'clock. Choice herbaceous Plants, flowering Shrubs, Gladiolus, Montbretias, Begonias, Liliums in variety, etc. About 50 c/s Japanese Lilies, various, and a large quantity of double and single Begonias.

At Three o'clock.—100 lots of choice Ornamental Plants, Standard Bays, and other Decorative Plants, Stove and Greenhouse Plants, Roses in pots.

FRIDAY NEXT, June 9th, at Quarter to One o'clock. —A fine importation, received direct, of Cattleya Dowiana in grand condition. Choice Established Orchids in variety. Orchids in flower and bud.

MESSRS. PROTHEROE and MORRIS will SELL the above BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C. On view morning of sale and catalogues had.

EDMUNDS and CO.—Specialities: Early vegetable plants, etc.; all hard grown in cold frames; lights off all day and very safe night; Tomato plants, Carter's Sunrise, Laxton's Open Air, Edmund's Supreme, etc., 12 for 1s., 25 for 1s. 9d., 50 3s. 3d., 100 4s. 6d.; Ridge Cucumbers, 6 for 1s., 1s. 9d. doz.; Celery, Clayworth's Prize Pink, extra strong, transplanted, ready for trenches, 1s. 6d. 100; bush Marrow plants, green or white, fine strong plants, 12 for 1s.; Pumpkins, same price; also all manner of Bedding Plants, Geraniums, Dahlias, Annuals, etc., etc.; write for our fully illustrated catalogue of up-to-date novelties for summer bedding; one of the finest published; post free on application. EDMUNDS and CO., Milton, Cambridge.

100 NURSERIES, MARKET GARDENS, FLORIST AND SEED BUSINESSES TO BE DISPOSED OF.

MESSRS. PROTHEROE and MORRIS'S HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained gratis at 67 and 68, Cheapside, E.C.

Roses in Pots.

For Outdoor Planting. from **10/6** per doz.

For the Conservatory. Coming into bloom. from **15/-** per doz.

For Walls and Pergolas. All best varieties. Extra strong for immediate effect from **1/6** to **5/-** each.

New May List gratis and post free.

Geo. COOLING & Sons,

◆

Climbers and Clingers.

MR. A. R. BROWN.
A well-known Midland Carnation and Auricula Expert.

In the study of the life struggle which is always going on in the plant world, as it is in the animal world on different lines, one of the most interesting features is the innumerable subtle ways in which many plants manage to hold their own in despite of certain inherent weaknesses. The light of the sun, and the free access of air, are the two main essentials for all green plant life. The first is the great vitalising and invigorating factor, while the second, the air, is at once the vehicle and the source of supply of the carbonic acid gas which forms the main structural material of the plant. The sturdy trees and shrubs hold their own by virtue of a more or less erect growth and spreading branches, the foliage on which is arranged in such a fashion as to receive the maximum amount of light, which also involves due exposure to the air. As a result of their sturdy growth under natural conditions they manage to cover large areas of the earth's surface. There have, however, been evolved a host of plants, with the same vital needs, but with slender stems and branches which are quite incapable of rising by themselves to any height, and, unless provided with some means of so doing, would be entirely deprived by the overshadowing trees of the two essentials aforesaid. To remedy this defect in construction they have been provided with various contrivances by which they are enabled either to attach themselves to the neighbouring soaring growths by hooks or clinging thorns, or to coil round them, and so ascend them to such a height as to enable their foliage to compete with that of their supports in the upper air. Hence, we are told that in the dense forests of the Tropics an almost impenetrable tangle of lianas and vines and other climbing and clinging plants exists beneath the shadow of the trees which they ascend, and upon whose very tops they spread their leaves and display their flowers, sometimes in such abundance that the trees themselves, instead of their weaker-growing neighbours, fall victims by deprival of sun and air, and often are practically strangled as well by the constriction of the ever-thickening coils of their insidious invaders. It is, however, in many cases by no means a mere matter of mechanical ascent by coiling stems or hooked thorns. If, for instance, we study the clematis family as a type, we shall find the stalk of every leaf to be endowed with a sensitiveness by virtue of which, where it touches a support, it is induced not only to bend and twist itself and the leaf lightly round it, but the very structure of the stalk is strengthened and toughened so as to give it a firm and permanent hold, from which it can only be detached by breakage. If we now turn to the tendril-forming climbers, such as the vine family, we find some of the foliage transformed into long slender branching processes resembling very slender fingers. These are at first straight, but, like the clematis leaf stalks, are also sensitive, and if, when swayed by the wind, they come into contact with a support, these points speedily become hooked, and if contact be thereby retained, they not only cling round it tightly, but the primary stalk, or wrist as we may term it, coils into a spiral, and thus brings the other fingers into contact with like effect, the branch being, at the same time, pulled home, as it were, and thus the greatest possible security obtained. In one member of this family, the now well-known Ampelopsis Veitchi, these little tendrils are very short. Their province is not a clutching one, as in the grape vine, but a clinging and cementing one adapted to the flat surfaces of rock, brickwork, or even glass. As the plant becomes attached to the nearest surface from the outset, and these tiny tendrils spring from the stem close to every leaf produced, they originate so near to the surface concerned as to touch it. They then appear to be endowed with a faculty of creeping until their points find a minute crevice or orifice, into which they insert themselves, and then exude a cementing sap which forms so adhesive a little disc as to be undetachable except by fracture of its stalk, or, as more frequently happens, of the material itself to which it adheres. In the hop we have an example of the clinger pure and simple, a type of many. Here the plant rises perpendicularly for a foot or so, when the top of the shoot commences to swirl round and round, lengthening as it does so until it is stopped by some obstacle, round which it continues its motion, encircling it, and thus achieving its purpose of climbing Ivy is another type which makes its way upwards by clinging, forming adventitious roots, which penetrate the bark of the tree, or the interstices of the wall, and so give it fresh holds as it proceeds on its upward growth. The parasitic dodder is of a different type; it climbs over its unfortunate host by penetrating roots which suck the very life sap of its support as it proceeds, as it is not, like the other plants named, provided with a root system of its own in the soil. It is thus an exception to the general rule that the climber and its support usually manage to exist fairly amicably together, a natural provision, where the destruction of the support would be, as a rule, inimical to the climber concerned.

Mr. Arthur R. Brown, of Arthur R. Brown, Lim., King's Norton, whose portrait appears on our front page, is one of the best known and one of the largest exhibitors in the carnation world. Quoting the words used by the mover of a vote of thanks to Mr. Brown after delivering a lecture at Manchester last year, "He comes of a generation of carnation growers, and it is rumoured, was born in a ten-inch pot with a pair of tweezers in his hand." Certainly he can claim to have been the youngest judge who ever judged at a National Show; the occasion was the Supplementary Show at Oxford in 1882, and he was then fourteen years of age. Born at Handsworth, Birmingham, in 1868, he went with his father, the late Samuel Brown, to his first show at the age of five, and has been to practically all the leading carnation shows since. Though a large professional grower, he is very keen on the encouragement of the amateur, and is connected, as president or vice-president, with nearly all the amateur gardening and mutual improvement societies which are so prominent a feature in Midland horticultural life, and which, in his opinion, are the chief factors in the success and popularity of the Midland shows. Though comparatively a young man, Mr. Brown, owing to his long connection with floriculture, has been intimate with most of the principal leading florists of the last thirty years, and a very popular lecture he gives is entitled, "Twenty-five Years of Flower Shows," in which he recounts many little anecdotes of famous exhibitors. Mr. Brown is also prominently identified with auriculas, is chairman of the Midland branch of the National Auricula Society, and his services as a judge are requisitioned at most of the exhibitions of this popular florists' flower.

Royal Gardeners' Orphan Fund.—It is with great pleasure we learn that the list of subscriptions to the above charity has been considerably augmented since the festival dinner, presided over by N. N. Sherwood, Esq., V.M.H. At the dinner the list amounted to £1,550; it has now reached £1,600.

American Sweet Pea Society.—Owing to the lateness of the season in America the National Society that cares for sweet peas has considered it advisable to postpone for one or two weeks the exhibition previously arranged for June 23 and 24, but the actual date will not be fixed for another week or so. The society's schedule appears to be a cumulative one, for at the recent meeting eight special prizes were offered and accepted, and the committee allocated 170 dollars to further classes for sweet peas in specified colours.

Oncoba Routledgei.—We are informed that since further opportunities of studying its flowers have been provided from Mr. C. E. Shea's garden, at Foots Cray, Kent, the Kew authorities have decided to accord specific rank to the plant figured in our issue of April 15 (p. 277), as Oncoba spinosa Routledgei. It is now to be known as Oncoba Routledgei, in honour of the gentleman who sent seeds from East Central Africa to Mr. Shea. Our readers will remember that the Royal Horticultural Society awarded a First Class Certificate to this white-flowered plant on April 11 last, when it was exhibited by Mr. C. E. Shea.

Fruit Prospects in the North.—The glorious weather which marked the departure of May, writes our Aberdeen correspondent, has warmed the hearts of the fruit growers. During the past few weeks they have been watching the weather with no little anxiety, dreading the advent of any of those sharp frosts which did so much damage two years ago. Fortunately up till now the season has been exceedingly favourable, but a week or so must elapse ere all danger is over. In the valley of the Dee, great stretches of which are devoted to the strawberry, there is the promise of abundant blossom. When the flowering has been completed there will be more definite ground for giving an indication as to the bulk and quality of the crop. Meantime, the plants are looking remarkably well, are in a particularly healthy condition, and give capital promise of a large and excellent harvest. With other fruits the prospects are equally encouraging. There was an enormous amount of flower on gooseberry bushes, and the red currant bushes are showing up capitally, with plenty of hangers now well formed. Everything, in fact, is looking in better condition, and gives hope of a more cheering character than has been the case in the North at the corresponding period for many years.

Success of the Temple Show.—There is, of course, a huge bill to pay for the recent Temple Show, but the Council of the Royal Horticultural Society is not worrying much about it, we imagine, considering that the takings at the gate amounted to £1,093; only £3 below the record of 1907; and £130 better than in 1910, notwithstanding the great increase of Fellows. The takings on the first day were £273; second day, £500; and third day, £320.

Rhododendrons at Vincent Square.—The very beautiful exhibition of rhododendrons at the Royal Horticultural Hall during the present week has been a great success. Messrs. J. Waterer and Sons, of Bagshot, arranged a delightful display in a most effective and natural manner. In the centre of the hall two big oval groups were placed, and in one of those Rhododendron Pink Pearl was an outstanding feature. Except for the tall crowning palms these beds might have been transported from some big garden. On either side of the entrance there were grand banks, and in one of these liliums, weeping standard roses, choice conifers, and groups of lily of the valley were used with great effect. Near the emergency exit an undulating group of kalmias attracted everyone, while the small-flowered Rhododendron odoratum, banked up in quantity, was equally attractive. Mollis azaleas provided brilliant colouring at the opposite end of the hall, while groups of Gomer Waterer, Alice, Pink Pearl, Doncaster, and other exquisite rhododendrons were magnificent. The whole display was arranged to represent a garden, and, as there was ample space to move about, and the air was kept delightfully cool, the garden was a pleasant, as well as a beautiful one. Messrs. Barr and Sons filled one annexe with choice hardy flowers and pigmy trees, and Messrs. Wills and Segar, Kensington, filled the other annexe with charming floral designs.

Two New Poet's Narcissi.—Two new varieties of Narcissus poeticus have appeared this spring, and some little confusion has arisen in regard to their names. N. poeticus Socrates, from Messrs. Barr and Sons, Covent Garden, received an Award of Merit on April 25, while N. p. Sonata gained a similar award for Mr. F. H. Chapman on May 9, but, by a clerical error we described the latter also as N. p. Socrates. The description of N. p. Socrates appeared in our issue of May 6.

Famous Gardens Round Edinburgh.—In our issues of June 10 and June 17 we shall devote considerable space to illustrated descriptions of a number of the leading private and public gardens in and round Edinburgh. This addition to our series of famous gardening centres should prove fully as attractive as the best we have yet published, and we anticipate a big demand for the issues of the above dates. The gardens described will include those at Dalkeith Palace, Hopetoun House, Carberry Towers, Preston Hall, and Oxenford Castle.

Nurseryman's Convention at St. Louis.—The great annual meeting and convention of the American Association of Nurserymen will take place this year at St. Louis, Missouri. This city is noted for the beauty of its parks, which have an area of 3,200 acres, and include the famous Missouri Botanical Gardens. A large number of subjects are down for discussion at the convention, including "Nurserymen and Entomologists," by Professor S. J. Hunter, the State Entomologist for Kansas; and "Spring versus Fall Planting of Fruit Trees," by Dr. J. C. Whitten, of the Missouri University.

The Past History of Conifers is a most interesting subject, and it is somewhat unfortunate that the lecture upon it, by Professor A. C. Seward, at the Royal Horticultural Hall, Westminster, is to be delivered on Tuesday, June 6, at three o'clock, as the audience is likely to be a somewhat small one on the day following Whit Monday.

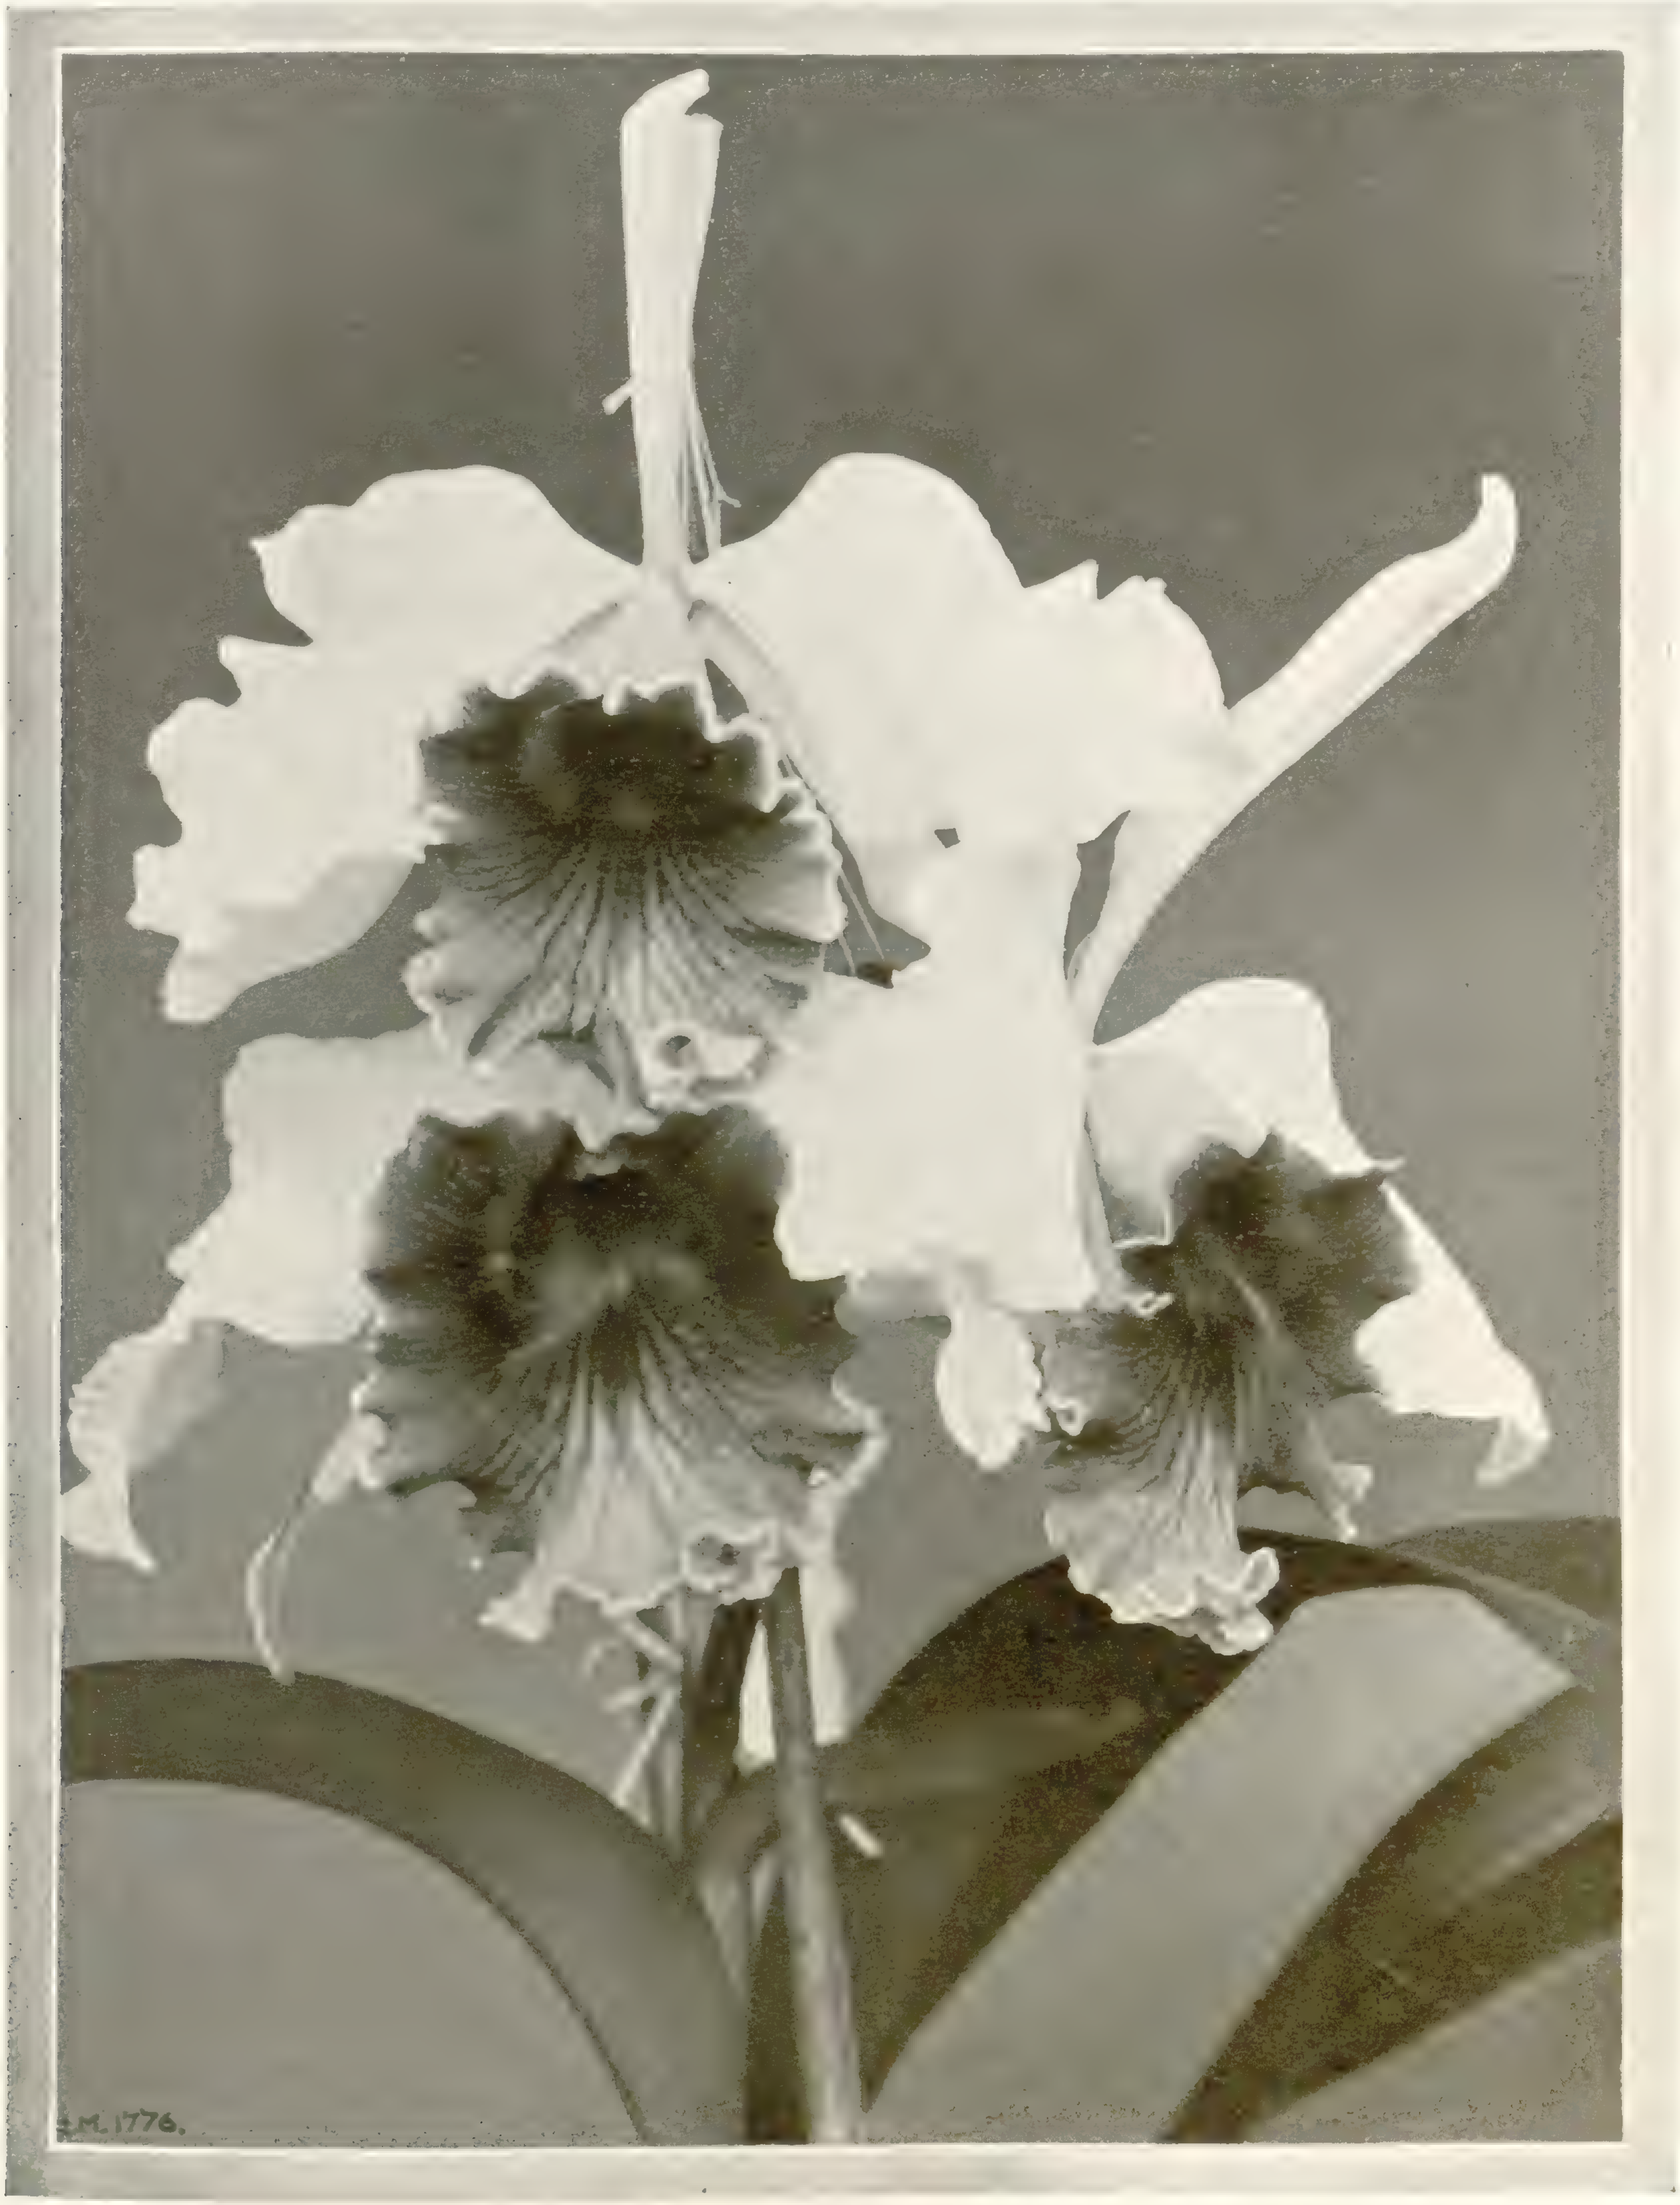
Trowbridge Floral and Horticultural Society. — This society suffered a loss of £70 on its flower show last year, but there was a profit of £50 on the tournament, in which the Life Guards took a prominent part. The total loss for the year was therefore £20, which, after all, is not a very serious matter, for the Trowbridge Society has still a balance of £544 on the general account at the bank.

Underground Gardens.—It is not quite correct to speak of the efforts being made to brighten some of the railway stations on the District Railway as underground gardening, but those who crowd into the great Metropolis day by day from the south-west and western suburbs do speak of these efforts as such. A number of hanging baskets of flowering and foliage plants have been suspended at the Temple and other stations, and in some cases, where space and sunlight permit, there are delightful little gardens just outside the stations, with rough walls made beautiful by means of climbers planted in baskets of soil. All these things point to the growing love of flowers, and the increased taste for gardening, even under difficulties.

Success in Slug Trapping.—With reference to the all-important operation of slug trapping, Mr. E. R. Tolley, gardener to E. H. M. Luckoch, Esq., Widworthy Court, Honiton, Devon, writes: "Having seen your note on 'Slug Hunting' in the Gardeners' Magazine of May 20 (page 373), of which I have long been a regular reader, it has occurred to me that my own experience in dealing with slugs may be of interest to your readers. In the past two and a-half years 250,000 slugs were trapped and destroyed, and of these 45,000 were caught in March last. The infested area consists of three acres of walled-in garden. The pests were trapped by means of boards laid by the sides of the paths, under which a layer of bran was spread. In the morning the slugs were found adhering to the underpart of the boards feeding on the bran."

SOME IMPRESSIONS OF THE TEMPLE SHOW.

I do not like to think of the number of Temple Shows I have seen, because it makes one feel that old age is creeping on, but each time of late years when I have made my annual pilgrimage to the Temple Gardens, it has been with the thought—Is this the last time? For there has been a kind of a hardy annual rumour about for some time that the Royal Society would have to seek fresh quarters for its great May show. Next year there will be no Temple Show, but a great big international exhibition instead. Of course, the great show will be larger than the Temple, but will it be better? Some say yes, but I have my doubts, and simply to say that the Temple Show is the Temple Show means more than I can express in words. It is absolutely unique, an institution the like of which there is no other, and if a year lapses without the familiar tents appearing on the Thames Embankment, will the show come back? And if not, where is there another spot in London where the Temple Show, such as we know it, could be held?



LÆLIO-CATTLEYA MORNINGTONIÆ.
A beautiful hybrid, with white, purple, and ruby-crimson colouring. F.C.C., R.H.S., May 23. Francis Wellesley, Esq. (gardener, Mr. W. Hopkins), Westfield, Woking.

I do not say that everybody who visited the Temple Show this year went for the express purpose of seeing the flowers; there were other things that you could not fail to notice. For instance, there were the ladies' frocks and the hats. I had seen the like of them on the fashion plates, but I never seemed to realise that such things actually existed. Did anyone ever see such hats, the size of them, and—dare I say it?—the ugliness of them, at least, so they seemed to my untrained vision. More than once I was filled with feelings of something like pity, when I saw ladies, not walking, for the frock would not allow that, but doing a kind of shuffle from stand to stand with the aid of a walking-stick, which really seemed very helpful. Of course, I do not pose as an expert, and perhaps I have no right to criticise, but if you ask me who was the best dressed, and with it all the most comfortably dressed lady I saw, I should have no hesitation in saying the Queen herself, and I venture to think there are others who will agree with me.

I wonder what the horticultural trade of England could do if the Temple Gardens would lend themselves to stretching and every nurseryman were allowed just as much space as he cared to fill? Perhaps it is as well that things are as they are, because one would never be able to get round the show; but I do not envy those who have the allotting of the space, and one heard the usual grumbles of exhibitors who asked for 100ft., got 25ft., and had to leave half the good things they intended to exhibit at home, etc., etc. And why do exhibitors clamour for space at the Temple Show, seeing that it is not competitive, and prize-money is unknown? Well, ask the men who stood, note-books in hand, in front of their exhibits, suffering the heat of those tents for three whole days without a murmur, while the society folk kept coming along with their orders. The whole thing then is explained in a nutshell—the magic words advertisement and business are written large in every corner of the Temple Show.

After considering the orchids, the roses, the carnations, and the rock gardens, and admitting everything that may be said about and in favour of them, there was one flower which, to my mind, seemed to possess as great a possibility as any other for a brilliant future. No, it wasn't sweet peas, and I'm not quite sure whether the world at large is not getting a bit tired of the sweet pea boom, but the flowers I have in mind were the May-flowering tulips. While a little handful of ardent florists were bending in admiration over a few blooms of florist's tulips in a small tent set apart for them, criticising and comparing like bird fanciers at a show, hundreds of people who never saw the inside of the florist's tulip tent were jotting down the names of Clara Butt, Bouton d'Or, La Tulipe Noire, Dom Pedro, and others of the May-flowering fraternity with minds made up that they would have some in their own gardens next year.

Some uncharitable people have been heard to say that the Temple Show is popular because it is a society function, and everybody who is anybody (you know what I mean) goes there for the purpose of seeing and being seen. Personally, I don't believe it, and the object of nine-tenths of the visitors was to see the flowers and improve themselves educationally in the art of horticulture. You may say, if you like, that gardening is fashionable just now; perhaps it is, but it was not merely a dictate of fashion which prompted the crowds of people to literally fight their way through those hot, overcrowded tents. Not a bit of it, they were a genuinely interested community, and when they came outside to get a breath of the fresh breeze which blew off Father Thames, it was not that they were tired of the flowers, but simply that the conditions of the tents were getting too much for them.

If you ask me who were the most patient, courteous, and yet much tried individuals I saw at the Temple Show, I should say that the members of the Metropolitan police force who acted as guides, and, in not a few cases, as friends, would be hard to beat. I wonder what it is in the estimation of the public that a policeman is not supposed to know; and when I heard a lady ask a man in blue the name of a flower on an adjoining stand, which I do not suppose he had ever set eyes on before, I felt sorry for him. My sympathies also went out to another officer who stood at the show entrance instructing people to "Pass along to the left, please." The left, of course, was crowded, the right was comparatively free from people, and a couple of ladies slipped out and tried to pass the limb of the law, but it was no good. They entreated and cajoled, informed the officer that they had paid half a guinea for their tickets, and thought they had a right to go which way they liked; then they threatened and abused, but the London "bobby" wiped his perspiring face, and smiled on when the injured ladies at length beat a retreat and went to seek solace in Carter's Japanese Garden close at hand.

If you have been a regular visitor to the Temple Shows you cannot help noticing how everything seems to have grown and developed. Even the members of the committees who bustle about making the awards on the morning of the opening day, though they seem to be as familiar almost as the tents themselves, have grown older, and, in some cases, quite patriarchal in appearance; but this is by the way, and one remembers when rock gardens were first introduced they were all tiny little models on the tables inside the tents, but at the last show the whole of the ground outside seemed to be a series of rock gardens, not models, but real gardens, so bold and natural that they looked as if they had been there for years. Thus the rock garden idea has grown, and so have others, including methods of arrangement which have improved out of knowledge in passing years. In fact, in my humble opinion, the last Temple Show of the first series—let us hope it will not be the last in reality—was the best the society has yet held, and with this remark these rambling impressions end. H.

VIBURNUM UTILE.

This is one of several very distinct and beautiful viburnums which have recently been introduced from China, and it promises to be quite as ornamental as the well known variety of V. tomentosum, which is known as plicatum. Doubtless as it becomes more common it will enjoy a wide range of popularity, for it appears to grow vigorously and blossom while quite small. In its home in Ichang it is said to grow to a height of five feet, and to form a rounded, many-branched bush on ground strong in lime. Judging from its behaviour in this country to the present time there appears to be no reason why its maximum dimensions should not be attained here. It is distinguished by oval leaves, which may be anything from one to three inches or more in length. They are deep green above but silvery beneath by reason of a covering of dense felty hairs. The white flowers are borne in rounded heads two inches or more in diameter, and they are succeeded by dark-coloured fruits. For specimen plants or specimen beds it has much to commend it, though it is probably still too scarce and expensive to plant on a large scale. W. Dallimore.

FITTONIAS.

The fittonias are certainly among the most beautiful foliage plants grown in our stoves. Their delicately veined leaves are very much admired by most people, and I find they always receive more than passing notice from visitors looking round our garden.

Usually two kinds are grown, one named F. argyroneura or Verschaffelti, having very dark foliage beautifully veined with red, and the other usually called F. Pearcei, the green foliage of which is very beautifully veined with white. They require stove treatment.

We find the most interesting way to grow them is to form pyramids of seed pans and flower pots and plant the cuttings in April in tiers one above the other, with one cutting in a thumb pot on the top. About three pans and four pots are used; the bottom pan of fair size, and the second smaller, and the third still smaller, and then four sizes of pots with the apex of the smallest size.

The pans and pots are duly crocked with potsherds, and regulated so that they rise evenly one above the other, and their moss is placed on the potsherds, and the fabric made secure so that no disturbance will take place after the cuttings are inserted. The soil must be of a rich light nature; good loam, leaf-mould, cocoanut-fibre refuse, and a very small proportion of peat, with which must be incorporated some sharp silver sand. The soil must be pressed tightly in to each pan and pot, and then it is ready for the cuttings, which are the tops of old plants just starting into new growth. They should be inserted with a pointed dibber and pressed firmly in the soil. A good plan is to fill one pan with the white-veined and the next one with the red-veined kind, and follow the same way with the pots, and by mid-summer the pyramid is very beautiful to look upon.

Fittonias are very tender subjects, and must remain in the warm moist stove, for if they are taken out and exposed to cold they soon become flaccid and lose their great beauty. As is the case with many beautiful leaved plants, the flowers of fittonias are insignificant, and should be removed with a sharp knife or vine scissors when they appear. Fittonias require plenty of water during the growing season, but in the autumn and winter only just enough to keep the soil moist. In the afternoons on bright days they are benefited by being lightly syringed overhead with tepid water.

Of course, I need scarcely add that to secure even growth the pyramids must be regularly turned round, so that all sides can have the benefit of light, but they must not be exposed to bright sunshine as they are apt to scorch and become disfigured, but this will not occur if ordinary stove blinds are used. W. M.

Evergreen Barberries.—One is puzzled which to admire the most—the rich orange coloured blossoms of Berberis Darwini, or the golden ones of Berberis stenophylla. As a specimen this last-named is the more graceful of the two, still Berberis Darwini is remarkably handsome when in bloom. It shows a considerable amount of variation, and from the depth of orange in the flowers of some individuals I have often thought of the possibility of a red-flowered form being evolved by gradual selection. Some, too, flower again very freely in the autumn. Though an accidental hybrid, B. stenophylla is quite the equal of any shrub obtained by systematic hybridisation.—W. T.

NEW PLANTS, ETC.

◆

ONCIDIUM MULLERI.

In this species we have a very distinct member of the macranthum group. It has long leaves, and produces a very long, twisting, and shortly branching spike. The flowers are an inch and a-half across, and fairly rounded; the sepals and petals are white, with a flush of rose at the base of each, and the somewhat heart-shaped lip is very bright and deep rose, with a cream-yellow crest. F.C.C., R.H.S., May 23. Messrs. Sander and Sons, St. Albans.

ODONTIODA LAMBEAUIANA.

A delightful odontioda, with medium-sized, shapely, and very substantial blooms of a deep rich scarlet shade, with a yellow crest on the orange-scarlet lip. The parentage is Cochlioda Noetzliana and Odontoglossum Lambeauianum. F.C.C., R.H.S., May 23. Messrs. Sander and Sons, St. Albans.

ODONTOGLOSSUM BLACK PRINCE, THE DELL VARIETY.

A very handsome variety, and represented by a splendid plant carrying a spike of fifteen flowers. The colour is rich deep red-brown, a very solid shade, with margins of blush-white, and veinings of the same colour. The lip has a yellow crest, and a white margin. Each flower was about four inches across. F.C.C., R.H.S., May 23. Baron Bruno Schröder (grower, Mr. J. E. Shill), The Dell, Egham.

ODONTIODA BRADSHAWÆ, GATTON PARK VARIETY.

This splendid variety attracted general attention by reason of the brilliant orange-scarlet shade of its shapely flowers, and the beautiful form of the long spike of nineteen blooms. Each bloom was about two inches across, and the yellow crest enhanced the brilliance of the sepals and petals. F.C.C., R.H.S., May 23. Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

ODONTIODA VULYSTEKEÆ CORONATION.

This was the most talked-of orchid at the Temple Show, and to date it is the last word in the hybrid genus of odontioda. The plant shown carried a spike of fourteen beautiful blooms, all flat, and of excellent form, sepals and petals being alike broad, and the latter overlapping the former. All the segments had rosy, purple-tinted margins, and a paler area within it at the apical portion, but the basal half was of rich red hue, with a few pale veinings in the case of the petals. The fiddle-shaped lip has red side lobes, a creamy apex, and a golden crest. The blooms were three inches across, and they attracted a vast amount of attention from orchid lovers. The price of the plant was said to be £1,000. F.C.C., R.H.S., May 23. Mons. Charles Vuylsteke, Loochristy, Ghent, Belgium.

LÆLIO-CATTLEYA MORNINGTONIÆ.

A chaste, large-flowered, and very beautiful orchid, obtained by crossing Lælio-cattleya Pallas with the fine Lælio-cattleya Fascinator. The blooms are of great size, the cream-white petals each measuring 3½ inches in length, and over two inches in breadth. The sepals are narrow. The big, broad, frilled lip is purple, with violet-purple edge and apex, and an area of ruby-crimson just in front of the orange and yellow throat. F.C.C., R.H.S., May 23. Francis Wellesley, Esq. (gardener, Mr. W. Hopkins), Westfield, Woking.

CATTLEYA MOSSIÆ VAR. G. M. HALE.

An unusual and striking variety of this old, popular, and beautiful orchid. The ample sepals and petals are rich rosy-purple, and the lip is of similar hue, except for the yellow colour in the throat and the bright violet-purple colouring on the broad and frilled apex. A.M., R.H.S., May 23. Samuel Larkin, Esq. (gardener, Mr. G. M. Hale), Ridgways, Haslemere, Surrey.

LÆLIO-CATTLEYA GERMANIA.

This showy hybrid has flowers of good size, and presents very much the general outline of Cattleya Mendeli, but the colour is a pleasing shade of yellow, with ruby-crimson shading almost obliterating the yellow over the whole of the front lobe of the lip. Lælio-cattleya Cappei and Cattleya Mendeli were the parents. A.M., R.H.S., May 23. Messrs. Charlesworth and Co., Haywards Heath.

LÆLIO-CATTLEYA GERMANIA.

A handsome hybrid with soft yellow sepals and petals, and a bright ruby-crimson lip. A.M., R.H.S., May 23. Messrs. Charlesworth and Co., Haywards Heath.

ONCIDIUM CLÆSI.

This is a strong-growing, long-spiked species belonging to the macranthum group. As shown it carried a branching spike about ten feet long. The flowers are about an inch and a-half across, the sepals being brownish and the lip and petals dark slaty-purple. A.M., R.H.S., May 23. Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

ODONTOGLOSSUM AMABILE EMPRESS OF INDIA.

A superb odontoglossum, producing flowers nearly five inches across. The deep rosy ground colour is heavily marked with bright brownish-red, the latter colour almost covering the base of the white lip. A yellow and red-brown crest, and a few yellow veins at the base of the lip add greatly to the beauty of the flower. A.M., R.H.S., May 23. Messrs. Sander and Sons, St. Albans.

CŒLOGYNE BURFORDIENSE.

An interesting hybrid between C. pandurata and C. asperata. In general appearance it was very like the first-named parent, but the green of the sepals and petals was rather lighter and the black markings on the lip showed a suspicion of brown pigment. A.M., R.H.S., May 23. Sir Trevor Lawrence, Bart. (orchid grower, Mr. W. H White), Burford Lodge, Dorking.

AZALEA DUCHESS OF PORTLAND.

A very fine azalea of the mollis type with cream-coloured flowers, marked with brown and tinged with pink. A.M., R.H.S., May 23. Messrs. R. and G. Cuthbert, Southgate.

LILIUM TENUIFOLIUM GOLDEN GLEAM.

This graceful lily has quite narrow linear leafage that clothes the stem well up towards the flowers. The spike carries from six to a dozen flowers, each flower about 2¼ inches across, with reflexing segments that are of a rich orange-yellow colour. A very pretty variety. A.M., R.H.S., May 23. Messrs. R. Wallace and Co., Colchester.

DAVIDIA INVOLUCRATA.

This quite hardy tree, introduced to cultivation by Mr. E. H. Wilson when collecting in the province of Hupeh, China, in 1903, has now flowered for the first time in Great Britain at Messrs. J. Veitch and Sons' Coombe Wood Nursery. The bright green leaves are somewhat like those of a lime, and also have a little resemblance to a hazel. The flower itself is not conspicuous but each one has a pair of large white bracts, the lower of the two being three or four inches long, and nearly as broad. F.C.C., R.H.S., May 23. Messrs. James Veitch and Sons, Chelsea.

LEWISIA COTYLEDON.

A new lewisia, with small, soft green, and rather succulent leaves, gathered into a little rosette two or three inches across. It appears to be quite free flowering, even small plants producing three or four little spikes about three inches high. The rounded flowers, composed of nine segments, are greenish as they open, but soon brighten into rosy-lavender, with white margins to each segment. The seeds originally came from Klondyke. A.M., R.H.S., May 23. Mr. G. Reuthe, Keston, Kent.

HABERLEA FERDINANDI COBURGI.

A neat low-growing alpine, with the habit of a ramondia, but with rather shiny leaves. The flowers are tubular, but two of the mouth segments are shorter than the other three. The colour is violet-rose on the outside, soft lavender at the mouth, and white in the throat. A.M., R.H.S., May 23. Mr. G. Reuthe, Keston, Kent.

ROSE SYLVIA.

This very beautiful rambling rose is one of the most graceful of recent introductions. The flowers are about two inches across, double, but not solidly so, and borne in big branching trusses at the end of every growth. The expanded flowers show a few golden stamens, and this adds to their beauty. A.M., R.H.S., May 23. Messrs. William Paul and Son, Waltham Cross, Herts.

ROSE PORTIA.

A beautiful and large hybrid tea rose, broad petalled, substantial, and a lovely shade of silvery-blush, or pale pearly-pink. It appears to be a very satisfactory grower, judging from its behaviour in pots. A.M., R.H.S., May 23. Messrs. William Paul and Son, Waltham Cross, Herts.

AZALEA DUCHESS OF PORTLAND.

A charming azalea of mollis character. It bears large trusses of shapely blooms that are a lovely shade of soft cream, prettily shaded with pale pink as they attain full size. The plant is very free flowering, and altogether a fine variety. A.M., R.H.S., May 23. Messrs. R. and G. Cuthbert, Southgate.

AZALEA SUBLANCEOLATUM.

This effective azalea has proved hardy at Woodbridge during the past winter, and therefore promises to be a success in the southern counties under kindly conditions. The leafage is that of an Indian azalea, but rather blunted at the top. The flowers are as large as those of a good Azalea indica, and of a bright glowing pink shade, very showy, with a few brownish marks on the lower segment. A.M., R.H.S., May 23. Mr. R. C. Notcutt, Woodbridge.

RHODODENDRON CORONA.

A most interesting variety, with a large and erect truss, in which the flowers are set quite clear of each other. The rounded blooms are of a most brilliant pink shade, almost cerise, with a little paler shading down the centre of the segments. A.M., R.H.S., May 23. Messrs. John Waterer and Sons, Lim., American Nurseries, Bagshot.

RHODODENDRON LODER'S WHITE.

A very beautiful rhododendron, probably a hybrid between R. Aucklandi and R. arboreum album. It is a strong grower, with modified Aucklandi foliage, and large trusses of purest white flowers that are broad and charmingly frilled or crimped. It is one of the most beautiful of rhododendrons, and the fine plant shown, smothered in snowy bloom, had been lifted from the open to bring to the show. A.M., R.H.S., May 23. Mr. G. Reuthe, Keston.

RHODODENDRON LITTLEWORTH CORALLINA.

This is a large-flowered hardy rhododendron, with neat stiff leaves suggestive of R. campylocarpum. The blooms are broadly funnel-shaped, and of a beautiful pink shade, exquisitely veined, and with a small and very dark base to the tube. The flat leaves are dark green above, and quite pale green beneath. A.M., R.H.S., May 23. Miss Mangles, Seale, Surrey.

RHODODENDRON GLORY OF LITTLEWORTH.

A very beautiful and quite distinct rhododendron, with a handsome shapely truss of white flowers, three of the segments being freely shaded with bright brownish-orange. It is a most effective variety, so far as colour and bloom are concerned, but the crinkled leafage is not beautiful. A.M., R.H.S., May 23. Miss Mangles, Seale, Surrey.

Prunus (Cerasus) pseudo-cerasus J. H. Veitch.—This is one of the most valuable plants introduced through the travels of the late Mr. J. H. Veitch in Japan, nearly twenty years ago. It was not found there by him, but according to "Hortus Veitchi," when travelling in that country he heard by chance in Tokio of a nurseryman who specialised cherries in a district he was unable to visit, and he wrote for the most distinct forms the man grew. Subsequent trial in England proved all to be valueless except this variety. It forms a specimen of compact, sturdy growth with large semi-double rose-pink flowers and prettily serrated leaves of a bronzy tint.—W. T.

AMONG THE ALPINE FLOWERS.

> "Then did I see a pleasant Paradise,
> Full of sweete flowres and daintiest delights,
> Such as on earth man could not more devise,
> With pleasures choyce to feed his cheerefull sprights."
>
> —Edmund Spenser.

Truly as May wends her way, and June steps upon the stage, we cannot but think that, after all, the rock garden is a "pleasant paradise, full of sweete flowres and daintiest delights," and we are loth to leave it for the desk and pen, even to single out for notice, and to hold up to others, the banners of the sweetest of our flowers. Truth to tell, the task of selecting the daintiest is an impossible one. Flowers galore lay claim to the distinction, and it is perhaps better to yield up the task, and simply to tell of those which come before us as we sit by the study window and gaze upon their delightful blossoms in sheets or in spires, in hollows, or upon the mounds and elevations. Even that is an impossible thing to do. There are too many among them. Saxifrage, iris, aubrietia, cerastium, cytisus, genista, azalea, rhododendron, alyssum, cheiranthus—aye, a veritable catalogue of dainty flowers, shining and gleaming in the bright sunlight of this truly blissful time. We never tire of them if we are imbued with true love for our flowers.

As the years swiftly pass along they seem to fly all the more swiftly when we are among our flowers. It appears as if it were only in the short winter days that we weary, and then it is for the coming of the sweet spring, the glorious summer, and the pensive autumn, all laden with the wealth of their seasons, and all gladdened by the blossoms they bear. And so now we are revelling amid the treasures of our gardens, happy in the contemplation of all their graces.

Cheiranthus alpinus.

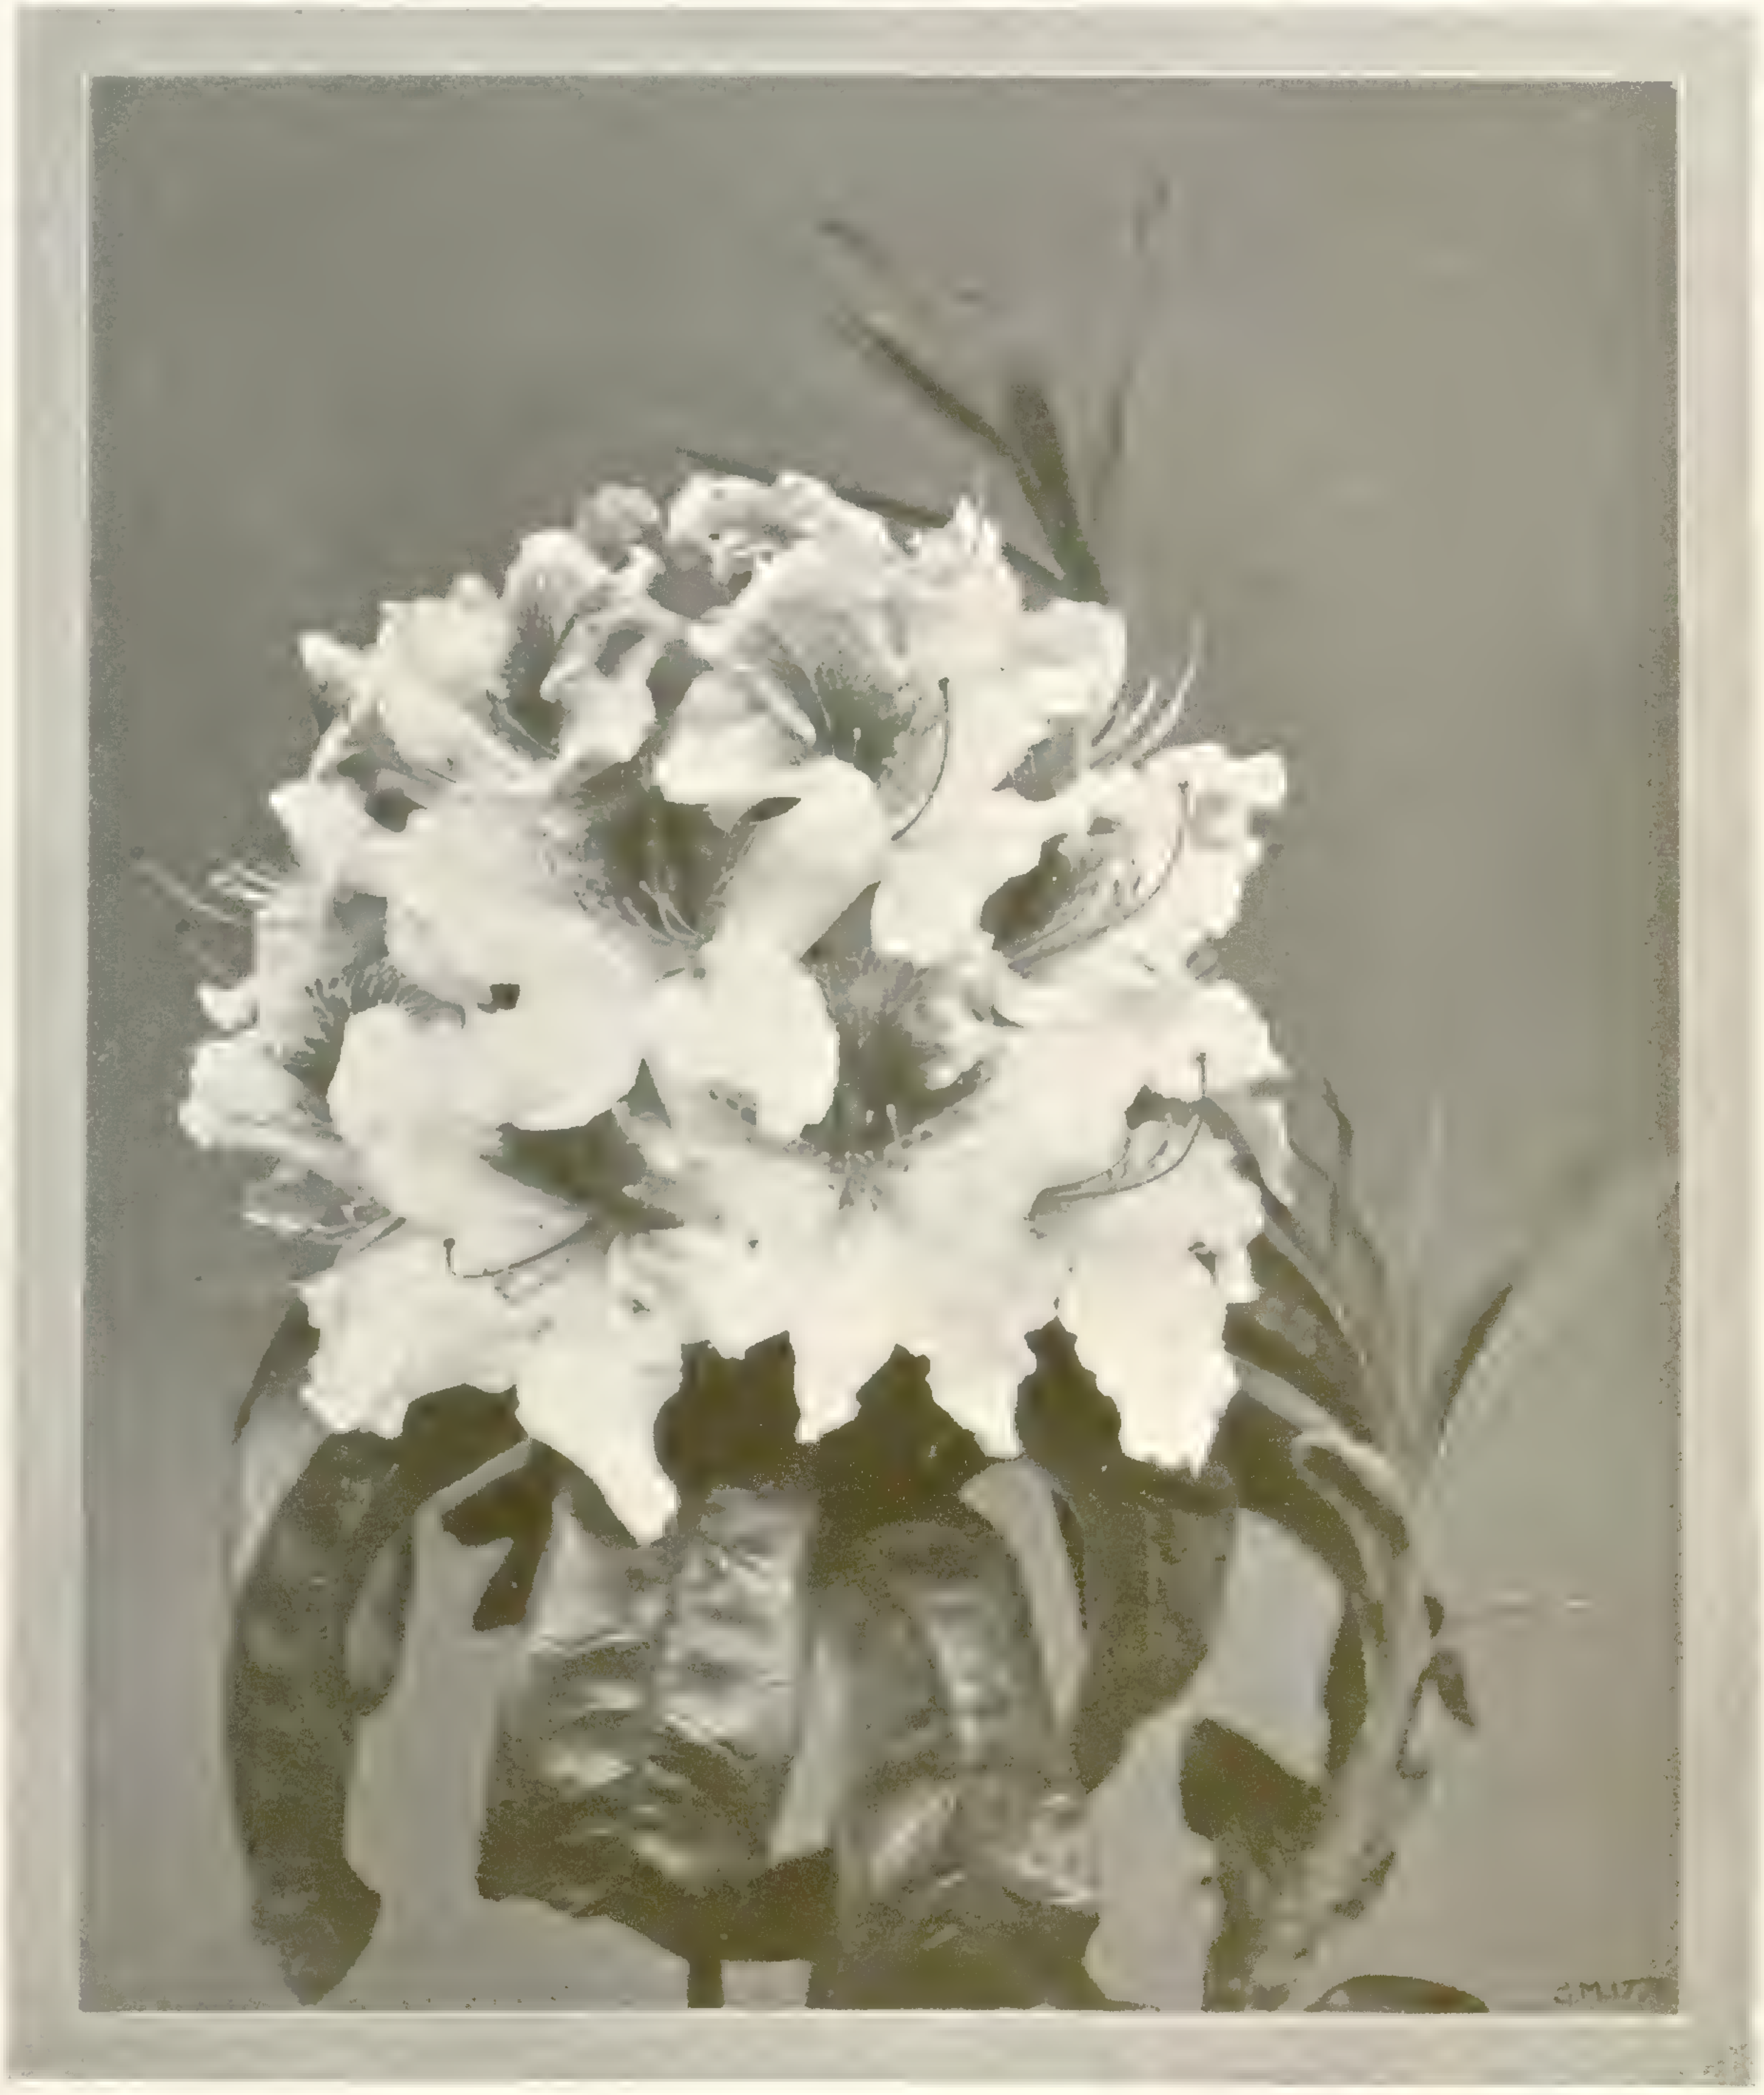
One cannot but speak a little about this alpine wallflower, of which there is here a mass some three or four feet across, all glowing in the light of the early summer sun, and on a dry bank proving quite perennial. Our ordinary wallflowers, with all the bravery of colouring they have now donned through the work of the seedling raiser, look far less refined than does this alpine one. Its clear yellow heads of flowers, its trailing habit, its profusion of bloom, all point it out as a good and acceptable flower, and one which, where it is happy, will thrive and flourish in a sunny place on a dry slope or amid the rocks, and will give true pleasure from year to year. In a damp climate it is liable to loss in excessively wet and unsettled winters, but with care in planting, and with full exposure to the sun and air, and thorough drainage, it lasts for many years, and gives entire satisfaction. The best way to raise it is from seeds, giving a good place to the seedlings, and planting a goodly number together.

Primula Munroi.

One of the most satisfactory and most beautiful of our moisture-loving primula species is P. involucrata, one of the many gems we owe to the Himalayan regions. Of high beauty is it indeed, with its dainty leafage and its slender stems, which show up so well the beauty of the white, golden-eyed flowers it affords us. The war of authorities respecting P. Munroi seems to have practically resolved into a fairly general agreement that this is only a variety of P. involucrata. This is in accordance with the views formed after their cultivation together, but we learn to appreciate the bluish tone of the flowers of P. Munroi as giving us a welcome variety in a lovely primrose—a gem amid the many jewels we have among these exquisite flowers. Given a moist place, in peaty soil, there seems little difficulty in making P. Munroi perfectly happy. It does not require shade if it has moisture, but it appears to appreciate a little shelter from strong sun if only poorly supplied with a full share of its requirements in the way of water near the roots. Growing about six or nine inches high, this Himalayan primrose is a lovely thing indeed.

Anthemis cupaniana.

Although some would consider this more a border than a rock plant, yet it is finer when grown on rockwork than on the level, while the nature of its growth would evidently suggest that its appearance is more studied if it is included in the rock garden rather than in a flat border. It is said to be the same as A. montana, but it does not at all agree with the description given of that plant so far as regards its flowering time. Here it blooms in May and June instead of in autumn, as reported in works of reference. Whatever its relationship to, or similarity with, A. montana, it is a good plant, giving us charming, finely cut silvery foliage, and good-sized single white flowers with a yellow centre, on stems long enough to render them fit for decorative purposes in a cut state. But the habit of the plant is prostrate, and hanging over a ledge, or covering a low brow of the rocks, it is a pleasing and conspicuous plant. Even when out of bloom the silvery foliage gives it a charm, while the aromatic fragrance of the whole plant will appeal to some who delight in the virtue of pleasant odours. It is more agreeable in this respect than are some of its other allies among the chamomiles.



RHODODENDRON GLORY OF LITTLEWORTH.

A hardy variety with bright brownish orange colouring on a white ground. A.M., R.H.S., May 23. Miss Mangles, Seale, Surrey.

Saxifraga Aizoon "Number Three."

As yet, so far as I can learn, unhonoured by a name, and still, after a lapse of years, to be found in a few good gardens and nurseries as "S. Aizoon No. 3," there is a dainty little saxifrage of the Aizoon type, and one which deserves to be much better known than it has become. If Mr. Reginald Farrer, to whom we owe it, would give it another name, we would feel grateful to him, seeing that we desire to look upon this charming little plant as a permanent member of the garden treasures, and not as a mere sojourner in one of the modern caravanserais, passing simply by the sobriquet of "Number Three," instead of being recognised as a friend of distinction whose name we delight to honour. I wonder how I can describe it. It is a dainty little silvery saxifrage, packing closely together its exquisite deep grey rosettes in a charming way for the rock garden, and brightened up by little tinges of red towards the centre. It grows very compact, and is, when out of flower, about as dainty a little silver saxifrage as we can see in a day's journey. But when it is in flower we admire it still more. It blooms very freely, and sends up many of its neat stems, each carrying a satisfactory number of rather large flowers. The ground colour of these is white, but they are thickly spotted with little red dots in the most beautiful way, so profusely that a pinkish appearance is given to the flower. On a dry and sunny rockery this little saxifrage is a perfect delight to the lover of this invaluable class of alpine flowers.

Such are a few out of many things to be seen as we sit at our desk, and scan through the window the blossoms of the time. They may be fleeting, but their memory never fades, and remains with us through the height of summer, the shortening days of autumn, and the long and dreary winter, enlivening us in the latter time with the hope of once more looking with delight upon these gems of the early summer.

S. Arnott.

TEMPLE SHOW—A FINE COLONY OF AQUILEGIA STUARTI IN THE EXHIBIT ARRANGED BY MESSRS. T. S. WARE, LIM., FELTHAM. (Silver Cup.)

Salvia splendens Pride of Zurich.—It was a matter of surprise to many to see quite a large batch of well-flowered examples of this salvia at the meeting of the Royal Horticultural Society on April 25. The typical Salvia splendens used to be regarded more as an autumn-flowering plant; then, when some improved varieties were put into commerce, they were used for summer bedding, but to meet with it in such grand condition during the height of the daffodil season was quite a revelation. Though matched for brilliancy by the zonal pelargoniums this salvia when in a mass, as shown, supplies a tone of colour essentially its own.—W. T.

SWEET PEA NOTES.

Thinning the haulm or bine of sweet peas is a matter of considerable importance to those growing for exhibition, and by this time all peas, whether early or late sown, should be in vigorous growth, so that no time should be lost in performing this operation, starting, of course, with the earliest sown plants.

With some varieties and on some soils it may be advantageous to keep the plants to one lead, but, presuming the soil is fairly holding, and that it has been well prepared, this is, in my opinion, overdoing the matter. Providing the plants have been given a fair distance apart, two or three shoots should be taken up, but in all cases sufficient space should be allowed between the shoots for the foliage to develop properly, and the growth generally to keep firm. One can hardly expect to obtain good hard-stemmed flowers with plenty of substance in them if the bine becomes at all attenuated.

After thinning the growths, each shoot retained should be given a tie, and, if possible, brought to the outside of the stakes, where it will receive still more light and air, and as growth from now will be pretty rapid, the plants will require to be attended to at least once a week to remove all side growths from the shoots and to tie them to their supports as may be necessary. This thinning, etc., is only necessary when growing for exhibition, as quite good enough flowers with long stems can be secured from rows planted and allowed to grow at will.

From many parts of the country one hears complaints of drought, and the early need for watering. It is quite as well to keep a watchful eye on the plants, as they quickly decline in vigour if allowed to become dry at the root, but by using the hoe frequently between the rows they ought not to be really suffering, except perhaps on shallow or very light porous soils.

In many gardens clumps of peas are used for the adornment of the borders, also for filling large beds on the lawn, and now that the bulbs and other plants used for the spring bedding have been removed, no time should be lost in planting the sweet peas. Plenty of good short manure should be placed around them, within easy reach of the roots, making the soil very firm, as a too rampant growth is not needed in this phase of sweet pea cultivation, but rather a steady, short-jointed growth, which produces plenty of bloom.

A considerable amount of water will be required by these clumps till the plants become well established in the soil, as they will have made many roots in the pots and, unlike the earlier planted ones, will not stand shaking free of the soil, so there is some danger of the ball of soil drying out if particular attention is not paid to the watering should the weather prove very hot after planting. A spraying overhead both morning and evening will help them, and possibly prevent the lower foliage turning yellow.

The staking of these clumps should be very neatly done, using rather firm, bushy stakes for the purpose, and tying the tops to a wire or withy hoop to keep them steady. Using a hoop also tends to keep the clumps to a uniform size, which is quite essential if they are in conspicuous positions on the lawns.

Thomas Stevenson.

SOME VARIETIES OF SCAB IN POTATOES.

There are several so-called "scab" diseases of the potato, some of which cause widespread damage to the crop. Wart disease, or "black scab," due to Synchitrium endobioticum, Percival, is dealt with in Leaflet No. 105; and corky scab, due to Spongospora scabies, Massee, is described in Leaflet No. 232. In the present leaflet it is proposed to give some account of three other forms of "scab," due, respectively, to the fungus Oospora scabies, Thaxter, to millipedes (Julus sp.), and to mechanical injury.

Oospora Scab of Potatoes.

The scab caused by Oospora scabies is one of the most widespread of diseases affecting the potato. The fungus usually attacks the tubers while young, forming scattered rough patches or scabs on the surface; these patches gradually increase in size and number, and not infrequently when the tuber is full-grown its surface is more or less completely covered with scab. This scab is distinguished from the other forms by the presence of the parasite, which appears on the wounded portions as a delicate greyish bloom.

The injury is confined to the surface of the tuber, the skin being broken up into fragments over the diseased patches. Though the market value is much depreciated when oospora scab is present in quantity, the quality of the potato is not in the least impaired for eating. The preventive and remedial measures which may be practised against this form of scab are:

(1) If scabbed potatoes are used for "seed" without having been sterilised, the resulting crop will almost certainly be diseased, and in addition the fungus will pass into the soil, where it is capable of living for several years. Scabbed potatoes may be used for "seed" without the slightest danger of spreading the disease if they are immersed for two hours in a solution consisting of one pint of commercial formalin (—formaldehyde, 40 per cent.) mixed with thirty-six gallons of water. The potatoes should then be spread out to dry, when they may be cut and planted in the usual manner. Great care must be taken after potatoes have been treated as above that they are not placed in sacks or hampers that have contained scabbed potatoes.

(2) Land that has produced scabbed potatoes is certain to be infected with fungus, and should not be planted with potatoes for several years afterwards; beets, swedes, carrots, and cabbages are also attacked by the fungus, and should therefore not follow a crop of diseased potatoes. Cereals may be sown with safety on infected land.

(3) In the case of gardens and small allotments, where potatoes are of necessity grown every year, the trenches in which the potatoes are planted should be sprinkled with powdered sulphur.

(4) Lime favours the development of the fungus in the soil; the same is true of stable manure, night-soil, etc. Acid manures only should be applied to land that is infected.

(5) Peelings from infested potatoes, unless they have been boiled, should not be given to pigs. Burning is the safest, and in the end the most economical, method of dealing with them.

(6) Nitrate of potash, at the rate of 2 cwt. per acre, has proved beneficial.

Scab Due to Mechanical Injury.

This type of scab resembles the scab produced by the fungus Oospora scabies in the very superficial nature of the scars, which often cover the greater portion of the surface of the tuber, and are entirely due to mechanical irritation of the skin of the potato during the early stage of growth. The most general cause of irritation is the presence of ashes in the soil, and it is very prevalent in the neighbourhood of towns where night-soil is used as a manure. In an experiment conducted at Kew, for the purpose of proving the correctness of this statement, twelve potatoes free from scab of any kind were planted in soil mixed with ashes. A second row parallel with the first, planted in soil containing no ashes, acted as a control. When the crop was lifted, all the potatoes grown in the land containing ashes were badly scabbed, whereas those grown in the land not containing ashes were free from scab. This experiment has been repeated on several occasions with similar results.

In addition to ashes, certain climatic conditions favour the formation of the scab under consideration. During a dry period the surface of the quickly growing tubers presses against the comparatively unyielding soil, with the result that the skin is injured. As such injured tubers continue to increase in size, the original minute scars are stretched wider and wider, and become bounded by a somewhat raised border of wound cork, the result being scab. This type of scab is often very prevalent on potatoes grown in sharp sandy soil during a dry season.

TEMPLE SHOW — PART OF THE GOLD MEDAL DISPLAY OF ORCHIDS ARRANGED AT THE TEMPLE SHOW BY MESSRS. SANDER AND SONS, ST. ALBANS.

Unless complications follow, the injury caused is slight, as the wounds are only "skin deep," and such scabbed potatoes may be used for "sets." In many instances, however, mechanical injuries to the skin enable eelworms, bacteria, fungi, etc., to gain an entrance into the tuber, which may result in its complete destruction.

The only means of preventing this type of scab consists in an improvement in the condition of the soil.

Scab Caused by Millipedes.

Among the various kinds of millipedes, popularly known as "false wire-worms," Julus pulchellus, L., is the greatest enemy of growing potatoes. It varies from half to three-quarters of an inch in length, and is not much thicker than an ordinary pin, pale yellowish-pink in colour, with a double row of crimson or purplish spots running its entire length. Though not generally a primary cause of injury, Julus readily takes advantage of any minute wound, which it quickly enlarges by feeding on the sound portion of the tuber. In some instances numerous shallow cavities are formed in the flesh of the potato, and as each wound becomes surrounded by a raised border of wound cork, a scabbed appearance results. In other instances small holes roughly circular and of varying depth are produced, whereas in some cases, as when following on an attack of Spongospora scabies, Mass. (Leaflet 232), very large cavities are formed, or the tuber may be completely hollowed out. In such cavities hundreds of millipedes are often present. Millipedes are often introduced to the land in leaf-mould or decaying vegetable matter. This form of scab may be reduced by destroying millipedes in the soil.—Board of Agriculture Leaflet.

Roses.—A sharp watch must be maintained to prevent green-fly. Frequent syringings with some approved insecticide will prove effective, and this operation should be carried out late in the day, when the sun has lost its power. If extra fine blooms are required, disbudding must be resorted to, removing the small buds, and allowing only one flower to each shoot. Should there be any duration of dry weather, the beds will require watering, and weak liquid manure may be given occasionally.—E. C. POOLEY.

PERPETUAL CARNATION NOTES.

I do not intend to again traverse the ground so skilfully covered by Mr. Allwood in a previous issue, but, with him, can enjoy a meditation on the porgress of the modern perpetual carnation.

He recalls with evident pleasure the very floriferous Alpine Glow, one of the freest carnations in existence; Floriana, which gave such a delightful shade of clear pink; Mrs. Theodore Roosevelt, one of the prettiest carnations under artificial light, and several others. These varieties, which are still offered by some growers, are superseded, but it is marvellous how the popularity of Enchantress and Mrs. Lawson still holds them warm favourites with the rank and file of cultivators. The constitution of these two varieties has indeed been splendid, but in certain cases I believe the stock is slowly losing vigour, perhaps the more marked in the case of Enchantress.

The query with regard to the raiser of Miss Joliffe I cannot safely answer, but it originated in the gardens of Campsea Ash, Wickham Market, probably about 1870, so that it had quite a long career

A favourite carnation of the seventies was La Belle, a very free white variety, raised by a Mr. Blackley, of Leyton, from a small consignment of French seed. At one of the meetings of the R.H.S., in 1872, this was shown on a balloon-shaped trellis, five feet in height, and a yard through. It was the boast of the raiser that from three to five dozen blooms coult be cut from this specimen all the year through, truly a wonderful record

TEMPLE SHOW—PART OF THE ROCK GARDEN DISPLAY MADE BY MESSRS. W. ARTINDALE AND SON, SHEFFIELD (Silver Flora Medal).

Nowadays a carnation has to be almost perfect to gain a position as a standard variety. Its constitution must be good, the stem long and stiff, the blossom large, of good form, and approved colouring, with a sound calyx. Furthermore, it is desirable that the variety should be free, and "get away" quickly to blossom, the latter being a very particular point with many growers, particularly the Americans.

Pink Delight, Mr. Allwood notes as a really difficult variety under ordinary culture. This remark calls to mind the difficulty of some of the older English varieties, such as Pride of Exmouth, which in many hands was an absolute failure. On the other hand, Mr. C. F. Waters and other good growers have shown this carnation remarkably well, and though smaller than the American varieties, yet its good form and appealing colour proved very attractive to flower lovers.

A seedling I have under the name of Elegance carries during the warmer months the colour and tinting of Pride of Exmouth, though at all points it is far more preferable than the old form. During the winter months, however, it has given a clear self pink colouring, almost approaching Winsor and Floriana, though perhaps showing a little tendency to a salmon shade. This, with me, has proved one of the quickest carnations to blossom, and should it retain its present vigour and freedom will undoubtedly prove a serviceable variety.

It is pleasing to note that Mrs. C. W. Ward is doing so well with growers on this side, thus continuing its victorious career, so markedly inaugurated at the American exhibitions. One will also watch with interest its companion variety, Alma Ward, which, though not perfect in blossom, yet undoubtedly is the largest, and one of the most fragrant carnations in existence. Both will undoubtedly be brought into service in the raising of novelties, as they have so many good points about them.

Coming to the question of future work and aims I believe we can rely for many fine forms upon our English raisers, which will be the equal of the best American novelties. Mr. Allwood could tell us, doubtless, of good things in new colourings, varieties that will follow Royal Purple, Regal Mauve, Mrs. Crook, and other notable forms among the newer English varieties, and Mr. Engelmann is sure to hold a further batch of good novelties for the future.

The main factor in carnation culture, the market grower, will call for good stout stems, clear decided colouring, and quickness to blossom, in addition to good form and freedom. And this is just what is needed, varieties that will yield to the utmost without losing their vigour and constitution or falling prey to the several insidious enemies which are ever ready to seize upon the weakling.

P. S. Hayward.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

PERMANENT SHADING.—It will generally be admitted that a light coating of permanent shading on the roof of the houses is found advantageous during the hottest of the summer months. On the cool houses in particular this shading should be put on without delay. The ordinary canvas blinds or the lath blinds even are not, in my opinion, sufficient protection from strong light during the summer season excepting in cases where the houses have a northern aspect. A thin solution of whitening mixed with butter-milk or skim milk, with a little salt added, and put on with a whitewash brush during favourable outside conditions will quickly become quite dry. The advantage of a slight shading on the warmer division is found in not having to lower the blinds so early in the morning and being able to roll them up again earlier in the afternoon; the plants thus obtain lighter conditions and a considerable amount of natural heat accumulates which dispenses with a corresponding amount of artificial heat. Even where the shading is syringed on the roof there is a considerable breaking up of the heat rays, which makes the plants practically safe from the danger of scorching.

TEMPLE SHOW—AN EXHIBIT OF CLIPPED TREES, FROM MESSRS. J. PIPER AND SONS, BISHOP'S ROAD BAYSWATER (Silver-gilt Banksian Medal).

LATH BLINDS.—I would draw attention also to what we consider one of the greatest drawbacks to the use of lath roller blinds. It will be frequently observed that the temperature inside the houses falls rapidly almost immediately these blinds have been lowered. This is to a great extent due to the rapid cooling of the roof glass, caused by the current of air passing between the blind and the glass. This must be minimised as far as possible by the discreet use of the ventilators. On bright mornings, when the free use of the lower ventilators is permitted before the blinds are lowered, the temperature naturally runs high, and it is the sudden fall, under such conditions, that causes great injury to many plants, and should be guarded against.

DAMPING. — With the favourable conditions now prevailing, we have been enabled to keep up a humid atmosphere with little difficulty. I do not consider it advantageous to lay down any hard and fast rules as to how a house should be damped, or the number of times in the day damping should be done. The conditions under which plants have to be grown in various situations throughout the country, and the changeable climate renders any rule of thumb unpractical. Those in charge should be the best judges of the conditions suited to meet the requirements of the plants.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—The potting of chrysanthemums, as soon as they become ready, should be taken in hand. The compost should be coarse, and consist of three parts good fibrous loam, with coarse sand and lime rubble. A six-inch potful of bone-meal to each barrowload of soil should be added, together with some old mushroom bed material. Sprinkle the whole with soot. The materials should be thoroughly mixed by turning them over several times before use. When potting see that the ball of the plant is thoroughly moist, and pot very firmly. After potting the plants may be placed in their summer quarters. The choosing of this site is a most important point, and must be carefully considered. As nearly as possible it should be chosen so that there is no shade from the sun, for sunshine is most essential in building up the constitution of the plant. A good solid ash bottom is best on which to stand the pots, but, failing this, battens may be used to prevent worms entering the pots and choking up the drainage. Syringe the plants twice a day with clear soft water, and occasionally with weak soot water.

CINERARIAS.—The main batch of seeds may be sown, using well-drained pans for the purpose. A light sandy compost should be used, and must be moistened before sowing. After sowing, place the pans in a cold frame in a shady part of the garden. Prevent evaporation by covering the pan with a piece of glass, on which place a sheet of paper. As soon as the seedlings are large enough to handle they may be pricked off in boxes about three inches apart. Do not allow the plants to become overcrowded in the boxes, but pot them off singly into small pots when ready.

HUMEA ELEGANS.—Seeds of this attractive plant may also be sown, and treated in the early stages in the same manner as advised for cinerarias. As the seeds are very light a little more care is necessary in sowing. Germination is very slow, but artificial heat must not be used.

HIPPEASTRUMS (AMARYLLIS).—Plants that have finished flowering should be given the full benefit of the sun to assist them in making their new growth. A stake should be placed in each pot, to which the leaves may be loosely tied. Do not hasten the ripening of the bulb by withholding water too early, but rather keep the plants fairly moist until the foliage shows signs of decay. Weak liquid manure or some fertiliser will be found very beneficial to them while growing.

RICHARDIAS (ARUMS).—Plants which have finished flowering should be stood outside to harden, preparatory to being divided and planted out.—A. Grubb, Porter's Park Gardens.

THE KITCHEN GARDEN.

CAULIFLOWERS.—The seeds sown outdoors in March will have by this time produced plants large enough for planting out into ground at two feet apart, and will succeed the earlier plantings, and provide heads until the autumn varieties are ready for cutting. If it is possible select showery days for removal of the plants. Preserve the fibrous roots by careful lifting, and settle the soil about the roots by giving them a copious watering as soon as planted, thus avoiding any unnecessary check to growth.

WINTER BROCCOLIS.—Prick out the young plants into nursery beds as soon as large enough. The soil should be sweet, and a good dressing of soot is highly beneficial, and will assist growth. Calculate the quantities required, allowing a margin for losses of each variety. Time and space in most places are valuable, therefore it is well to keep down to a minimum the number of tender kinds, allowing the larger quantities to contain the well-tried ones suitable to the part of the country one is situated in.

CELERY.—During the next week or two the main crop of celery will be in condition for planting out into the trenches. Give a thorough soaking of water to the plants previous to lifting, and preserve as many roots with a ball of earth to each as possible, doing everything to avoid a check during the process. If the weather is hot and dry it may be necessary to give a light shade to the plants during the middle of the day by placing a few boughs to ward off the direct sunshine. Apply water to the roots, and give a sprinkling to the foliage according to the weather conditions.

GLOBE ARTICHOKES.—The plants will be in active growth, and to strengthen the bearing shoots a good mulching of manure should be given to the roots. At the same time remove the small worthless growth to avoid a thicket, and to admit light amongst the stronger ones. Where stocks of plants have been obtained by division, and established in pots, they should now be planted out in prepared land at about three feet apart, and will be also benefited by a mulching of light manure during the hot months.

RUNNER BEANS.—Seed that was sown outside a short time since will have produced plants about to run up. Have them staked at once before being damaged by wind, and to carry the leaders of the plants out of the way of slugs. Plants that have been raised under glass, and potted on, must be attended to at once.

POTATOES.—Up to the present crops of potatoes seem very satisfactory, coming up regularly and strong. Work between the rows as soon as they appear above ground, and if any show themselves weak, give them assistance with a quick-acting manure by spreading in round the plants and working it in the surface of the soil. Do not delay the earthing up of the crops too long, or considerable damage follows to the young laterals under ground that are running away to tuber.—C. Flack, Cholmondeley Castle Gardens.

TEMPLE SHOW—AVENUE OF FLOWERING AND ORNAMENTAL-FOLIAGED TREES AND SHRUBS ARRANGED BY MESSRS. JOSEPH CHEAL AND SONS, CRAWLEY. (Silver Cup.)

HARDY FRUITS.

MULCHING FRUIT TREES.—Apple and pear trees that are heavily set with fruit will require a thick mulch of good manure, which need not necessarily be half-rotted. Pig or cow manure coming straight from the pens will be found more stimulating, although somewhat more unsightly. Where, for appearance sake, objection would be made to farmyard manure at this time of year, this may, in a great degree, be rendered less unsightly by flooding, and puddling down with water at the time of application, and as soon as the material has become a little dry on the surface, a thin dressing of fine soil may be spread lightly over it. This will act in two ways, by keeping down the offensive odour, and obviating further attention in watering unless an exceptional drought is experienced.

WALL FRUITS.—Peach, nectarine, and apricots trees have generally set a very heavy crop, and thinning should be taken in hand as soon as possible. This should be carried out gradually until the size of the fruit warrants the final thinning. This requires a determined hand, and a knowledge of the trees and varieties. The quantity of fruit left to mature will be governed by the size of the fruits and vigour of the trees. Young trees planted this season should not be allowed to carry fruit, or a serious check will be given them. Such trees need all their strength in becoming established, and in the making and ripening of next year's fruiting wood. At the first signs of mildew on the foliage or fruit, flowers of sulphur may be dusted over the affected parts before the disease has time to spread.

PEARS AND PLUMS.—A practice of stopping the strong growths of pears and plums should be carried out during the whole growing season, always, of course, excepting the shoots required for extension. The first stopping should be made at about the sixth leaf, and all further lateral growths be stopped at the second or third leaf. This will regulate the flow of sap, and allow air and light to pass readily through the trees and ripen the wood. If exhibition pears are required it will be found advantageous to fully expose the fruits of some varieties, such as Durondeau, and Doyenne du Comice, which is best done by picking off a few leaves; Beurre Diel, Beurre Superfin, Pitmaston Duchess, and several other varieties will obtain a much finer finish and texture of skin if grown entirely shaded by the leaves.

RED AND WHITE CURRANTS.—These will derive much benefit if stopping is carried out at the present time. Aphis, that usually attack the currants, choose the very young leaves as a nursery. Light will be admitted to bring the fruit to maturity earlier, and the general condition of the bushes be improved.

GOOSEBERRIES.—If large berries are required for dessert or exhibition purposes, and the trees are heavily cropped, the fruits may be severely thinned and used in the kitchen. If manure has not already been applied, a good littering down with stable manure will prove very beneficial to the bushes, and keep the fruits free from grit and splashing by heavy rains. Gooseberries for bottling and jelly should be gathered while still quite young to be perfectly satisfactory.—James Whittle, Cheveney Gardens.

Seakale.—Thongs planted as advised will have formed heads of growth, and in many cases produced more than is required. Where so, reduce them down to one, retaining the strongest, and assist the young plants with a dressing of salt or nitrate of soda, and work the Dutch hoe frequently amongst them on fine days, to give them a good start to form vigorous plants.—C. F.

The Value of Lime in the Garden.—The beneficial influence of lime on garden crops is difficult to overestimate, for with the exception of a few conifers and the ericaceous order, nearly all plants cultivated in this country may with advantage have lime as a soil constituent. On ground devoted to the production of fruit and vegetables lime becomes a great factor, as without it the organic matter in the soil cannot be transformed into nitrates, the form in which plant food is assimilated by growing crops. Lime produces marked results on garden soils that have been heavily manured for a number of years; such rich soils can be made sweet and fertile with lime, the growth of the crops are much freer and heavier, and they mature quicker. Lime is being continually washed out of the soil and lost in the drainage, hence the necessity of applying it at frequent intervals. It is best applied as slaked lime at the rate of 10 to 15 cwts. per acre.—Thomas Smith.

CHESTERFIELD FLOWER SHOW,
WEDNESDAY, 2nd August, 1911.
Affiliated with the National Rose Society.
Special large Marquee for staging Roses.
Schedules on application.
CHAS. WM. HADFIELD, Secretary.

PORTSMOUTH HORTICULTURAL SOCIETY.
SUMMER SHOW, July 18th and 19th. AUTUMN SHOW, Nov. 1st. Schedules and particulars, W. E. GILL, Osborne Road, Southsea.

RICHMOND HORTICULTURAL SOCIETY.

THE THIRTY-SEVENTH ANNUAL SHOW will be held in the Old Deer Park, Richmond, Surrey, on
WEDNESDAY, 28th June.

Silver Challenge Cups, Gold and Silver Medals,
upwards of 300 Money Prizes.

W. J. COOK, Hon. Sec., Holmsley, Richmond, Surrey.

STRATFORD-ON-AVON FIFTH ANNUAL FLOWER SHOW.
On BANK HOLIDAY, August 7th, 1911.
OPEN TO ALL.
MARIE CORELLI CHALLENGE CUP,
Value 25 guineas,
With Gold, Silver, and Bronze Medals,
For Best Collection of Cut Flowers and Fruit to occupy a stage 12ft. by 4ft.
NUMEROUS OTHER PRIZES.
Schedules to be had of Mr. J. HOWE, Hon, Secretary, Stratford-on-Avon.

WOLVERHAMPTON GREAT FLORAL FETE,
JULY 11, 12, and 13, 1911.
£900 in PRIZES.
Schedules on application to the Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

The Great Temple Flower Show.

In the present issue we give the reports of those sections of the Temple Show which pressure upon our space prevented us from including in our issue of May 27. We also present our readers with a series of illustrations of this great exhibition.

STOVE PLANTS.

A magnificent contribution of stove plants from Messrs. Jas. Veitch and Son, Chelsea, was a striking feature in the orchid tent, and showed in a marked manner the grace and beauty of ornamental leafage. At the back were tall and brilliant crotons, and bold caladiums, and a huge Cocoloba pubescens with umbrella-like leaves in the centre. Anthurium Veitchi, Deiffenbachia imperialis, D. Jenmani, and Alocasia Mortefontainensis were also grouped with more and bright caladiums over the central area. Towards the front were quaint and vivid anthuriums, with beautiful bertolonias, Rex begonias, maranthas, and the yellow green-margined Sanseviera Laurentia. Medinilla magnifica and Dracæna indivisa atropurpurea were other notable plants.

Messrs. J. Peed and Sons, Norwood, again contributed a big group of caladiums, many of these vying with orchids in their colouring; the big leaves always attract attention, especially those of such varieties as Fastuosum, Oriflamme, Red Indian, Rufus, Mons. Leon Say, John Peed, Duke of Teck, and Triomphe de Comte. Some of the plants were of great size, and all represented high culture.

The group of hippeastrums from Messrs. R. P. Ker and Sons, Aigburth, Liverpool, was greatly admired; the flowers were glorious in colouring, and of fine shape. With the deeper colours, such as orange-scarlet and crimson, we are familiar, and the Messrs. Ker have introduced new colours and notably rosy and pink shades, and such varieties as Cerise King, Lady Rose, Rosa Mundi, and Arcadia were specially fine in this line of development.

Stove foliage plants from Mr. L. R. Russell, Richmond, formed a bold group, and specially good were the specimens of Dracæna Victoria, Croton Reidi, Anthurium crystallinum, nepenthes, bertolonias, and strobilanthes.

CARNATIONS.

A large exhibitor of carnations was Mr. C. Blick, Hayes, Kent, who had very pretty and bright blooms of perpetual, Malmaison, and border varieties. Among the latter a few fine things were Prince Arthur, Victory, Thomas a'Beckett, Sir Walter, Donald McDonald, San Remo, and Lieut. Shackleton; Mr. Blick had also a very fine vase of Lady Hermione, the Coronation carnation.

We always expect fine perpetual carnations from Mr. A. F. Dutton, Iver, Bucks, and are not disappointed. On this occasion he set up beautiful flowers of Winona, Carola, May Day, Mikado, Mrs. T. W. Lawson, Lawson-Enchantress, Pink Delight, Beacon, and the large new blush American variety named Mrs. Charles Knopf.

Messrs. Wells, Merstham, Surrey, had a small, but choice, collection of perpetual-flowering carnations, amongst which White House, a fine white flower, was conspicuous.

Messrs. Bath, Lim., Wisbech, were represented by a nicely arranged collection of carnations, in which Mrs. C. W Ward, May Day, White Enchantress, and Mrs. T. W. Lawson were boldly conspicuous.

A beautiful new crimson carnation, called Edith Walters, was a conspicuous feature in the exhibit staged by Mr. C. F. Waters Balcombe, Sussex, but other flowers which attracted attention were Alma Ward, Glendale, and Carola.

Mr. H. Burnett, Guernsey, made a fine show with perpetual-flowering carnations. Mikado and R. F. Felton were remarkably fine, and other varieties which were much admired were Mrs. C. F. Raphael, Mrs. H. Burnett, Mrs. W. J. Hunter, and Scarlet Glow.

FRUIT AND VEGETABLES.

Vegetables were not largely represented, but it was a pleasure to turn from the flowers to the fresh-looking specimens from the kitchen garden of the Hon. Vicary Gibbs, Aldenham House. The specimens bore the stamp of high quality, which is characteristic of everything shown by Mr. E. Beckett, and on the long length of table were cucumbers and peas with the natural bloom intact, the whitest of cauliflowers, neat little marrows, dishes of fine tomatoes, potatoes of wax-like appearance, aparagus that you could eat to the very stump, crisp salading, curious looking fruits of egg plants, pure white turnips, crisp-looking radishes, etc. The method of arrangement left nothing to be desired, and the whole exhibit was most effective.

Another small collection of salading and forced vegetables came from the Thatcham Fruit and Flower Farm, Newbury. Some of the lettuces were very good, as also were the cauliflowers, but radishes struck us as being rather overdone.

Messrs. Laxton Brothers, Bedford, had some splendid baskets of strawberries, which included the varieties King George V., George Monro, Bedford Champion, and Laxton's Maincrop. The fruits were well grown and highly coloured, but tasting was, of course, prohibited.

Messrs. Harwood, of Colchester, were represented by several large bunches of asparagus.

Giant sticks of rhubarb came from Mr. T. E. Dawes, Syderstone, Norfolk, the best amongst them being Dawes' Challenge.

In amongst the flowers and fine foliage plants was a collection of fruit trees in pots from Messrs. T. Rivers and Son, Sawbridgeworth, and a fine exhibit it was. The leaves of the peaches and nectarines were of that dark green hue which indicates perfect health, and the fruits with which they were thickly studded were fine and highly coloured. Peaches and nectarines were the feature, but Early Rivers and Knight's Early Black cherries were included, as well as specimens of the well-known Rivers Plum.

ROCK AND ALPINE EXHIBITS.

The King's Acre Nursery Company, Hereford, put up a little rock garden display in the begonia tent, but the moss covering for the soil was not in keeping with the plants. Saxifragas, Heuchera sanguinea, Corydalis Wilsoni, Primula sikkimensis, P. Sieboldi, and Daphne Cneorum were noticeable plants in the exhibit.

In the rock garden exhibit prettily arranged by Messrs. James Backhouse and Son, York, a whole host of delightful alpine and other hardy flowers was brought together. There were fine forms of aquilegias, and trollius, a collection of the newer primulas, including P. Bulleyana and P. Littoniana, colonies of Gentiana acaulis, Ramondia pyrenaica, hardy cypripediums, daphnes, saxifragas, and Haberlea rhodopensis.

Being rock garden experts, Messrs. J. Cheal and Sons, Crawley, were able to put up a very pretty alpine exhibit, where, backed by dwarf pines, Japanese maples, and mollis azaleas, they filled the rock crannies with phloxes, daphnes, saxifragas, sedums, dianthuses, Lithospermum prostratum, and Ramondia pyrenaica, and had colonies of Primula japonica, violas, and hardy orchids in the lower foreground.

Messrs. G. and A. Clark, Dover, presented a low rock garden, and Trillium grandiflorum, Primula Veitchi, Heuchera sanguinea, and Incarvillea Delavayi were prominent subjects; the same firm had a rare show of brilliant trolliuses, tulips, and Pyrethrum John Malcolm, a fine rosy single variety.

The exhibit of hardy flowers contributed by Messrs. Whitelegge and Page, Chislehurst, was rich in Primula japonica, P. Unique, P. pulverulenta, saxifragas, Dodecatheon Meadia, the handsome Geum coccineum Mrs. J. Bradshaw, and Aquilegia Mrs M. Nicholls, the latter a beautiful and large blue and white variety.

Messrs. Jarman and Co. were forward with their charming sweet sultans—The Bride, Bridegroom, and Bridesmaid; these are lovely flowers, both for garden and table decoration.

Messrs. Cunningham, Fraser, and Co., Comely Bank, Edinburgh, showed a collection of alpines, and charming things in it were Cytisus Ardoinei, Rhododendron glaucum, Veronica Fairfieldi, Saxifraga D. Ramsey—a very pretty hybrid, Pentstemon Lewesi, and Celmisia holocerisea.

A small rock garden display from Messrs. W. H. Rogers and Son, Lim., Red Lodge, Southampton, was lightly filled with choice dwarf shrubs, and small-growing alpines, with rhododendrons and lilacs at either end.

A pretty combination of flowering azaleas and tiny alpines was shown by Mr. H. Hemsley, Crawley. The arrangement of the stones was natural, and the plants were set off to great advantage.

A pretty little rock garden was shown by Messrs. Bees, Lim., Liverpool, in which saxifragas, primulas, sempervivums, and other things were displayed in interesting variety. Particularly effective in this exhibit were several clumps of Saxifraga Lindsayana.

Messrs. Bunyard and Co., Maidstone, had a neat little rock garden, in which the pretty Dianthus Atkinsoni looked effective. A background was formed with specimens of flowering shrubs, and amongst hardy herbaceous subjects we noticed eremurus, spiræas, irises in variety, pæonies, and different varieties of trollius.

OUTSIDE EXHIBITS.

A very artistically arranged rock garden was erected near the main entrance by Messrs. Pulham and Son, Elsenham, and the broad pathway through it was very freely patronised. A good background of shrubs served to show up the pretty colonies of saxifragas, phloxes, primulas, etc., so pleasingly disposed.

Messrs. W. Cutbush and Son, Highgate, brought up a very large collection of their cut bushes, and the quaint forms of these clipped trees proved a great attraction; the ships and the "Teddy Bears" seemed to be specially interesting. This firm also presented a big rock garden, with great banks or borders of flowers leading up to it, and a narrow mound of alpines dividing the broad pathway down the centre. The back of the rock garden was furnished with rhododendrons, wistarias, azaleas, and liliums, and around the pool of aquatics were big gunneras, and colonies of irises and trollius. In the foreground a very large colony of hardy cypripediums was linked up with grouplets of Primula japonica, P. Bulleyana, P. Littoniana, meconopsis, and brilliant mimuluses, sarracenias, and funkias clustering close to the water's edge. In the borders were bold groups of Eremurus himalaicus, Lilium candidum, L. Harrisi, L. Browni, L. excelsum, German irises, Lupinus Moerheimi, Incarvillea Delavayi—very fine, and Anchusa italica Dropmore variety, all backed by roses and bamboos. A great and striking display.

The Japanese garden designed and planted by Messrs. James Carter and Co., Raynes Park and Holborn, occupied a position near the Embankment entrance. All around were Japanese maples rising out of the grass, and a number of stately pyramids of the Umbrella Pine (Sciadopitys verticillata), some of unusual size. A winding stream, bridged by stepping stones, and a pretty little bridge that led to a bamboo-thatched garden house was the central feature, and along its banks were iris, funkias, blue hydrangeas, and bamboos. Here and there were rare old dwarf Japanese trees, in quaint shapes, and some rare old Japanese lanterns and cisterns added a further touch of Japanese art and interest. The wistarias were very pretty, and at one end a rock garden prettily planted flanked the charming little gateway with its thatched porch. The whole was a pleasing design, and cleverly and prettily carried into effect.

The graceful Japanese maples were pleasingly grouped by Messrs. W. Fromow and Sons, Chiswick, the red, purple, crimson, green, and yellow-green foliage all adding beauty of colour to the grace of the foliage of these charming shrubs.

A very interesting arrangement of rockwork was exhibited by Mr. C. Elliott, Stevenage, in which stones were boldly used, and showy groups of Saxifraga granulata, achilleas, and other alpines looked very natural in their temporary quarters.

The Craven Nursery, Clapham, Yorks, had a novel, but prettily arranged, rockery, in which many charming little gems of the alpine family were exhibited.

A bold arrangement of stones and alpines was set up by the Guildford Hardy Plant Nursery, and Mons. H. Correvon, Geneva, had a quaint little collection of natural alpine plants.

Not the least interesting of the outdoor exhibits was the rock garden arranged by Mr. M. Prichard, Christchurch, Hants, in which rocks and alpine plants were employed with charming effect.

Messrs. Eggett and Son, Thames Ditton, had a pretty rockwork arrangement, and another charming rock garden was shown by Mr. R. Prichard, Wimborne.

Mr. R. C. Notcutt, Woodbridge, showed azaleas, rhododendrons, and lilacs in charming profusion. Messrs. W. Paul and Son, Waltham Cross, had a similar arrangement, and the tulips shown outdoors by Messrs. R. and G. Cuthbert, Southgate, were much admired. A pretty table of alpines came from the Burton Hardy Plant Nursery, Christchurch.

One of the boldest of the outdoor rockeries was that arranged by Messrs. R. Wallace and Co., Colchester. Stones in just sufficient quantity were used, and low shrubs and alpine plants contributed to the making of an effective exhibit.

Boxes and yews cut into various shapes, and illustrative of the art of topiary, were exhibited by Messrs. Pipers, of Bayswater.

Unique in design and highly effective was the rockwork arrangement set up by Messrs. W. Artindale and Son, Sheffield. Stones, large and bold, were used with marked effect with alpines growing apparently quite naturally in the crevices, while a group of pæonies in the front gave a finish to the exhibit which was admired by everyone.

Barr's Japanese pigmy trees are too well known to need any description, but they were in their usual place, as dwarf and venerable as ever.

In a square enclosure Messrs. H. B. May and Sons, Upper Edmonton, had an interesting exhibit, consisting of ferns in variety, fuchsias, and heliotropes in standard form, and verbenas and tricoloured geraniums in baskets.

In the annexe between the tents Messrs. Barr and Sons, Covent Garden, had an interesting rock garden, in which we observed the effective foliage of the new Rodgersia tabularis, from Northern China.

Messrs. Stuart Low and Co., exhibited a large collection of the bottle-brush plant, and the same firm also set up a fine group of rambler and polyantha roses in pots, both standards and trained plants being represented.

The Misses Hopkins, Shepperton-on-Thames, had an interesting group of alpines, arranged with stones and water, in an effective manner.

Messrs. J. Cheal and Sons, Crawley, set up a fine collection of flowering and foliage plants, in which Rhododendron White Pearl, Japanese maples, Rhododendron The Bride, and other beautiful things were noticed.

The outdoor alpine garden arranged by Messrs. T. S. Ware, of Feltham, was much admired, especially for its fine colony of Aquilegia Stuarti; and Messrs. J. Veitch and Sons exhibited a group of flowering subjects that was a blaze of colour.

Messrs. Heath and Son, Cheltenham, had an interesting display of rock plants, and Mr. L. R. Russell, of Richmond, made a big show with rhododendrons, azaleas, acers, and other flowering and foliage plants. A pretty arrangement of rock plants, etc., was set up by Mr. G. R. Reuthe, Keston, and much admired; Lewisia cotyledon was a very interesting plant in this group.

National Sweet Pea Society.

The special general meeting of this society, held at the Hotel Windsor on Thursday, May 18, for the purpose of considering the proposed Floral Committee's rules, as drawn up by the sub-committee, and approved by the General Committee, was fairly well attended, and Mr. G. W. Leak presided.

After the notice convening the meeting had been read, the Chairman formally moved the acceptance of the rules on behalf of the committee, and this was seconded by Mr. H. J. Wright.

Each rule was then taken in order as arranged on the set sent out recently to every member of the society. Remembering what has gone before, and led up to the construction of the rules, i.e., the alleged need for a reorganisation of the Floral Committee, and the exclusion of any one having an interest in any variety or trial, the temper of the meeting was interesting.

We have not space in this issue to give the rules as passed for immediate use by the general meeting, but we may give the chief points. The Floral Committee is to consist of nine persons, to be elected from the members, by the General Committee, by ballot, and the election will be annual, no portion of the committee being ineligible for election by rotation. The members of the Floral Committee need only be members of the society, their status matters not; nor does the fact that they are interested in any variety or trial exclude them from election. The Floral Committee must visit the trials at least twice annually; their awards will be made by ballot, each member having his or her own personal voting card; but if a vote is recorded by any member for a variety, he or she is financially interested in, then such vote will be struck out by the trials superintendent and secretary before the ballot is declared.

The silver medal will be only provisionally awarded the first year, and the variety must keep up its reputation a second year to obtain the medal. A First-Class Certificate will need seven-ninths of the votes of the committee, but an Award of Merit may be granted if there is a clear majority of votes.

Further, the Floral Committee is to bracket varieties it considers to be identical as seen growing at the trials; to prepare a list of too-much-alike varieties; and to indicate in order of merit the three varieties it considers best in each colour class.

On the whole, the meeting was a good-humoured one. There were some misunderstandings, and some speakers added chaff and sarcasm to their arguments. Now that a general meeting has adopted the rules as amended by a very large majority, only two voting against the set as a whole, matters ought to run smoothly, at least, until the annual general meeting.

National Tulip Society.

This society did not make a large display in Inner Temple Gardens on the second day of the Temple Show, the majority of the Southern growers being unable to compete owing to the early season. But although the flowers were not numerous, the quality was good throughout, and maintained the prestige of the old English tulip.

Class A was for twelve dissimilar rectified varieties, two feathered and two flamed in each class. There were three entries, Mr. C. W. Needham, Hale, Cheshire, winning first prize with fine examples of Sam Barlow, George Edward, Annie McGregor, George Hayward, Chancellor, Mabel, Sir Jos. Paxton, Stockport, Mrs. Collier, Masterpiece, Mrs. Hepworth, and Modesty. Mr. Jas. W. Bentley, Middleton, Manchester, was second with good specimens of Robert Headley, Coningsby, Mrs. Collier, Mabel, and Sir Jos. Paxton, while Mr. W. Dunn, Cambridge, had good blooms of Sam Barlow, Adonis, Bertha, Dreadnought, and Sir Jos. Paxton in his third prize stand.

In the smaller class, for six rectified flowers, one feathered and one flamed of each class, Mr. C. W. Needham again secured the first prize with fine specimens of Duchess of Sutherland, Sir Joseph Paxton, Mabel, Stockport, George Hayward, and Mrs. Collier; Mr. J. W. Bentley followed with Stockport, S. Barlow, W. Annibal, and Alice McGregor; Mr. W. Dunn third.

There were but two entries for three feathered tulips, Mr. Jas. W. Bentley winning with Garibaldi, Fanny, and Mrs. Atkin; Mr. C. W. Needham was second. For three flamed varieties there were as many exhibitors, Mr. C. W. Needham being placed first with good examples of Sir Jos. Paxton, a very fine Talisman, and Annie McGregor; Mr. J. W. Bentley was second, and Mr. W. Dunn third.

The class for breeder tulips was better filled, Mr. C. W. Needham winning first prize with Talisman, Mad. St. Amand, Lloyd's Seedling, Litchurch, Annie McGregor, and Sir Joseph Paxton; Mr. J. W. Bentley was second, staging nice examples of Mrs. Barlow, Alfred Lloyd, Talisman, and Mad. St. Amand; Mr. W. Dunn was third with good examples, while Mr. A. D. Hall, Harpenden, had to be content with fourth place. Mr. C. W. Needham was first for three breeder varieties, having good examples of Dr. Hardy, Mabel, and Litchurch; Mr. J. W. Bentley followed with Lady Grosvenor and Goldfinder, the third falling to Mr. Dunn.

Mr. J. W. Bentley was first for a feathered rose with Modesty; Mr. C. W. Needham was second. Mr. J. W. Bentley led off with a flamed rose, exhibiting Mabel; Mr. W. Peters, Cambridge, second with Sarah Headley. Mr. A. D. Hall scored for feathered byblœmens with Elizabeth Pegg, and was second with the same variety. For a flamed byblœmen Mr. J. W. Bentley led with Miss Henderson, Mr. C. W. Needham coming second with Talisman. For a feathered bizarre Messrs. Barr and Sons won with a good flower of James Wild; Mr. A. D. Hall was second with George Hayward; Mr. J. W. Bentley third with Garibaldi; and Mr. A. D. Hall fourth.

Flamed bizarres were only represented by two exhibitors, Mr. C. W. Needham being first with Sir Joseph Paxton, and Mr. A. W. Needham second with Sam Barlow. Mr. A. D. Hall led with byblœmen breeders, staging a finely-shaped seedling. The same exhibitor was second with a light-coloured seedling

The growers of less than four hundred flowering bulbs did not make a great show. For six varieties Mr. R. W. Hall, Cambridge, was the only exhibitor, and was awarded first prize; the varieties were Sam Barlow, Mabel, Talisman, Diarmid, Mrs. Atkin, and a seedling. The same exhibitor won first in the class for three feathered varieties, and also for three breeders, with examples of Diarmid, John Heap, and Annie McGregor. He was also the only exhibitor for two rectified varieties, and won with Dr. Hardy and Mr. Wilson.

Messrs. Barr and Sons put up a pretty display that included Talisman, Sir Joseph Paxton, Dr. Hardy, and Mabel, also some handsome bunches of the May-flowering varieties.

Mr. C. W. Needham had the premier flamed flower, winning with Sir Joseph Paxton. Mr. J. W. Bentley had the premier feathered flower, with Stockport; while the premier breeder was from Mr. C. W. Needham, who showed Dr. Cooper.

British Gardeners' Association.

(LONDON BRANCH.)

The third annual meeting of the London Branch took place at Carr's Restaurant on Thursday, May 11. Mr. North presided, and there was an attendance of over fifty members. The committee, in presenting the report, stated that the results of the past year's work were very gratifying, and that the branch is now firmly established, with a steadily increasing membership. Eight general meetings have been held during the past year, and these are held principally for the purpose of transacting general business; but they have also been made interesting and instructive by lectures and papers dealing with subjects of horticultural interest generally, or with the policy of the association. Two very successful concerts have been held during the past year, and these proved very popular, and were a valuable source of revenue to the treasurer, the net profits amounting to £7 5s. 11d. From the fund thus raised a subscription of £2 2s. has been forwarded to the Royal Gardeners' Orphan Fund, and £2 2s. to the British and Foreign Blind Association.

During the summer months excursions were made to the Priory Gardens, Roehampton; Downside, Leatherhead; and the R.H.S. Gardens, Wisley.

The balance-sheet shows the branch to be in a sound financial condition, and the auditors in their report highly compliment the treasurer, Mr. A. G. Barnes, upon the excellent manner in which the accounts of the branch have been kept.

The committee conclude their report with an earnest appeal to members to unite with them in their efforts to make the work of the branch a greater success than ever during the coming year.

In moving the adoption of the report and balance-sheet, Mr. Hawes congratulated the branch upon the good progress made, and the fact that it had been able to carry on its work during the past year without a money grant from the executive council.

The officers for the coming year were duly elected, and the meeting terminated with a hearty vote of thanks to the retiring officers.

Croydon Gardeners' Society.

On Tuesday evening last this society held its usual fortnightly meeting at the Sunflower Temperance Hotel, George Street. This meeting concludes their programme of lectures for the first session of the year. During the summer months it is found more acceptable to visit the gardens of repute within the district, when members can examine the mode of culture carried on at these establishments and interchange their views as they pass through the gardens.

Nothing could be more appropriate for a final meeting than to hold discussions on subjects relative to horticulture, and at Tuesday's meeting this was the form of entertainment. At each meeting since January of this year a question box has been placed on the table so that any member experiencing a difficulty or wishing to record a success that his fellow members may profit by his system of culture, he notes it at the time, and after writing it on a piece of paper drops it into the box for reference during discussion night. A goodly number of questions were dealt with, and much useful information derived from this source. With time to spare other questions were invited, and as each one came in for criticism all the members entered into friendly discourse on the subject. Knowledge diffused in this way keeps each member in touch with present-day experiences, and is very useful in circulating up-to-date ideas.

Broughty Ferry Horticultural Association.

The ordinary monthly meeting was held in the British Restaurant. Mr. James Bethel presided. The essayist for the evening was Mr. Alexander McLennan, Laurelhill Gardens, Stirling, who had for his subject, "Some Ways of Making Gardens Attractive." In the course of an excellent paper, Mr. McLennan gave many helpful hints, and in eloquent fashion drew many vivid pictures of attractive corners in notable gardens where he had been a visitor or worker. Confining his remarks chiefly to the flower garden and pleasure grounds, he dealt with their adornment and furnishing, giving advice on the best methods of constructing and planting rock and wall gardens; the making of undulating borders and edgings for alpine and rock plants, bowers, arches, pergolas, pillars, etc., and what to grow or train on them. Wild and bog gardens, too, were treated upon, as well as the formation of shrubberies, and the best plants to use. At the same time he gave a useful list of shrubs suitable for covering walls in exposed as well as sheltered positions.

Regarding the formal flower garden as the most attractive place for all, he was glad to note a change from the old designs and ribbon borders and carpet beds laid down with neat regularity and composed of tender bedding plants that took the greater part of the year to grow under glass. Too much he could not say in praise of the colour schemes executed with hardy annuals, biennials, and herbaceous perennials to be seen in some gardens. In connection with this style of gardening he spoke in flattering terms of the wonderful achievements wrought by Mr. Thomas Hay, at Hopetoun Gardens, Queensferry.

A good discussion followed, after which Mr. McLennan was cordially thanked for his paper and interesting replies.

Mr. Wm. Grant, Fernhall Gardens, exhibited vases of parrot, Darwin, and May-flowering tulips in new and choice variety, for which he was cordially thanked.

FORTHCOMING ENGAGEMENTS.

THURSDAY, June 1.—Linnean Society.
Ipswich Flower Show, in conjunction with the Suffolk Agricultural Society
MONDAY, June 5.—Bank Holiday.
TUESDAY, June 6.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. on "The Past History of Conifers," by Professor A. C. Seward, F.R.S.; Scientific Committee at 4 o'clock.
WEDNESDAY, June 7.—Thames Flower Show, at Tagg's Island, Hampton Court; two days.
MONDAY, June 12.—United Horticultural Benefit and Provident Society; committee meeting.
WEDNESDAY, June 14.—Grand Yorkshire Floral Fête and Gala; three days.
Royal Cornwall Agricultural Show at St. Austell; two days.
THURSDAY, June 15.—Linnean Society.
TUESDAY, June 20.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. on "The Origin of Monocotyledons from Aquatic Dicotyledons," by Rev. Prof. G. Henslow; Scientific Committee at 4 o'clock.
Oxford Summer Show.
THURSDAY, June 22.—Coronation Day.
TUESDAY, June 27.—Great Flower Show at Norwich, in connection with Royal Agricultural Society; four days.
Southampton Rose Show.
WEDNESDAY, June 28.—Richmond Flower Show.
Windsor Rose Show.
Irish Gardeners' Association.
THURSDAY, June 29.—Isle of Wight Rose Show.

"**The Homestead**" is the title given by the Great Central Railway Company to a booklet that is at once an illustrated guide to that beautiful locality in and around the Chiltern Hills, and a gazette showing where residential centres are developing. It also includes lists of available houses, and of builders and estate agents, consequently to those seeking residence—a homestead—in this charming district, the book is a great boon. There is a very complete time-table showing how the City man can get to and from business; rail fares and prices of season tickets are given from every place referred to, and to this is added such important information as population, subsoil, altitude, cost of water, gas, electric light, and rates, the local authority, and distance from Baker Street. Still further, as an inducement to read on, there are three interesting articles in the beginning of the book. A Sportsman's Paradise breathes of open spaces, of golf links, of hunting and cycling. Climatic and Geological Considerations tell of chalk hills, breezy uplands, of winding streams, and good drainage; while The Flowers and Gardens of the Chiltern Hills gradually leads the reader from the beauties of hedgerow and woodland to the glories of cultivated roses, and ideal rock gardens. "The Homestead" is a book all living in or near London should secure from Marylebone.

Babianas. — These pretty little Cape bulbs are well worth growing for the decoration of the greenhouse during the late spring or early summer months. Most of them form a tuft of rather broad hairy leaves, which are overtopped by the spikes of flowers. These last are in many cases of some shade of blue, frequently with a metallic lustre, and often marked with some other colour. In rubro-cyanea, the flowers, which are a couple of inches across, are of a brilliant metallic blue, with a rich crimson centre. Bulbs of these babianas are by no means expensive, and they need the same treatment as the ixias, sparaxis and tritonias, all of which are well suited for greenhouse decoration.—W. T.

ANSWERS TO CORRESPONDENTS.

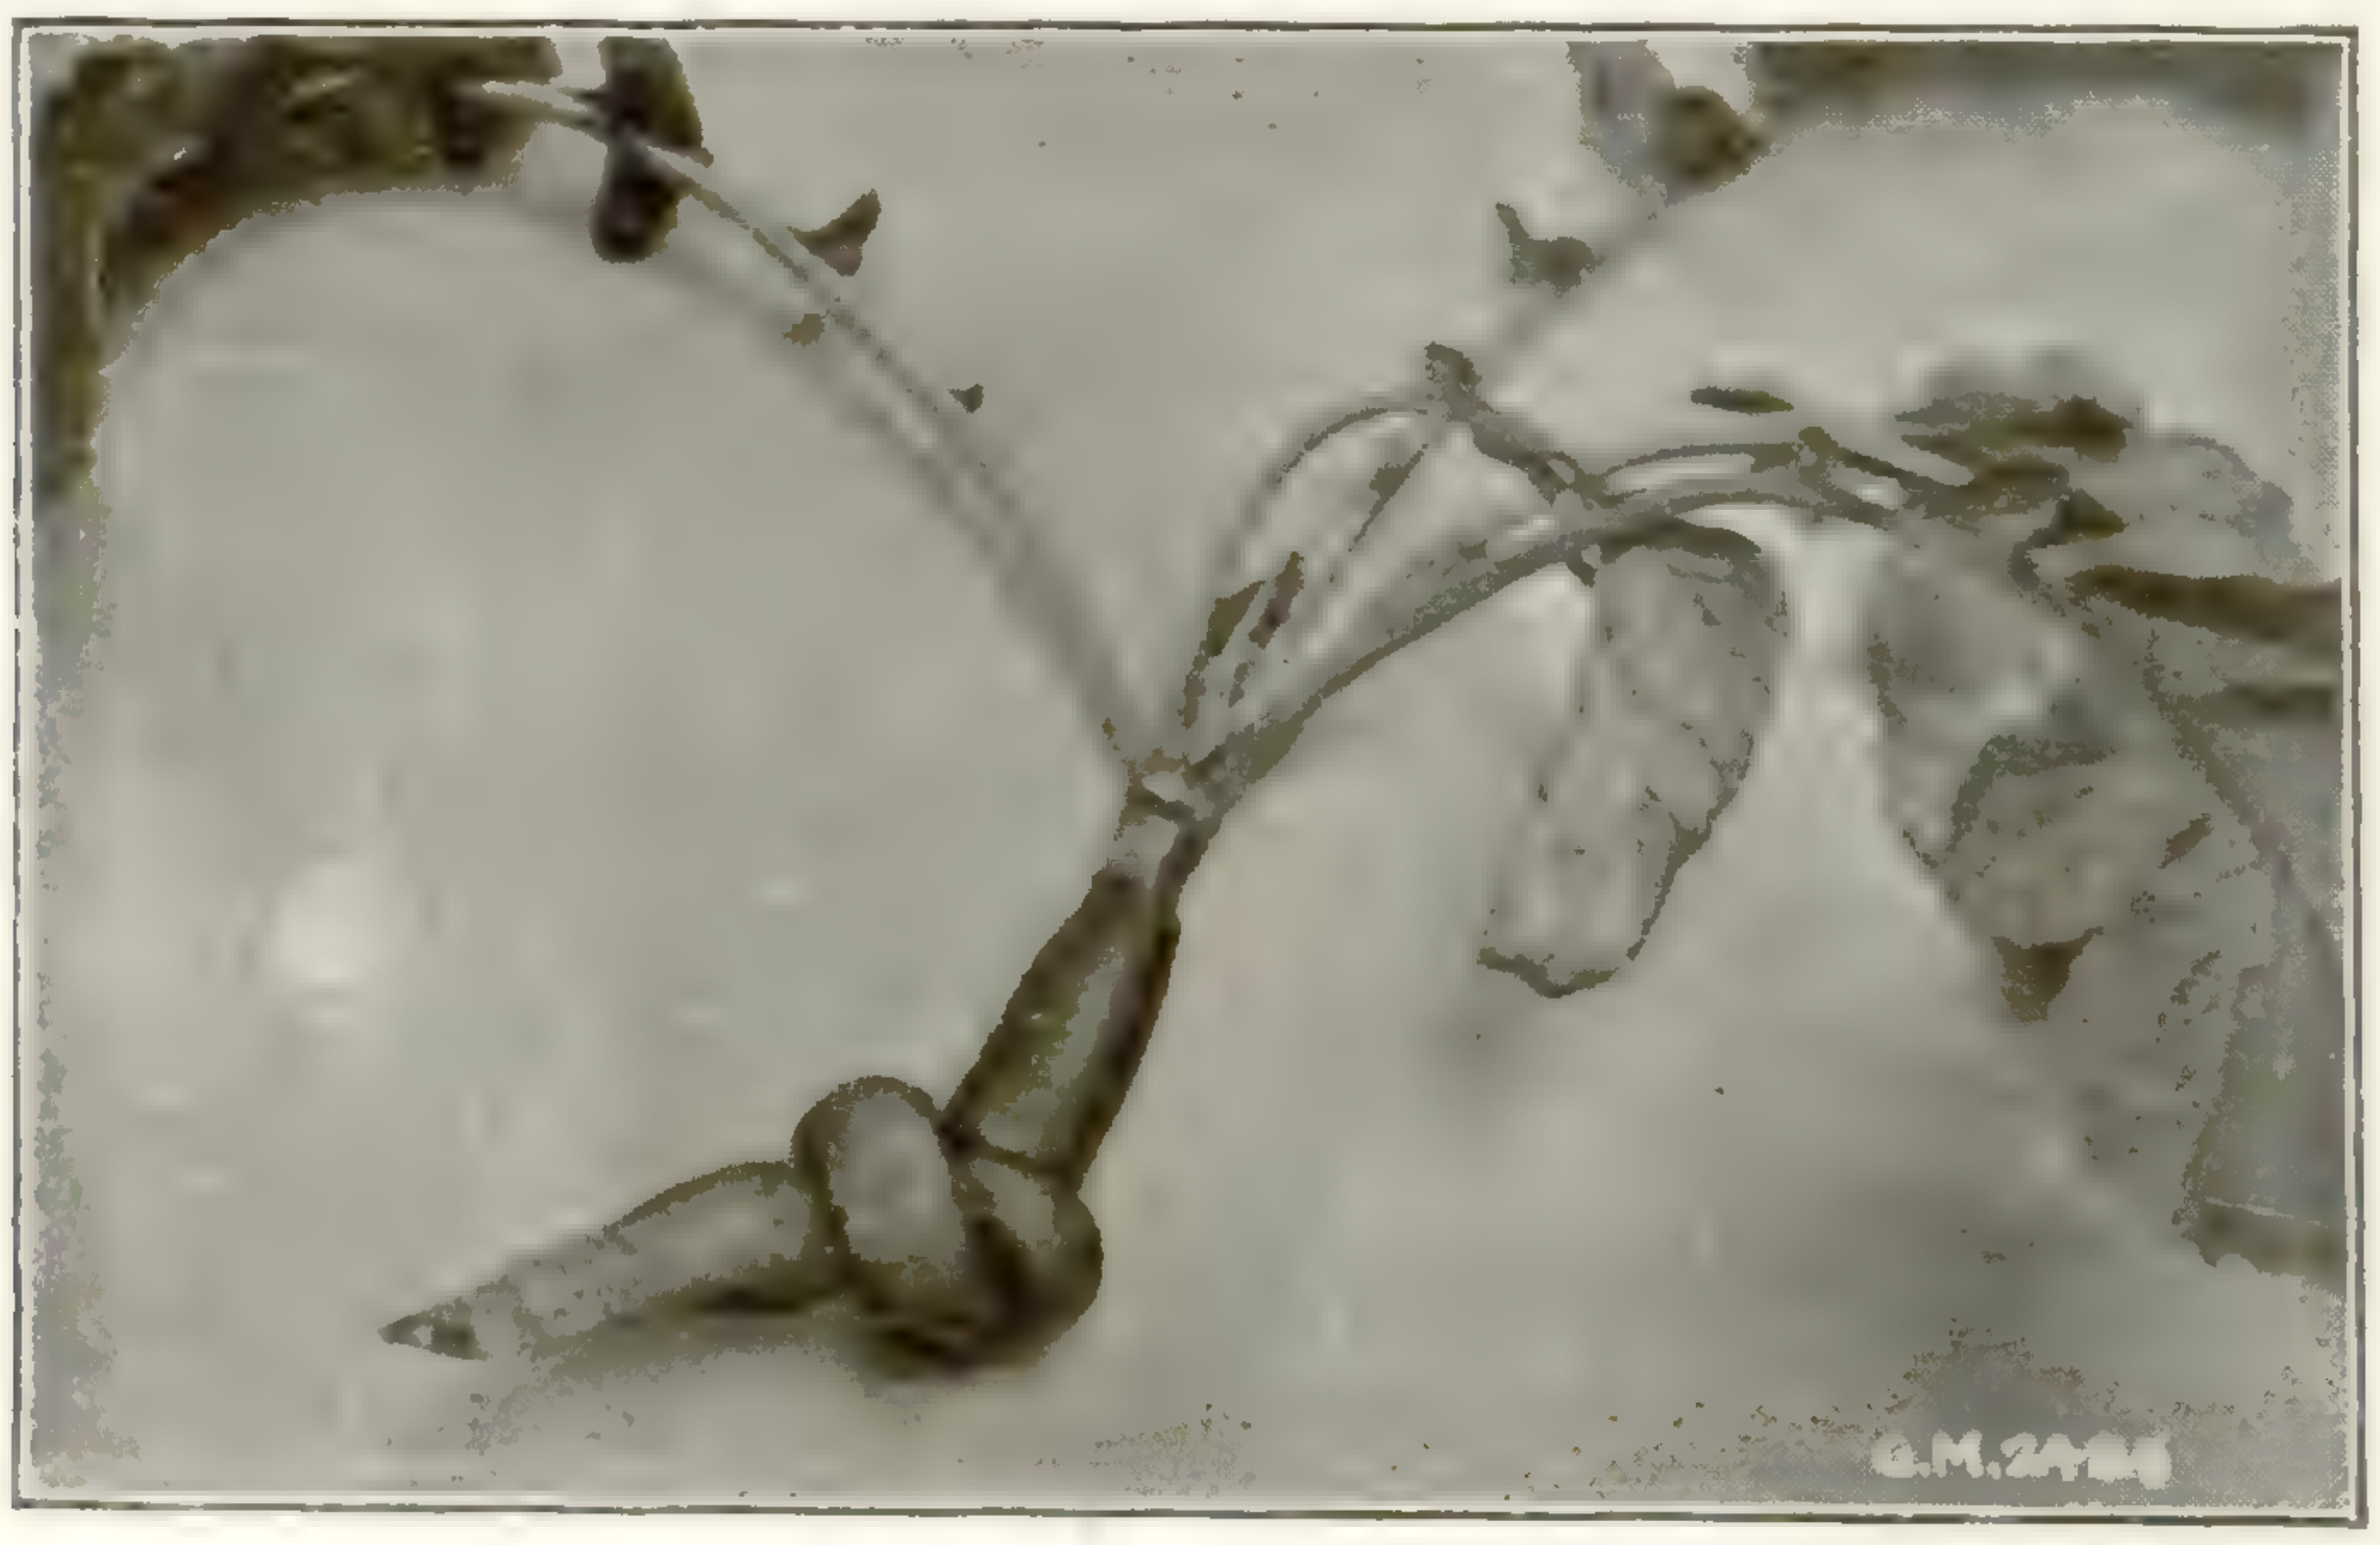
Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

QUAINT VEGETABLES.—W. S. A., Gillingham: All root crops are apt to produce quaint examples, especially when a root comes into contact with some hard substance, or has to squeeze between hard material. A carrot or parsnip growing through the neck of a bottle, and a potato growing through an iron ring or link are fairly familiar objects. A quickly-growing root like a long turnip or radish, will sometimes turn upon itself if the growing point comes into contact with a smooth hard surface, such as a piece of slate, glass, or crockery-ware. In the accompanying illustration you will see what a radish is capable of doing under some such conditions; the growing point of the root reached a curved piece of hardware, and it bent round with the curve until the line of least resistance was through the loop it had already made, and so, literally, the radish tied itself in a knot.



A RADISH TIED IN A KNOT.

PINK LILY OF THE VALLEY.—C. E. N., Denbigh: When the flowers reached us the only evidence of colour was a tinge of rose at the base of each bell; in every case the rest of the flowers had faded to greenish-brown during transit. We take your word for it that the flowers were pink when fresh, and that the plants have produced coloured flowers for several years, but your expectation that yours are the only pink-flowered lily of the valley in England is not likely to be realised. There are several varieties of the beautiful Convallaria majalis, and the difference is chiefly one of habit and size of spike and flower; some have variegated leafage, and yet another has double flowers; while one variety—and this is what concerns us most at present—has rosy or pink flowers, and is known as Convallaria majalis rosea. This is not much grown, but we believe it can be supplied by the leading hardy plant purveyors who advertise in our pages. If grown under glass this pink variety comes pure white.

FASCIATED POLYANTHUS.—A. M. P., Chepstow: The excessive vigour of the plants has resulted in the cohesion of numerous spikes of bloom, the main compound stem being peculiarly flattened or fasciated. Such specimens are not common, but they do appear now and again. It is most improbable that the specimen will behave in similar fashion next year, and even supposing this method of flowering became a fixed character it would not add to, but rather detract from, the beauty of the plant. Such a freak would possess no commercial value.

COMPOUND MANURE.—M. E. M., Lichfield: If the several constituents were purchased separately in the percentages stated, the manure could be obtained at a cost of about 28s. per ton. Nitrate of soda, superphosphate, and basic slag would provide a similar compound. Write to the Board of Agriculture, Whitehall Place, London, S.W., for Leaflet No. 72.

GALLS ON WILLOW.—W. L., Stocksfield: The gall-like swellings on the willow stems are produced by one of the numerous sawflies that attack willows, in this case probably a species of Euura. As a rule, this does not do much harm, but every care should be taken to remove fallen leaves and other refuse from among and below the willows attacked. Frequent applications of soot or the removal of surface soil to the depth of three or four inches during winter if there are but a few trees, will mitigate the attack. Most of the sawflies burrow into the soil to become pupæ.

NAMES OF PLANTS.

J. G. C., Tavistock.—1, Gerbera Jamesoni; 2, Arnebia echioides.

G. R., Abergavenny.—1, Androsace sarmentosa; 2, Morisia hypogea.

R. B. A., Chelmsford.—1, Scilla hispanica; 2, Berberis Darwini; 3, Rubus deliciosus.

G. A. J., Bicester.—1, Ophiopogon Jaburan; 2, Ficus repens; 3, Berberis stenophylla.

L. V., Swindon.—1, Viola cornuta; 2, Berberis stenophylla; 3, Phlox setacea; 4, Pyrus Malus floribunda; 5, Clematis montana.

T. J. C., Macclesfield.—1, Odontoglossum triumphans; 2, O. Cooksonæ; 3, Cattleya Mossiæ, a very pretty variety; 4, C. Mossiæ, a poor and worthless form.

T. B., Hillsborough.—The little box and also the enclosed specimen were badly smashed in the post; the azalea is probably a garden variety closely approaching a rosy form of A. nudiflora.

A. B. C., Lincoln.—1, Send again, probably a veratrum; 2, Funkia ovata; 3, Funkia Sieboldi; 4, Thalictrum purpureum; 5, Geum triflorum; 6, Kerria japonica fl.-pl.; 7, Spiræa prunifolia; 8, S. confusa; 9, Exochorda Alberti.

T. I., Byfleet.—1, Lælia purpurata, a good form—the other would have been a variety only, and this species is somewhat variable; 2, Cattleya Schroderæ; 3, C. Mossiæ; 4, Odontoglossum citrosmum; 5, not sufficient for identification, probably Miltonia flavescens; 6, Rhynchospermum jasminoides.

The nozzle turns up or down.
No fixed bends to introduce.

The adjustable bend is NOT the only advantage

of the Pine Spray Syringe. The nozzle has a double delivery; an insecticide sprayer, quite mist-like in its fineness, and an ordinary rose for watering, either of which can be brought immediately into use by half turning the syringe bodily in the hand

Every spraying combination of rose and bend or spray and bend, instantly obtainable without the removal or addition of a single fitment.

PINE SPRAY SYRINGE
(PATENT)
24in. long × 1¼in. diam. barrel. PRICE 10/6

You ought to see it; ask your ironmonger or seedsman to get one for your approval, neither he nor you will be asked to buy if the Pine Spray Syringe is not the most perfect hand syringe you have ever seen.

Ask your ironmonger or seedsman to-day, tell him we pay carriage both ways if you reject it.

TESTED AND GUARANTEED
Every Pine Spray Syringe is numbered, tested and guaranteed.

NATIVE GUANO

BEST and CHEAPEST MANURE for VEGETABLES, FRUITS and FLOWERS.

Price £3 10s. per ton in bags at works. Lots under 10 cwt. 4s. per cwt. at works; or 5s. per cwt., carriage paid to any station in England.

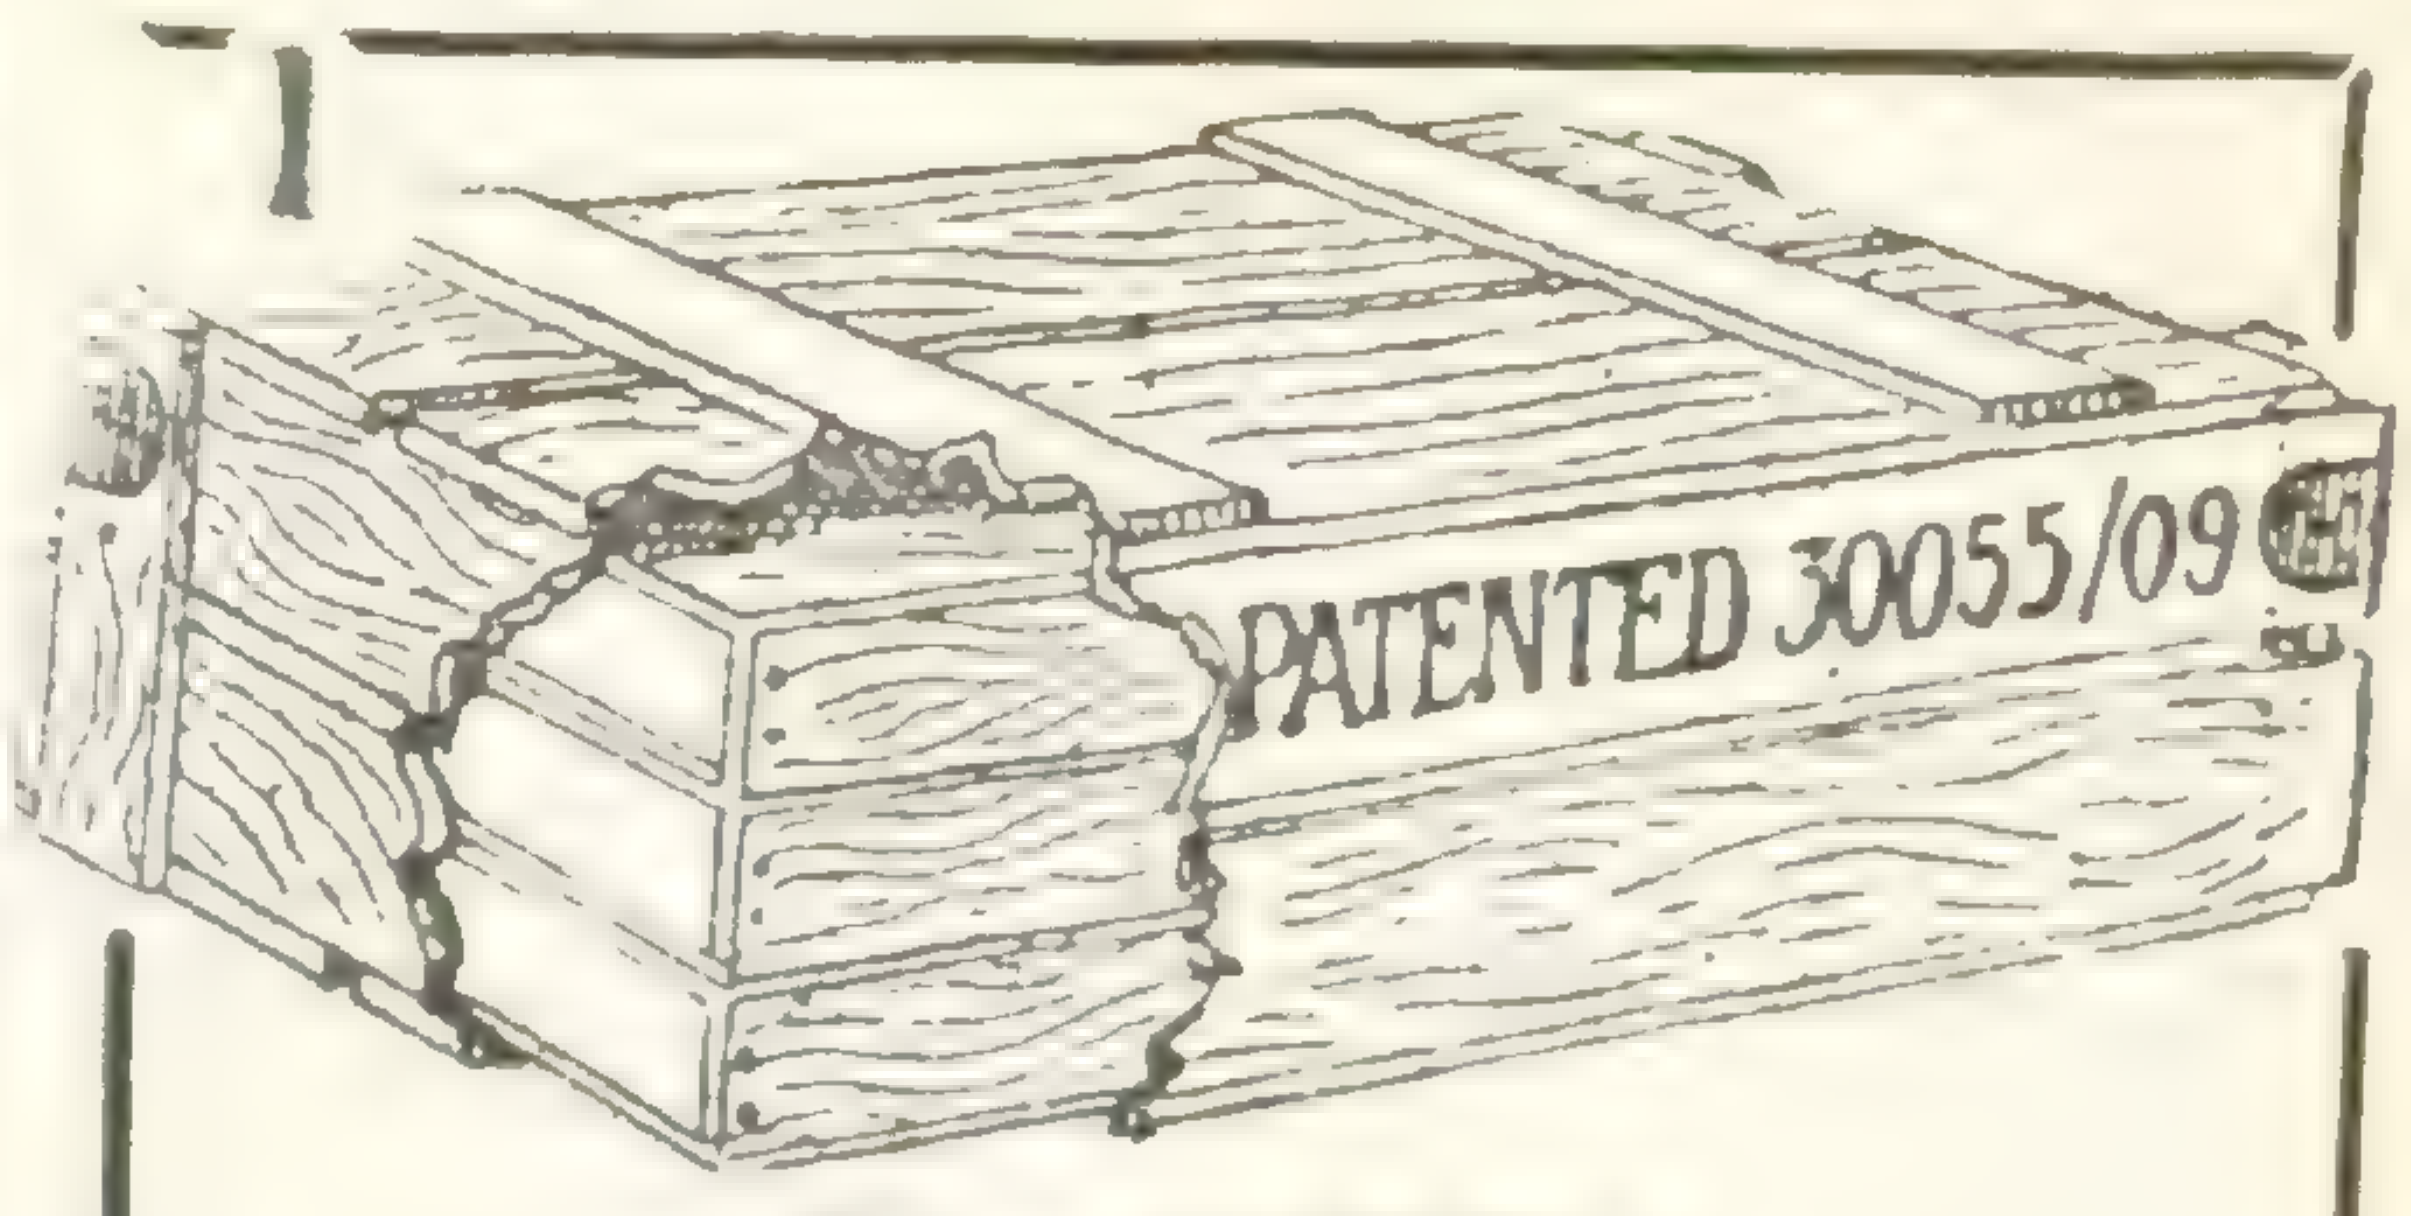
Extracts from 35th annual collection of reports:—
NATIVE GUANO for POTATOES, VEGETABLES, etc.

A. J. Beard, Erdington: "Potatoes, splendid, free from disease. Best I ever had."—H. Chester, Nantwich: "Best onion manure I ever used. Grand for onion fly."

NATIVE GUANO for FRUIT, ROSES, TOMATOES, etc.
J. Cant, Ipswich: "Tomatoes excellent. Roses grand. Cheapest manure in market."—W. Frampton, Titchfield: "Strawberries, splendid crop."

Orders to the **NATIVE GUANO CO., LIMITED**, 29, New Bridge Street, London, E.C., where 35th year's testimonials, etc., may be obtained. Agents Wanted.

FOR ROSE MILDEW
use
V2K FLUID
THE BEST REMEDY FOR THIS PERSISTENT PEST.
Does not discolour the foliage.
OF AGENTS EVERYWHERE.
Sole Mfrs., Willm. Cooper & Nephews, Berkhamsted.



Use DAY'S
Fruit Trays & Crates

No more damaged fruit. If properly packed it is impossible for it to get damaged.

The trays hold about 3lb. of Strawberries, Gooseberries, or Cherries, and are non-returnable, price 2d. each. The Crates are 1s. 6d. each, and may be returned to growers for renewals. C.W.O.

They are strongly made, and growers speak very highly of them.

THOMSON'S Celebrated
VINE PLANT & VEGETABLE
& SPECIAL CHRYSANTHEMUM & TOPDRESSING
MANURES
SOLD BY
NURSERYMEN & SEEDSMEN
EVERYWHERE.

HAYWARD'S
Eureka
WEED KILLER

insures clean paths, best known and most satisfactory. It is no new experiment. A Weed Killer that can be thoroughly relied upon to keep paths clear for 12 months with one dressing is most helpful, but under-strength articles with no reputation are an aggravation. The "Eureka" is sold everywhere, 1/9 for 100 sq. yards, 6/- for 400 yards, 49/- for 4,000 yards; intermediate sizes at suitable prices. The "Eureka" Lawn Sand, Soilfume, Quassia Extract, Bordeaux Mixture, etc., have been in regular use for years, and there is no better value. If any difficulty in obtaining apply only makers, TOMLINSON and HAYWARD, Ltd., Lincoln.

"EUREKATINE"
is the satisfactory fumigant for destroying
Greenhouse Pests.

THE NATIONAL HARDY PLANT SOCIETY.

If you are interested in Hardy Plants write for particulars of the Society to the Hon. Secretary—FRANK BOUSKELL, Market Bosworth, Nuneaton.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The Evolution of Flowers.

In visiting our present-day floral exhibitions, such as we have recently seen at the Temple, one of the chief things which strike the thoughtful student of Nature is the truly marvellous capacity of flowers to respond to selection, and by such response, in many cases, to become altogether transformed from their original primitive type. It is quite true that there are exceptions to this in the case of plants which by purely natural evolution have become so elaborate and so beautiful as to rival the finest results of human selection, such as the Gloriosas, Tacsonias, and other grand tropical productions, but these nowadays are greatly in the minority, and the bulk of the flowers we see owe their brilliancy and splendour almost entirely to man's influence in selective breeding. Even Nature's masterpieces, to which we have alluded, are rarely long under cultivation before variation occurs and novelties are brought forward as rivals for supremacy, and in the large majority of instances the end result of this is that in time the normal falls into the background and its descendants alone monopolise popular attention. Thus it is, for instance, with those wonderful tulips which figured so largely at the Temple. It would have been an instructive lesson could the normal wild flowers from which they have descended been exhibited alongside, such as was done some years ago with the chrysanthemum. In them we should see an uniform tint in each species, instead of an infinite variety ranging from snowy white to the nearest approach to jet black which flowers can be induced to adopt; and it is here that we get a glimpse of the fact that human selection and natural selection are effected on very different lines. Nature has evolved all her floral beauty to one particular end, viz., as an aid to reproduction. Brilliancy of colour is primarily due to insect tastes, and, judging by many of the results, those tastes must be fairly æsthetic. Where would a black tulip come in on those lines? Assuming the dark colour to have been arrived at progressively, it is clear that the first approaches thereto would have involved a marked dimming of that conspicuous lustre which the natural tulip mostly displays, and that hence any tendency in that direction would have seriously handicapped the reproduction of the strain. Man, however, conceived the notion that a black tulip would be, if not beautiful, at any rate a valuable curio, and hence in the days of the great tulip mania, every approach to that desired end was hailed with delight, greater and greater nigritude rewarded the selector, and finally success was attained so far as an intense purplish black is concerned. But, after all, the popular taste so far agrees with the entomological one that it far and away prefers the brilliant scarlets and yellows and exquisitely feathered and flushed varieties to this swarthy example of misapplied perseverance. Could we imagine Dame Nature accompanying us in lady-like form round the exhibition tents at the Temple we should probably hear numerous drastic criticisms of many of our floral triumphs. The all-important and all-essential aim of seed production is entirely ignored in all the myriads of double flowers we behold. In Nature's eyes they are mere attractive gauds to no effective purpose, and, if handed over to her tender care, would either speedily die out or survive only by reversion to her own original type. The beauty by itself to her is nothing; it must, from Nature's point of view, be a means to an end, and that end the survival of the race. With man's selection, it is true, it is a means to an end, but that end is his own profit or pleasure, not the individual advantage of the plant concerned, and if it bear no seed at all, he is quite content if it can be propagated by cuttings or layers. In point of fact, he has so manipulated many of his triumphs by crossing and hybridising that even if they bear seed that seed is so fraught with mixed influences that he cannot at all rely on the reproduction of the parental form in its integrity. Nature, however, has been kind enough to encourage these outrages upon her laws by every now and again departing from them herself in the way of spontaneous "sports," which serve as starting points for the selector, and are, indeed, at the bottom of much of the diversity we enjoy. In making these starts man is utterly powerless, all he can do is either to keep his eyes open for natural variation in the wild plants or to sow on a large scale and profit by any break which turns up. Once Nature affords such an opportunity, she is usually liberal in further departures in the progeny, and so progress is made. In the process of hybridising, however, i.e., the combination of the peculiarities of diverse species or even genera, man is only indebted to Nature's endowment of the plants concerned with the capacity of combining the potencies in the seed cells and contriving some mode of architure, so to speak, which permits of a new structure on the lines of a compromise, often of great beauty. This we may particularly see in the orchid displays, and also in those of the wonderful tuberous and other begonias, which are really mixtures of three species in many cases, and of two at least in all. It would be an extremely interesting feature of the International Exhibition of next year if, as already suggested, the normal progenitors whose union gave the starting point in these and other cases could be shown side by side with their marvellously diversified progeny, as exemplifications of what human selection can effect in a comparatively short period as contrasted with the results of æons of natural selection.

MR. JOHN DICKSON,

Head Gardener to Adeline, Duchess of Bedford, Woodside, Chenies.

Mr. John Dickson, head gardener to Adeline, Duchess of Bedford, Woodside, Chenies, is a capable gardener, who has paid particular attention to the culture and improvement of hardy flowers, and has taken special pains with the group of hellebores known as Lenten roses, and with primulas of the obconica type. Mr. Dickson was apprenticed to the late Mr. A. Brown, then gardener to Mr. W. Macalpino

Levy, at Dalswinton, Dumfries, and after five years' service with this fine old cultivator, he went as journeyman to Drumlanrig castle, under the late Mr. David Thomson; here, for five years, he worked through all the departments, and thus obtained a fine foundation of horticultural practice under an exceptionally fine master of the art. Leaving Drumlanrig, he went as foreman to Douglas Castle, Lanarkshire, the seat of the Earl of Home, where the late Mr. Thomas Brown was in charge. The gardens at Douglas Castle were then kept up in fine style, and here Mr. Dickson spent five years. After this he worked with Messrs. Cunningham and Fraser in their Edinburgh nurseries for a while, and then came south, eleven years ago, to take charge of the Woodside gardens. Not long ago we gave an illustrated account of these gardens, which showed how finely choice hardy plants are managed there. Mr. Dickson has raised the fine Gesnera Orange King, which we figured last year, and also a brilliant primula of obconica habit, named Chenies Excelsior. The Woodside strain of Primula obconica is a superb one, and Mr. Dickson uses the plants freely for outdoor decoration, as well as for the conservatory and greenhouse. His good work and excellent judgment have secured for Mr. Dickson a seat on the Royal Horticultural Society's Floral Committee.

The Whitsuntide Holiday was accompanied by weather of the most brilliant description, Saturday, Sunday, and Bank Holiday being alike wondrously fine. For some people the temperature was rather too high, but very few complained of the heat, and they spent all the hours they possibly could out of doors. Crowds hurried from the great centres of population and business to the country, the seaside, or the river, while others, with fewer hours to spare, busied themselves in their own gardens or visited the great public parks and gardens that are now so numerous in our land. On Whit Monday 157,000 people had a glorious day at the famous and extensive Kew Gardens; over half a million went to the White City; nearly 16,000 visited Hampton Court, 27,591 were admitted to the Zoological Society's Gardens, Regent's Park, and 40,000 went to the Alexandra Palace. The Crystal Palace, Richmond Park, Epping Forest, Bushey Park, and all the public parks and gardens in and around London had a full complement of visitors.

The U.H.B.P. and the National Insurance Bill. Mr. Mark Webster, Kelsey Park Gardens, Beckenham, writes: "Legislation is now under consideration which very materially affects the United Horticultural Benefit and Provident Society, and calls for special and immediate attention. In the committee's report for 1910 (issued with the balance-sheet), under the heading of 'State Insurance,' it states: 'A keen watch has been kept on all statements and reports in the Press in regard to the tentative proposals of State insurance against sickness, and the committee has been in communication with the Chancellor of the Exchequer twice on this matter. A report and balance-sheet for 1909 was also forwarded to the Chancellor with a request that the committee be kept informed of any developments.' Judging by the Bill, the 'communication' appears to have been fruitless, and the time for keeping 'a keen watch,' also waiting to 'be kept informed' is past; a crisis has arrived, which calls for the attention of all members to the unfavourable position of the society, which under the Bill as at present drafted is expressly excluded from the State benefits on account of a less membership than 10,000, although otherwise eligible. Established in 1865, the society has a contributory membership of 1,324. With an accumulated balance of £39,799, it is solvent, and conforms to all the provisions of Section 18 of the Bill except the membership limit. The benefits are in many respects more ample than those of the Government scheme. As a class, gardeners are underpaid, and to be called upon to contribute another 4d. per week towards a general scheme of insurance is a serious item. Members of the U.H.B. and P. Society are so widely distributed throughout the United Kingdom that it might have some effect if each one addressed his particular parliamentary representative, pointing out the hardship, and asking him to support an amendment in committee on the Bill, so that our society may be dealt with at least as equitably as others now eligible for State benefits."

Heat and Drought. With the exception of the great thunderstorm that was so general a fortnight or so ago (and which, by the way, did not do the good we could have wished, because the rain fell so heavily that much of it passed away down the drains instead of soaking into the warm earth), there has been practically no rain over the greater part of the country for a month. Crops are already suffering badly in many districts, and twenty-four hours of gentle rain would be a priceless blessing. In the garden annual flowers, notably sweet peas, are rushing into flower in a way that suggests a short life and a merry one. Turnips, potatoes, and peas need water badly, and so do the fruit crops. Whit Sunday and Whit Monday provided a record of high shade temperature that has not been reached for many years. On Bank Holiday the shade temperature in London was 84 degrees, while 78 was the highest temperature the following day, though in the sun 117 degrees was reached on Tuesday last, and this was quite comfortable as compared with the two previous days. In London the tube railways have been the coolest places lately, always excepting the ice stores.

Wandsworth Common. — The good people of Wandsworth are afraid lest a large slice of land almost in the midst of their fine common should be sold or let for building purposes. The slice consists of about 20 acres, hitherto let on an agricultural lease, and belonging to the Royal Patriotic Fund Corporation. This is a portion of 55 acres secured at the close of the Crimean war for providing schools and education for children of officers killed in that war. The Corporation complains that increasing expenses and diminishing income compel them to obtain better terms than the £150 a year received in rent for the 20 acres it is now proposed to sell on building lease. The latest statement is that only as a last resort will the land be used for building purposes.

A King's Cup for the International Horticultural Exhibition of 1912. In connection with the great International Horticultural Exhibition which will be held next May in the spacious grounds attached to the Royal Hospital, Chelsea, His Majesty King George V. has intimated his intention to offer a cup, valued at 100 guineas. In accordance with the King's wish, this cup will be awarded for the best exhibit in the show. Many other valuable cups, medals, and awards offered by the Duke of Portland and others will be included in the vast number of prizes contained in the schedule. Altogether the exhibition promises to far exceed in interest and in spectacular effect any show of the kind ever held in any part of the world. The show authorities have reason to believe that the exhibition will be opened by their Majesties the King and Queen on May 22, 1912.

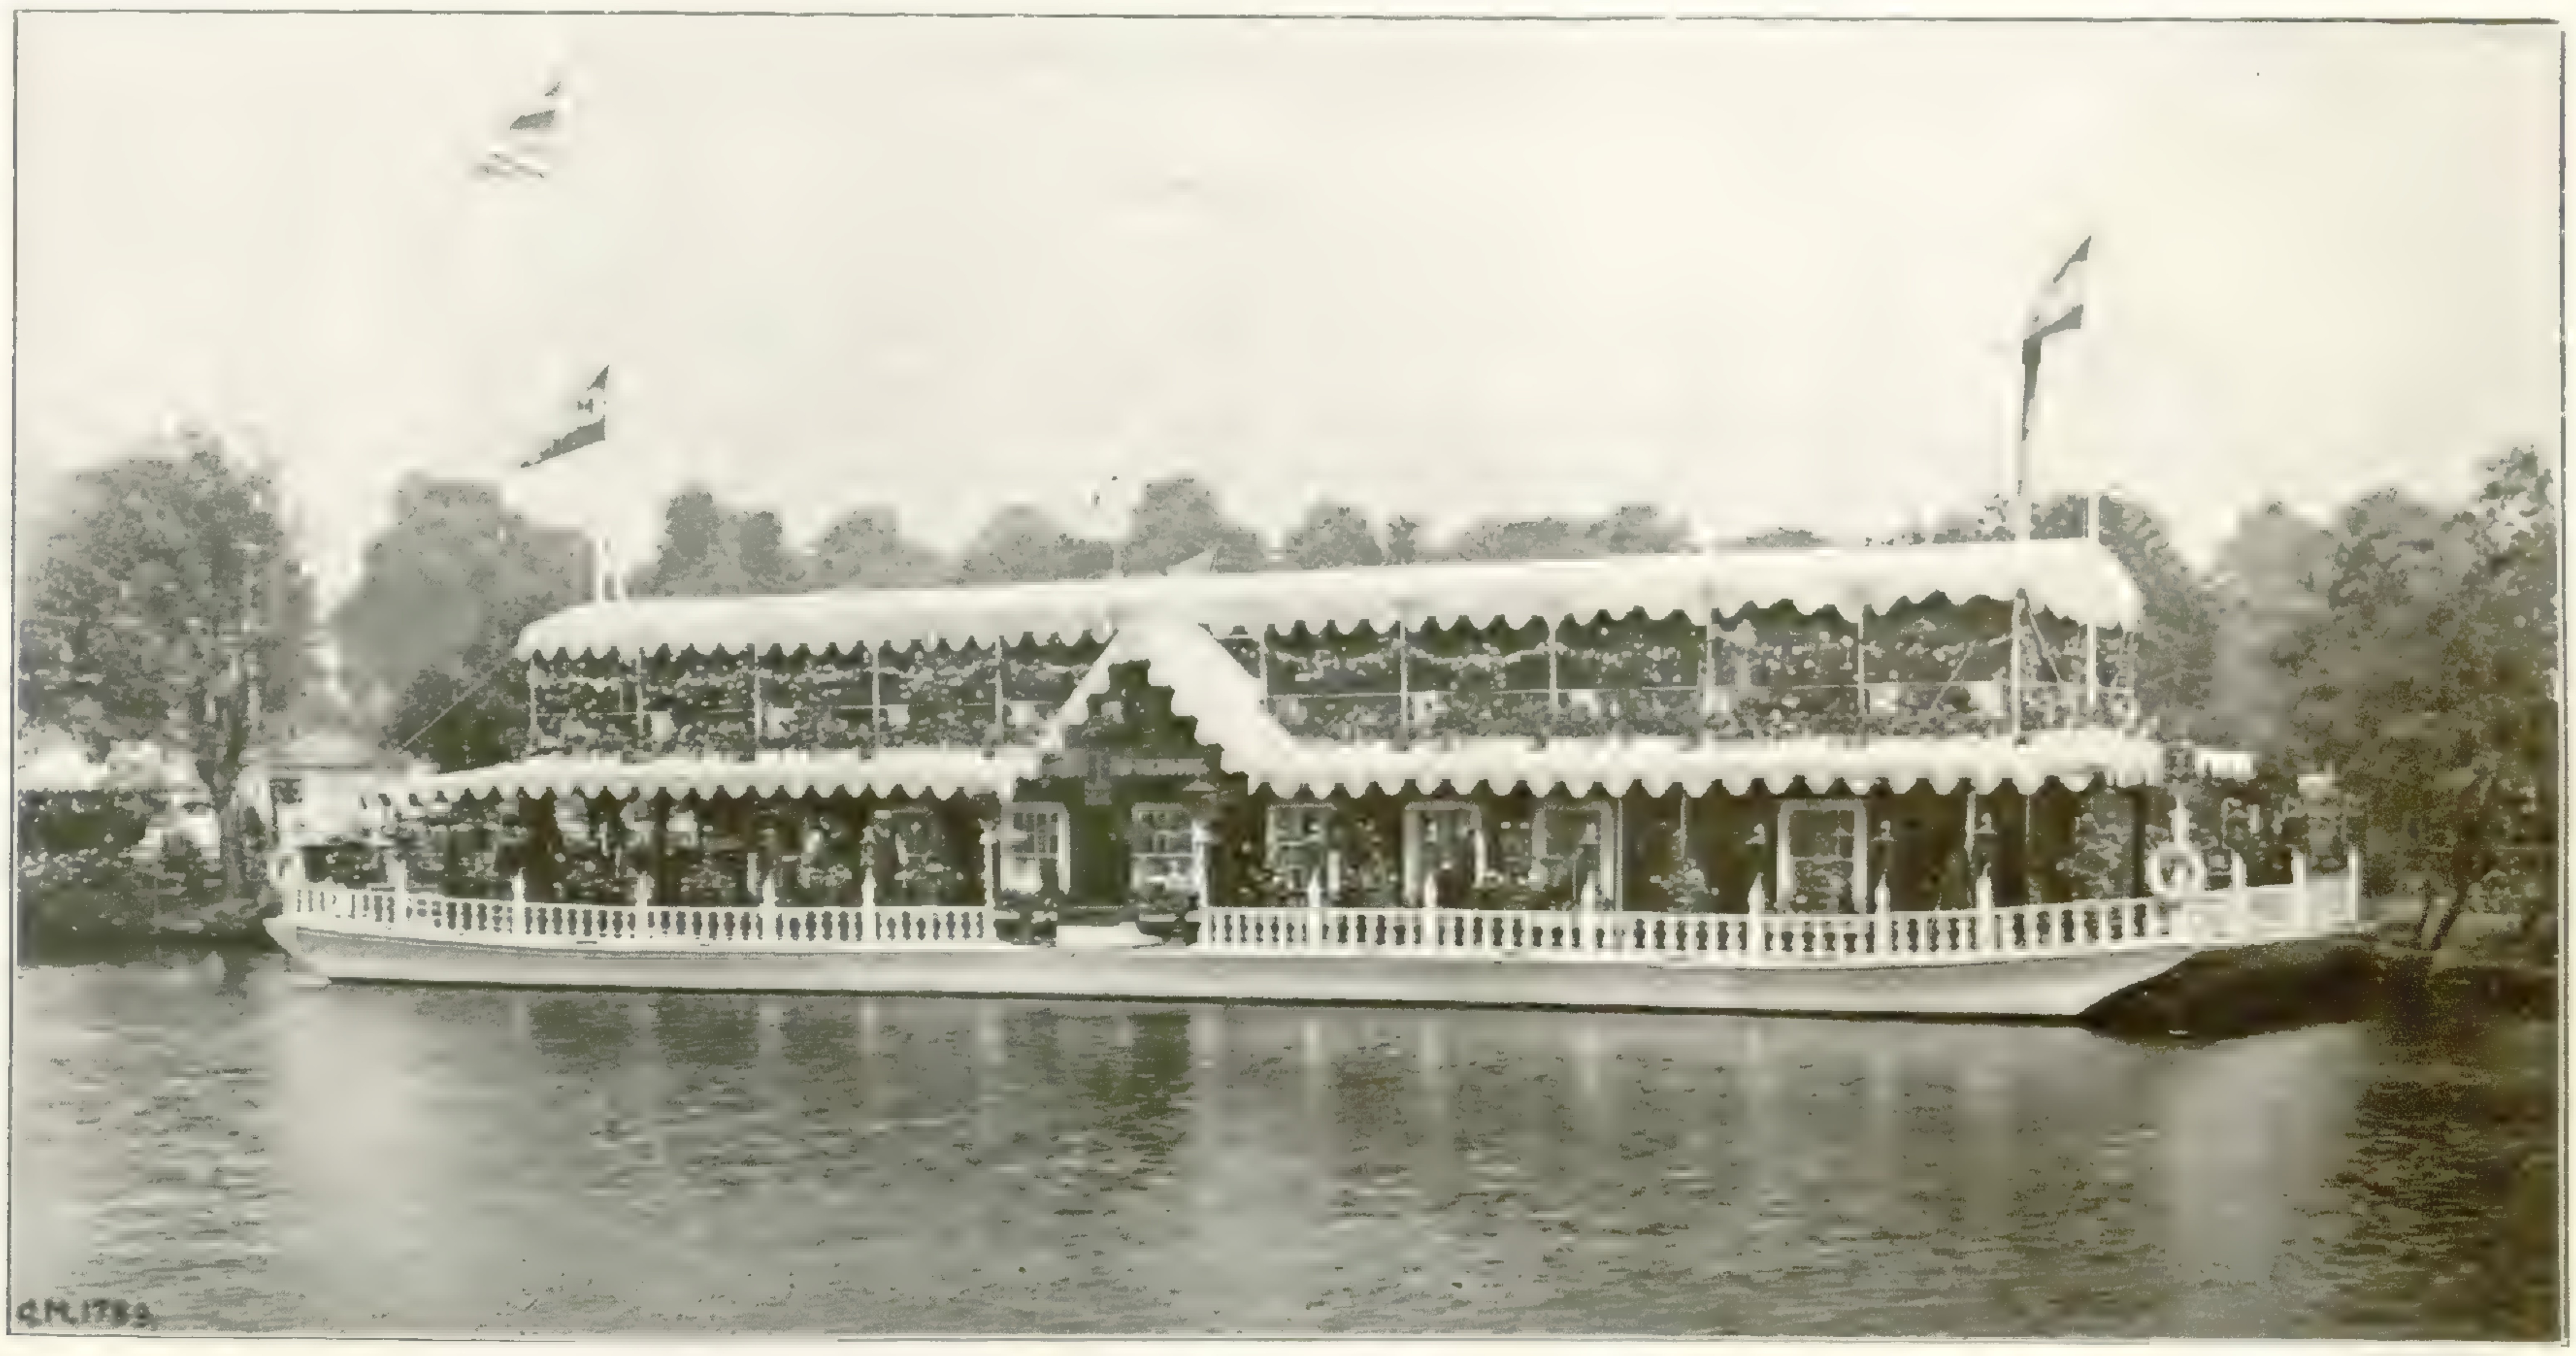
Seeds of Chinese Trees and Shrubs for Kew. Kew has lately received, through Mr. J. C. Williams and Mr. A. K. Bulley, a quantity of seeds collected in South-Western China by Mr. Forrest. The country traversed by this intrepid collector is considerably to the south of that explored by Henry and Wilson, and the respective floras, whilst presenting much the same general features, are, no doubt, in many ways distinct. That of Mr. Forrest's country had in part been revealed by the work of some of the earlier Jesuit missionaries, notably by Abbé Delavay. Among Mr. Forrest's seeds (of most of which the genus only is known), there is a considerable number of rhododendrons, ranging from low matted shrubs to trees 30 high. One of the latter, says the "Kew Bulletin," described as having large, pale yellow, fragrant flowers, is of exceptional interest. Will it provide us with the long-desired, yellow-flowered, hardy rhododendron with large leaves and trusses? All the yellow species we cultivate at present, with the exception of R. campylocarpum, are of a small Alpine type, and although very pretty in their way, they are not robust, and their charms are of a modest kind. Mr. Forrest describes this new one as growing in the rhododendron forest on the Tali range of mountains at 12,000-13,000 feet altitude. On the same range, at somewhat lower altitudes, he obtained seed of two other yellow rhododendrons; these he describes as from two to four feet high, one with "bright yellow," the other with "deep yellow" flowers. Of the remainder of the seeds the most interesting are two spruces, two firs, a larch, and a cedar. Mr. Forrest seems somewhat doubtful as to the generic identity of the cedar, but we may hope that his estimate is correct. A new cedar would be a great acquisition, and, with the deodar growing on the Himalayan ranges, the existence of one on the mountains northward seems at least probable.

The Forest of Auchnacarry, composed of ancient Scots firs, has, we understand, been sold to the timber merchant, but it is just possible some effort may be made to secure its preservation. The forest is in the west of Inverness-shire, to the north of Fort William, and near Loch Askaig. It is probably the largest and finest part now left to us of a primæval forest, neither planted or tended by man. It is the remains of a huge forest of Scots firs that at one time extended from Ben Nevis to the Spey, and which, like other forests, was chiefly used up for shipbuilding purposes during the end of the eighteenth and the beginning of the nineteenth centuries.

Officers and Council of the Linnean Society. At the recent anniversary meeting of the Linnean Society the following officers and council were elected for the year 1911-12: President, Dr. D. H. Scott, F.R.S.; Treasurer, Mr. H. W. Monckton; Secretaries, Dr. B. Daydon Jackson, Professor A. Dendy, F.R.S., and Dr. Otto Stapf, F.R.S. Council, Prof. V. H. Blackman, Mr. H. Bury, Sir Frank Crisp, Prof. A. Dendy, F.R.S., Prof. J. Stanley Gardiner, F.R.S., Mr. E. S. Goodrich, F.R.S., Mr. H. Groves, Prof. W. A. Herdman, F.R.S., Mr. A. W. Hill, Dr. B. Daydon Jackson, Mr. H. W. Monckton, Prof. F. W. Oliver, F.R.S., Prof. E. B. Poulton, F.R.S., Dr. A. B. Rendle, F.R.S., Dr. W. G. Ridewood, Miss Edith R. Saunders, Dr. D. H. Scott, F.R.S., Dr. Otto Stapf, F.R.S.; Miss E.

N. Thomas, and Dr. A. Smith Woodward, F.R.S.

Engelmann's Spruce (Abies Engelmanni), which has a wide distribution in the western parts of the American continent, is dealt with at some length in a circular recently issued by the U.S. Department of Agriculture. It is possible that from its wind and frost-resisting powers, and its thriving under moist conditions, it may be of considerable service for planting in exposed positions in Great Britain; therefore, a brief summary of the circular may be useful. The species is found from the Yukon territory south through British Colombia, Oregon, and the Rocky Mountains, to Arizona and New Mexico. As in the case of other species, Engelmann's spruce occupies progressively higher altitudes from north to south, and over the greater part of its range, it grows in small bodies, and, except in the south, it is found growing in association with other species. The tree is dependent for its healthy development upon a liberal amount of moisture in the soil and atmosphere; and altitude and aspect are important factors, inasmuch as they affect the amount of precipitation and its conservation. The physical condition of the soil appears to be of greater importance than its composition, but a limestone soil appears to be the most conducive to full development. In good situations the trees range from 80 to 100 feet in height, and from twenty to thirty inches in diameter, and the most cylindrical trunks are found in deep, moist valleys, where they are growing closely. The roots do not strike deep into the soil, but the root system is so fully developed that the trees are well able to resist strong gales. This spruce is rather slow in growth, and in its forests the trees require about 150 years to produce trunks eighteen inches in diameter. The timber is light in weight, pale yellow, very close, and usually straight, even in texture, and easily worked. It is not very durable when in contact with the soil, but it possesses considerable value as construction material. The U.S. Forest Service recommends that forests of this spruce should be treated under the selection system, and be regarded as protection forests.



A BEAUTIFUL FLORALLY-DECORATED HOUSEBOAT.

This fine boat, the "Gipsy," belongs to John Bradford, Esq., one of the secretaries of the River Thames Flower Show. It is moored to Tagg's Island, and proved one of the most attractive features of the exhibition held there on June 7 and 8.

THE THAMES FLOWER SHOW.

Held on Tagg's Island—a spot beloved of all who frequent the Thames above Richmond—amid beautiful surroundings, the Thames Flower Show was a great success. A good schedule was provided, and there were numerous non-competitive displays, but it was obvious that everyone was out to do his or her best in the sacred cause of charity. The exhibition, with its accompaniment of dramatic fête, illuminations, and aeroplane flights was promoted for the purpose of raising funds for the League of Mercy, which assists all hospitals.

The Duchess of Albany attended in the afternoon to officially open the fête, and she was received on the "Gipsy," a handsome and beautifully-decorated house boat, belonging to Mr. John Bradford, who, with Mr. C. W. Kent, fulfilled the secretarial duties. The "Gipsy," with its vases of flowering plants, its window and house-top boxes, and its hanging baskets, we figure in our present issue, but we cannot show the glowing colours of the flowers or of the electrically lit Chinese lanterns.

The Flower Show Committee was composed of the leading market growers of the Hampton district, with Mr. T. Stevenson. The judges, all well-known horticulturists, gave their services, and everything was done to secure a handsome result for the charity.

COMPETITIVE.

Mr. C. W. Breadmore annexed the chief award for a group of sweet peas arranged on an area of fifty square feet, and he had a charming display, in which the colours were well blended, and the flowers of fair quality. Dazzler, Stirling Stent, Mrs. C. W. Breadmore, Lavender George Herbert, Aurora Spencer, and Edrom Beauty all looked well. Mr. W. E. Alsen, Denmead, Hants, came second with a pretty arrangement of flowers, his arch of blooms being quite effective; Stirling Stent was a great feature; Messrs. S. Bide and Sons, Farnham, third.

There were six entries in the big class for a display of any kind of plants or flowers arranged on a space of 200 square feet, and these provided a rare display in themselves. The premier award, a silver cup presented by Mr. H. O. O'Hagan, and valued at £20, was won by Mr. W. H. Page, Hampton, with a superb exhibit of weeping standard roses, pillar roses, masses of pink spiræas, and of the rich scarlet zonal pelargonium His Majesty, while liliums, yellow richardias, and dozens of vases of carnations made up a most artistic arrangement. Mr. C. Engelmann, Saffron Walden, came second, securing Mr. R. J. Kent's silver cup with a bright corner display of perpetual carnations, and Messrs. George Mount and Sons, Canterbury, came third, winning Mr. Preston's cup with a display of roses that was good, but not quite up to some of the best of their wonderful exhibits. Miss Hemus, Upton-on-Severn, put up a big group of sweet peas in this class, and while the flowers were good the spikes were crowded in the bunches; Messrs. H. Cannell and Sons, Swanley, had a brilliant show of cannas; and Mr. Thos. Page, Hampton, presented a miscellaneous group; these three latter competitors were all very highly commended.

Mr. H. Burnett, Guernsey, won the cup offered for a group of carnations, and he scored on the high quality of his flowers, Mr. C. F. Waters, Balcombe, who was placed second, had a more artistic display, and showed Edith Waters finely. For half a dozen vases of carnations, Mr. B. Bell, Guernsey, was a capital first, and Mr. C. Engelmann second.

Mrs. Maslin, Addlestone, beat Mr. C. W. Breadmore for an epergne of sweet peas, and the same lady was awarded first prize for a basket of sweet peas. Messrs. Gibson and Co., Leeming Bar, Yorks, were the only competitors in the class for a group of hardy flowers, and their effective bank contained grand bunches of poppies, Campanula glomerata, and pyrethrums.

NON-COMPETITIVE.

Mr. Amos Perry had a rare display of ornamental poppies, a perfect blaze of colour, and in the centre of their contribution a mass of Dictamnus fraxinella backed up a little pool of water lilies and hardy orchids.

A huge exhibit of pæonies, pyrethrums, delphiniums, and lupins from Messrs. Kelway and Son, Langport, provided another mass of lovely and soft shades of colouring, but the display lacked something in the matter of arrangement. The single pæonies were very lovely, and attracted a vast amount of attention by reason of their grace and simple beauty, while the scarlet and crimson pyrethrums provided the deep and vivid hues in the group.

A very elegant exhibit set up most artistically by Messrs. James Veitch and Sons, Chelsea, was composed of palms, rare stove plants, grouplets of cannas, carnations, hydrangeas, such choice ferns as Cyrtomium Rochfordi, and Nephrolepis Marshalli, the bright Kalanchoe flammea, some delightful cattleyas, and odontoglossums and anthuriums, graceful standard fuchsias, and Japanese maples.

Messrs. Bakers, Wolverhampton, presented a selection of Oriental poppies. Messrs. Young and Co., Hatherley, made up a very pretty exhibit of well-grown carnations. Oriental poppies in art shades, and a collection of cut pelargoniums came from Mr. W. J. Godfrey, Exmouth. Messrs. Barr and Sons, Covent Garden, had one tent to themselves, and here their little forest of pigmy trees was an outstanding feature, and the great attraction. The firm also contributed banks of Spanish irises, poppies, pyrethrums, and other fine hardy flowers. Messrs. W. Wells and Co., Merstham, staged the White House carnation and other good varieties.

Messrs. Jarman and Co. brought up their elegant sweet sultans from Chard, and Messrs. R. H. Bath, Wisbech, made a brave show of herbaceous pæonies and pyrethrums.

Mr. W. J. Unwin, Histon, Cambs, had a delightful lot of sweet peas, all well set up, and he showed Mrs. W. J. Unwin, Constance Oliver, Frank Dolby, and Mrs. Hallam in excellent condition. Messrs. Jackman and Son, Woking, were large exhibitors of hardy flowers, and so were Messrs. J. Peed and Son, West Norwood.

MEDALS.

Gold.—To Messrs. James Veitch and Sons, Chelsea.

Silver Gilt.—To Messrs. Kelway and Son, Langport; Mr. W. J. Unwin, Histon; Mr. Amos Perry, Enfield; and Messrs. Barr and Sons, Covent Garden.

Large Silver.—To Messrs. Young and Co., Hatherley.

Small Silver.—To Messrs. Jarman and Co., Chard; Mr. G. Lange, Hampton (carnations); Mr. W. J. Godfrey, Exmouth; Messrs. W. Wells and Co., Merstham; Messrs. R. H. Bath, Wisbech; Messrs. Bakers, Codsall, Wolverhampton; and Messrs. G. Jackman and Son, Woking.

NEW PLANTS, ETC.

◆

DENDROBIUM SANDERÆ.

This beautiful species, from South-eastern Asia, was introduced in 1909. It is closely allied to D. Dearei, but has larger flowers and bright purple stripes at the base of the white lip, and on the side lobes of that organ. So far as present knowledge goes it would appear that the treatment found successful for D. Dearei is suitable for this fine introduction. Messrs. Sander and Sons, St. Albans, were the introducers. "Bot. Mag.," t. 8,351.

ASTER FALCONERI.

This splendid aster, a native of Sikkim and Eastern Nepal, was originally considered identical with A. diplostephioides. It is hardy, grows about 1½ft. high, is very leafy at the base, and carries flower heads 3½in. across. The linear blue ray florets are 1½in. long, white at the base, and trifid at the apex. The disc florets are orange-yellow. Messrs. Barr and Sons introduced this plant to cultivation, and it was flowered in May, 1910, both at Kew and with Mr. William Marshall, V.M.H., of Auchinraith, Bexley. A most interesting and beautiful introduction. "Bot. Mag.," t. 8,355.

PHÆDRANASSA CORMIOLI.

Apart from the popular hippeastrums few bulbs needing stove treatment are now cultivated to any extent, consequently the Costa Rican species under notice is not likely to receive attention in many gardens. It produces a spike about 2ft. high, bearing an apical umbel of from five to ten flowers; these latter are about two inches long, yellowish at the base, and green, with yellow margins at the apex, the rest of the flower being scarlet. "Bot. Mag.," t. 8,356.

DWARF, FRENCH, OR KIDNEY BEANS.

Perhaps more commonly known as dwarf beans, the above are extensively grown, and are very popular with the cooks, especially before the runner beans come into use.

The earliest supplies are produced under glass from pot plants, or, where heated pits are at hand, from rows of plants. Their culture is not at all difficult where space and heat is at command. I will not, however, describe this early culture, but just deal with details for those grown in cool frames, and with a little protection, in order to keep up a more or less continuous supply until crops can be picked out of doors.

Where a cold frame is to be had, and preferably standing on a mild hotbed, excellent results may be expected. Raise the seedlings in pots containing a moderately light compost of loam and leaf-mould, with a little spent mushroom-bed manure, sowing the seeds about the end of March. Raise them in gentle heat, and do not allow the plants to become drawn through an insufficiency of light. When about six inches high plant out in the frame, in a good holding mixture of loam and leaf-mould, to which has been added some horse droppings and bonemeal. Keep the frame close, and damp the inside with the syringe whenever the weather permits. This will serve to keep red spider in check, which is to this plant a deadly enemy. When the plants have made their first pair of rough leaves pinch out the point of growth. This will slightly retard the first supply of beans, but does much to preserve a dwarf habit, and increase their productiveness.

For the earliest crops out of doors I follow the course adopted for peas, and raise the seedlings in pots, in the same way as advised for frame culture. As soon as germination takes place the plants are gradually inured to cooler surroundings, and as soon as possible transferred to cold frames, being careful to protect them in cold weather at night. Give air cautiously but plentifully when the weather admits, and endeavour to get the beans as hardy as possible. Before they are planted out the lights must be entirely removed for a while during the daytime. Select a warm border that has been previously well dug and manured, and, if possible, at the foot of a south wall. Place the plants out carefully with a trowel at a foot apart, and two feet between the rows. Give them a damping over, and water as required; a sprinkling of finely-sifted cinder ashes placed near the base of the plants will keep slugs at bay. Protection may be afforded by placing spruce boughs round or on the more exposed sides of the batch.

As the plants grow dress with soot in showery weather, and a little fertiliser sprinkled on the ground before Dutch hoeing will prove beneficial. The first sowing out of doors, unless in a favoured place, should not be made before the last week in April, and then only on a sheltered site. When the ground is in a suitable condition fork it down to a fine tilth, dust the surface with soot, and draw drills two inches deep and six inches wide, allowing a distance of a yard between each drill. Sow two rows of seed in each drill, cover it, and well rake down the bed. If the seeds appear good, do not sow thickly, and when the plants are up thin out so that the remaining plants are left alternately in the double row.

Keep the plot free from growth of weeds by frequent Dutch hoeings, and dust the plants with soot during showery weather. This will act as a valuable stimulant, and cause increased vigour in the foliage. Support the growth with twiggy sticks, and when the beans are large enough look the plants over at frequent intervals, remove the beans, and tie them up in bundles, placing the stalks in water or wet sand until required. If the beans are removed before they get too large the plants will yield considerably larger supplies.

For continuous supplies make further sowings once a fortnight till the end of July.

If needed for exhibition purposes it will, of course, be necessary to assist the plants with copious supplies of water and liquid manure, and apply a mulch to the soil. The beans must be of uniform size, good in colour, and exhibited in a young state. Canadian Wonder and Ne Plus Ultra are two of the best I know

E. Beckett.

Aldenham House Gardens.

HAWTHORNS IN THE GARDEN.

Standards and bushes of these plants have flowered beautifully this year, and, as there are few flowering shrubs and trees more cheery-looking, I often wonder why more are not planted in our gardens.

They look charming as standards on lawns, and as standards and bushes in shrubberies. I have, in my mind's eye, some very old specimens that have never received any cultural treatment since they were planted, and the soil in which they grow is of poor quality and shallow, too, yet they have rarely failed to blossom freely three years out of five.

Some of the finest specimens of both single and double-flowered thorns I have ever seen are growing in the New Forest, in Hampshire. The cattle eat away all young shoots as high up as they can reach, so the result is, trees with the lower branches perfectly level. Scores of such trees measure from 20ft. to 30ft. in diameter, and average 20ft. in height. Trees of equal beauty grow near Guildford in Surrey. Not far from Clandon Park, Lord Onslow's country seat, I have seen some grand specimens growing amidst many acres of the common buttercup, which formed a dense carpet. In many parts of the New Forest the trees are growing in quite swampy ground, and I could not see much difference between their general condition and that of other specimens growing on high, dry mounds.

In a garden I would plant the trees in a deeply-trenched loam, which was never either very wet nor very dry; if the soil was shallow I would remove some subsoil and replace it with good loam. I have had considerable experience of the cultivation of thorns on lawns and in extensive shrubberies, and always found them to do best in a nice loam without any feeding during the first ten years. Only a little pruning is then necessary as the object should be to secure specimens with long branches, not growing too closely together, thus leaving the head somewhat open, and not too formal in outline.

A few good varieties are: Cratægus oxyacantha punicea, single scarlet; C. o. plena, double scarlet; C. o. rosea, single rose; C. o. rosea plena, double rose; and C. o. multiplex, double white. All these are very beautiful, and the single-flowered white, rose, and scarlet varieties are equally lovely, being light and graceful.

G. B.

SOME GARDENS AROUND EDINBURGH—I.

In giving a brief account of some of the more noteworthy of the gardens within a short distance of Edinburgh, there is no occasion to write in a general way on the high position to which gardening has attained across the Border, or to refer to the great ability of Scottish gardeners as evidenced by their work, for both these interesting points are so well known as to have become proverbial wherever gardening matters come up for discussion. Neither does it appear necessary to indulge in much praise of a general character of gardening as carried on around Edinburgh. It is well known that great gardens abound within a short distance of the city, and it is reasonable to assume that a large proportion of those who are interested in horticulture are well acquainted with a considerable number of them. It is a matter of interest in this connection that practical horticulturists take advantage in largely increased numbers each year of the facilities that exist for spending their holidays in Scotland, and the majority of those who do so make a point of visiting several of the leading gardens that can be readily reached from the capital, even if they do not attempt to visit some that are further north. Hence it will suffice to say that Edinburgh is surrounded by gardens that are not less remarkable for their extent and beauty than they are for the splendid demonstrations they afford of the more advanced methods of horticultural practice. They are indeed so numerous and admirably managed, that the selection of a few for notice is not easy, and in connection with this point it should be mentioned that in making a selection an endeavour was made to include gardens that were representative of the district, and so situated that they could be visited in the time at disposal. One could have wished to visit at least double the number, and there is ground for the hope that it may be possible at a date not so far distant, to have the pleasure of participating in the enjoyment which a tastefully designed, judiciously planted, and well-managed garden is so well able to give.

CONIFEROUS TREES, DALKEITH PALACE GARDENS.

Dalkeith Palace.

The wide-spreading gardens which form so delightful a setting to the historic Midlothian seat of the Duke of Buccleuch, have from time well nigh immemorial occupied a commanding position among the great horticultural establishments, not only of Scotland, but of the whole kingdom. How far it would be necessary to go back to find a period when these gardens were not more or less famous for their extent and the great excellence of the work accomplished within their boundaries cannot be stated. It is extremely doubtful if there has been such a period, and it would be a tedious, if not an unprofitable, task to make the search necessary to determine the point. It must, therefore, suffice to state that for many generations the Dalkeith gardens have been under the charge of men of the highest eminence in their profession, and that, as the result of their famous. If we take a retrospective glance extending over three-quarters of a century, we shall find Charles McIntosh busily engaged in the preparation of his "Book of the Garden," one of the most important books of its kind published during the past century, and not less assiduous, or successful, in the cultivation of grapes, pines, and other subjects that received attention during the first half of the nineteenth century. His successor, the late Mr. William Thomson, will be remembered as one of the most accomplished gardeners of his day, and as a raiser and cultivator of grapes with but few equals. On the retirement of Mr. Thomson the gardens came under the charge of the late Mr. Malcolm Dunn, who, as the result of his great abilities, and his activities in the promotion of the various movements that had for their object the advancement of horticulture, was held in high esteem. On Mr. Dunn's untimely death Mr. J. Whytock, who had won golden opinions by the splendid work he had accomplished at Powerscourt, was appointed his successor, and during the decade or so that he has been in charge he has succeeded in greatly adding to the fame of Dalkeith, and, what is not less deserving of mention, has obtained the esteem of the large body of horticulturists who pursue their avocations in Midlothian.

Dalkeith is some eight or nine miles to the south of Edinburgh, and is a quaint old burgh, remarkable for the number of seats that are close at hand, for the ruins of the old collegiate church, on the north side of the principal street with which the town is intersected, and for the extent of its grain market, which is said to be one of the largest in Scotland. The palace and grounds are close to the boundary of the town, and the former is built upon a rock overlooking the junction of the North and South Esks, and occupies one of the most delightful spots imaginable. It was built from designs by Sir John Vanburgh towards the close of the seventeenth century, and has a very substantial appearance. The valley of the Esk is one of the beautiful spots near Edinburgh, and for that matter in Scotland, and, although less picturesque near Dalkeith than higher up at Hawthornden, the residence of William Drummond, the poet, it possesses much beauty, and the widespreading park through which the Esk proceeds merrily on its way to the sea, and the fine trees, form an excellent setting to the stately edifice, and affords a succession of charms to the visitor. Especially noteworthy are the coniferous trees, which include a cedar of Lebanon of stately proportions, the beautiful Ginkgo biloba, rising to a height of between thirty and forty feet; a specimen of the weeping ash that is not less in stature; and the large groups of Portugal laurel and rhododendrons, both of which flourish under the conditions that obtain, and it is not difficult to imagine how beautiful must be the colour effect produced by the last-named when the spring is merging into summer.

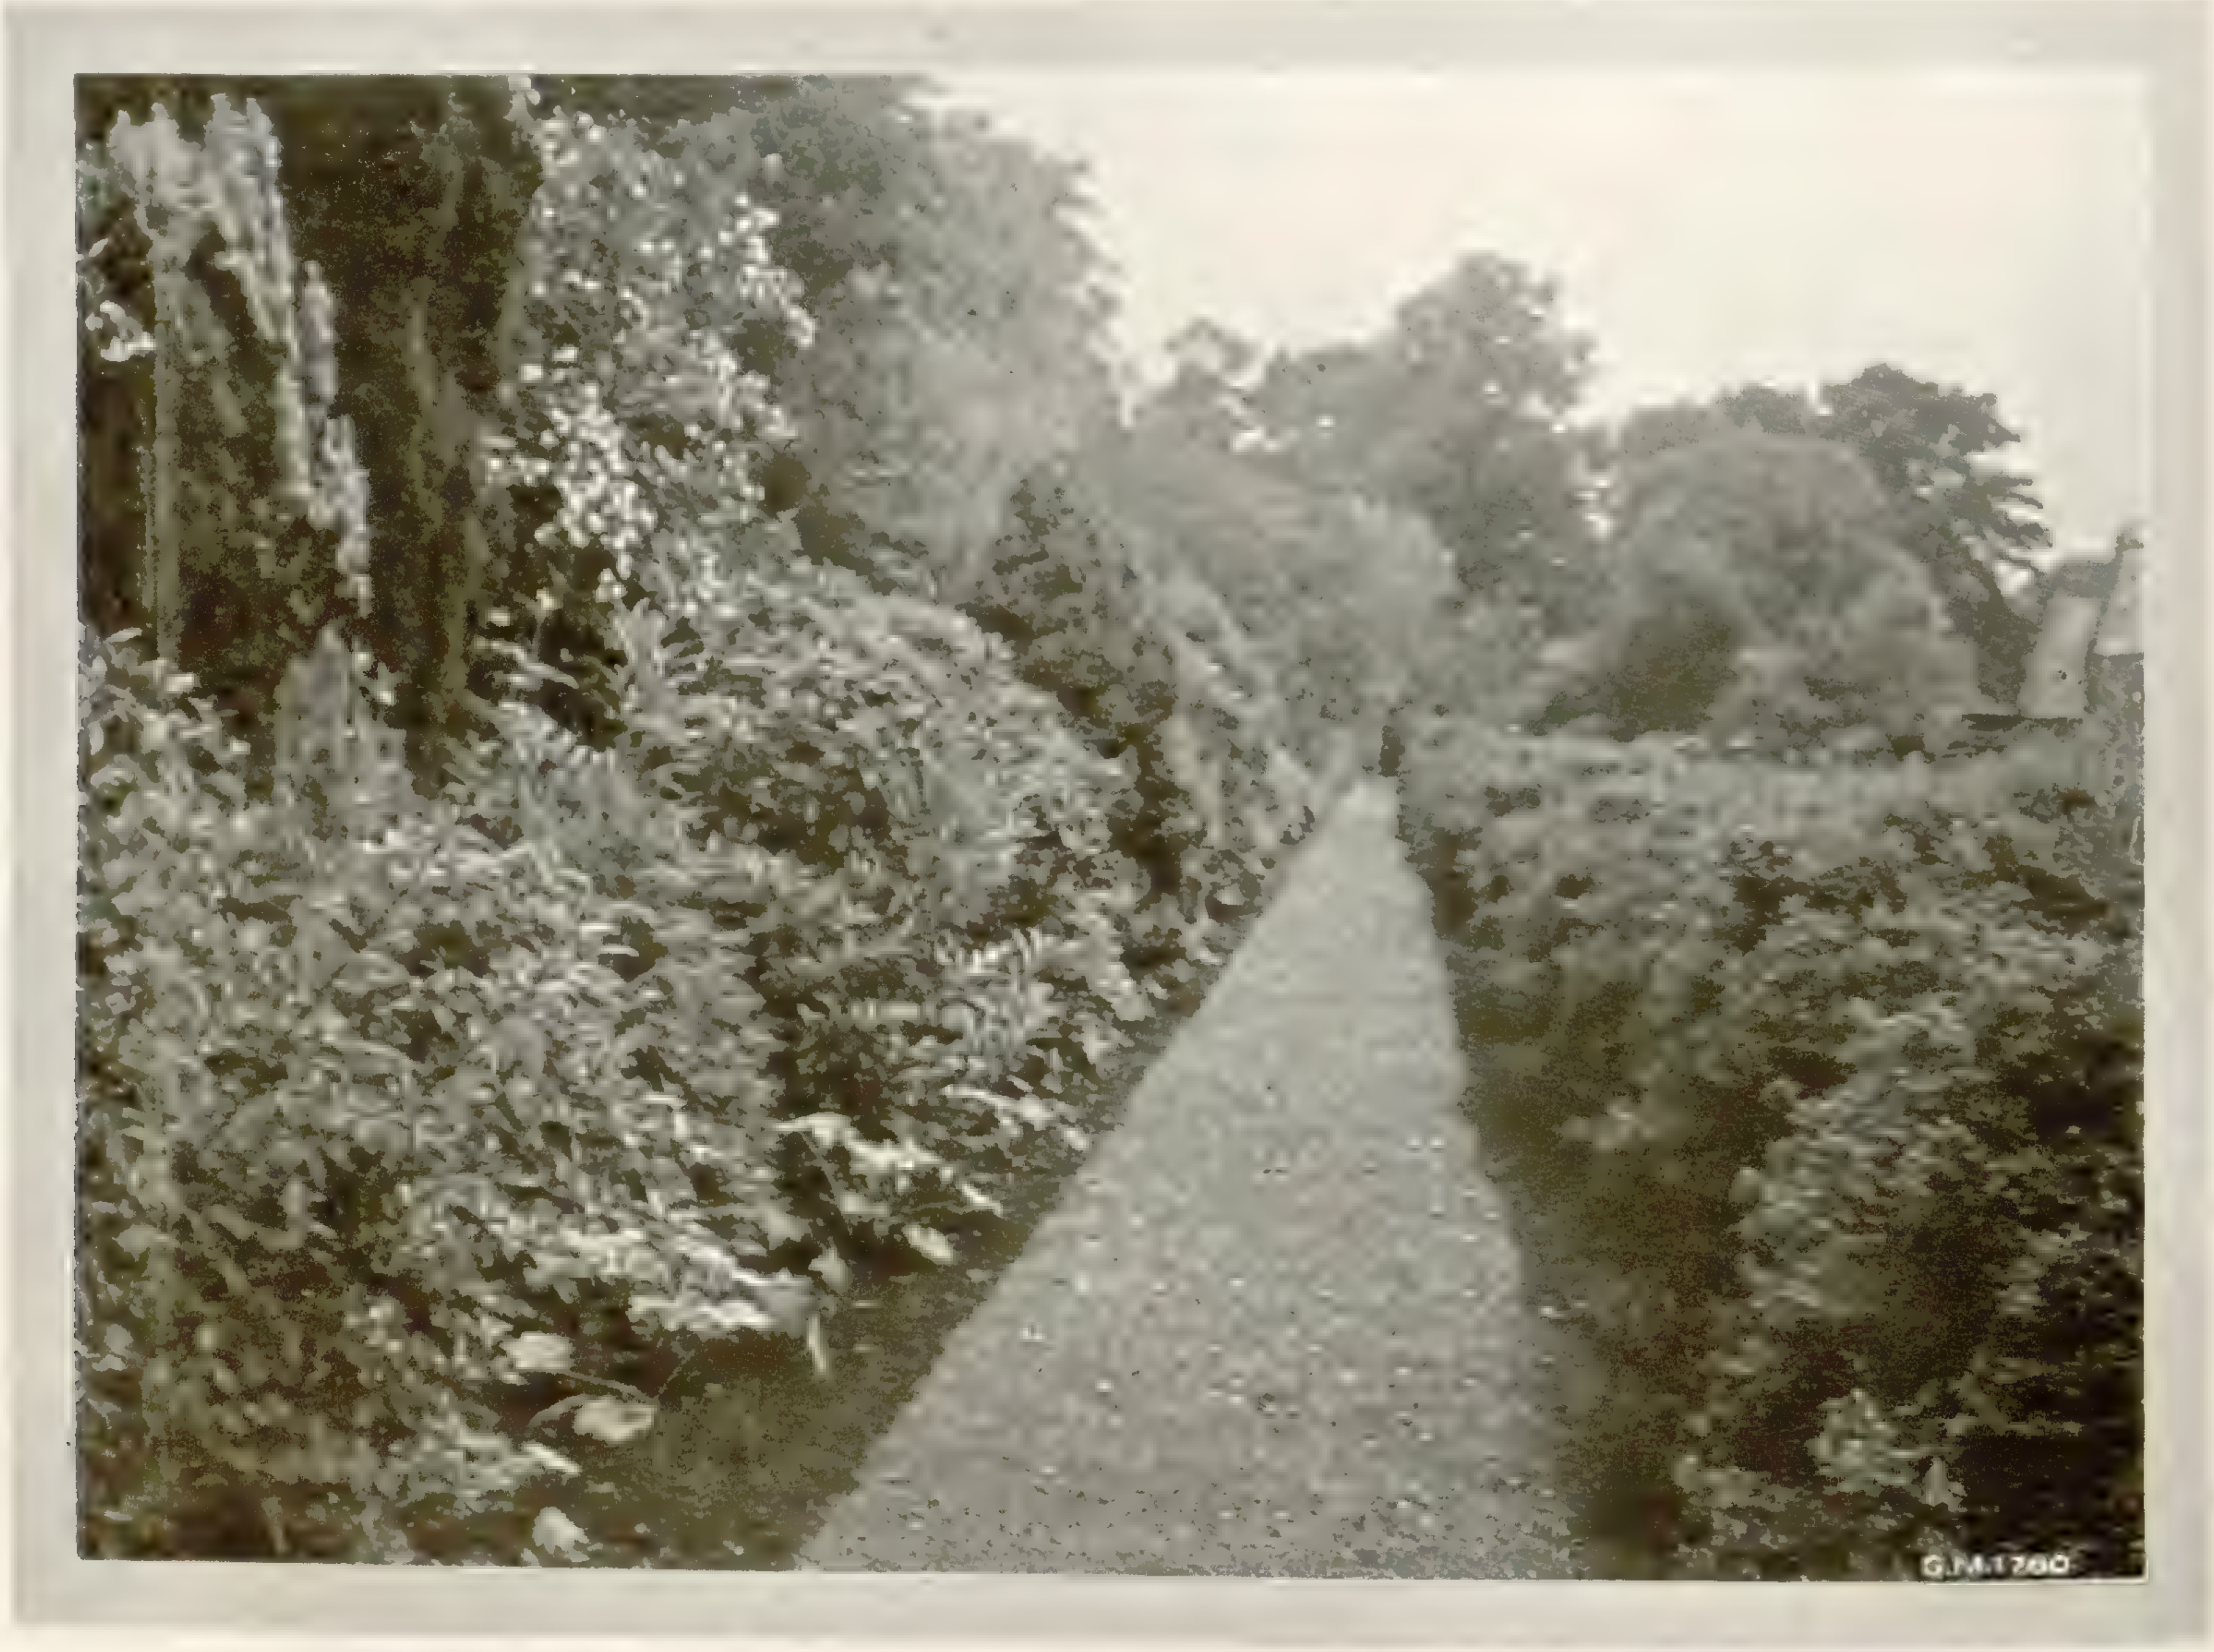
Not far distant from the palace is the old-fashioned, but handsome, conservatory that was built when the gardens were under the management of James Macdonald, who was gardener at Dalkeith sixty years previous to Charles McIntosh, and did excellent service. The structure is handsome in design, although heavy as compared with plant houses at the present day, and is remarkable for the fine stone, the product of the Craigleith quarry.

Proceeding from the pleasure grounds immediately contiguous to the palace, in a northerly direction towards the kitchen garden and orchard, we pass through, on reaching the higher ground, a spacious lawn, on which are groups and single specimens of ornamental trees of various kinds. Especially deserving of mention are the finely developed lilacs and laburnums, which annually yield a rich harvest of flowers, Japanese maples, which flourish and assume goodly proportions, and a weeping wellingtonia, which makes a strong appeal to those who have a predilection for trees that have a pendent habit of growth. At the end of this lawn there is a border with a sheltering wall, in which are many subjects in a robust state of health that one would hardly expect to find in really first-class condition so far north. Among the many good things of which note was made are Cistus ladaniferus, eucalypti in variety, Staphylea colchica, which not only blooms freely, but ripens seed; Virgilea utes a handsome shrub with long pinnate leaves; Buddleia variabilis Veitchiana, Magnolia acuminata, M. hypoleuca, Chimonanthus virginicus, and Cydonia japonica in variety, the several forms being of the best.

A short distance from the border containing the shrubs briefly referred to in the preceding paragraph there is a remarkably fine collection of coniferous trees, all of which are in an excellent state of health, and have, for the most part, reached a size that shows their distinctive characteristics. On the way is a series of scroll beds that extend several hundred yards, and tastefully filled with flowering plants, as they certainly were when the present writer saw them, they are singularly attractive. On the one side the beds are flanked by a high wall that is clothed with pear trees in such manner as to clearly indicate that the training of wall trees is well understood at Dalkeith, and must, indeed, have long been carried out in a skilful manner, for many of the trees are of great age. On the other side the ground slopes away towards the town, and in this area are many fine specimens of trees and shrubs remarkable for the beauty of their flowers. Still proceeding in the direction of the pinetum we reach a rose bower so well clothed with rambling roses as to prove to demonstration that Mr. Whytock is not less successful in the cultivation of roses than in dealing with the many other subjects that come within the scope of his activities. The bower is 500 feet long, eight feet wide, and ten feet high, and one can, even if above the average in height, pass along the bower without discomfort.

The pinetum contains many fine specimens, and it was interesting to find the trees, as in other parts of the garden, had their names attached to them, and that the labels used possess the two desirable characteristics of legibility and durabi and the example set in this matter at D keith might be followed in many ot gardens with advantage. It need har be said that the handsome Cupressus La soniana and the finest of its varieties are well represented, the specimen of the fine golden form known as lutea being parti cularly noteworthy. Also deserving of mention are the specimens of Abies polita, A. Alcockiana, A. Veitchi, Thuiopsis boreale, Sciadopitys verticillata, golden yews, including Taxus elegantissima aurea, and T. Dovastoni pendula aurea, which forms a widespreading bush, with pendulous branches.

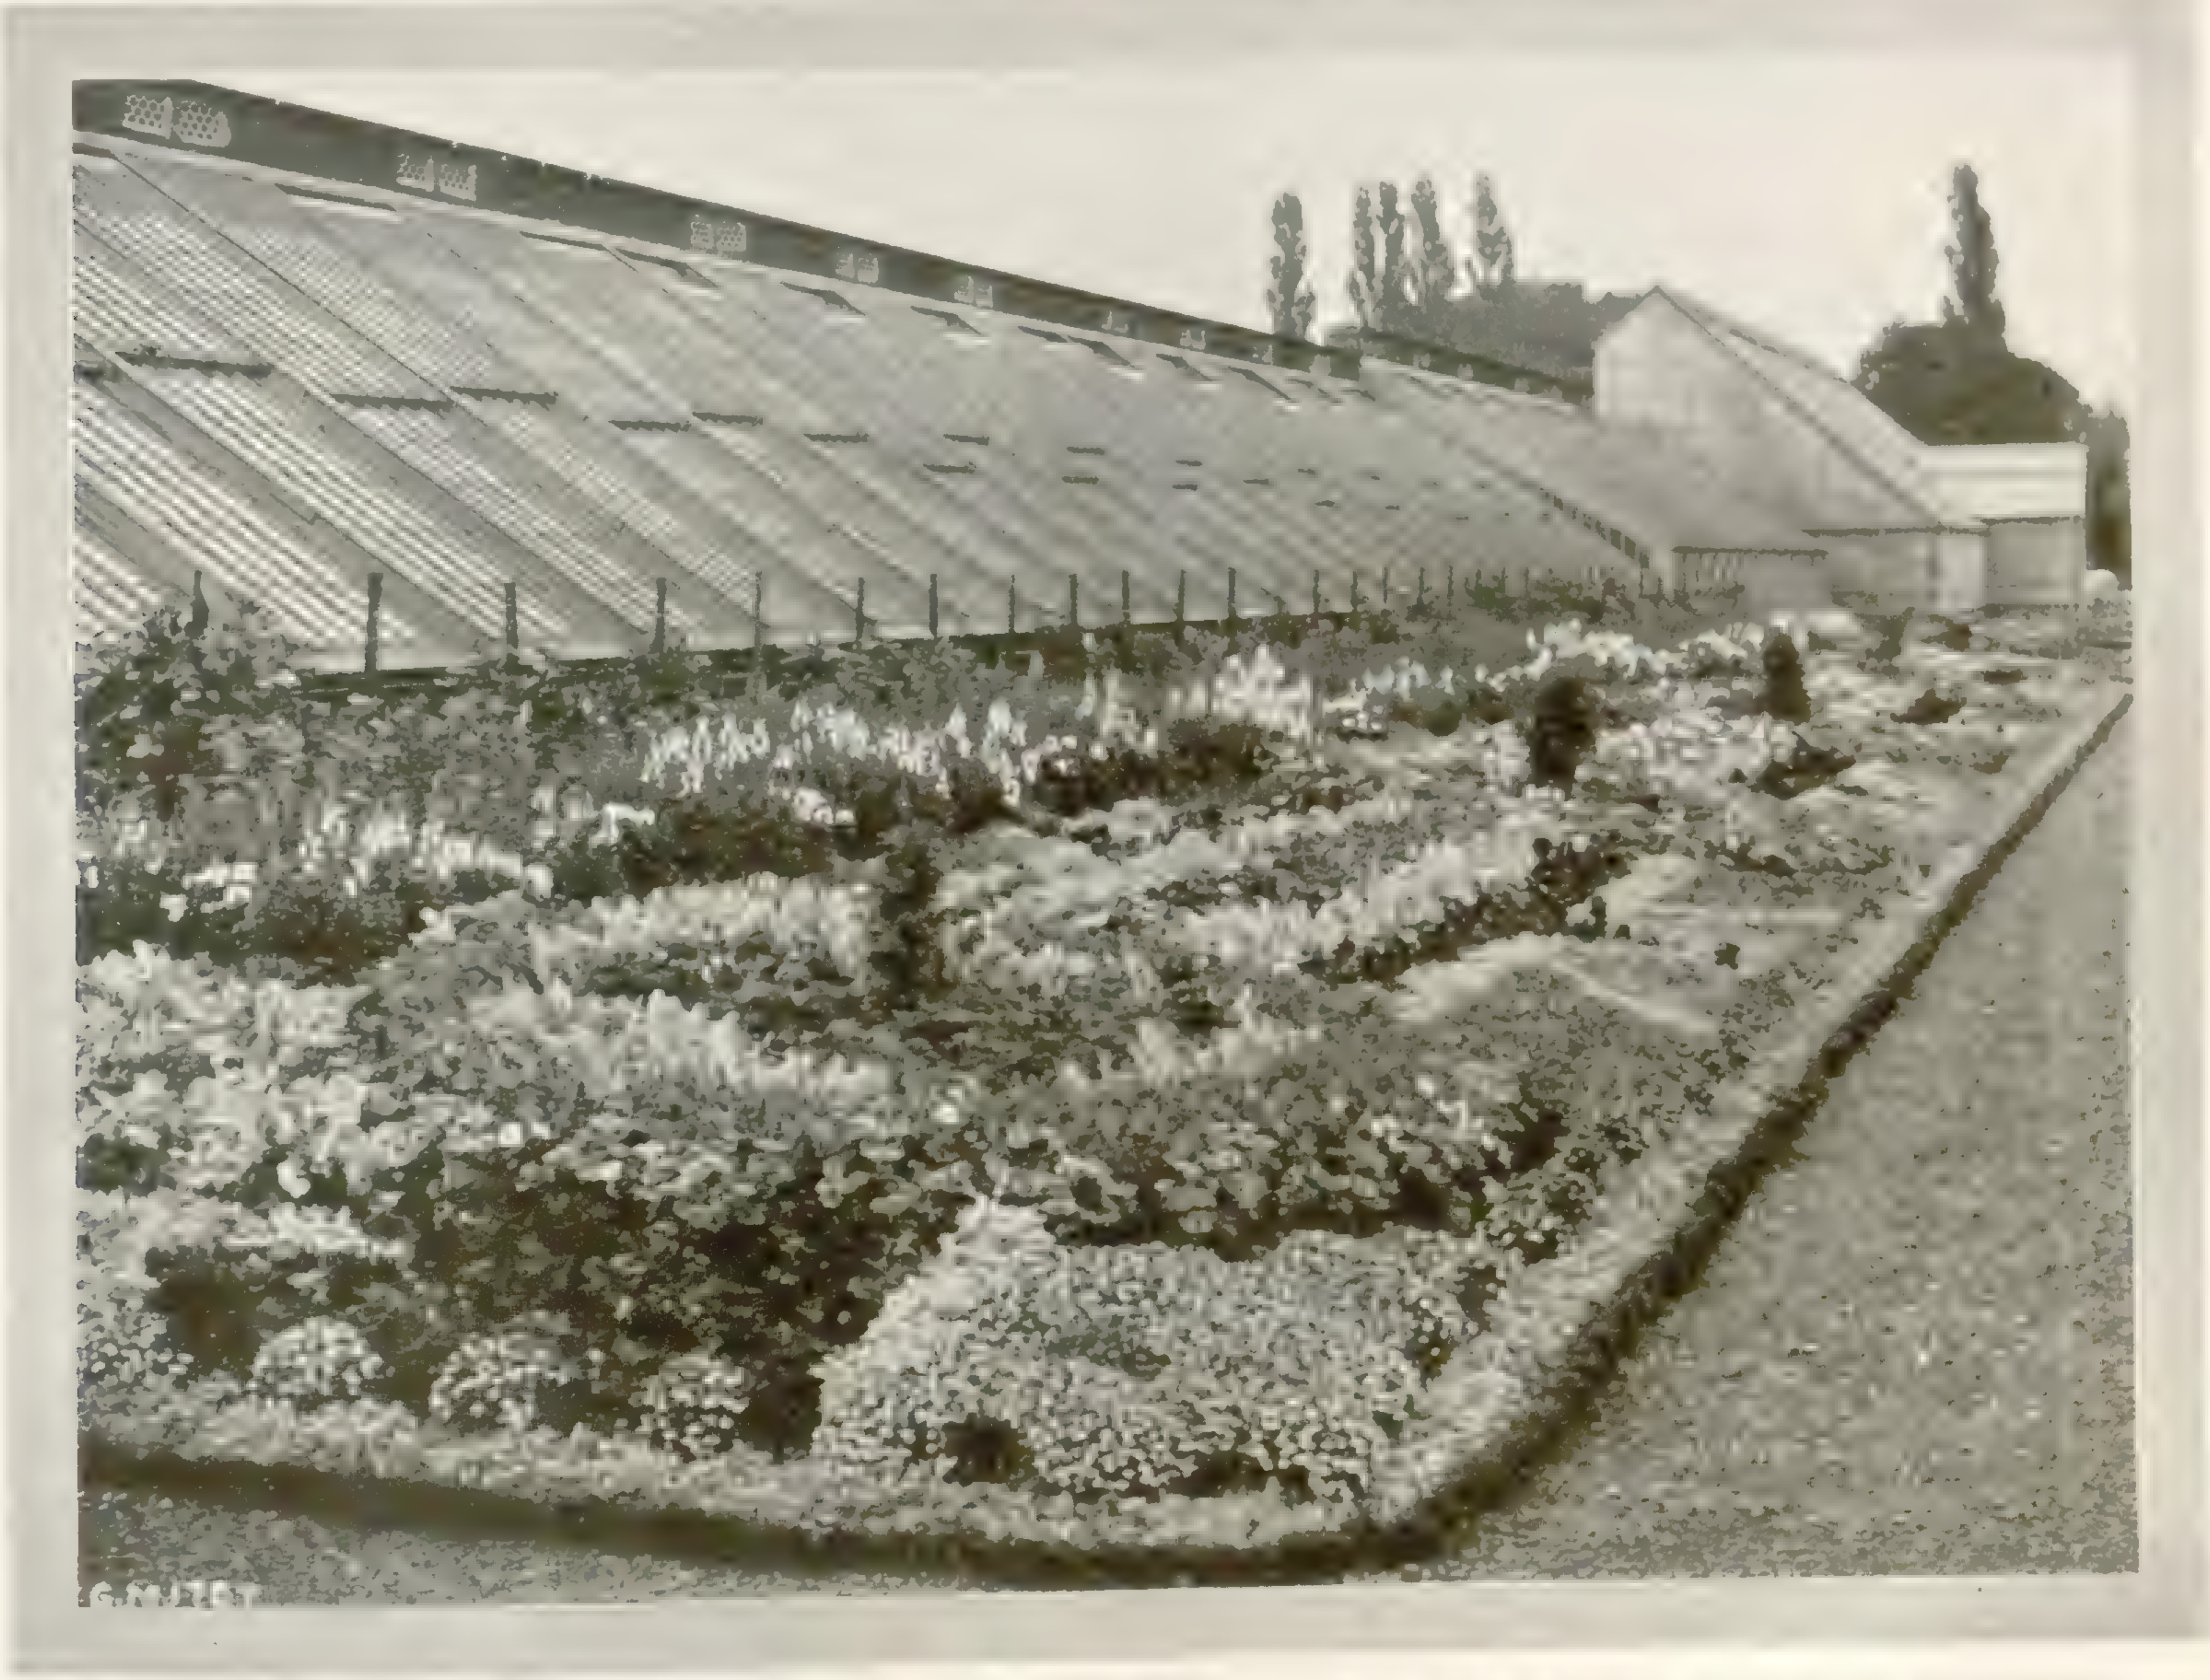
Hybrid perpetual, hybrid tea, C rambler, and other roses that produce rich colour effects when in bloom are grown largely and well at Dalkeith, and deserve all the attention the visitor can give but the Scotch roses that are growing in an enclosure not far distant from Mr. Whytock's house should not be overlooked



COLLECTION OF SCOTCH ROSES, DALKEITH PALACE GARDENS.

There are upwards of ninety varieties, and these were collected by a former Duke of Buccleuch, who was greatly interested in the section, and as they have been well cared for during the long period that has elapsed since they were planted they have continued a feature of much interest. The roses, as will be seen on looking at the accompanying illustration, are arranged to form a broad hedge, which has a length of several hundred yards, and on the opposite side of the walk the broad border is admirably furnished with evergreen and deciduous shrubs, the last-named consisting chiefly of those grown for their flowers.

It is a point of some interest that at Dalkeith the flower garden is brought into close association with the plant and fruit houses, and rich and diversified are the displays that are annually produced during the summer months. The illustration of one of the borders renders a description of the plants employed and the style of arrangement unnecessary, but it should be mentioned that there are numerous single beds, that help materially to enhance the general effect.



AN EFFECTIVE ARRANGEMENT OF SUMMER FLOWERS. DALKEITH PALACE GARDENS.

The glass structures are so numerous, and their contents so varied, as to almost bewilder one when time so presses as to render it impossible to have more than a rapid run through them, and to take a cursory glance at their occupants. A detailed description of them is unnecessary, nor would it be possible without occupying much space. There are many vineries, for a liberal supply of grapes is maintained during the greater part, if not the whole of the year, and in the several structures may be seen, in their respective seasons, magnificent crops of Black Hamburgh, Muscat of Alexandria, Mrs. Pince, and other of the more valuable grapes. The houses devoted to peaches and nectarines are numerous, and in one range we noticed four spacious structures, which furnish supplies of ripe fruit from the end of April or the beginning of May until the end of September. As supplementary to these, there is, in another part of the gardens, an unheated peach house, which has a length of 250 feet, and is furnished with trees that bear abundantly. Pines, which have been banished from so many gardens during the past forty years, are grown largely and well at Dalkeith, and those who know the pineapple as grown in British gardens previous to it having become unfashionable, will derive much pleasure from a glimpse of the finely finished fruits—The Queen, Black Jamaica, and Smooth Cayenne—that may be seen in a walk through the several houses, and a peep into the pits devoted to these noble fruits.

As the demand is great for cut flowers and decorative plants liberal provisions have been made for maintaining the necessary supplies. Hence there are plant stoves, intermediate houses, and greenhouses in considerable numbers, with carnation houses, orchid houses, and structures for other subjects that give the best results when so arranged as to admit of their being placed under the exact conditions most favourable to their full development. Of the plant houses there must be sufficient to form a respectable village of glass, and in walking through them it is not difficult to see that while the noble owners of Dalkeith Castle fully appreciate the charms of carnations, they do not, as is done in so many cases, overlook the merits of other beautiful flowers.

The heating arrangements of the immense number of fruit and plant houses are remarkable for their completeness, and have been conceived with due regard to economy of fuel and convenience of working. There are six miles of hot-water piping, and three Trentham or Cornish boilers, all of which are set in the one stokehole, which is a model of its kind. In the summer and autumn but one boiler is used, and in the winter and spring two are brought into requisition, the third being held in reserve in cases of an emergency arising. The result of this arrangement, as compared with several stokeholes and boilers, is a saving of several tons of coal annually, and one man only is sufficient for attending to the stoking in the busiest times.

The kitchen and fruit gardens have an area of twenty-two acres, and it need hardly be said that the whole of the space is utilised to the best advantage. On the high enclosing walls are splendidly trained pear, plum, cherry, and other fruit trees, all of which bear abundantly in seasons when the climatic conditions are at all favourable. In the open quarters are low standards and bush fruit trees, apples predominating, and of these useful fruits there are between three and four hundred varieties, the most comprehensive collection probably in this country.

Much might be written with reference to the many object-lessons the kitchen garden is so well able to afford, but more cannot be said than is necessary to mention the fact that there is a big collection of herbaceous phloxes therein, which produce a display of colour, and fill the air with perfume during their season of flowering, and that Mr. Whytock always grows his crop of carrots on the same ground.

Hopetoun House.

Hopetoun House, the truly magnificent seat of the Marquis of Lothian, stands some nine or ten miles to the north-west of Edinburgh, and, as in the case of Dalkeith, has long been famous for its highly-kept and beautiful gardens. Upwards of eighty years ago Loudon, whose judgment on such matters was beyond question, described the Hopetoun gardens as typical of the highest development to which the art of gardening had attained in Scotland, and to-day they may be described as in every way worthy of the palatial edifice to which they form so charming a setting. In the long interval that has elapsed since Loudon expressed his well-considered opinion on their merits, the gardens of Hopetoun House have been specially favoured, for the noble owners have taken a keen interest in them, and have been careful to place them under the management of gardeners who have been equally remarkable for their cultural skill and administrative ability. It may not, perhaps, be so easy to trace the line of gardeners who have had charge of the Hopetoun House since they were originally laid out by Switzer rather more than a century and a-half ago, as in the case of Dalkeith, but there can be no doubt as to their having possessed ability of a high order. We know beyond all question that Mr. James Smith, who for many years was gardener at Hopetoun, was a man of great ability, and the condition of the gardens at the present time is an unquestionable proof that Mr. T. Hay is a gardener of the highest eminence.

SCROLL FLOWER BEDS AND FAMOUS PEAR WALL, DALKEITH PALACE GARDENS.

The mansion, which was built about the same time as the grounds were laid out by Switzer, from designs by Sir James Bruce, is of imposing elevation, and occupies a commanding position not far distant from Queensferry. From the plateau on which it stands magnificent views are obtained over the Firth of Forth, and the fertile tract of land which has given West Lothian a leading position among the corn and root-growing counties of Scotland. While essentially agricultural in its characteristics, the district is remarkable for its beauty, and one might range over the whole of the lowlands of Scotland and yet fail to find views equal in diversity and charm to those that meet the eye in walking through the grounds. The park is extensive, and finely wooded, and many are the fine specimen coniferous and deciduous trees that attract attention, a goodly proportion of which have been planted since the gardens and grounds were remodelled about ninety years ago.

The gardens, without taking into account the wide stretches of lawn contiguous to the mansion, or the leafy glades in the policies, have an area of about thirty acres, and, with reference to this large area, it might be said there is not a square foot of ground that is not utilised to the best possible advantage. Briefly stated, the gardens occupy a portion of a valley that extends some distance, and has a small stream flowing through it, but the valley is not so low as to affect in any way the ornamental or useful plants that are grown on its slopes. On the northern slopes are the flower, fruit, and kitchen gardens, and the numerous fruit and plant houses, and lower down is the extensive and beautiful rose garden, and at the bottom of the slope is the wondrous border of hardy herbaceous plants, which, if it has an equal, has certainly no superior. Then, on the south side of the stream that intersects the valley is a large and tastefully designed area devoted to moisture-loving plants.

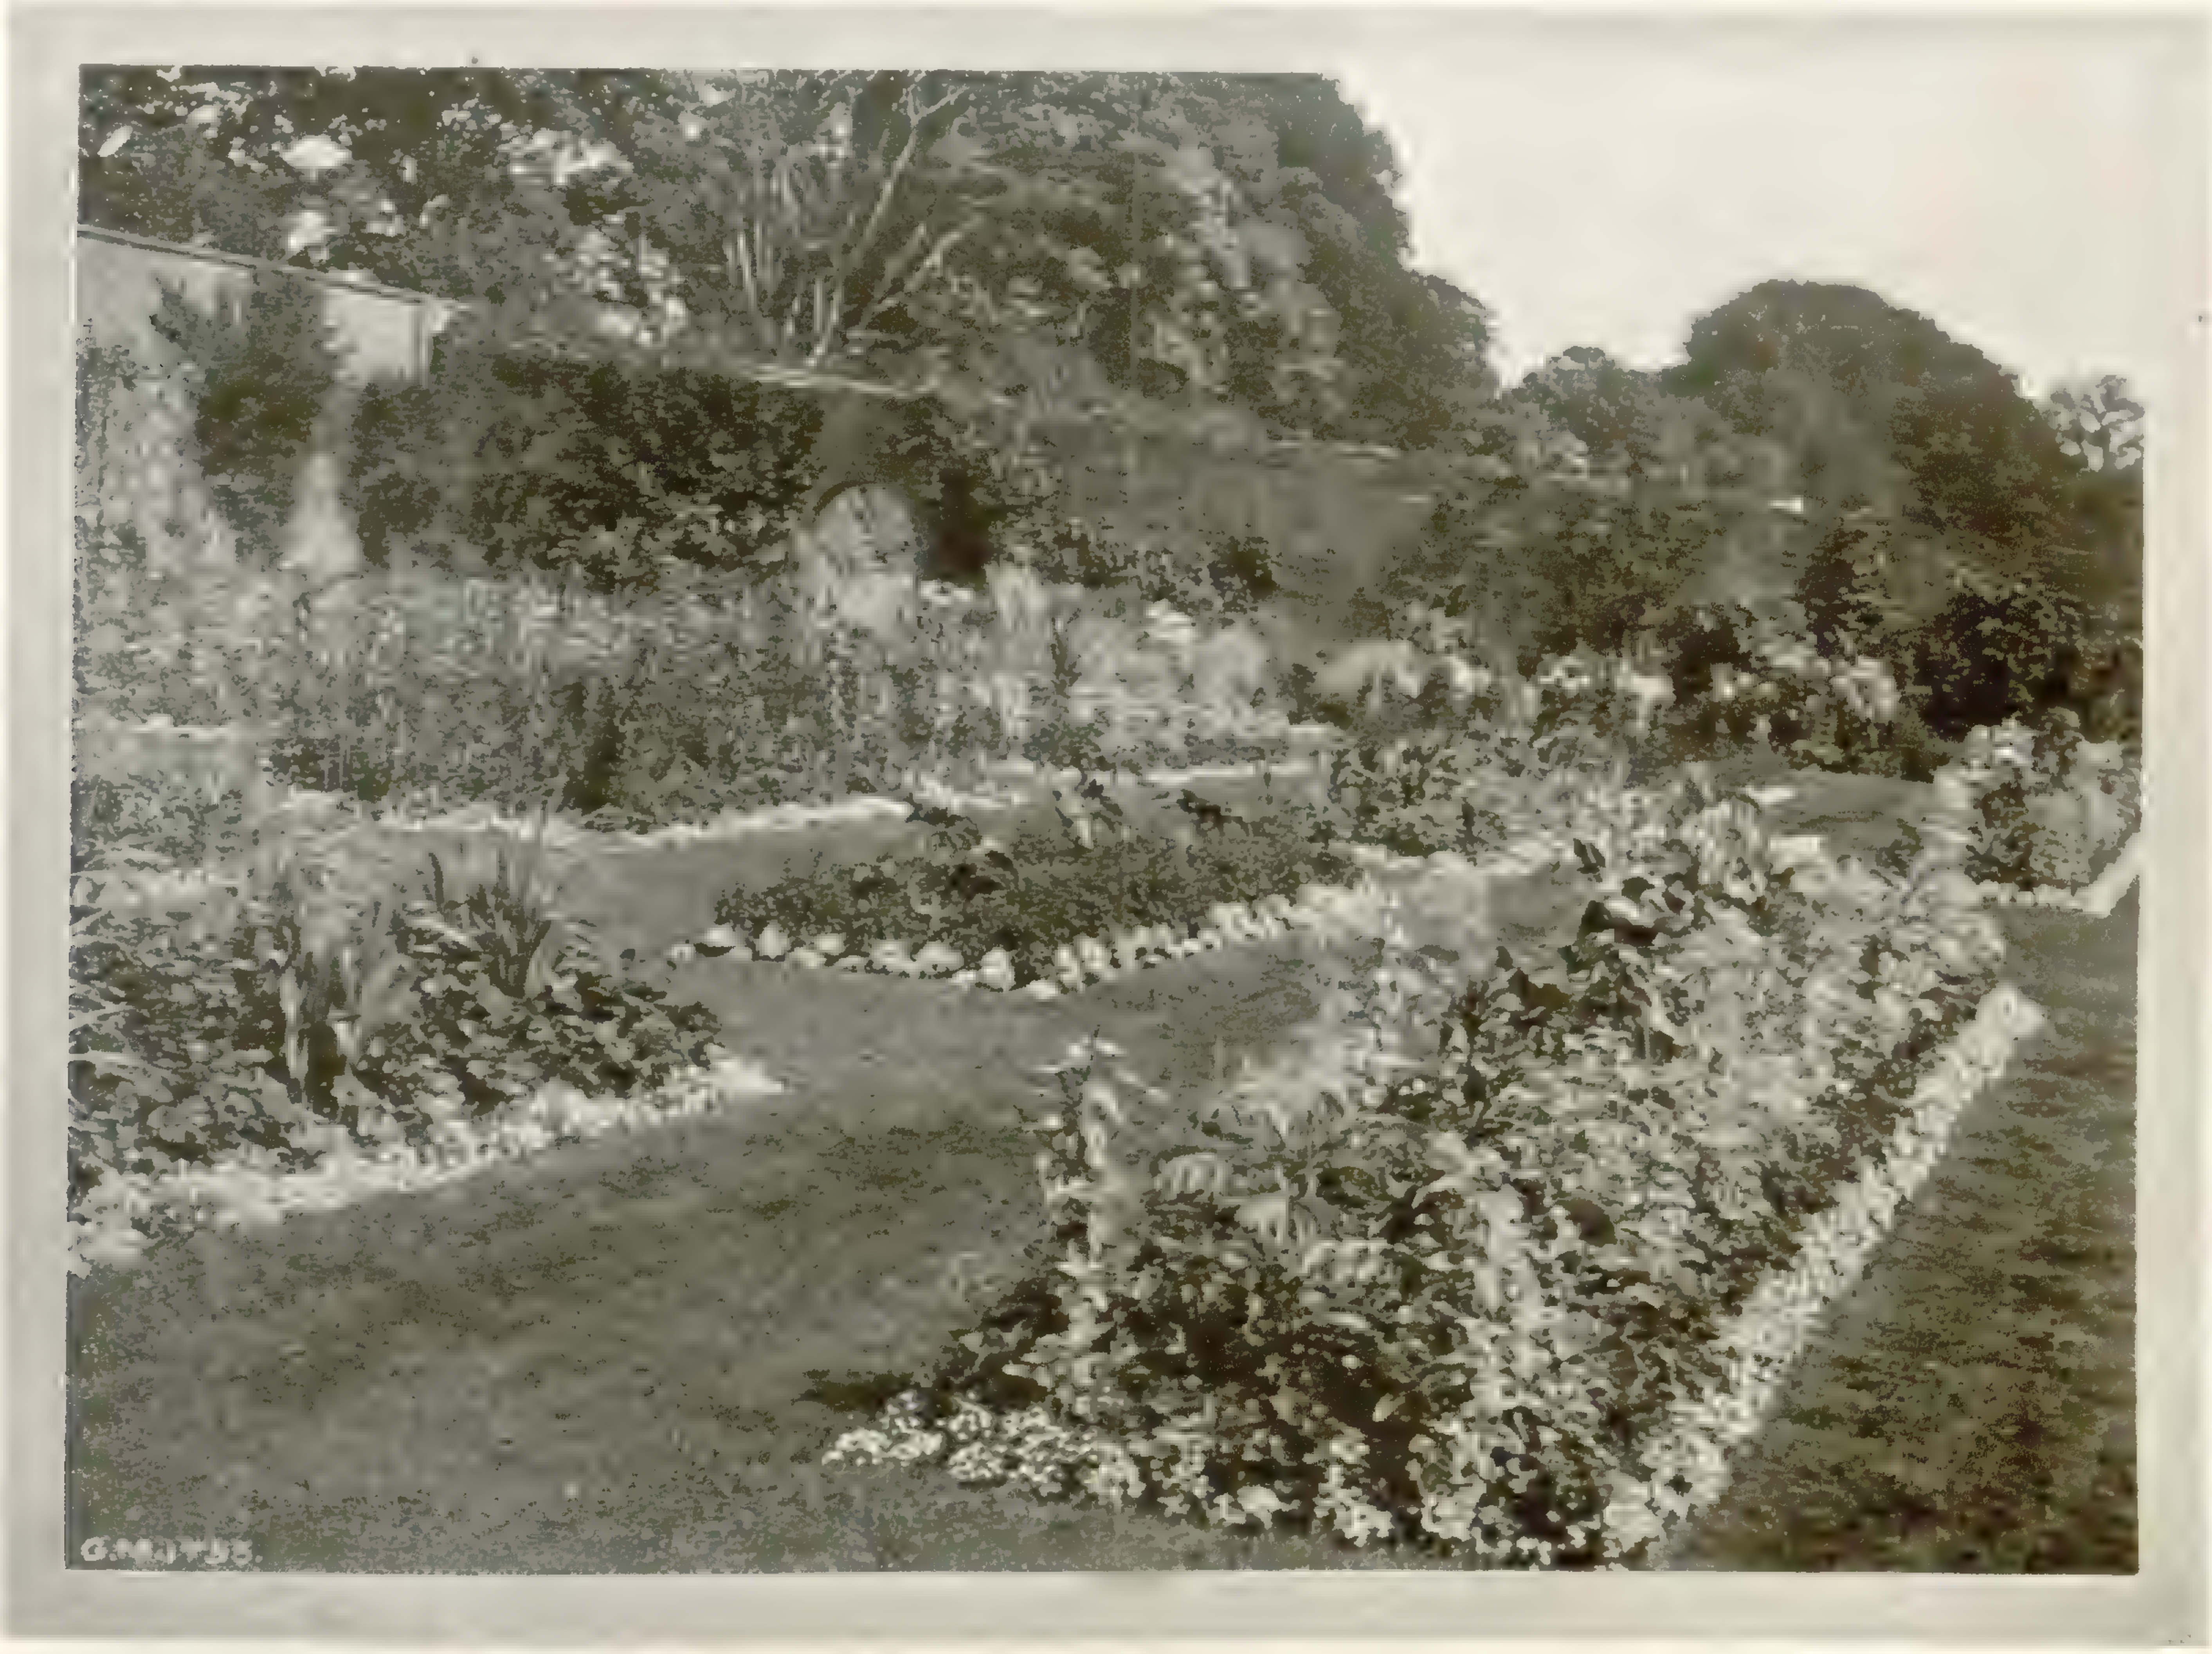
Having surmounted the slopes to reach the high ground on which the glass structures have been erected, one is beset with some difficulty in determining which of these shall be first explored. If the trend of his mind favours the various fruits he will be anxious to pass on to those devoted to grapes, peaches, and other kinds, but if he has a preference for ornamental subjects he will turn to the plant houses. It matters not which course is taken, the visitor will find much that is both interesting and instructive. In the fruit houses he will find crops of grapes, etc., according to season that fully testify to Mr. Hay's ability as a fruit cultivator, while the plant houses will afford object-lessons of immense value in the selection of plants from tropical and temperate regions.

Grapes have long been cultivated with much success at Hopetoun, and the splendid crops of Madresfield Court, which is a great favourite; Black Hamburgh, Muscat of Alexandria, and Lady Downes, that may be seen in their respective seasons, have contributed in no small degree to the fame enjoyed by the gardens. There are six or seven houses, each with a length of forty feet, devoted to grapes, and after admiring the large, finely finished clusters of the richly-flavoured Madresfield Court, and the golden hue of the Alexandrian Muscat, it was a matter of much interest to turn to the fine crop of Lady Downes intended for use during the winter months. This crop was interesting as a proof that grapes of high flavour are preferred at Hopetoun House, and that in the production of the necessary supplies a high degree of success is annually achieved. There are the same number of peach houses as vineries, and they are not less remarkable for the health of the occupants, and the abundance and quality of the crops obtained from them than are the latter. The varieties are those known to produce fruit of good appearance and high quality, and with reference to these it may be mentioned that the crop of Peregrine peach attracted special attention by reason of its abundance and the high finish of the fruits. Figs also are cultivated with much success, and in the several houses devoted to melons there was no lack of fruits in a high state of development, and in those in which the crop was approaching maturity the perfume that pervaded the structures suggested that the size and exterior finish of the fruits were not the only claims they had for attention.

Many are the plants of interest in the cool houses and plant stoves to which reference might be made, but it is not possible to do more than mention a few. In one of the stoves there is a remarkably fine collection of hibiscus that has but few, if any, equals. There are upwards of twenty species and varieties, and trained to the rafters in such manner as not to exclude the light, they produce an attractive display of flowers, extending over a considerable period without in any way injuring the plants growing on the stages below. There is also in this structure, among other noteworthy specimens, a fine example of that distinct and handsome fern, Platycerium alcicorne.

In the greenhouses may be seen a host of good things, chief among them being the perpetual-flowering and Malmaison carnations. Two or more houses are devoted to these popular and exquisitely beautiful flowers, and Mr. Hay would appear to possess the secret of banishing the enemies of these carnations from the structures in which they are grown. At all events, all the plants were in a condition that bespeaks perfect health. Perpetual-flowering carnations are not only cultivated in pots, in accordance with the orthodox practice, but they are most successfully grown in baskets suspended from the roof.

Immediately in front of one of the ranges of houses is a large rose garden, in which roses and violas are grown in association with much success. This fine garden has been already illustrated in these pages, and it will suffice to say that the large lozenge-shaped beds radiate from a central point, and are filled with dwarf roses set in a carpet of a pale blue viola known as Come to Stay. Each bed is filled with one variety, and as it is necessary the garden should present a bright appearance in August, when the family is in residence, Caroline Testout and Madame Abel Chatenay are the two roses that have been planted. The viola mentioned, which is one of the late Dr. Stewart's raising, has very pale blue flowers, and, consequently, there is no clashing of colours, as in the case when the deep purple, rich yellow, and dark blue violas are associated with roses.



A TASTEFUL ARRANGEMENT OF SUMMER FLOWERS, HOPETOUN HOUSE GARDENS.

The flower garden on the upper slope, which is, for the most part, furnished with plants that are more or less tender, is invariably arranged with much taste, and highly attractive. All the beds were more or less effective, but generally more than less, especially those filled with dwarf-growing scarlet-flowered begonias, notably Hatton Bedder, in association with variegated abutilons and other plants with ornamental leafage. The illustration of the flower garden will render detailed description unnecessary, and among other things it will show that Koniga maritima is freely used as an edging to the flower beds.

At the lower part of the slope, on the northern side of the valley, is the herbaceous border, which forms a magnificent feature, and is of itself sufficient to make the garden famous. This is many hundreds of feet in length, and sixteen feet in width, and planted with subjects that flower from about the middle of July onward. Conspicuous among the many good things represented was Anthemis Kelwayi, a distinct form with soft yellow flowers, that is of much value in borders that are required at their best during August. The photograph, of which the illustration herewith is a reproduction, was taken at the end of the first week in August, and is a proof, if proof were wanting, that those who complain of a dearth of flowers of hardy plants in August have much to learn.

In the area devoted to the plant and fruit houses, and in the kitchen garden, are numerous borders devoted to flowering plants of various kinds. In one part of the gardens we meet with a border of pentstemons containing some 4,000 plants, a big border of carnations, from which some hundreds of excellent blooms may be cut at any given moment; a large area containing a thoroughly representative collection of herbaceous phloxes; a border of immense length given up to early-flowering chrysanthemums; a large breadth of antirrhinums and East Lothian stocks; an extensive collection of gladioli, and so one might continue at some length without exhausting the interesting features of these great gardens. But space renders it necessary to bring these notes to a close; but before this is done mention must be made of the well-equipped recreation room that was provided, with his usual thoughtfulness and kindness, by the late Marquis of Linlithgow, for the use of the young men employed in the gardens, and in some other departments of the estate. It is one of the best-equipped recreation rooms the writer has yet seen, and it is gratifying to know that the kindly spirit which prompted its provision is remembered with feelings of gratitude by those who have the privilege of using it. George Gordon.

[Since the foregoing notes on the gardens at Hopetoun House were written, Mr. Thomas Hay has, as we have previously noted, been appointed Superintendent of Greenwich Park; his successor at Hopetoun is Mr. Highgate, from Yester.—Ed.]

Gardener's Notice to Leave.—At Salford County Court, Mr. F. Stocker, a gardener at Swinton, sued his late employer for three weeks' wages in lieu of proper notice. He had had one week's notice to leave. His Honour Judge Mellor gave judgment for the amount, £4 7s., claimed by the plaintiff, with costs.

AMONG THE HEUCHERAS.

Old hardy plantsmen love to dwell upon the changes they have seen in the plants of their choice, but I fancy they find few flowers which have increased in variety within a short time to a greater degree than the heucheras, or alum roots, of which we have now a host indeed. These are excellent for cutting, their sprays or panicles of graceful flowers being admired when cut, and equally valuable in the garden when growing. A little talk about these may be of use and of interest when readers are pondering over the flowers they want to secure by and by

Long ago Heuchera Richardsoni was valued for its bronzy-red leaves in spring, but its flowers are of little account, so that it has never been so popular as the others. The advent of H. sanguinea transformed the heucheras, however, and it is from the union of this and other species that the greater number of the newer kinds now to be mentioned derive their origin. Sanguinea is a lovely thing, with spikes of the most brilliant scarlet. Its drawback is its shyness of flowering in many gardens. Splendens is a fine variety of this, but is not so free in flowering as we would like. Walker's variety is the best of the trio, being finer in every respect, and also freer in flowering.

Brizoides marked an advance, and resulted from the union of the two species already named. It has graceful spikes of elegent rosy flowers, small in size, but very useful in their loose spikes. Brizoides gracillima has pretty spikes of red flowers, and looks graceful anywhere

In H. micrantha we have a still more beautiful alum root, with many little rosy-white flowers on long stems two to three feet high. Its variety rosea has rosy-pink blooms on red stems, and is a most exquisite plant in every way.

When we come to the newer heucheras, whose parentage is a mixture of races, but mostly owing their fine characters to the species and hybrids already named, we are embarassed by the choice. Brownsea Brush is among the latest of the novelties. It has hosts of sprays of the most elegant growth, having flowers whose shading seems to pass through blush to rose. Then Coralie, coral-tinted, bearing many fine panicles, and the graceful, lax-growing elegans are two good varieties, the latter being a soft rosy-red.

Heath-like in their appearance are the varieties known as ericoides, the first, ericoides itself, having charming pink sprays of flower; the variety alba has these of a pure white; and rosea is blush—a shade likely to be popular among these exquisite heucheras.

Fantasy, blush-white, seems to have a future before it, because of the elegance of its inflorescence, but Flambeau is more likely to be sought after by those who like bigger blooms. It has bright red long-shaped flowers. Grenade has brighter flowers than Flambeau—more approaching scarlet-crimson than those of that variety; and the noble Pageant has fine bright crimson blooms. Madeline, dwarf in its growth, has blush-white flowers in plenty; and Pluie de Feu has these of a vivid fiery-red.

Rosamunde, of the micrantha style, has proved itself a favourite. Its branching stems of fine coral-red flowers are glorious in the border, rising, as they do, from three to four feet high. Saladin may be said to be a deeper-coloured sanguinea; and Snowflake, although pretty, appears to have been misnamed, as the flowers, white inside, are only grey on the exterior.

To conclude, we may name two good heucheras of much the same habit. These are Sancyl—between sanguinea and cylindrica—and Zabeliana. Both of these bloom twice in the year, and give good panicles of charming, long-shaped, bright pink flowers. The greater number of heucheras will thrive in any good soil, but some flower less freely than others, for some obscure reason. Yet a rich soil does not seem to cure this defect, and a good loam, with a little peat and leaf-soil mixed, will generally answer well for these fine flowers, which are of high value for the ornament of the garden and the home.

S. Arnott.

A MAGNIFICENT DISPLAY OF HARDY FLOWERS, HOPETOUN HOUSE GARDENS.

Crown Gall Disease.—An important investigation into the crown gall disease of plants has, during the past six years, been conducted by the U.S. Bureau of Plant Industry, and the report thereon has just been published. From this we learn that Dr. E. F. Smith, one of the authors of the bulletin containing the report, suspected a bacterial origin for the disease as far back as 1904, but definite proof was not obtained until 1906. In the last-named year those engaged in the investigations succeeded in isolating a bacterium, and in transmitting infection resulting in gall production from pure cultures. To this organisation, a short, rod-like form, the name of Bacterium tumefaciens was given. The investigations were commenced with galls upon glass-grown plants of Chrysanthemum frutescens, and later on similar galls on apple and peach trees, grape vines, sugar beet, and other plants. It is considered probable that there are different physiological races of the bacterium, but cross inoculation was, generally speaking, possible. Dr. Smith regards the manner of growth of the galls as bearing a resemblance to certain animal tumours.

BIENNIALS.

The various biennials provide the garden with a grand display during the early summer. Considering the ease with which they may be raised and grown, it is rather surprising they are not made more use of. When raising the plants all that is necessary is a cold frame, wherein the pots or boxes may be placed for the seeds to germinate. If one has not the frame, and only a few plants are required, the seed pots may be placed in a box, and a few sheets of glass laid on the top will suffice. The seeds germinate with great freedom when kept fairly close and shaded. When the seedlings appear light and air may be gradually afforded until they have made sufficient roots to withstand full exposure. When the plants are large enough to handle they should be planted out into nursery beds, where they will make suitable plants for putting out the following autumn.

If one has several frames to spare for the work better results are obtained by pricking the seedlings out in them and growing them on for a time before planting in the nursery beds. More labour is entailed by following this latter method, yet one is amply repaid for the extra trouble expended on the culture, for, to a great extent, success depends on a good start, and having a sturdy plant to put out in the first instance. An ordinary Canterbury bell will usually give one spike of flowers, but one that has been well grown from the commencement will, as a rule, throw several spikes. Sweet williams, too, respond readily to the better treatment, and finer plants are obtained. May is the most suitable month for sowing the seeds, and by following the advised methods an excellent display can be obtained for the following year.

Foxgloves are indispensable for woodland planting, and excellent effects are obtained by boldly grouping the plants in large masses. They may also be planted to advantage amongst dwarf shrubs, where the flower spikes may tower above the shrubs. Ivery's Spotted is a good variety, and the gloxiniæflora strain is exceedingly pretty.

Canterbury bells adapt themselves to use in shrubbery borders, and also for grouping in the herbaceous borders. They are also useful as pot plants for conservatory decoration if potted in October.

Sweet Williams have been largely improved, and are now very popular for bedding purposes. Pink Beauty is a charming variety, and makes a beautiful bed. The scarlet and crimson both give excellent effects, either in the herbaceous borders or in beds.

The Evening Primrose (Œnothera Lamarckiana) is seen at its best when naturalised in the woodland or shrubberies; a bold group or two flowering amongst evergreen shrubs is very effective, the dark green foliage showing off the soft yellow blooms to great advantage. It lasts for some considerable time in flower.

Honesty (Lunaria biennis) is hardly good enough for the flower border, yet is very pretty when associated with other plants in the wild garden. It is somewhat neglected, yet quite worthy of a place where natural effects are aimed at.

Verbascum Chaixi, V. longifolium, V. olympicum, and V. phlomoides are extremely useful for naturalising, and should be boldly grouped in the wild garden and woodland. The phœniceum hybrids make pretty groups in the herbaceous borders, and are quite suitable for the purpose. On warm soils the verbascums will prove perennial, but on wet ones it is advisable to treat them as biennials.

Papaver nudicaule, the Iceland Poppy, owing to its habit of damping off in the winter, or dying out after flowering one season, should be raised annually to maintain a stock. It is one of the most beautiful and graceful of poppies we have, and extremely lasting in a cut state. For light vases, either in the drawing or dining-room it is a lovely flower. A combination of yellow Iceland poppies and Campanula persicifolia for a drawing-room table is most effective, and highly appreciated. The improved strains contain a large variety of colours, and the plants adapt themselves well to rock garden culture; in fact, when planted in dry, sunny spots, they live longer than in the open border.

Of the meconopsis perhaps the best are M. integrifolia, M. Wallichi, M. aculeata, and M. puniceus. In dealing with these the safest plan to follow is to gather and sow the seeds as soon as ripe, otherwise they often lie dormant for some considerable time.

E. C. Pooley.

MULCHING AND WATERING SWEET PEAS.

The continuance of dry weather naturally tends to make the sweet pea grower contemplate mulching, and on light dry soils it may be advantageous to get it done at once—at least a light mulching of leaf-soil or leaf-soil and well-rotted horse manure may be given. This should be prepared some little time beforehand, and before it is applied the ground between the rows should be well hoed, and, if necessary, the rows should be hand weeded. Work the leaves or manure well between the plants, and for at least a foot on each side of the rows; this should suffice for a time. Although the plants at this stage should not require any manure, it is not wise to waste anything, so the mulching should be well watered in, as by this means its manurial properties are washed in also, while the mulch itself will lay closer to the plants, and so prevent evaporation. A little later on, should the weather continue warm and dry, a heavier mulching should be given to all the sweet peas, but this should be delayed until actually needed, as this heavy mulch, with plenty of water, will do much to rejuvenate the plants after they have flowered for a few weeks.

As may be inferred, I am not in favour of much water until the plants are well in bloom, when, of course, they will quickly suffer if allowed to become dry; but as we have had so little rain in many parts of the country since planting out time, where plants are failing to grow properly the grower will be well advised to make quite sure that they are not suffering from drought.

At the time of writing, May 30, many varieties (autumn-sown) are opening flowers nicely, Elsie Herbert, Sunproof Crimson, Earl Spencer, Evelyn Hemus, Scarlet Monarch, and Doris Burt being among the most forward, though perhaps the earliest of all is Bertha Massey, every plant of this variety having well-expanded flowers on it. This is a variety that was shown under the name of Mrs. Ryle last season, and is of a very pleasing shade of rosy-lilac, quite distinct from anything else, and if the whole stock is as true as the few plants I have it will be much sought after

After what we saw at the great Temple Show we shall all be looking forward to those varieties Messrs. Dobbie and Co. exhibited; several of them appear to be real acquisitions, notably Melba, Mrs. Cuthbertson, May Campbell, and Dobbie's Scarlet.

Thomas Stevenson.

HARDY AZALEAS.

The delicate shades of colour noticeable amongst the flowers of the numerous forms of deciduous rhododendrons, or azaleas as they are more popularly called, combined with a delicious perfume, makes these shrubs justly popular, and few more effective sights can be imagined than a collection of the various kinds when in full bloom. Collectively known as Ghent azaleas, these hardy plants have originated by crossing several North American species with the Chinese and Japanese R. sinense (Azalea sinensis or A. mollis) and the Caucasian R. flavum. As may be ascertained from the common name of "Ghent azaleas," a great many varieties originated in Ghent, but English growers also have done their share in raising new kinds, the nursery of Mr. Anthony Waterer, Knap Hill, Woking, being specially noteworthy as the birthplace of many of the richer reds, whilst the late Mr. Cripps, of Tunbridge Wells, raised a number of very pretty sorts.

Given ground fairly free from lime, whether it be loamy or peaty in character, it is possible to succeed with azaleas, and providing a few particulars about cultivation are borne in mind, they cannot be said to be difficult shrubs to manage. Should the natural soil be peaty, all well and good, if it is not so, however, there is no necessity to provide a lot, in fact, it is better to exclude peat altogether, rather than excavate beds 1½ feet deep or so and fill them entirely with peat. A good plan to adopt is to trench ordinary light loamy ground 1½ feet deep, and remove a few inches of the lower soil, then spread over the surface sufficient peat to make up the deficiency, afterwards forking it into the upper foot. When planting, care must be taken to keep the upper roots near the surface of the soil, for deep planting is often fatal to the well-being of the bushes. At the same time, the soil must be well trodden about the roots, for if left loose, the water will run round about the sides without penetrating the old ball of roots. It is also necessary to provide against drought. But while this may be done by continued watering, it is better to so arrange that a minimum amount of artificial watering is necessary by applying a good surface dressing of decayed leaves to the soil. Leaves used in this manner keep the soil cool and moist for a long period, and also encourage surface roots, which is a very necessary item towards the successful cultivation of azaleas. Surface dressings of manure are not to be encouraged, though an occasional application of liquid cow manure after the plants are thoroughly established will do good. The removal of the old flower heads before seeds have time to form is attended with advantageous results, for the strength which would have gone towards the maturing of the seeds is thereby available for the promotion of new growth and the ensuing year's flower buds.

The kinds which have played an important part in the production of the numerous hybrids are A. calendulacea (R. calendulaceum), a North American species, which usually grows to a height of from 4 to 6 feet, though it occasionally grows much taller. The flowers are often orange or orange-scarlet in colour, and very fragrant. A great many of the best orange and scarlet flowered varieties claim it as a parent. Like other species from the same country, it is very floriferous.

A. nudiflora (correctly R. nudiflorum), commonly called the "Pinxter Flower," is another N. American shrub. This contributes varieties with white, red, and pink flowers, which are not so large as those of the last-named species. The two plants have often been crossed, and their progeny may be frequently noted, especially in red, white, and bi-coloured sorts.

A. flavum, sometimes called Azalea pontica, bears yellow flowers, which are very large and fragrant. It is a native of the Caucasus, and has been used with the American kinds in the production of the garden azaleas. Some of the larger-flowered orange and yellow varieties owe their existence to the influence of this species.

A. sinensis (correctly R. sinense) is well-known as a shrub for forcing, but it is also grown largely out of doors, though it is less useful in some respects than the previously-mentioned species. It blossoms earlier than the American and Caucasian kinds, therefore the flowers are sometimes injured about the end of April or early May by late frosts. This year they have escaped, and have been responsible for a gorgeous display. Orange, red, and scarlet flowered forms are common, while cream and yellow also exist. The varieties of this species lack the fragrance of the American sorts, thus one charm usually attributed to the azalea is absent. It has of late years been crossed with other kinds and numerous showy hybrids are the result.

A. viscosa (syn. R. viscosum), the Swamp Honeysuckle of N. America, blossoms later than the others, and is usually at its best about the middle of July. Its peculiarly fragrant flowers are easily determined by their viscid character.

A. occidentalis (correctly R. occidentale) is another late-flowering kind, for it is usually at its best about the end of June and early July. It is from California, and forms a looser bush than the other kinds, often 8 or 9 feet high. The flowers are white or pink, and very fragrant.

A. arborescens (R. arborescens) flowers about the same time as the last-named. It is a N. American species, bearing white, or occasionally pink, fragrant blossoms. Crossed with the earlier kinds, these late-flowering sorts have so influenced their progeny that flowering takes place after the majority of the Ghent azaleas are over.

W. Dallimore.

Rhododendron Pink Pearl.—No variety of rhododendron has within recent years attracted such a large share of attention as Pink Pearl. It is such a grand rhododendron that its extreme popularity is not to be wondered at, though now there are several newer forms on somewhat the same lines. The Temple Shows of recent years have made us familiar with the fact that for flowering indoors at that season it is really superb, while strictly as an outdoor shrub its merits rank high. Another feature more pronounced I think this year than at any previous time, is that it may be included among the varieties which can be forced into flower early, when its noble blooms are as at all other times much appreciated.—W. T.

New Hydrangeas.—We have had a great many new varieties of hydrangea distributed within recent years, notably those from the establishments of M. E. Moullière, Vendome, and MM. Lemoine et Fils, Nancy, both in France. Last year a variety from each raiser was given an Award of Merit by the Royal Horticultural Society, namely, Ornement, from MM. Lemoine, and Madame E. Moullière, from the other raiser. A singular feature in connection with the last-named is that again on March 28 this year a similar award was given it by the Floral Committee. It is certainly a very fine hydrangea, and one, I should say, destined to stay, but of the two I prefer the variety Ornement, though that is, of course, only a matter of personal opinion. Both, however, are good.—W. T.

INFLUENCE OF SOIL ON THE COLOUR AND FLAVOUR OF STRAWBERRIES.

I think it is generally admitted by experienced cultivators that the soil has a direct influence on both the colour of the fruit and its flavour. In some districts strawberries are very highly coloured, but of poor flavour; in others they are not highly coloured but are of rich flavour. I would like to give an instance bearing out these facts.

When the variety Noble was first cultivated I planted several long rows of plants in a rather heavy, clayey soil, the latter being light in colour. The resultant fruits were almost as scarlet as those of Royal Sovereign, and very rich in flavour—for Noble. A few miles away a doctor, who was very fond of gardening generally, had a plantation of Noble strawberries. His fruits were of a deep crimson, almost black, and he gleefully contrasted his fruits with my light-coloured ones. But when it came to the eating test his fruits almost entirely lacked flavour, while mine were really very agreeable to the palate.

The soil in which the doctor's plants were grown was dark, and had, in time past, been a part of old heath, or forest.

To digress a little. I once exhibited some apples at an exhibition at Earl's Court. While staging them some gentlemen remarked, "Those apples have been grown under glass; no apples grown in the open air were ever coloured like those." As a matter of fact, the trees were grown in an almost pure clay bed, not the light-looking clay one so often sees, but dark red, and of a crumbling nature. To properly drain the orchard open trenches 2ft. and more in depth were made, a row of trees growing between each pair of trenches. In summer time, when the clay crumbled down and got baked in the sun, the particles were almost as hard as bullets. I told the gentlemen in question the conditions under which the apples had been grown, but I think they were disinclined at first to believe my statement. A silver medal was awarded. The trees are still growing in the same position, and are fruitful, but canker is a little troublesome.

Even in the same garden I have found that the fruits from young strawberry plants are more highly coloured than those from three-year-old plants. I am quite convinced that many inexperienced growers allow too much space between their rows and the plants in them. As a private cultivator I grew about five hundredweight of strawberries each year for a considerable number of years. During that period I experimented, of course, and I found it to be much more profitable to discard my plants (grown in a medium light soil) after the second year's fruiting, so every year some rows were destroyed, and others planted. In a heavier loam I think the plants will last quite a year longer in a remunerative state—until after the third year.

I would urge cultivators who have only small gardens to deal with to grow a number of strawberry plants as annuals, putting out the plants 14in. apart each way. Runners are plentiful, are easily rooted, and if the very earliest ones are secured, as in the case of runners for forcing in pots, the resultant crops from even a small plant would surprise the owner. Moreover, the fruits so grown are of the highest quality, both as regards flavour and appearance.

The ground for the plants should be prepared early, and the runners secured as soon as possible, and treated generously.

G. B.

THE CYPRESS OAK.

The oak which is known under this name is a pyramidal form of the common oak, and is correctly Quercus pedunculata var. fastigiata. To its peculiarity of habit, no doubt, the common name is due, for it has that distinct upright character noticeable in some of the cypresses. A similarity of habit may be seen in several varieties of the commoner trees, for the hornbeam, robinia, elm, and mountain ash have all produced varieties which exhibit the stiff character of the Lombardy poplar to a remarkable degree.

The Cypress oak forms a narrow tree 20 feet or more high, and is useful for planting in gardens where stiff growing trees are required to relieve those of a more spreading character. Several variations of it occur, one of the most distinct being Grangei, which is inclined to develop a globular habit with age. The forms known respectively as cucullata and oxyacanthifolia are distinguished by their contorted leaves; tortuosa by its twisted branches; and variegata by its variegated leaves. The latter cannot be called an ornamental tree by any means, for its leaves have a diseased appearance rather than a decorative character. These several varieties are increased by grafting on to stocks of the common oak.

W. D.

Summer-flowering Chrysanthemums. — Where not already done these may be planted in the beds and borders in which they are to bloom. Rich soil is necessary to obtain good results, therefore the beds or borders where they are to be grown should be well prepared beforehand. A good dressing of well-decayed manure and soot should be thoroughly mixed with the soil, and when planting out a small quantity of artificial manure may be added. The style of planting depends a great deal on the tastes of the owner of the garden, for whilst some prefer planting each bed in separate colours, others favour the mixed style. In cases where one has only a single bed to devote to chrysanthemums then mixing the varieties has to be resorted to, but when several beds are set aside for their culture, the whole colour system may be carried out, that is separate varieties in each bed. Regarding the border planting, each group or block should be of one variety. A few varieties may well be grown in the reserve garden in sufficient quantities to provide flowers for cutting, also a good batch should be grown in the nursery beds for the herbaceous borders. These will be found extremely useful for the filling up of blanks caused by the removal of sweet williams, canterbury bells, etc. They will lift readily, especially if dull showery weather can be chosen for the work. The plants should be well watered in, and syringed daily, in the evenings, until established. The taller growers may be planted out two feet apart each way, and the dwarfs eighteen inches.—E. C. P.

Azalea Anthony Koster.—The different nursery catalogues give this azalea as one of the varieties emanating from the intercrossing of Azalea mollis and Azalea sinensis, but as these two are by all botanical authorities regarded as synonymous, this particular variety can only be looked upon as an improved form of A. sinensis, better known in gardens as A. mollis. At all events Anthony Koster must be regarded as one of the very finest of the entire group, equally desirable for the outdoor garden, and for flowering under glass. It is of a free, rather upright habit of growth, while the flowers, borne in good-sized trusses, are individually large, of fine shape, and of a delightful rich pure golden-yellow colour. Being of unusual substance, they also last in bloom longer than some of the others.—W. T.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

VANDA TERES.—As plants of this species pass out of flower they should be examined, in view of repotting. It is not desirable to disturb the plants unless they have become leggy from loss of the lower leaves or the potting material is in a decomposed state. Where repotting is necessary carefully remove the old material from about the base of the plants, and turn them out of their pots. The stems that need shortening may be cut away to the best advantage, aiming to secure as many live roots as possible. If the plants have to be grown in pots, it is desirable that as many stems as possible should be grown together; sticks of suitable size to secure the plants in position should be neatly attached to each; then place the plants in position, and fill in the usual drainage material. The potting compost may consist of equal portions of fibrous peat, osmunda fibre, and chopped sphagnum moss, with sufficient broken charcoal and crocks added to render the compost porous. After potting replace the plants in position, and water with rain water sufficiently to wet the compost thoroughly. Syringe daily, and afford hot humid conditions and ample light all through the active season of growth. These vandas may also be successfully grown in boxes, and are most suitable subjects to be cultivated at the south end of an East Indian or stove house, where they may have the full benefit of the sun's rays.

V. HOOKERII is not so extensively grown as the above-mentioned species. It is altogether of weaker constitution, and is not generally found easy to cultivate; for a few years after importing they grow and flower satisfactorily, but soon deteriorate, and are then difficult to manage. Unlike V. teres, it does not require a prolonged rest under absolutely dry conditions; the plants are best managed and retained longest in a healthy state when grown in a semi-exposed position in a hot humid atmosphere throughout the whole year.

V. MISS AGNES JOAQUIM is derived from the intercrossing of the two above-mentioned species, and, strange to say, it is of a more vigorous constitution than either of its parents. It combines the characteristics of each in its flowers, and as the plants have now become reasonably plentiful it should have a place in every garden where this class of vanda is appreciated. The habit of the plant is somewhat straggling, and it makes plenty of growth where conditions favourable to its requirements are afforded. It should be placed in a position where it may be trained up the roof within reasonable distance of the glass, and where it may have the full advantage of strong light. During active growth liberal treatment is required, but during the dormant season dry conditions are essential, and a reasonably cool airy atmosphere. Upon the proper maturing of the growth depends the successful flowering of the plants.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

BEGONIA GLOIRE DE SCEAUX.—The handsome metallic foliage of this begonia renders it most attractive, and well deserving of a position in any collection of plants. Its flowering season usually commences about Christmas and extends over three or four months. It may be cultivated to provide a display of bloom to follow Begonia Gloire de Lorraine. The method of culture outlined in a previous calendar for this latter will be found suitable for B. Gloire de Sceaux, with the exception of high temperature: cooler conditions are more suitable, i.e., a temperature of 50 to 55 degrees. Cuttings may be inserted at this date and they will form useful decorative stock for next springtime. The plants should not experience any check to growth, and better results may be obtained by restricting the roots and using small pots. This begonia is an exceptionally gross feeder, and growth responds too freely to liberal treatment. All stimulants should be withheld until plenty of flower buds are showing, when an occasional watering with clear soot water and diluted farmyard liquid will have beneficial results. Occasional fumigation will keep the stock clean.

CROTONS.—The splendid bright sunshine which is so unusual for the Northern Counties has had a decided and beneficial effect on the colouring of these handsome foliage plants. They should be exposed to the full light, but it is often found advisable to shade lightly for a couple of hours during the hottest part of the day. The house should be thoroughly syringed and closed early in the afternoon, the shading removed, and full advantage gained from the heat of the sun. Extreme care must now be exercised with the management of the hot-water pipes: a minimum of 70 degrees will now suffice at night, and the pipes must not be overheated during the mornings, or the sun may easily cause much damage to foliage. Crotons are now growing freely, and those retained in small pots will require constant attention in the matter of top-dressings and watering.

ACALYPHAS.—The acalyphas are now developing their handsome foliage freely. The red and bronzy crimson leafage of A. Macafeeana adds a bold and distinctive appearance to any collection of foliage plants. This must now be afforded all the light available, giving but a very thin shade during the hottest part of the day. It enjoys an exceptionally robust constitution, and will freely respond to liberal treatment, thereby adding much to the quality of its foliage. If the stock is required for house decoration it will be found a distinct advantage to restrict the size of pot used for final potting, and frequent applications of chemical fertilisers must be given. Where large specimens are required a better plant is obtained with this particular kind if pots of from seven to nine inches in diameter are used, according to the size and strength of plants to be treated. Red spider and mealy bug are the most troublesome pests to deal with, and there must be frequent applications of insecticide to hold them in check.

ACALYPHA HISPIDA (SANDERIANA) may be treated similarly to the above, with the exception that as soon as the handsome long tassels of bright crimson flowers make their appearance the atmosphere must be kept considerably drier, and syringing overhead altogether dispensed with, or the ornamental flowering tails will not last long.

ALOCASIAS.—These will now need further top-dressing with some lumpy fibrous loam and peat, and a few lumps of charcoal and broken crocks to assist in keeping the soil sweet and porous. A few pieces of sphagnum moss dibbled in are always appreciated by the surface roots, and serve as a covering from drying sun, etc.; the sphagnum moss also serves the purpose of making the plant appear more decorative. Alocasias will now need abundance of heat and moisture, and on no account should they be allowed to suffer from dryness at the roots. The foliage at this season develops quickly, and will need careful attention to shading and ventilation. Owing to the exceedingly tender nature of the leaf stalks in their early stages these should be supported by a neat green stake and safely secured. Before the plants are used either for exhibition or decoration their general appearance may be much improved by a syringing over with soapy water.—John Donoghue, Bardon Hill Gardens.

THE FLOWER GARDEN.

BORDER CARNATIONS.—It is advisable to provide the flowering growths with the necessary support before they become too heavy; when allowed to remain too long without staking they grow bent, and are often snapped off when endeavouring to straighten them. The coil wire support is, perhaps, the best for many reasons: the work is done quickly, and when the flowers are required for cutting one has only to turn the stem off the coil. Brown bamboo canes are useful for the purpose, and inconspicuous; green raffia should be used for tying. Watering must be resorted to during dry weather, and great benefit is derived from frequently stirring the surface of the beds with the hoe. Where the buds are close and numerous, a few should be removed, as those left will produce finer flowers, and the spray will be more effective. No hard and fast rule can be laid down regarding disbudding; it has to be done at the discretion of the operator, who will see at a glance which should be removed.

ROSES.—An important point at the present time regarding the cultivation of roses is to prevent any damage being done by maggot or greenfly. A constant watch must be maintained to keep these pests in check, syringing with insecticide for the fly, and hand picking for the maggot. Where one has the advantage of a good pressure of water, it takes but little time to hose the plants in the evening, and this will greatly assist in keeping the foliage healthy. The young growths which are now being produced on the ramblers must be carefully tied in to prevent the wind from damaging them.

VIOLETS.—All runners should be picked off as soon as they appear, and the soil between the plants frequently stirred with the hoe. Good waterings will be necessary during dry weather, and the plants derive much benefit from being damped overhead every evening. This helps to keep red-spider down, which in some gardens is extremely troublesome.

PINKS.—It is necessary to propagate early to obtain a good stock of plants for next season, and as soon as the growths are of sufficient length they should be taken off for the purpose. The quickest plan is to slip the young shoots from the stem with a downward pull, and trim off the ragged ends and a few of the lower leaves with a sharp knife. A small frame should be prepared by placing a few inches of sand in it, and the cuttings may be dibbled in closely. Here they quickly form roots, if kept moist and shaded, after which the shading may be gradually dispensed with, and the light removed altogether. When the cuttings have become accustomed to full light and air, and well-rooted, they should be planted into nursery beds, where they will make good plants for autumn or spring planting.

ANNUALS.—A good supply of bloom for the autumn may be obtained by sowing the seeds now. The beds should be prepared as advised for earlier sowings, and the plants thinned in their young stages of growth. The early plants will require to be watered during dry weather or they quickly cease flowering, and supporting them must not be neglected.

MIXED BORDERS. — These are usually filled with a collection of herbaceous, biennial, and annual plants, and must not be confused with the herbaceous borders proper. Wallflowers, myosotis, silene, polyanthus, tulips, etc., are generally made use of to create an early display, and now these have finished flowering replanting the spaces must be taken in hand. The various annuals, such as asters, stocks, phloxes, zinnias, etc., which have been grown in frames, will come in handy for refilling the blanks caused by the removal of the spring flowers. Summer-flowering chrysanthemums will be found useful for the purpose, also the surplus plants from the general bedding. For the background dahlias, sweet peas, and tall sunflowers are effective.—E. C. Pooley, Gnaton Gardens.

FRUITS UNDER CLASS.

MUSCAT GRAPES. — Great attention should be paid now to the final thinning. Aim at keeping a good supply of berries at the top of the bunch, so that when ripe the bunch maintains its position when placed upon the table or show board. Mistakes are frequently made in over thinning, especially when a good set has been obtained. Do not overcrop, or the berries will fail to develop thoroughly, and if Muscats are not properly and thoroughly developed they never have that beautiful rich flavour for which this grape is distinguished. One bunch to a spur would, in most cases, be more than the vine could bear; at least, for several years in succession. One pound of fruit to a foot of rod is considered a very fair crop. Thinning should be taken in hand as soon as it can be determined which berries have set the best and which are the most useful. Supernumerary bunches are a great waste of energy. Great care should also be exercised that the points of the scissors do not pierce the berries, or a berry may have to be taken away and cause a gap. It is essential also that the stalks be cut short, as these, when left long, disfigure the otherwise smart appearance of the bunch. The temperature should be kept at about 70 deg., giving more and more air as the temperature rises, and diminishing it correspondingly in the afternoon; at the closing time give a thorough damping with the syringe, wetting every portion of the floors and walls; damp down again about 8.30 p.m. with soot water or liquid manure. A little air should be given early in the morning, at 6.30 a.m.

LATE GRAPES. — These must now be finally tied down to the wires, and the branches stopped; take out all laterals, and stop the shoot about two or three eyes beyond the bunch. The latter will in most cases be ready for final thinning by the time these lines are in print; take care that such varieties as Gros Colmar are well thinned. The bunches appear to look thin if berries are left an inch apart, but the grapes rapidly fill up the space, and it is much better for this type of grape for each berry to stand clear of its neighbour, as they then keep so much better. Alicante and Lady Downes require thinning evenly and expertly, as these are also late keepers. Afford plenty of water when the borders need it, and close the house as recommended for Muscats. It is imperative that a little ventilation be left on in hot weather, and this will practically prevent scalding. The temperature at night need not be more than 65 deg., and the merest circulation in the hot-water pipes will keep up this temperature.

FIGS.—When these are ripe, and are being gathered keep the house cooler by means of more air, but on no account allow the roots to become dry, or it will be at the expense of the second crop. As soon as the crop is finished the house may then be kept warmer, and more moisture used for the well-being of the second crop. Keep the branches pinched and the leaders tied in as occasion demands.

MELONS.—As soon as the early house is cleared give it a thorough washing with petroleum soap, and whitewash the walls. See that everything is scrupulously clean; make up another bed, and replant. In succession houses and frames keep the growths regulated, and set the fruits as they become ready for pollination. Sow seeds again for the latest batch, which should be ready for planting by the first week in August.

ORCHARD HOUSE.—Keep the growths well pinched, and do this regularly. Syringe copiously twice daily, and water well whenever necessary. Thin the plums for cooking purposes, so as to give those left more chance of becoming fine specimens for the dessert table. Thin peaches and nectarines finally. —W. A. Cook, Leonardslee Gardens.

Kalmia glauca. — Compared with the well-known Kalmia latifolia, this is quite a small growing kind, forming as it does a neat growing little bush, usually from eighteen inches to two feet in height. The flowers are bright rosy-red, and borne in terminal heads in the early part of the month of May. The leaves are only about an inch long, dark-green above, and glaucous underneath. This Kalmia, which is a native of Canada, and some of the North-Eastern States, is well suited for association with the smaller growing members of the ericaceæ, such as the heaths, ledums, the lesser azaleas, and others of this class. Like most of its allies, it needs a fairly moist, but not water-logged soil, while the presence of lime is injurious to it.—W. T.

HANLEY PARK, STAFFORDSHIRE.
JULY 5th and 6th, 1911.
FIFTEENTH GREAT
ANNUAL FLORAL FETE.

£650 in Prizes, Silver Cups, Gold and Silver Medals.
Silver Challenge Cup, value £10 10s., offered for TRADE EXHIBIT.
(For particulars see page 8 in Schedule.)
Valuable Special Prizes offered by the Principal Firms in England.
Schedules post free on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

RICHMOND HORTICULTURAL SOCIETY.

THE THIRTY-SEVENTH ANNUAL SHOW will be held in the Old Deer Park, Richmond, Surrey, on WEDNESDAY, 28th June.

Silver Challenge Cups, Gold and Silver Medals, upwards of 300 Money Prizes.

W. J. COOK, Hon. Sec., Holmsley, Richmond, Surrey.

SHREWSBURY GREAT FLORAL FETE.
AUGUST 23 and 24, 1911.

£1,200 in Cash Prizes.

Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs.,
Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The exhibition held on the day following Whit Monday was of moderate dimensions and moderate quality, while the attendance was small. We have previously uttered a mild protest against exhibitions at Westminster on a day following immediately on a Bank Holiday, but without effect; many exhibitors would gladly stay away, but as the hall is open they do not care to leave all the business to others, and so they bring up a group and grumble at the lack of visitors, and, in this case, at the heat as well.

Hardy flowers, orchids, and roses were the chief features of the meeting

FLORAL COMMITTEE.

The display of pæonies from Messrs. R. H. Bath, Wisbech, was very pleasing to the eyes as the abundant and beautiful flowers toned from purest white through cream, blush, and pink to soft crimson. Solfaterre was a particularly pleasing cream-white. To beautiful colour and form was added lovely fragrance.

The leading features of the group from Messrs. G. Bunyard and Co., Maidstone, were the graceful heucheras in variety, some delphiniums, Oriental poppies, and some lovely ixias.

Messrs. Wm. Cutbush and Son, Highgate, had in their exhibit of carnations some especially fine specimens of Frank Galsworthy, Lady Coventry, Alma Ward—a fine white, Queen Mary, Mikado, Marquis of Tweeddale, and O. P. Bassett.

Messrs. Whitelegge and Page, Chislehurst, presented a pleasing and interesting display of hardy flowers; their two little rock gardens were gay with Dianthus Napoleon III., Saxifraga pyramidalis, bronze antirrhinums, etc.; heucheras were very well shown in large bunches in tall glasses, the forms of H. sanguinea being especially graceful; Delphinium Persimmon was another fine thing in this group.

Mr. J. Box, Lindfield, Sussex, was responsible for an effective contribution of Oriental poppies, the salmon-coloured Mrs. Perry being very fine, and largely shown; these were backed by tall stands of long-spurred aquilegias, flanked by single and double pyrethrums, and edged with violas and a fine box of the showy Incarvillea Delavayi.

Mr. Amos Perry, Enfield, showed a lovely collection of irises in novel style. A host of tiny hardy ferns, chiefly tasselled forms of the Lady fern, formed a soft green bed, out of which the iris spikes (set in concealed vases of water) rose erect and stately. It is difficult to particularise in such a fine lot of varieties, but just a few that attracted our attention were pallida Beatrice, Bronze Beauty, Perfecta, Gold Crest, Sweetheart, Ada, Foster's Yellow, Queen of May, Sympathy, Albert Victor (a noble pallida form), Mrs. Newbronner (rich yellow), Standard Bearer, Oriflamme — a glorious variety, Herald, Sincerity, and Mdme. Patti.

Messrs. Kelway and Son, Langport, brought up a collection of pæonies, single and double, and a set of single and double pyrethrums; the hot weather had somewhat affected the pæonies during their journey from Somersetshire; good double pæonies were Lord Curzon, Leonard Kelway, Media, Addison, and Princess Beatrice, while good singles were Cherry Ripe, Lady Helen Vincent, Her Grace, Princess, and the dark crimson Millais. The white double pyrethrum named Aphrodite, with long graceful guard florets, was a notably good thing in the Langport group.

Messrs. W. and J. Brown, Peterborough, presented some very good bunches of Achillea Grassi, the pink and rose Lupinus Moorheimi, the brilliant Heuchera sanguinea splendens, Lilium umbellatum, L. Sovitzianum, the large yellow gaillardia Lady Rolleston, and pot plants of Dianthus Napoleon III., and the good old Trachelium cœruleum, the latter a useful greenhouse plant.

Phyteuma comorum, the white form of Ramondia pyrenaica, Dianthus alpinus, Anemone alpina sulphurea, hardy cypripediums, edelweiss, alpine campanulas, and free-flowered azaleas of the anemone group were the leading features in the exhibit from Mr. G. Reuthe, Keston, Kent.

Messrs. Barr and Sons, Covent Garden, were represented on this occasion by a display of irises of the germanica group; Perfection, Maori King, Bridesmaid, Dalmarius (new soft lavender), Queen Alexandra, Rhein N[illegible] Black Prince—very fine deep colour; Nie[illegible]lungen, copper and purple; Cordelia, very handsome blue and purple, and King of Iris, gorgeous in gold, copper, and crimson, were a few of the best.

A particularly fine specimen of the graceful Utricularia montana was shown by Mr. Downes, gardener to J. T. Bennett-Poe, Esq., M.A., V.M.H., Holmwood, Cheshunt.

The roses from Messrs. B. R. Cant and Sons, Colchester, included rambling varieties that backed up bunches of Dr. J. [illegible] Hall, Killarney, Mdme. Alfred Carrière, Betty, Joseph Hill, Aimee Cochet, and other lovely varieties

Messrs. Stuart Low and Co., Enfield, associated nephrolepis fronds with their carnation flowers; good varieties of the latter were Roseate Dawn, May Day, C. P. Little, a new yellow, Royal Purple, and Sunset. Hydrangeas were also well shown by this firm.

A fragrant, compact double white stock named New White Winter, was shown by Mr. Ernest Benary, Erfurt; the flowers were [illegible] extraordinary in size or spike, and the variety did not appeal to us.

Messrs. G. and A. Clark, Dover, filled the table across the top end of the hall with hardy flowers, but their grouping was too low to be really effective. Pyrethrums were in great force, and so were German or flag irises, Siberian irises, Oriental poppies, Heuchera Edge Hall, Geum John Bradshaw, G. Mrs. Bradshaw, delphiniums, lupins, p[illegible], and trollius.

The long-spurred aquilegias from Messrs. Dobbie and Co., Edinburgh, were very beautiful, and were presented in a rare range of colours: crimson and yellow, white and pink, and slate, cream and purple, yellow and pink, and [illegible] and blue were a few of the delightful [illegible] combinations; the sweet peas shown in [illegible] the fine new Melba, Masterpiece, Edrom Beauty, Mrs. Cuthbertson, and Elfrida Pearson.

Show pelargoniums from Messrs. H. Cannell and Sons, Swanley, were reminders of the value of these showy plants for greenhouse and conservatory decoration; Countess, Lady Treloar, Alice Hayes, Admiral Beresford, Dainty, and Royalty were varieties that greatly appealed to us.

Mr. C. Blick, Hayes, Kent, showed a fine lot of carnations, and specially good were Lady Hermione. Lieut. Shackleton, Enchantress, Skirmisher, White Perfection, Nell Gwynne, and Beacon.

Oriental poppies from Messrs. Bakers, Wolverhampton, made a rare blaze of colour; Mrs. Perry, Mahony, Lady Roscoe, White Queen, Beauty of Livermere, and Prince of Orange were all very showy, while the lupins and irises were scarcely less effective.

Messrs. George Mount and Sons, Canterbury, had a lovely lot of roses, and set up large stands of Lady Hillingdon, Mrs. G. Shawyer, Mrs. John Laing, and Frau Karl Druschki, as well as the smaller vases of other varieties.

Eremurus robustus overtopped everything else in the group of hardy flowers from Messrs. T. S. Ware, Lim., Feltham, but the towering spikes did not subdue the colours of pæonies, gaillardias, pyrethrums, erigerons, campanulas, and hardy orchids.

Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, presented a small group of old-fashioned varieties of scented-leaved pelargoniums, and these, though small-flowered, were very beautiful; the varieties exhibited were Little Pet, Pretty Polly, Chiswick, and Countess of Devon.

Other contributions included standard fuchsias, nephrolepis, and fragrant heliotropes from Messrs. H. B. May and Sons, Edmonton; spotted and self gloxinias from Messrs. J. Peed and Sons, Norwood; varieties of Primula obconica from Mr. L. R. Russell, Richmond; pyrethrums from Mr. G. W. Miller, Wisbech; St. Brigid Anemones from Messrs. Reamsbottom and Co., Geashill, King's Co., Ireland; dahlias, etc., from Messrs. Carter Page and Co., London Wall, and hardy flowers from the Guildford Hardy Plant Company.

ORCHID COMMITTEE.

Messrs. J. and A. A. McBean, Cooksbridge, Sussex, had a lovely lot of Miltonia vexillaria with fine spikes of Odontoglossum crispum, good forms of Cattleya Mossiæ, Lælia purpurata, etc.

Lælio-cattleya Farrantia, as shown by Mr. Francis Wellesley, Westfield, Woking, was very effective.

Sir Trevor Lawrence's Cattleya Mossiæ Aureola, with a fine yellow lip, secured an Award of Merit, but his L.-c. Fascinator x Mossiæ did not pass muster.

Mr. W. J. Stables, gardener to De Barri Crawshay, Esq., Sevenoaks, brought up several fine odontoglossums, and some new odontiodas, the best of the latter were O. Rosefieldiense and O. Ganymede, the latter an O. elegans cross of considerable beauty.

Messrs. Sander and Sons, St. Albans, had Phaius Cooksoniæ in good form, a dozen fine flowers on a Lælio-cattleya Canhamiana, the rare Ornithocephalus grandifolius, the pretty Ærides Houlletiana, Odontoglossum Thompsoni, Phalænopsis Rimestadiana, and the wee little Masdevallia O'Brieniana.

Mr. Hale, gardener to S. Larkin, Esq., Haslemere, presented a small group of orchids wherein Phalænopsis Rimestadiana, varieties of Cattleya Mossiæ, Lælio-cattleya Canhamiana, Odontoglossum Pescatorei, O. excellens, and Renanthera Imschootiana were effective.

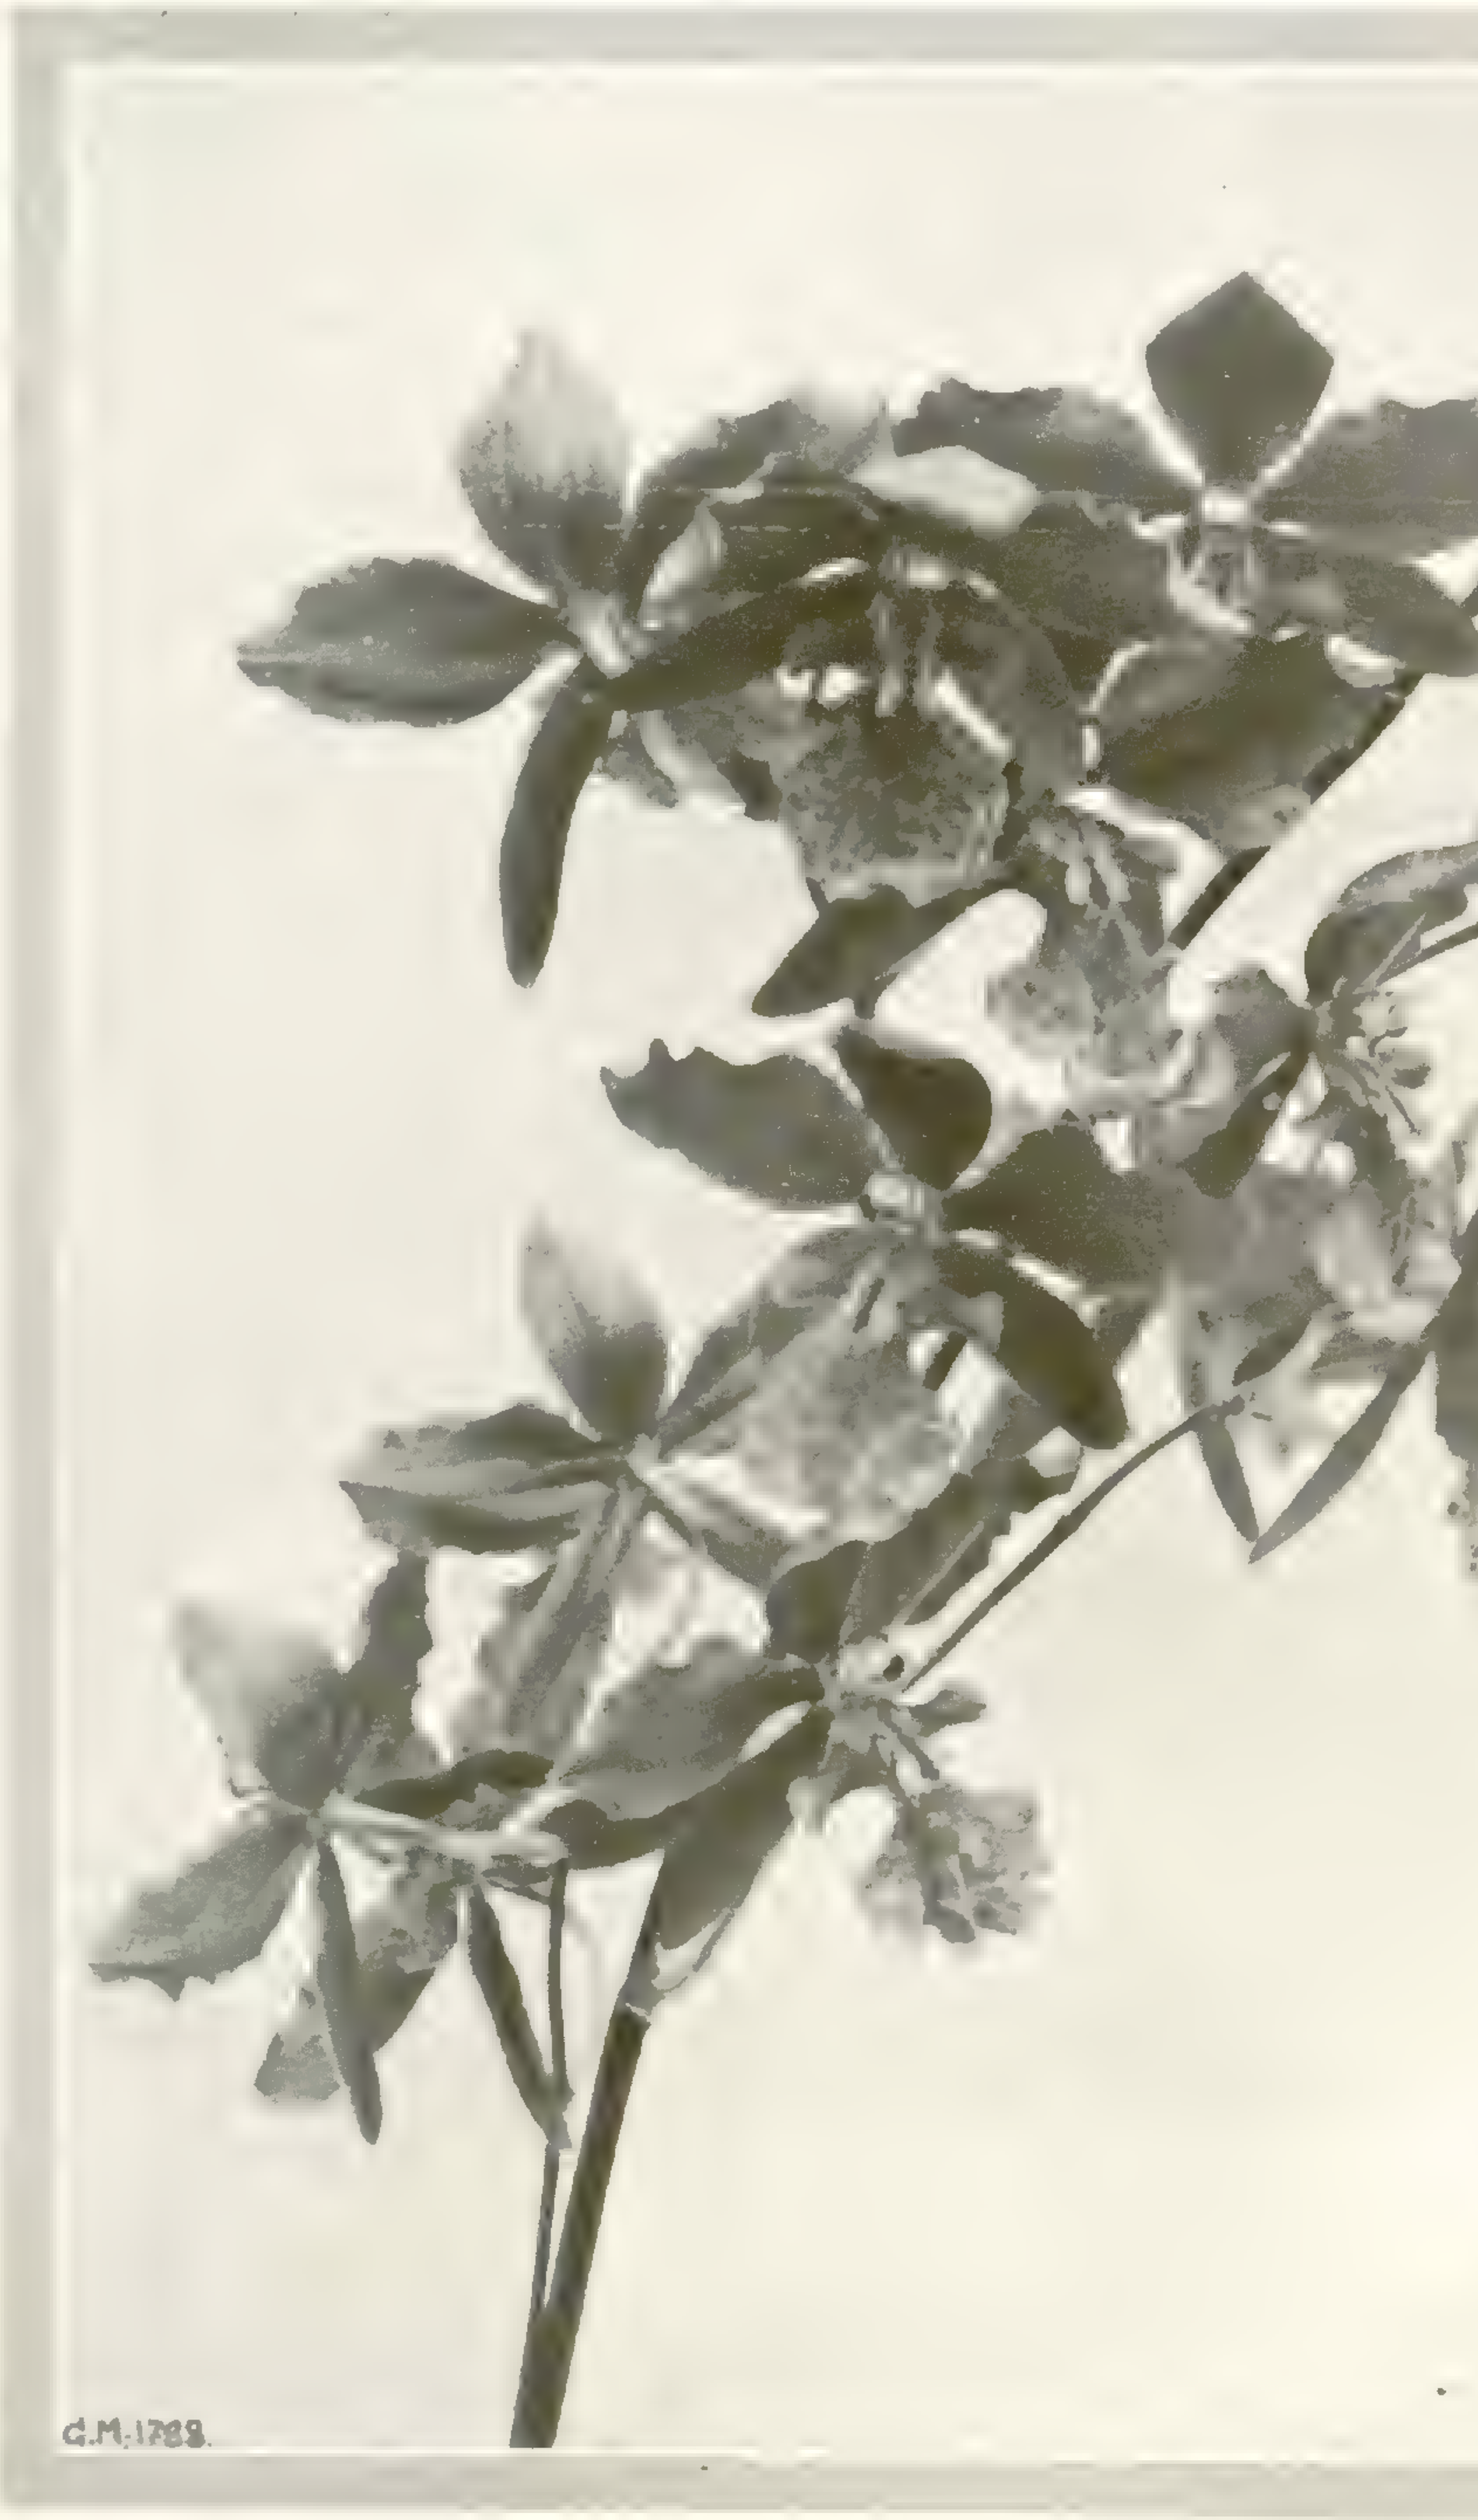
Oncidioda Cybele (A.M.), a very interesting cross between Cochlioda Noetzliana and Oncidium sarcodes was prominent in Messrs. Charlesworth and Co.'s group of orchids; here also were fine plants of Lælio-cattleya Canhamiana, L.-c. Fascinator, L.-c. Aphrodite, Odontoglossum Jasper, O. Lambeauianum, and the splendid Odontioda Charlesworthi.

Messrs. Stuart Low and Co., Enfield, had a quite good show of orchids, the varieties of Cattleya Mossiæ showing up conspicuously, here also were Odontoglossum Pescatorei, Cœlogyne pandurata, Miltonia Queen Alexandra, Lælio-purpurata in variety, Odontioda Bradshawiæ, and the very fragrant Odontoglossum citrosmum.

White-petalled forms of Cattleya Mossiæ made a good central feature in the group from Messrs. Hassall and Co., Southgate; all around these were coloured forms of C. Mossiæ, with L.-c. Canhamiana and Brasso-cattleya Veitchi.

Mr. E. V. Low, Vale Bridge, Haywards Heath, had a pretty and pale form of Lælia purpurata, Cœlogyne pandurata, forms of Cattleya Parthenia, and two plants of the sensitive Bulbophyllum barbigerum, but not a single plant was labelled.

In Messrs. Armstrong and Brown's orchid exhibit from Tunbridge Wells, Brasso-lælia Veitchi was very effective; Cœlogyne pandurata attracted considerable attention, and Renanthera Imschootiana gave a bit of brilliant colouring; odontoglossums were freely shown, and there was a plant of Pescatorea cerina.



ONCIDIODA CYBELE.
A remarkable hybrid between Oncidium sarcodes and Cochlioda Noetzliana. Flowers bright brown and yellow. A.M., R.H.S., June 6. Messrs. Charlesworth and Co., Haywards Heath.

FRUIT COMMITTEE.

Figs in pots, from Messrs. Stuart Low and Co., Enfield, carried good crops, notably the varieties St. John's, Pingo de Mel, and White Marseilles.

Messrs. Le Laicheur and Sherris, The Flower Farm, Henfield, Sussex, sent a dozen and a-half fruits of an unnamed melon, and Miss Dixon, Westergate, Chichester, contributed a small collection of melons.

AWARDS OF MERIT.

No First-Class Certificate was awarded on this occasion.

Award of Merit.—To Heuchera sanguinea Nancy Perry, and to Iris variegata Miss Eardley, from Mr. Amos Perry, Enfield; to Grevillea robusta compacta, from Mr. R. B. Leech, Woodhall Gardens, Dulwich; to Primula pulverulenta Hidcote strain, from Lawrence Johnston, Esq., Campden, Glos.; to Crinum Johnstoni, from Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking; to Cattleya Mossiæ Aureola, from Sir Trevor Lawrence (grower, Mr. W. A. White); and to Oncidioda Cybele, from Messrs. Charlesworth and Co., Haywards Heath.

MEDALS.

Silver Flora.—To Messrs. J. and A. McBean, Cooksbridge, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Mr. C. Blick, Hayes, for carnations; to Mr. J. Box, Lindfield, for hardy flowers; to Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; to Messrs. G. and A. Clark, Dover, for hardy flowers; to Messrs. H. B. May and Sons, Edmonton, for ferns and fuchsias; to Messrs. G. Mount and Sons, Canterbury, for roses; to Mr. Amos Perry, Enfield, for irises; to Messrs. R. H. Bath, Lim., Wisbech, for pæonies.

Silver Banksian.—To Messrs. Bakers, Codsall, for Oriental poppies, etc.; to Messrs. H. Cannell and Sons, Swanley, for pelargoniums; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. W. Cutbush and Son, Highgate, for hardy flowers; to Messrs. Dobbie and Co., Edinburgh, for aquilegias and sweet peas; to Messrs. Kelway and Son, Langport, for pæonies and pyrethrums; to Messrs. Stuart Low and Co., Enfield, for carnations, etc.; to Messrs. J. Peed and Son, Norwood, for gloxinias; to Mr J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, for scented-leaved pelargoniums; to Mr. S. Larkin, Haslemere, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; and to Messrs. Whitelegge and Page, Chislehurst, for hardy flowers.

Bronze Flora.—To the Guildford Hardy Plant Co., for hardy flowers.

Bronze Banksian.—To De Barri Crawshay, Esq. (gardener, Mr. Stables), for orchids; to Messrs. W. and J. Brown, Peterborough, for hardy flowers, etc.; to Messrs. Carter Page and Co., London Wall, for dahlias, etc.; to the Misses Hopkins, Shepperton, for hardy flowers; to Messrs. Jackman and Son, Woking, for hardy flowers; to Mr. G. Reuthe, Keston, for hardy flowers; to Mr. L. R. Russell, Richmond, for primulas; to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; to Miss C. M. Dixon, Chichester, for melons; to Messrs. Le Laicheur and Sherris, for melons.

Kew Guild.

The annual meeting of the Kew Guild was held on May 24 at the Tavistock Hotel, Covent Garden, under the presidency of Mr. R. Hooper Pearson. The meeting followed after a dinner, at which nearly one hundred Kewites sat down.

Great good fellowship prevailed, and, while there was plenty of straight talk at the business meeting—indeed it was the liveliest meeting of the series—no ill-feeling was shown. Everyone was pleased that the old function of an annual dinner had been revived, after a brief lapse. In connection with the Guild accounts there were many, notably the younger present Kewites, who considered the Guild had no liabilities concerning life subscribers, and therefore there was no need to place the life subscriptions on the liability side of the balance-sheet. Old Kewites who are life subscribers should keep their eyes on this matter, or they may find themselves called upon for annual subscriptions, notwithstanding they have previously compounded. As there was no "Annual" in 1910, subscriptions were in many cases not paid, consequently the annual income did not meet the annual expenditure.

There was an "Irish Question" forward; about a score of Kewites in the Sister Isle are anxious to form an Irish branch of the Guild, and they suggest a strong forward policy and the creation of a kind of employment bureau, but these matters were all presented to the committee for consideration, and to be reported upon at the next annual meeting.

Mr. R. Hooper Pearson, in proposing "The Guild," made an excellent speech, in which he eulogised the work of Old Kewites in all parts of the Empire, and gave encouragement and advice to the present Kewites, and urged them to do all they could to maintain the prestige of Kewites. He made a strong point of increased educational facilities at Kew, and pointed out that, whereas at various horticultural colleges theoretical and scientific studies were being strongly backed up by horticultural practice, at Kew the practical work, which was of exceptional value, was not backed up in equally vigorous fashion by a full course of study. At present, Kew men occupied an unique position in the horticultural world, but if such position was to be maintained by future Kewites then the Kew authorities must move with the times, or the leading positions would be filled from students at horticultural colleges rather than from Kew. "The Guild" was toasted with great enthusiasm, and a great reception was accorded the toast of "The Chairman," proposed in able and pleasing fashion by Mr. W. Watson.

Mr. Hillier, Mr. Briscoe, and others rendered musical items during the meeting, and the proceedings closed at a late hour, many Old Kewites having to leave at various times during the evening to catch trains for distant parts of the kingdom.

Bath and West and Southern Counties Agricultural Society.

The annual show of this society opened at Cardiff on Tuesday, May 31, and continued until Whit Monday. It was a grand show, and the opening day was glorious so far as the weather was concerned. The horticultural section is now a feature of considerable interest and importance. It is by way of being unique, in that no schedule of classes is issued, no awards of any kind are made, but nevertheless the available space was on this occasion filled to the crowding point with exhibits of a very high order of merit. The thought crossed our mind as we strolled through the big marquee that it would be by no means difficult for this society if so inclined to extend the horticultural section, and make it not only a more important feature but a flower show that would take rank among the best fixtures in the country.

Messrs. W. Cutbush and Son, Highgate Nurseries, brought down from London a remarkably fine collection of carnations, rambler roses, and foliage plants, which were grouped across the end of the marquee in that tasteful manner which has become familiar as the particular style of the firm. Dwarf plants of Orleans rose, Jessie, and Mrs. W. H. Cutbush, made a groundwork, above which the tall stands filled with such carnations as Britannia, Lord Charles Beresford, The Queen, and King Arthur displayed their charms to the full.

At the opposite end of the tent Messrs. R. Veitch and Son, Exeter, built up a group of miscellaneous plants and flowers that comprised subjects of outstanding merit both in the way of hardy border and rock plants and in ornamental shrubs. The latter were used mainly as a background, and were carried almost to the top of the tent, providing a capital foil to the gorgeous colours of rhododendrons, azaleas, roses, and dwarfer herbaceous subjects in the foreground. A dripping well and pool of water added charm and provided a suitable environment for such things as Primula Unique, P. Cockburniana, sarracenias, Ramondia pyrenaica, Ourisia coccinea, and a variety of equally interesting things.

Ferns suitable for glasshouse or dwelling were tastefully displayed by Mr. H. N. Ellison, West Bromwich, a few well-grown young Dicksonias being prominent, as also were plumose forms of nephrolepis. Hybrid gerberas in delightful colours were also shown by Mr. Ellisoa. Alpine plants and border flowers were well shown by Messrs. H. and W. Evans, Hardy Plant Nursery, Llanishen. Encrusted saxifragas, Onosma taurica, dianthuses, and a few sedums were backed up by heucheras, iris, pyrethrums, etc.

Mr. J. Milburn, Victoria Nursery, Bath, was another exhibitor of alpines, his collection being particularly pleasing by reason of the freedom with which choice little gems were blooming. Messrs. Jarman and Co., Chard, showed their well-known centaureas, which were in fine form for so early in the season. A bright lot of zonal pelargoniums and some carnations were also well staged by this firm. Mr. Frank Lilley, Guernsey, made a bright display with ixias, irises, sparaxis, and other seasonable bulbous flowers.

Border flowers, such as pyrethrums, Oriental poppies, aquilegias, etc., came from Messrs. Rich and Co., Bath. Messrs. A. A. Walters and Son, Bath, set up a big bank of rambler roses, including beautifully-grown plants of Dorothy Perkins, Lady Gay, Hiawatha, Aennchen Muller, and other favourites. Pyrethrums were the great feature of a big bank of flowers from Mr. Wm. Treseder, Cardiff. The flowers were well grown, bright, and fresh, and the varieties of the best. Lupinus arboreus, in several new varieties, and hybrid aquilegias were also well shown, a background of roses competing a group which worthily upheld the fame of the Cardiff growers. Messrs. Garaway, of Bristol, staged their excellent strain of schizanthus in a manner that claimed the admiration of every visitor. Mr. W. J. Godfrey, Exmouth, continued his efforts to revive the popularity of the fancy pelargonium by exhibiting a big collection of choice varieties. We commend Mr. Godfrey for his enterprise, and are confident his object will be achieved.

Messrs. John Waterer and Sons, Lim., Bagshot, Surrey, showed rhododendrons in their own inimitable style. Lady Eleanor Cathcart, Pink Pearl, M. Waterer, and Gomer Waterer were just a few of the more striking varieties. Messrs. Cooling and Sons, Bath, showed rambler roses in the form of pillars and weeping standards, together with clematis, azaleas, early gladioli, and other seasonable flowers. A glorious bank of begonias came from Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath; Mrs. J. Whalley, Pink Pearl, Mrs. Ainslie, and Duchess of Cornwall being a few names taken at random of varieties that displayed exquisite form and colour.

Weeping standards and pillars of American Pillar, Lady Gay, Lady Godiva, and other teas, such as Florence Pemberton, Dorothy Page Roberts, and Madame A. Hewetson, were superbly shown by Messrs. Paul and Son, The Old Nurseries, Cheshunt. A group of perpetual carnations came from Messrs. Young and Co., Hatherley, Cheltenham; their new variety Duchess of Devonshire, the popular Enchantress, and Lady Audley Nield were well represented. Orchids from Messrs. J. Cypher and Sons, Cheltenham, provided a distinct feature of the show, and naturally were much admired and commented upon.

A big but rather densely-packed group of stove and greenhouse plants was brought by Mr. Farmer from the Marquis of Bute's gardens, Cardiff Castle; crotons and liliums, Spiræa Peach Blossom, heliotropes, verbenas, etc., were all nicely arranged, so far as blending of colours went, but the group was rather formal.

ANSWERS TO CORRESPONDENTS.

NAMES OF HARDY FERNS.—S. P. R., Fulham: It would certainly have been more helpful had the "Kew Hand List of Ferns and Fern Allies" indicated which generic titles still in common use are included under the several genera of hardy ferns therein given. In your list No. 1 should be polypodium; Nos. 2 and 3 are correct; No. 4 should be nephrodium, according to Kew; Nos. 5 and 6 are correct, but No. 7 should be a nephrodium, and N. dilatatum is given as a variety of N. spinulosum; No. 8 is correct, but No. 9 should be Nephrodium montanum. Aspidium angulare is a sub-species of A. aculeatum, but is regarded as a distinct species for garden purposes. You will find good botanical descriptions of British species of ferns in Hooker's "Students' Flora of the British Isles" (Macmillan and Co.). Many thanks for your congratulatory letter.

FERTILISERS FOR APPLES.—H. C., Taunton: As the trees were not overtaxed last year, and as they have been well cared for in the matters of pruning and spraying, they are not likely to need much assistance in the production of this year's crop. However, if the crop promises to be a heavy one, and the trees seem to need assistance, give a dressing of 4lb. of superphosphate and 2lb. of kainit per square rod, adding 1lb. of nitrate of soda per square rod if the trees are not making good growth. Spread the dressing regularly after a thorough mixing, and hoe it into the soil.

PYRETHRUMS.—J. R. K., Stocksfield: The collapse of the flowers is due to some severe check, probably at the roots. Extreme drought may be the cause, but we are inclined to think that grubs or wireworms at the roots of the plants have also had a part in bringing about the collapse. Lift and examine the roots of one or two of the affected plants, and you will then probably find a clue to the trouble.

NAMES OF SPECIMENS.—T. I., Byfleet: The specimens were duly named when received, but pressure upon our space in previous issues squeezed out several answers relative to plant names, yours among them, but you will have seen the answer in our issue of June 3.

ARTIFICIAL MANURES.—S. B., Swindon: We have drawn attention to this matter on previous occasions. A complete explanation of the method of valuing artificial manures so as to ascertain their true commercial value is given in Leaflet 72, issued by, and to be obtained on application to, the Board of Agriculture, Whitehall Place, London, S.W., and gardeners and farmers should consult this leaflet in order to see whether the price of the manure, having regard to cost of carriage and terms of payment, is approximately equal to the value of the fertilising constituents which the manure is stated to contain. When wide discrepancies are disclosed no purchase should be made; the chances are that the manure would be dear at any price. Apart from lime, which may be purchased at from 10s. to 18s. per ton in most localities, there are three constituents, and only three, which should be taken into consideration in arriving at the value of artificial manures, viz., nitrogen, phosphates, and potash. These are the constituents which an artificial manure is intended to supply to the crop, and any statements as to its value in other directions should be ignored.

NATIONAL TULIP SOCIETY.—S. W., Shoreham: The hon. secretary of the National Tulip Society is Mr. W. Peters, Farcet House, Cambridge. Subscriptions are from [illegible] upwards per annum.

ASPARAGUS BEDS.—T. G. C., Dunstable: By the middle of the month, when cutting should cease, give the beds a good watering, and follow this with a thorough soaking of fairly strong liquid manure. Diluted farmyard or stable drainings make a suitable dressing. Make arrangements for supporting the growth by placing cords around and also zig-zag fashion across the beds. Give two or three good waterings with liquid manure during the season of growth, the aim being to secure tall, strong stems, and thus enable the crowns below to form strong buds to provide a crop for the following season.

RHODODENDRON LUSCOMBEI.—A. B., Reading: R. Luscombei was raised by crossing R. Fortunei with R. Thomsoni; it flowers towards the end of April in the south-west of London and the large blooms are rich rose colour.

BIENNIALS.—M. L., Northampton: June is the best month in which to sow biennials; an article on this subject appears in the present issue.

YELLOW CINERARIA.—P. D. D., Cork: The yellow cineraria, like the yellow sweet pea is yet to seek, but there is a yellowish variety which shows quite a yellow shade just as the buds open, but the colour quickly fades to white. This is called Cineraria flavescens, and is the result of crossing Cineraria Feltham Beauty with Senecio auriculatissimus.

NAMES OF PLANTS.

R. C., Nottingham.—1, Geum coccineum; 2, Thalictrum purpureum; 3, Aster alpinus; 4, Kerria japonica fl.-pl.

M. E. H., Warminster.—1, Linum arboreum; 2, Camassia Cusicki; 3, Polemonium cœruleum; 4, Dianthus alpinus.

G. S., Ryde.—1, Asperula odorata; 2, Corydalis lutea; 3, Cochlearea officinalis; 4, Thalictrum minus; 5, Saxifraga hypnoides.

F. G., Manchester.—1, Oncidium concolor; 2, O. Marshallianum; 3, Cattleya Skinneri; 5, Adiantum polyphyllum; 6, Gazania ringens.

A. E., Winkfield.—1, Streptosolon Jamesoni; 2, Impatiens Sultani; 3, Lavendula dentata; 4, Cyperus alternifolius; 5, Ophiopogon Jaburan; 6, Carex brunnea; 7, an aloe, species not recognised.

Ransomes, Sims, and Jefferies, Lim., Ipswich. — This well-known firm have issued a prospectus inviting subscriptions for 133,334 5½ per cent. cumulative preference shares of £1 each at par, and for £166,667 4½ per cent. first mortgage debenture stock at 99½ per cent. The business was founded in 1789, and to the majority of our readers the firm is principally known as manufacturers of lawn mowers and rollers; but it appears from the prospectus that the manufacture of lawn mowers is only an adjunct, although a valuable one, to the more important departments of the company's business, which includes the manufacture of ploughs, agricultural machinery, portable, traction, and other steam engines, and of thrashing machines, the export of which is now even more important than the home trade, so much so that they have a branch at Odessa, as well as distributing agencies in nearly every part of the world. The auditors to the company certify that the average profits earned for the past ten years amount to no less than £63,018, which would have been sufficient to pay the interest on the debenture stock now being issued more than five times over, and that the surplus, after deducting the debenture interest, would have been sufficient to pay the interest on the preference shares more than four times over. The interest in the stock and shares now offered to the public, therefore, seems well secured. The proceeds of the present issue are intended to be applied partly in paying off existing debentures and loans; partly in recouping to revenue account moneys advanced thereout for capital purposes; and partly in the extension of the company's works and as additional working capital. The subscription list closes on Saturday, the 10th inst.

Say for instance you want to spray the undersides of Roses—Well then you merely turn the syringe until the word "Spray" (clearly engraved on the nozzle) appears uppermost. Bend up the nozzle at the knuckle joint to the required angle, and there—in a second—without the removal or addition of a single fitment you have exactly what you require, and the spray is the very finest of the fine.

To use the rose for watering, you turn the word "Rose" (engraved on the other side of the nozzle) uppermost, and its there, waiting.

Every Syringe is Lettered by the Inventors, individually Numbered and Guaranteed.

Situations Wanted.

GARDENER (Head, where several are kept); thoroughly experienced in all branches, Inside and Out; Grapes, Peaches, Melons, Stove and Greenhouse Plants; 4½ and 11 years' excellent references as head; married, family out. E. STONE, 13, Coniston Road, Addiscombe, Croydon, Surrey.

GARDENER (Head Working).—H. ESSAM can with confidence recommend his Foreman, where several are kept; life experience in all branches; age 30; married when suited; excellent references. Address Clovee Hall, Gisburn, Clitheroe.

GARDENER (Head Working, where three or more are kept).—Mr. LAST, The Gardens, Homewood, Chislehurst, Kent, can with every confidence recommend his Foreman, W. WAITE, as above; 13 years' experience, gained in good establishments; five years present situation. Married when suited.

GARDENER (Head Working, where two or more are kept); good all round; 14 years as head in large and well-kept establishments; married; age 40; excellent references. E. MAYLETT, Park Hall, Salford Priors, Evesham.

GARDENER (Head Working), life experience in all branches; land and stock if required; age 47; excellent character. WILLIAM MASKELL, School House, Lovel Road, Winkfield, Berks.

GARDENER (Head Working).—Mr. GOULD, Shernfold Park, Frant, Sussex, highly recommends his Foreman, A. DAY, as above; thorough practical experience Inside and Out; excellent references; age 30.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here six years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working, where two or three are kept; life experience; age 36; married; good reference. HALES, 8, Ivy Terrace, Old Church Road, Romford.

GARDENER (Head Working, of two or three).—Mr. Clarke, Oakwood Gardens, Bath, highly recommends his Foreman, G. Longman, as above; 16 years' practical experience; age 29; married when suited. Apply LONGMAN, Stoney Stoke, Bruton.

GARDENER (Head Working, where two or three are kept); life experience Inside and Out; good references; disengaged 29th; age 38; married, no family. C. DOMAN, The Gardens, Thornes Beach, Beaulieu, Hants.

GARDENER (Head Working, where two; three, or four are kept); 20 years' experience Inside and Out; age 35; married; two children; youngest six. H. TEER, The Gardens, Bark Hart, Orpington, Kent.

GARDENER (Head); good Single or Fruit Gardens Manager; Budder, Grafter, Pruner, Cucumbers, Melons, Vines, Chrys., Bedding Plants, Roses, Mushroom, ridge or flat; Kitchen, Lawn, Flower Garden. Special Prize 1910. W. BLOOMFIELD, Staplehurst, Kent.

MR. SALTER, The Gardens, Avenue House, Church End, Finchley, highly recommends W. BICKER as GARDENER (Single-handed, or with help); experienced Inside and Out; at present in his employ; age 28; Eastern Counties preferred.

GARDENER (good Single-handed or otherwise); life experience; good all-round Man in all branches; age 45; married, one child; would take very moderate wage with cottage for a comfortable place. Excellent testimonials; willing to be useful. F. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER (Single-handed, or with help) seeks SITUATION; 14 years' experience; good references; age 27; married, no family. BISHOP, Stockwell Hall, Billericay, Essex. (No circulars.)

GARDENER (Single-handed or Second) seeks SITUATION; understands Fruit, Flowers, Vegetables; age 25; single; good references; seven years last place. STRUTT, 70, Croft Street, Ipswich.

FOREMAN (General), age 30; 18 years' experience in Stove and Greenhouse Plants, Fruit, and Carnations; good references. A. HAYES, 22, St. Nicholas Street, Droitwich, Worcestershire.

GARDENER, with thorough knowledge and experience of growing Fruit, Flowers, and Vegetables, Outside and under glass, Tree and Malmaison Carnations, Orchids, requires Situation; nine years present situation as Head. Apply, HORTICULTURIST, care of Mr. Collins, 88, Catherine Street, Reading.

GENTLEMAN can highly recommend JOURNEYMAN; six years in present place; age 20; Inside or Inside and Out; Bothy preferred. Address E. EASON, Merriott, Crewkerne, Somerset.

GARDENER (Under) seeks SITUATION, where 3 or 4 are kept; well up Inside and Out; 7 years' experience; age 21; excellent references. H. F., Ladds House, Sandhills, Witley, Surrey.

TO FLORISTS and FRUITERERS.—Disengaged MANAGER requires situation; seven years' experience; good salesman, window dresser, and maker-up; excellent references. CUSSONS, care of Rennison, Low Bondend, Knaresborough.

IMPROVER in the Houses.—Gardener's son; age 20; 5 years' experience; live in Bo premium given. C. BLYTH, Penrice Gardens, Austell, Cornwall.

YOUNG MAN (22) seeks SITUATION (In side and Out); seven years' experience years present situation; good references. W. WH The Gardens, Briggin Park, Roydon, Ware, H

Situations Vacant.

WANTED a young Scotch Gardener, where garden boy kept and help given; wages commencing 21s., with good cottage, coal, and tables. Write in first instance, with age and particulars, HEMMING, Cambridge L H

HAYWARD'S
Eureka
WEED KILLER

insures clean paths, best known and most satisfactory. It is no new experiment. A Weed Killer that can be thoroughly relied upon to keep paths clear for 12 months with one dressing is most helpful, but under-strength articles with no reputation are an aggravation. The "Eureka" is sold everywhere, 1/9 for 100 sq. yards, 6/- for 400 yards, 49/- for 4,000 yards; intermediate sizes at suitable prices. The "Eureka" **Lawn Sand, Soilfume, Quassia Extract, Bordeaux Mixture,** etc., have been in regular use for years, and there is no better value. If any difficulty in obtaining apply only makers, **TOMLINSON and HAYWARD, Ltd., Lincoln.**

"EUREKATINE"
is the satisfactory fumigant for destroying
Greenhouse Pests.

HAYWARD'S

Eureka WEED KILLER

insures clean paths, best known and most satisfactory. It is no new experiment. A Weed Killer that can be thoroughly relied upon to keep paths clear for 12 months with one dressing is most helpful, but under-strength articles with no reputation are an aggravation. The "Eureka" is sold everywhere, 1/9 for 100 sq. yards, 6/- for 400 yards, 49/- for 4,000 yards; intermediate sizes at suitable prices. The "Eureka" Lawn Sand, Soilfume, Quassia Extract, Bordeaux Mixture, etc., have been in regular use for years, and there is no better value. If any difficulty in obtaining apply only makers, TOMLINSON and HAYWARD, Ltd., Lincoln.

"EUREKATINE"

is the satisfactory fumigant for destroying

Greenhouse Pests.

MODERN GLASSHOUSES

as supplied by MESSENGER and CO., Ltd., are made of the best materials, and only capable and reliable workmen are employed in the erection thereof.

The following letter was recently received by us on the completion of a contract for a well-known Member of Parliament.

February, 1911.

"I should not be doing my duty to your workmen if I did not at once tell you, on the completion of your work, how pleased I have been with each and all of them.

"They have been most obliging throughout the whole job, and have endeavoured to do everything in an efficient and thoroughly workmanlike manner, and I must congratulate you upon having such capable employees."

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The Boon of Rain.

To fully appreciate the blessing of the rainfall, it is necessary either to have experienced its absence by a sojourn in dry and arid countries, or, at any rate, to have passed through a period of drought at home, when both the agriculturist and the garden lover find their crops threatened and their precious floral pets wilting under the influence of drying winds and persistent unmitigated sunshine. Even to the merely pleasure-loving social part of the community, who regard wet weather merely as a bar to picnicking and outdoor sports, long-continued drought becomes monotonous; and in these days of the motor car, the pleasures of travelling through country roads of a normally pretty and umbrageous character is practically annihilated by the clouds of dust, which do not merely almost choke the traveller but, what is even worse, cover vegetation with a dingy coating of the same material to the detriment of its first appearance, and also of its vitality. Contrast all this with the enjoyment experienced after a copious and refreshing drenching, such as the country generally is from time to time blessed with. The dust-laden atmosphere gives place to pure air which it is a delight to draw into the lungs, the hard white dusty roads are transformed into pleasant tracks bordered, not by whitish or greyish travesties of vegetation, but by verdant lucent shrubs and trees, beneath which the smaller growths, the primroses, violets, etc., etc., glory in the vivifying moisture, which has at once washed, as it were, their faces, and decked them apparently in new robes, so fresh and glistening has their foliage become. The agriculturist sees his nascent crops springing from the moistened soil, and those more advanced growing vigorously, obviously eager to seize the opportunity and make up for lost time; and everywhere the wide prospect is revivified and rebeautified by the beneficent boon of rain which is literally heaven's own gift. Irrigation may do much by supplying moisture to the roots, on a smaller scale the garden lover may do something to alleviate the drought by means of the hose, but it is the heaven-sent boon alone which does the work thoroughly by at once cleansing the foliage, opening its pores, and thus, to the maximum degree, facilitating that vital work which it is the province of the leaves to perform, while at the same time, providing the roots with the needful supply from below. Fortunately, in the course of evolution, Nature has endowed most plants with a fairly wide margin of drought endurance, this depending largely upon the character of their natural habitats and habits of growth. The tiny oval pores or stomata which perform the double office of admitting the carbonic acid gas which the air supplies for the structural needs of the plant, and of permitting the escape of the water vapour transpired from the leaf-cells, are beautifully shaped, so as to close up or nearly close in dry weather, thus economising expenditure. Some plants which grow in exposed positions, such as walls, besides doing this, contract their foliage also, and after a long, exhaustive drought, which would and does kill many plants, these, though apparently dead and shrivelled, are capable of absorbing the rain when it comes and resuming their pristine freshness unharmed. Thus it is with some of our ferns, such as the Ceterach and Common Polypody. Others, like the stonecrops, have thick fleshy leaves so replete with moisture as not to be easily exhausted. Many plants, too, like the saxifrages, form such dense masses as to prevent the drying sunbeams reaching the soil beneath them, and in this way, coupled with leathery leafage, they manage to hold their own. Apart from all this, however, we may legitimately ask ourselves, Whence does the boon of rain come? The day, perhaps, commences hot and sunny. Not a cloud is in the sky, and we sigh once more, "Another baking day." Presently, however, clouds appear and gather, and if we watch them we may see them grow. A faint, ragged wisp thickens into a mass, and ere long the sky is covered, the air grows cooler, and the rain begins. It may surprise many to know that under such conditions the whole of the water which eventually drenches the soil and everything on it may have been there overhead all the time as transparent vapour, and has only become visible and tangible by virtue of a cooling change of wind. Or, if accompanied by a south-westerly wind, as is more frequently the case, the raindrops which we delight in may have been lifted up by the sun at the equator, and wafted across the ocean invisibly as transparent vapour or visibly as driving cloud masses, to find a temporary lodging here as a benefactor, and when its work is dcne to be wafted away again on its manifold and eternal mission as a factor in the great circulatory system of the earth's water supply.

ALDERMAN J. W. BENTLEY, J.P., C.C.
Famous for his work among Auriculas, Carnations, and Tulips.

Alderman J. W. Bentley, J.P., C.C.—The well-known florist whose portrait appears in the present issue, was born at Royton, near Manchester, in 1859; his father, Mr. William Bentley, being a well-known botanist and tulip grower. So from his earliest years our friend has been familiar with plants and flowers. He was educated at the Manchester Grammar School when the famous Mr. Walker, who afterwards finished his life's work at St. Paul's School, London, was the headmaster. On leaving school in 1876 he came to Stakehill to learn the business of his uncle, Mr. Samuel Barlow, who was himself an ardent florist, growing, among other things, auriculas, tulips, and carnations; here he was in daily contact with flowers and flower-lovers, and soon became afflicted with auriculamania; the rich brown flowers of Campbell's self, Pizarro, having such an effect upon him that in 1877 he got a small collection together himself. At Stakehill, Mr. Barlow delighted to get together men who were prominent in floriculture, and so Mr. Bentley came to know a great many, including Thomas Moore, Shirley Hibberd, E. S. Dodwell, Rev. F. Symons, John Hepworth, Joseph Lakin, James Thurstan, Richard Dean, John Beswick, Ben Simonite, David Jackson, Rev. F. D. Horner, and Mr. James Douglas. He was a lad among grown men, and naturally most of these old florists have gone to their rest, though Messrs. Horner and Douglas are fortunately still with us, both of whom he has to thank for gifts of auriculas when he started as far back as 1877. Mr. Bentley did not begin to grow tulips until 1889, being already interested in his uncle's collection; but as he was always expected to be on hand at the tulip shows, writing labels, prize-cards, etc., he decided to grow some flowers himself, so as to have a more personal interest in these matters, and so he has been a constant grower and exhibitor of tulips ever since. Many years ago, at the request of the late Dr. Hogg, Mr. Bentley wrote a series of articles on tulips, with a catalogue of the varieties known to him at that time. Although written so long ago the catalogue would not now need much revision or addition, as new meritorious varieties of old English tulips are very slowly evolved, or good old varieties eliminated. Mr. Bentley has been the hon. secretary of the Northern Branch of the Tulip Society since 1893, and has done a good deal in conjunction with Mr. C. W. Needham, of Hale, Cheshire, and a few others, to keep interest in the flower alive. Mr. Bentley became the hon. secretary of the Northern Auricula Society in 1897, at a time when nobody could be found to undertake the duties and it was feared that the society would have to break up, but he gave up the office this year, leaving the society in a healthy condition, with plenty of members and enthusiasm. He was president of the Northern Carnation Society from 1893 until last year, with Mr. W. Prescott as hon. secretary, but both resigned last year owing to lack of support, and the society is now continuing more on the lines of the London and Birmingham Shows, in the capable hands of Messrs. Budenberg and Rogerson. As a public man, Mr. J. W. Bentley has been a member of the Middleton Town Council since 1889, was Mayor of the town in 1904-1905, and is now the oldest member of the Council. He was appointed a magistrate in 1893, and has been chairman of the licensing justices since 1904. He has represented Middleton on the Lancashire County Council for four years, and quite recently has been appointed a member of the Horticultural Committee. In business he is the managing director of the firm of Samuel Barlow and Co., Lim., bleachers, dyers, and printers of cotton goods, principally for the Far East. Much more might be written concerning Mr. Bentley's floricultural enthusiasm and success, but these few notes will serve to show that a man may be a foremost florist of his times, a capable and hardworking business man, and also find time to take a full share in the conduct of local and county affairs.

The Coronation.—As we go to press the finishing touches are being given to the preparations for the crowning of the King and Queen in Westminster Abbey, and everything points to the ceremonial and the various functions associated with the Coronation being exceptionally brilliant. The immense amount of interest that is being taken in this great event by all classes of the community fully justifies the expectation that there will be an enormous influx into London of loyal subjects from all parts of the United Kingdom, filled with a strong desire to do honour to King George V. and his Royal Consort, who, happily, have already won the hearts of their subjects. There is at the present time but one thought uppermost in the public mind, and that is the hope their Majesties may have a long, prosperous, and happy reign. That this may be so is certainly the earnest hope of ourselves and our many readers.

Lecture by Rev. Professor G. Henslow.—Professor Henslow's lectures are always of great interest, and they have the merit of being entertaining as well as instructive; on Tuesday, June 20, he will deliver one at the Royal Horticultural Hall, Westminster, at 3 p.m., on "The Origin of Monocotyledons from Aquatic Dicotyledons."

R.H.S. Committee's Outing.—As in previous years, Mr. and Mrs. Harry J. Veitch are inviting the members of the Royal Horticultural Societies to East Burnham Park, and the date fixed for the outing is Friday, June 30. This is somewhat earlier than usual, chiefly because a later date proves inconvenient for a number of the members. Those committeemen who have not yet accepted Mr. and Mrs. Veitch's kind invitation and purpose visiting the delightful gardens and grounds at East Burnham Park, near Slough, are requested to notify Mr. S. T. Wright, R.H.S. Gardens, Wisley, Ripley, at once, so that the necessary arrangements may be made.

The Crush at the Temple Show.—Mr. W. J. Godfrey, of Exmouth, writes: "No one will deny that, in spite of the increased charge for admission, the tents and grounds were uncomfortably crowded at the recent Temple Show, but there was a smaller proportion of the élite of the land than used to visit this exhibition. This is due to the fact that it is impossible, even with a struggle, to obtain a fair view of the varied exhibits, and the crush of the crowd of visitors is unbearable to many. Would not this crush be avoided in a large measure if the show were opened earlier? The tents are promptly cleared of exhibitors at 10 a.m., but for the next two hours the exhibits are losing most of their beauty owing to the heat. Thus, precious time is practically wasted, mainly for the purpose of allowing numerous small groups of learned men to display their knowledge by awarding medals, which awards in most instances are far from satisfactory, or even appreciated by the exhibitors. I am, of course, referring to the awards of less value than the Gold Medal or Silver Cup. The main object of the exhibitor is business, and the awards are intended as an advertisement. Much more business would result if the show were opened the first day at 10.20 or 10.30 a.m., and more satisfaction would be given to all concerned. Why the medal awards are unsatisfactory need not for the moment be discussed. The additional time which would be saved if this suggestion were adopted could be reserved for subscribers of not less than two guineas, others being charged a guinea for admission."

Floral Decorations at the Gala Opera.—It is estimated that about a hundred thousand roses will be used in the decoration of the Royal Opera House, Covent Garden, on June 26, when their Majesties and their Coronation guests will attend the gala performance. White and gold orchids and carnations will be used to decorate the Royal Box; pink roses will be used on the ground floor, arranged on trellises. The proscenium will be outlined with crimson roses, and baskets of crimson roses, connected by festoons of pink roses, will adorn the grand tier.

Messrs. J. Cheal and Sons' Success.—The Council of the Festival of Empire at the Crystal Palace have just awarded Messrs. J. Cheal and Sons, Crawley, a twenty-five guinea silver cup for designing and laying out the gardens around the Terrace Club, comprising enclosed flower gardens, paved terrace, walks, pergola, rockery banks, terrace walls, garden houses, seats, etc.

The Fruit Crop.—At the Council meeting of the National Fruit Growers' Association held at the Horticultural Hall on Monday last, Mr. C. S. Martin presented a report on the fruit crop prospects, which, he stated, was based on information obtained from trustworthy sources. Apples will, judging from present appearances, yield a fair crop, but the prospect is not very good in West Kent and the Evesham district. Plums are promising an abundant yield, but as the trees are suffering considerably from drought, the yield may not come up to expectations. Damsons are likely to be plentiful, particularly in Kent. Gooseberries are less plentiful than was anticipated earlier in the season in all parts of the country, with the exception of Hereford and Norfolk. Black currants are indifferent in all districts, but red currants range from fair to good. Raspberries bloomed satisfactorily, but the dry weather has checked the development of the fruit. Strawberries have failed to realise the splendid promise of a few weeks since, as, owing to the continued dry weather, the fruits have failed to attain their full size. Cherries will be a light crop in all districts. Aphis and other insect pests are abundant in fruit plantations and doing considerable damage.

U.H.B.P.S. and the National Insurance Bill.—At the monthly meeting of this society, held on June 12, it was proposed by Mr. Wesker, and seconded by Mr. Burge, that, at as early a date as possible, Messrs. C. H. Curtis, Jas. Hudson, W. Collins, J. H. Dick, W. P. Thomson, and W. A. Bilney act as a deputation to the Chancellor of the Exchequer re the United Horticultural Benefit and Provident Society in its relation to the National Insurance Bill.

Agricultural and Forestry Exhibition in Sweden.—The next quinquennial gathering of the Swedish Agricultural Societies takes place at Orebro on July 3 to July 9, inclusive. There will be a great display of horses, pigs, cattle, poultry, sheep, rabbits, bees, etc., and sections will be devoted to scientific agriculture, dairy farming, forestry, and pisciculture. Full particulars may be obtained from the Swedish Consul-General, 63, Finsbury Pavement, E.C.

GRAND YORKSHIRE FLORAL FETE AND GALA.

Although the wind was cool and brisk, the weather was bright for the great York flower show, which was held on June 14, 15, and 16, and, as usual in Bootham Park. It was a magnificent show, and some rearrangement of the classes made the general effect different from that of previous years. The hardy flowers, roses, rock gardens, orchids, and fruit were especially good. There was a good attendance, including a deputation from the North of England Horticultural Society, one from the Council of the International Horticultural Exhibition of 1912, and also one from the National Hardy Plant Society. The latter body granted a First-class Certificate to Heuchera Lady Greenhall, from Messrs. Bakers, Wolverhampton, and Awards of Merit to Delphinium Lady Faire and Pæony Lena Ashwell, from Messrs. J. Kelway and Son, Langport; to Iris Asia, from Mr. G. Yeld, M.A., Burton Lane, York; and to Verbascum Salmon Queen, from Mr. F. Bouskell, Market Bosworth. Altogether the good folks at York have every reason to congratulate themselves upon their latest gala.

YORKSHIRE FLORAL FETE AND GALA—A NEW METHOD OF STAGING HARDY FLOWERS.

Cut hardy flowers, with a few plants, were delightfully arranged on a ground space by Messrs. W. Artindale and Son, Sheffield, to form a herbaceous border. An entirely new class was provided, and the Sheffield firm won first prize with the display here depicted.

GROUPS.

In the leading group class the usual area of 300 square feet was allowed, and awards were made with due regard to the plants and flowers used and the effect created therewith. There were five competitors, and once again the premier award of £20 was won by Mr. J. Donoghue, gardener to J. Pickersgill, Esq., Bardon Hill, Weetwood, Leeds. With tall palms and dracænas, rambling roses and liliums as a background. Mr. Donoghue arranged an arch of ferns and moss from which sprang sprays of odontoglossums and beautiful blooms of Cattleya Mossiæ. In front of these, over the wide foreground, tall, stately, and gorgeous crotons rose from among smaller plants, with light caladiums, a few cattleyas and Clerodendron fallax all tastefully disposed. Small caladiums, foliage begonias, and bertolonias made a pleasing margin, while a few graceful plants of Humea elegans lent additional lightness to a very fine effort. Mr. W. A. Holmes, West End Nurseries, Chesterfield, won second prize; his exhibit was rather weak in the background, and needed a few more choice flowering plants towards the front; crotons were prominent in the group; Messrs. R. Simpson and Sons, Brook Street, Selby, gained third prize; Mr. Wm. Vause, Leamington, fourth; and Mr. G. Cottam, Alma Gardens, Cottingham, Hull, fifth. The whole set of five groups made a fine show.

For a smaller group, arranged on a space of 200 square feet, Mr. W. Holmes annexed the premier award of £12 with an effective but rather crowded arrangement, that was rendered beautiful by the extreme brilliance of the very many fine crotons used in it; Mr. J. Donoghue was second, and it was evident that he had made his great effort in the big class; Mr. W. Vause third, his alocasias, Dracæna Sanderiana, and Rex begonias giving his group a silvery-grey effect; Messrs. Simpson and Sons fourth.

Mr. J. Barker, Clumber Gardens, Worksop; Mr. J. Donoghue, Weetwood Gardens; and Mr. W. Langstaffe, secured the awards for a group of carnations, but in neither case were the plants at their best. Mr. W. Walls, gardener to Mrs. Craven, Moorlyn, York, staged the best group of gloxinias; Mr. Douthwaite, gardener to Miss Barstow, Garrow Hill, York, led for a group of begonias; and Mr. F. Dean, gardener to Joseph Rowntree, Esq., Rose Cottage, Clifton, York, secured the premier award for a group of calceolarias. The prizes in all these classes were well contested by the local growers.

SPECIMEN PLANTS.

Down the centre of the chief tent specimen stove and greenhouse plants were arranged in large numbers, but their disposition, while effective, was such that the first, second, and third prize specimens were often quite a long way from each other. There were eight classes, and the chief one was for a collection of specimens, in bloom, arranged on a space 20ft. by 10ft. Messrs. James Cypher and Sons, Cheltenham, were first prizewinners with bold examples of Erica Cavendishiana, E. ventricosa, Anthurium Scherzerianum, Pimelia diosmæfolia, Ixora coccinea, I. Regina, Clerodendron fallax, etc.; Mr. W. Vause, Leamington, was second, bougainvilleas and anthuriums being his best features.

Mr. W. Vause led for three stove or greenhouse plants, and also for one specimen in bloom, the latter being a fine bougainvillea. Messrs. J. Cypher and Sons were a capital first for six ornamental foliage plants, with magnificent kentias, latanias, crotons, etc.; the Cheltenham firm had the best flowering greenhouse plant—Erica Cavendishiana, and they were also first for three foliage plants that included a huge Croton Warreni.

ORCHIDS.

In the class for a table of orchids, arranged on a space of 12ft. by 5ft., there were two competitors, and the judges awarded equal first prizes to Messrs. Mansell and Hatcher, Rawdon, Leeds, and Messrs. Jas. Cypher and Sons, Cheltenham; for ourselves, we think the latter firm had a trifle the better of the contest, but no doubt the judges had good reasons for placing the competitors on an equality. Messrs. Mansell and Hatcher had fine plants of Lælio-cattleya Canhamiana, L.-c. Fascinator, Cattleya gigas Sanderiana, Renanthera Imschootiana, and Odontoglossum crispum, while the Cheltenham firm used cut flowers gracefully in their background, and made features of Miltonia vexillaria, Cymbidium Lowianum, Brassavola Digbyana, and Lælio-cattleyas.

Messrs. J. Cypher and Sons led for ten specimen orchids with goodly examples of Miltonia vexillaria, Cattleya gigas, C. Mendeli, C. Mossiæ, L.-c. Canhamiana, Oncidium macranthum, and Epidendrum prismatocarpum; Mr. J. Barker, gardener to W. P. Burkinshaw, Esq., West Hill, Hessle, second with good specimens of Cattleya Mossiæ alba, Miltonia vexillaria magnifica, and M. St. Andre; Mr. James Sunley, South Milford, third with quite small plants.

The Cheltenham firm was also to the front for six orchids, and here they scored well with Miltonia vexillaria, Cattleya gigas, C. Mendeli, C. Mossiæ, Lælio-cattleya Canhamiana, and L.-c. Aphrodite splendens; Mr. J. T. Barker, second. For three orchids Messrs. J. Cypher and Sons led with Cattleya gigas with eight big blooms, Lælio-cattleya Pecunia, and L.-c. Canhamiana; Mr. J. T. Barker was second again, and Mr. J. Sunley third.

ROCK GARDEN CLASS.

Four competitors came forward in the prominent class for a group of hardy flowers and plants arranged in the form of a rock and water garden. This year the groups were placed at the side of the big tent instead of in the centre, for the purpose of keeping down the recent tendency to erect very high shrubbery backgrounds. The first prize was won by Messrs. James Backhouse and Son, Lim., York, with a bold and charming contribution. Roses, bamboos, and rhododendrons occupied the high ground, and below these came a massive rock arrangement adorned with colonies of Saxifraga pyramidalis, Ramondia pyrenaica, double lychnis, dwarf roses, campanulas, azaleas, and erigerons. In the cool and moist recesses at the base were pretty groups of Primula sikkimensis, Orchis latifolia, and Cypripedium spectabile, while in the little bridge-spanned stream floated flowers of the newer nymphæas. The island and the rockery margin were furnished with dwarf campanulas, sedums, Primula Littoniana, violas, dianthuses, etc. Very bold and striking was the second prize arrangement from Messrs. W. Artindale and Son, Sheffield, who used little alpine shrubs, Primula Cockburniana, Japanese maples, heucheras, alpine phloxes, and pink spiræas freely and well in their design. Mr. S. Pickering, 31, Rosslyn Street, Clifton, Yorks, a working joiner, was a most creditable third prize winner, and Mr. Gledhill, Cottam, Cottingham, Hull, came fourth.

ROSES.

Roses were an unusually fine display, the competition being excellent throughout, and the flowers very bright and good.

In the chief cut bloom class, for seventy-two flowers, there were six entrants, and the first prize fell to Messrs. Benjamin Cant and Sons, Colchester, who presented a beautiful set of blooms, among which we noted Bessie Brown, Frau Karl Druschki, Lyon Rose, J. B. Clark, Yvonne Vacherot, Killarney, Colcestra, Gustave Piganeau, Lady Helen Vincent, Captain Hayward, and Lady Ashtown; Messrs. R. Harkness and Co., Hitchin, came second, their Marechal Niel, Capt. Hayward, Hugh Dickson, Mrs. W. McKee, and S. M. Rodocanachi being especially fine; Messrs. D. Prior and Sons, Colchester, third.

For forty-eight blooms, in not fewer than two dozen varieties, Messrs. R. Harkness and Co. were winners of the first prize, and they exhibited large, full blooms of Frau Karl Druschki, White Lady, J. B. Clark, and Caroline Testout; Messrs. J. Burrell and Co., Cambridge, second; and Mr. G. Prince, Longworth, third. From eleven competitors Mr. H. Drew, Ledbury, came to the front for three dozen flowers, in not fewer than eighteen varieties, and he had Madame Jules Gravereux and Kaiserin Augusta Victoria in fine form; he was followed in order of mention by Messrs. R. Harkness and Co. and Messrs. W. and J. Brown, Peterborough.

Messrs. B. R. Cant and Sons, Colchester, led for two dozen roses, distinct, and here they scored with large light-coloured varieties, such as Mildred Grant, Joseph Hill, Bessie Brown, Yvonne Vacherot, etc.; Messrs. R. Harkness and Co., second; and Messrs. D. Prior and Sons, Colchester, third.

Ten competitors came forward in the class for eighteen blooms, distinct, and here Mr. Drew, Ledbury, secured first place with lovely flowers of Comtesse de Nadaillac, C. J. Grahame, Bessie Brown, etc.; Messrs. G. and W. Burch, Peterborough, second; and Mr. E. J. Hicks third.

Mr. Drew also scored for a dozen white or yellow roses, with Messrs. Perkins and Sons, Coventry, second, and Messrs. D. Prior and Sons third. Mr. T. Park, Bedale; Mr. W. Hutchinson, Kirby Moorside; and Mr. F. A. Grange, Worcester, were the chief prize-winners in the amateur classes.

Mr. J. E. Skaife, Clarence Street, York, led for a group of roses in pots, with a moderate display; Mr. W. Langstaffe, Garth Terrace, York, second, his weeping standard of Lady Gay being very pretty; Mr. W. Todd, Vyner Street, York, third. In a class for twenty pot roses grouped with foliage plants, the above-named competitors were placed in a similar order of merit, with Mr. H. Pybus, Wormald Green, Leeds, third.

HARDY FLOWERS.

A new and important class that has brought into effect the sort of thing we have all been talking about so long, i.e., the grouping of hardy flowers in a more natural method than that of the sharply pitched banks now so common, was a great feature of the gala, and in the near future we shall see many more of these groups arranged on a ground space where the flowers can be comfortably inspected. The space allowed was 200 sq. ft., and there were four competitors. Chief honours fell to Messrs. W. Artindale and Son, Sheffield, for a simple and bold display. The design represented the end of a double herbaceous border, with a few central steps from whence the whole could be surveyed. Across the end of the scene were acers, bamboos, and rambling roses; in the centre were lovely groups of Lilium Szovitzianum, Verbascum Caledonia, Spanish irises in distinct varieties, the rosy form of Lupinus polyphyllus, James Kelway pyrethrums, and gorgeous Oriental poppies. To the right and left of the steps were further beautiful groups of Spanish irises, Anchusa italica, Delicata pinks, Campanula persicifolia alba, Gilenia trifoliata, Heuchera brizoides gracilis, Gladiolus Ne Plus Ultra, and deliphiniums, with Viola cornuta purpurea and funkias in the foreground. Messrs. Harkness and Sons, Bedale, won second place, but their arrangement was a trifle flat, while the stands of pyrethrums, poppies, etc., rather spoiled the idea of a flower border that this class was obviously intended to bring out; Mr. G. Cottam, third.

FRUITS.

There were two competitors in the interesting class for a table of ripe dessert fruit, and here Mr. Jas. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, secured the first prize with a total of 106 points. His table was pleasingly decorated with blush and pink carnations. The dishes of fruit were Buckland Sweetwater grapes, 5 and 5; Black Hamburgh grapes, 7 and 5; Early Rivers cherries, 6; Lady Sudeley apples, 5; Early Rivers and Lord Napier nectarines, 7 and 7; Bedford Champion strawberries, 5; Bellegarde and Hale's Early peaches, 6 and 7; Golden Gem and Duchess of Portland melons, 4½ and 4½; Brunswick and Brown Turkey figs, 5 and 4; and Kirk's plums, 5 points; beauty of flowers and foliage, 6; blending of colour, 6; and general effect, 6, the three latter items being 2 points each below the maximum. Mr. A. Seale, gardener to the Marquis of Northampton, Castle Ashby, Northampton, second, with white odontoglossums, yellow oncidiums, and Cattleya Mendeli as floral decorations, and a total of 97 points; his British Queen strawberries, Early Rivers nectarines, and Gross Mignonne peaches were good.

There were three competitors in the class for a collection of ten kinds of fruits, and here Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, came first with Black Hamburgh and Buckland Sweetwater grapes, Early Rivers nectarines, and Early Transparent Gage plums, as his best dishes; Mr. J. Brennand, gardener to J. E. Hathaway, Esq., Baldersly Park, Thirsk, second; and Mr. Hague, gardener to W. D. Cliff, Esq., Meanwood Towers, Leeds, third.

For six kinds ot fruits Mr. Gibson led with a good set of Foster's Seedling and Black Hamburgh grapes, Hale's Early peaches, Early River's nectarines, Brown Turkey figs, and Royal Sovereign melon; Mr. J. C. McPherson, gardener to Baron de Forest, Londesborough, second; and Mr. J. Brennand third.

The best set of four dishes of dessert fruit came from Welbeck, Mr. Gibson scoring with good clusters of Black Hamburgh grapes, Lord Napier nectarines, Hale's Early peaches, and Superlative melon; Mr. J. McPherson second, and Mr. A. Searle third.

Out of six entries Mr. James Gibson scored for a pair of bunches of Black Hamburgh grapes, his clusters carrying large, well-finished berries; Mr. H. S. Bray, gardener to Lady Hawke, Wighill, Yorks, second, with rather loose clusters; Mr. W. Nicholls, gardener to the Hon. Lady Beaumont, Carlton Towers, Selby, third.

There were five sets of white grapes, and here Mr. McPherson scored first with rather green, loose bunches of Muscat of Alexandria; Mr. Hague was placed second with tiny clusters of Buckland Sweetwater; and Mr. J. Gibson third with larger clusters of the latter variety. The judging in this class came in for some amount of criticism, and an opinion freely expressed was that the Muscats did not deserve the high position given them.

NON-COMPETITIVE.

The non-competitive exhibits contributed materially to the size and effect of the exhibition.

Mr. G. Yeld, Burton Lane, York, showed some of the latest results of his work among irises, hemerocallis, and liliums. His Neptune and Asia irises were superb, and Hemerocallis Corona bids fair to become as popular as his older H. Apricot. Messrs. Aldersey and Marsden Jones, the new sweet pea specialists, of Tilston, Malpas, exhibited a small collection of sweet peas, in which were good bunches of such new and interesting varieties as Tortoiseshell, Ruby, Moonstone, Helen Grosvenor, and Topaz. Robert Sydenham, Limited, Birmingham, displayed sweet peas in rustic stands and pretty bowls, several of these flower holders being of entirely new shape.

Pæonies in big blocks of colour from Messrs. G. Massey and Sons, Spalding, made a brave show, and as each block represented one variety, the exhibit was interesting: Solfaterre, Mons. C. Leveque, Duchess de Nemours, Caussie, and Lady Bramwell were all excellent varieties. Messrs. Gilbert and Son, Dyke, Bourne, Lincs., arranged sweet peas in small vases, grouping the colours in tasteful style.

Some beautiful cattleyas and lælio-cattleyas were shown by Messrs. Sander and Sons, St. Albans. L.-c. Canhamiana Marguerite, Cattleya Mossiæ Wagneri Mrs. F. Sander were among the best. Messrs. Sander also showed their double white Marguerite Mrs. F. Sander. Kelway's pæonies and delphiniums were remarkable for both size and colour. The great mass of blooms embraced varieties of both flowers that must be considered the best in cultivation, and were worthy of the Langport specialists.

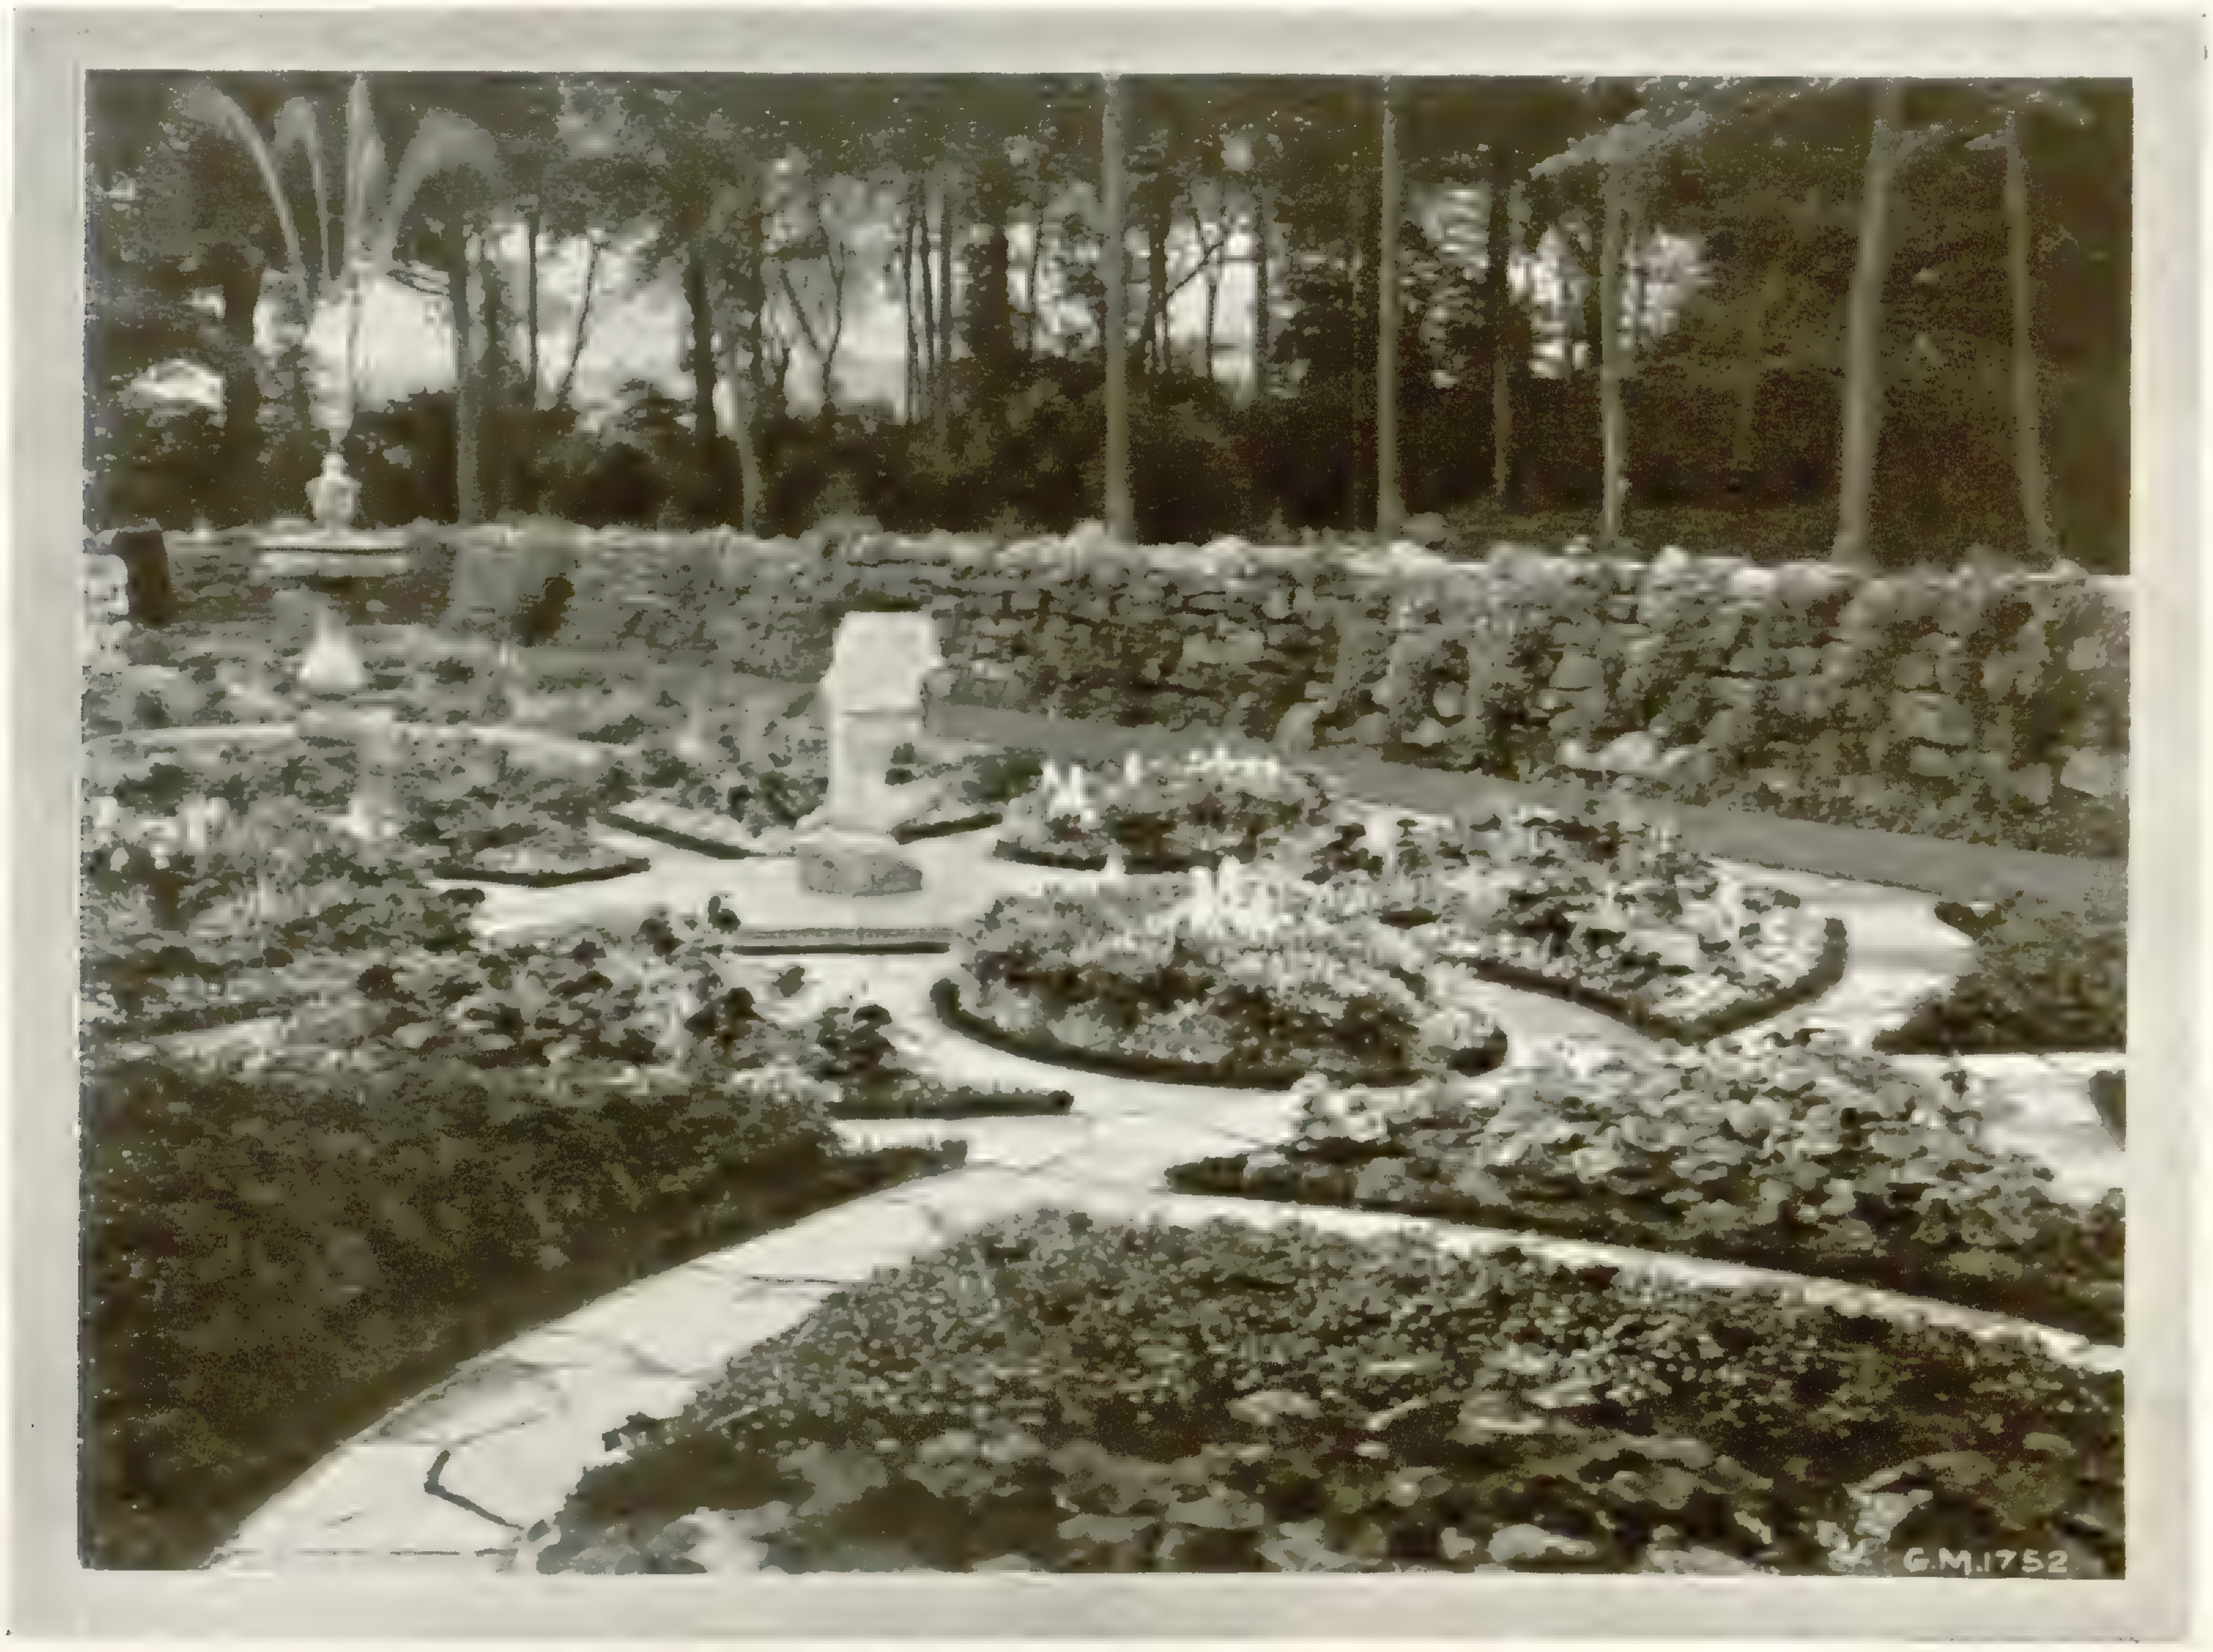
The stand of fruit, vegetables, and flowers put up by Messrs. Sutton and Sons, Reading, was of a particularly bright and interesting character. The dishes of tomatoes, the melons, and the carrots were almost as gay as the sweet peas, delphiniums, and other blooms used to set off the stand. Hardy flowers shown by Messrs. Dicksons, Chester, were representative of the best of the flowers of June. Pæonies, liliums, irises, and delphiniums were all well staged, as also were

(Continued on page 456.)

SOME GARDENS AROUND EDINBURGH—II.

Carberry Towers.

For a long period the gardens of Carberry Towers, the residence of Lord Elphinston, have been regarded by those who are well qualified to express an opinion on the subject as some of the best in the Edinburgh district. They have not been seen by so many of the English horticulturists who go North on the occasion of the great gatherings in the Scottish capital, but that is wholly due to their being less easy of access than some others that could be mentioned. Situate in the direction of Musselburgh, Lord Elphinston's delightful seat is not any great distance from Edinburgh, and is well within an easy drive; but those who have to depend upon the railway as a means of locomotion find the service of trains rather inconvenient. To those who have plenty of time on their hands the service is satisfactory enough, but when the horticulturist wishes to see all he can in the time at his disposal, and endeavours to compress two days' work into one, he has of necessity to limit his visits, however much he may regret having to do so, to those gardens which are within a comparatively short distance of a railway station and have the advantage of a frequent train service. The drive to Carberry Towers is exceedingly pleasant, for the distance is not too great, and the road passes through some of the most beautiful scenery on the south-east side of Edinburgh.



AN OLD DUTCH GARDEN AT CARBERRY TOWERS.

One of the great features of the gardens of Carberry Towers has for many years past been fruit culture under glass, for grapes of various kinds have been grown to a high degree of perfection, and have obtained many high awards at Edinburgh and other of the leading exhibitions. Grape growing is still carried on with much success, and one might linger long in the several vineries and discuss with Mr. Kidd, the able gardener, the principal points in the management of vineries, and the relative merits of varieties of grapes for various purposes. What is true of grapes is true also of various other fruits that are usually grown under glass. They have been, and still are, grown with quite exceptional success, and the several structures devoted to peaches, nectarines, etc., afford object-lessons of immense value on the various points to which the cultivator must give the closest of attention if he would obtain the best possible results from the area of glass of which he has command.

The cultivation of the various classes of plants requiring the shelter of glass and the assistance of artificial heat that are of value for decorative purposes or the supply of cut flowers receives, as in other establishments of the highest class, a full share of attention; but, as brevity is necessary, it is not possible to speak of them in detail. At Carberry Towers the cultivation of hardy flowers has, within recent years, been so greatly developed that the borders devoted to them form a glorious feature from the opening days of spring until the autumn. Lord Elphinston has a strong predilection for hardy plants, and, in consequence thereof, their cultivation has been greatly extended. It would be a pleasant task to write of the borders in detail, and discuss the relative merits of the many kinds of plants that have a place in them, but for the present purpose it must suffice to refer to both borders and plants in a general way. An illustration of one of the principal borders several hundred feet in length is given herewith, and this will give a far better idea of its general features than would a written description. The border occupies a rather open position, and in the provision of a background to the occupants rambling roses have been utilised with much success. Stout poles, standing eight or nine feet out of the ground were fixed in a line at the back of the border. The poles were connected with chains, rambling roses planted, and these have clothed both pillars and chains with a healthy growth and produce an abundance of flowers. Need it be said that in the formation of this beautiful screen the best of the varieties belonging to the section were used. These pillars are not only useful for the support of the roses, but they show with much clearness the splendid development of the various herbaceous plants. It can be readily seen that the latter attain to a height that is exceptional, and with regard to their development it may be added that the growth is stout and short-jointed, and that the flowers, of which there is a profusion, are characterised by high quality.

Water gardening, in which the noble owner of Carberry Towers is greatly interested, has been materially developed of late years. The fine expanse of water herewith illustrated forms a distinct and immensely attractive feature; the margin is well furnished with vegetation that thrives in association with moisture; and the finer of the nymphaeas are being planted in the lake. A goodly number of the latter are already well established, but in the case of a lake of such large dimensions as this a considerable period elapses before they cover sufficient areas of water to produce an impression in a photographic reproduction.

Another new feature is that formed by the old Dutch garden which has been created within the past three or four years. The design is well shown, and no description is necessary. The garden has been formed in a somewhat retired part of the grounds, and is enclosed with low, dry walls, in which various rock plants are making vigorous growth, and clothing its surface with foliage and flowers, and contributing not a little to the general effect. A feature that is not new, but is of much interest, is the remarkably fine avenue of Wellingtonia gigantea in the park. The avenue is of great length, and the trees have occupied their present position long enough for them to attain full development, but not so long as to have an opportunity of giving evidence of age by losing their lower, or, indeed, any other branches. When, as here, the trees grow to a considerable age without showing signs of a diminution of vigour, the wellingtonia is of much value for avenue planting; but when, as in so many cases, it begins to lose its branches at an early age, it is very disappointing.

A FINELY FURNISHED HERBACEOUS BORDER IN CARBERRY TOWERS GARDENS.

Preston Hall.

The gardens of Preston Hall, the charming residence of Mrs. Callender, occupy a prominent position among the great horticultural establishments that cluster around Dalkeith, and are therefore within a comparatively short distance of Edinburgh. It is a fresh, invigorating walk or drive from Dalkeith Station to Preston Hall; the roads are of the best, and intersect some of the finest agricultural land in Scotland, as indicated by the fine crops of cereals and roots that may be seen on all sides in the respective seasons, as for example, at the beginning of August, when the writer was last there. On approaching Preston Hall the country becomes finely wooded, and the policies on the estate and those of the immediately adjoining estate of Oxenford Castle, add materially to the attractiveness of the scenery, and are of much interest to those who are in any way concerned with arboricultural matters.

The mansion occupies a position whence fine views are obtained over a broad stretch of country, wherein are wide expanses of woodlands remarkable for their high keeping, rolling meadows, and arable land, that, by the splendid condition of their crops, reflect the more advanced methods of farming. The principal flower garden is situate a short distance from the mansion, and the annual displays that are produced therein would of themselves fully justify the fame which the Preston Hall gardens have so long enjoyed for the success achieved in the cultivation of ornamental plants. The fame of the gardens does not, moreover, rest upon the work that has been accomplished within the flower garden proper; the spacious kitchen garden contiguous thereto is largely devoted to hardy flowering plants, and the glorious effects that are obtained from spacious borders devoted to herbaceous plants must be a revelation to many, including not a few of those who are acquainted with what is being done in various parts of the country. Mrs. Callender possesses a wide knowledge of hardy plants, and the important position they occupy in her beautiful and interesting gardens is largely due to the generous encouragement given those in charge to do their best, and, it may be mentioned, to the value of the advice they receive.

The flower garden is enclosed in some part by the high walls of the kitchen garden, which are so masked by climbing roses and other plants as to present a highly attractive appearance from the opening days of spring until the autumn is well advanced. The predominant features are large beds of dwarf and tall summer bedders, bold groups of hardy plants, beds of roses comprising dwarf and tall specimens, pillars of roses and coniferous trees. The garden is altogether free from formality, and the sense of retirement one experiences in walking through it adds immensely to the enjoyment of the many delightful features awaiting attention. Very attractive were the big beds of Calceolaria amplexicaulis, the plants rising to a height of six feet, and producing in great profusion their soft yellow flowers. In association with this old, but fine form was the dwarf-growing Calceolaria mexicana, which has [illegible] yellow flowers. Very conspicuous also were the group of the Sunderland Hall variety of Fuchsia Riccartoni, and the attractive bed of Preston Hall pentstemon, attaining a height of about two feet, and bearing large crimson flowers. Some [illegible] of tuberous begonias were bright [illegible] colour and immensely attractive, and [illegible] of interest as showing how well tuberous begonias thrive in the district. The beds devoted to hardy herbaceous plants were especially noteworthy, for in one of them were delphiniums upwards of twelve feet in height, and Spiræa gigantea in great masses; the magnificent spikes of blue flowers of the one, and the breadths of the foamy inflorescence of the other were equally attractive. Dahlia Pink Pearl had a bed to itself, and the freedom with which it flowers, and the pleasing colour of the blooms fully justified its use in flower garden decoration.

The roses constitute a glorious feature of this garden, for they have been judiciously selected, freely planted, and successfully cultivated. The rich pink and highly popular Dorothy Perkins is strongly represented in standard and pillar form, and contributes materially to the general effect. Very attractive also were the beds of Laurette Messimy rose, carpeted with Wm. Neil viola, an excellent variety bearing pale blue flowers. At one end of the garden is a group of four beds, all of which are circular in form, and of large size. In each bed are three poles, connected at top with horizontal poles, and flinging their graceful flower-laden shoots over them are such useful and popular climbing roses as the cream-coloured Allister Stella Gray, the brilliantly-coloured Crimson Rambler, the pure white Madame A. Carriere, and the bright red Carmine Pillar. On the wall, to which reference has already been made, the delicate pink Blush Rambler and Allister Stella Gray were yielding freely of their floral wealth, and trained to chains supported by pillars several of the Ayrshires were demonstrating their usefulness as aids in beautifying the flower garden.

A BEAUTIFUL WATER SCENE IN THE GARDENS OF CARBERRY TOWERS.

One of the great features of the Preston Hall gardens is that formed by the magnificent borders of hardy flowers that flank the broad grass walk by which the kitchen garden is intersected. In these are represented at their best all the finer kinds that can be successfully grown so far north, and an enumeration of any considerable proportion of them would form a somewhat lengthy list. Here, as in the flower garden, the delphiniums attain to noble proportions, and the spikes of flowers in various shades of blue rising to a height of ten or twelve feet produce a surprisingly beautiful effect. There are other borders of hardy flowers in the kitchen garden, and these are not less remarkable for the splendid development of the many fine things that have found a home in them. Of special interest also is the pergola, which is of immense length, and of a height and width that renders it possible to enjoy the delightful display of flowers, the grateful shade, and the soft turf, without risk of injury to headgear from the spiny growths. The ramblers already mentioned are prominent, but they by no means occupy the larger portion of the area available for training, as all the finest of those introduced until within a very recent period are included in the selection.

Some distance from the gardens to which reference has been made Mrs. Callender has had formed within recent years another one, in which bulbs and other classes of plants are grown under what may be described as natural conditions. Known as the bulb garden, it has an area of several acres, and, with a gentle slope to the west, it has a fine view, in which some of the Oxenford policies are prominent; crocuses, daffodils, scillas, tulips, English and Spanish irises, and others of the more attractive bulbous subjects, have been planted in large numbers, and under the conditions that obtain grow freely and produce beautiful displays of colour in their several seasons. There are also bold groups of rhododendrons and Ghent and Mollis azaleas, and arranged in various parts of the garden are lilacs, spiræas, laburnums, thorns, and other flowering trees and shrubs of great beauty. Floating on the surface of the brook that forms the western boundary of the garden are numerous water lilies, comprising many of the newer hybrids, and on the margin of the stream are bold groups of some of the finest of the moisture-loving plants.

The kitchen and fruit gardens, and the plant and fruit houses, are on a scale proportionate to the needs of a first-class establishment, and the several departments afford ample evidence of the ability with which they are managed by Mr. W. Staward, the head gardener.

Oxenford Castle.

This fine seat of the Earl of Stair occupies a delightful position on an estate a few miles south of Dalkeith, and affords abundant interest to those who appreciate good gardening, especially when carried out on a large scale, and can enjoy beautiful scenery. The stately mansion occupies a commanding position in the spacious park, and the great masses of woodland, fine old trees, and rolling greensward that constitute its environment, form a living picture of surpassing beauty.

The flower garden contiguous to the mansion is of comparatively small dimensions, but it is well kept and judiciously planted, and the bright displays of flowers that are produced in the respective seasons contribute materially to the attractions of the surroundings. The garden is enclosed with a neatly-clipped low hedge, and as one admires the flowers, the fine expanses of turf, and noble trees, one forms a high opinion of the judgment which limited the number of flower beds and kept them within the enclosure immediately contiguous to the mansion, instead of spreading them over the lawns, where, amid such charming surroundings as those of which Oxenford Castle can boast, they would distract attention, and it maybe, prove irritating, by breaking up areas of turf where an unbroken surface has so great a charm. As in the case of so many mansions standing in a great park, Oxenford Castle is approached from various points of the compass; but while not in a position to determine the relative merits of the several approaches, it appeared difficult to imagine a more delightful approach than that by way of the Terrace Walk, which extends from the grounds around the castle to Cranston Parish Church, which is in view throughout the whole length of the walk, and produces a picturesque effect. Between the two points there is an avenue of wellingtonias and purple beeches, and the planting of the latter is due to the fact that within recent years it has been found necessary to remove some of the wellingtonias, and the noble owner, anxious to avoid a break in the avenue, has had purple beeches planted between them. The rich colouring of the leafage of the beeches produces, in contrast with the green of the wellingtonias, a very pleasing effect, but it appears possible that as years pass on, and the beeches predominate, the avenue will present a rather sombre appearance. This is not likely to happen for many years hence, for, as so admirably shown in the accompanying illustration, the trees are not only finely developed, but are in a robust state of health.

SPLENDIDLY DEVELOPED HERBACEOUS BORDER IN KITCHEN GARDEN, PRESTON HALL.

The gardens and grounds of Oxenford Castle have many features of interest, but the one of outstanding importance is unquestionably that devoted to the production of fruits and vegetables. The fruit and kitchen gardens are extensive, and enclosed within high walls that are finely clothed with trees of such fruits as thrive in the district. On the north side of the kitchen garden there is a range of peach houses and vineries in which the peach and nectarine trees, and the grape vines, in their respective structures, suggest cultural skill of a high order. There are seven houses in the range, and all are of the same size and dimensions, being forty-five feet in length, twenty-five feet in height, and twenty-two feet in width, and are characterised by elegance and strength. In the vineries Black Hamburgh, Madresfield Court, Muscat of Alexandria, and Lady Downes grapes were all remarkable for their robust health, and the excellence of the several crops; and in the peach houses there were especially fine crops of Stirling Castle and Royal George peaches, and Lord Napier and Pine Apple nectarines. At the back of one of the peach houses is a large tree of Negro Largo fig, which fills the whole of the wall space and bears heavy crops of fruit.

The central house in the range is devoted to plants of various kinds, which prove to demonstration that Mr. R. Ness, the able head gardener, is not less successful with plants than fruits. Where all was good there is no occasion to specialise, but it should be mentioned that the baskets of carnations were especially attractive, and that the hundred or more specimen clivias leave no doubt in the mind as to the rich display of colour they produce when in bloom. In a second set of houses there is one of large size, and the roof of this is wholly covered with lapagerias, from which thousands of flowers are obtained in the course of the season. The lapagerias are planted in the front, and include the pure white, which grows as freely and blooms as profusely as the red-flowered forms. In the same set of houses is a plant stove, in which palms and other decorative plants luxuriate. The conservatory is of large size, and is used as a show house during the winter. Noteworthy in this structure for its splendid development is the large specimen of the elegant Acacia Riceana, which annually bears a profusion of flowers, and is highly attractive when in bloom. Azaleas, it should be added, form a great feature, and one can readily imagine how beautiful is the effect produced by their varied and richly-coloured flowers.

Annuals and other ornamental plants have a liberal amount of space assigned them in the kitchen garden, and they add much to the interest of the department. It was interesting to observe that British ferns are well represented, both as regards number and development, and, judging from the appearance of the several kinds, the climatic conditions that obtain are highly favourable to this interesting and beautiful class of plants. In another part of the garden we made note of a rockery on which various alpines were making good growth, and many flowering freely.

A portion of the spacious kitchen garden has, on the east side, been grassed down, and a number of beds provided for summer and other flowers, and contiguous thereto is an extensive rose garden, in which dwarf and standard roses and the various ramblers grow vigorously and produce flowers of high quality. In a second kitchen garden, which is known as the orchard, there are tomato and melon houses, and a fig house, devoted to the handsome and richly-flavoured Brown Turkey variety.

In these gardens the apricot trees are a fine feature, they are large in size, and remarkable for fruit production. There are great avenues of apple trees, many fine coniferous trees, and, indeed, the objects that should be mentioned are so numerous that to refer to them would necessitate at least double the amount of space available. It is, therefore, not possible to do more than take leave of Mr. Ness feeling that the visit to Oxenford Castle had, as in the case of the other gardens, been both pleasant and profitable.

GEORGE GORDON.

SUMMER PRUNING.

This is an important operation in gardens where the production of a quantity of high-class fruit is essential. Where the best results are required a judicious shortening and regulating of the growths of trees is very necessary. The advantages of summer pruning are numerous; in the first place, by admitting more sunlight and air to the trees it assists the wood to ripen, and helps in the formation of fruit buds. It induces the fruits to swell, and by exposing them to the influence of the sun better colour and flavour are secured.

The apricot is one of the first trees to need attention, and where these were carefully disbudded the matter of summer pruning is considerably lessened. All main shoots that are required for extension purposes are laid in full length, and this is a means of encouraging a free circulation of sap throughout the tree. It is also desirable to lay in young shoots wherever possible without overcrowding, as on this young wood the best fruit is invariably produced, hence the necessity for keeping a regular amount trained in all over the tree. Lateral shoots growing from spurs should be shortened back to within four leaves of their base. It is not advisable to cut them closer, or the basal buds will break into growth, and so ruin next season's fruit prospects.

The next trees to receive attention are sweet cherries, and these are pruned on much the same principle. Plums will next require treatment, and with these the laying in of young growths is very important, and it is the neglect of this that is the cause of so many bare and badly furnished trees one sees about the country. Peach and nectarine trees require frequent attention during the summer, but in the case of these all surplus shoots will have been removed at the time of disbudding, and the remaining ones must be trained in, taking care to avoid overcrowding. Lateral growths that form on this season's wood are pinched out altogether.

Pear trees growing on walls can be pruned after the middle of July, which is quite soon enough. Bush and pyramid trees of apples and pears must not be dealt with until August, except in the case of early varieties, which may be advantageously pruned during the last week in July. In dealing with these the main growths are left full length, and the lateral shoots shortened to within four leaves.

J. Gardner.

VIEW IN FLOWER GARDEN AT PRESTON HALL.

PITTOSPORUM TOBIRA.

The pittosporums are classed with greenhouse plants, but in the southern counties, and even in Wales, the species abovenamed will thrive in the open borders, and especially in borders near walls, such as garden walls and those of the dwelling-house. The flowers are pure white, and, on large, strong plants the trusses measure about six inches across. They are very fragrant. The leaves are somewhat similar to those of a rhododendron, but are very glossy, having the appearance of smooth-surfaced leaves that have been sponged with soapy water.

Shoots of young wood, taken off with a tiny heel of older wood attached, root freely enough in a compost of fibrous loam, peat, and sand, if placed under a handlight, or in a cool frame, in the spring or early part of summer. As pot plants for the embellishment of the cool greenhouse or unheated conservatory, porch, or glass-covered verandah, these are ideal, especially where very fragrant flowers are appreciated.

B.

CULINARY PEAS.

It is a difficult matter for cultivators to grow satisfactory crops of peas in some soils during the hottest part of the summer. It is a question whether an unlimited water supply is a real boon to growers. Of course, it is in one way, but if they are tempted to use it too freely disaster may follow. I know of many instances where mildew has quickly ruined the plants which have been freely watered during hot spells of weather. I will give one instance only. The garden is situate on the bank of the Thames. A trench was made, and several times each week the water was allowed to flow into the pea trenches. Result, entire loss of plants through mildew.

Other plants growing near, but not subjected to the weekly soakings, succeeded well, and bore good crops; these rows of plants were well mulched and watered occasionally.

I have myself experienced much loss through overwatering peas in hot summers. I grew them in trenches for the greater convenience of watering. I treated some rows extra well, as I thought, but they were not nearly so satisfactory as others which had less attention as regards watering. Then I commenced to surface mulch my peas systematically, immediately after a heavy rainfall, even when this came early in the growth of the plants. In the absence of rain the ground was well soaked with water, and the mulch put on at once. Half-rotted manure was used chiefly, but the grass from the lawn was also placed on, and I found that the soil remained moist under it for a longer time than under the manure. I also began to manure the whole of the ground where peas were grown, and I found the result in every way satisfactory.

G. Garner.

SCHOOL TEACHERS' EXAMINATION IN GARDENING.

I have before me the list of questions set in the recent school teachers' examination in cottage and allotment gardening, which is undertaken, so says the prospectus of the Royal Horticultural Society, in view of the increased demand in country districts that the school teachers shall be competent to teach the elements of cottage and allotment gardening, and of the absence of any test whatever of such capacity. If the part of the schoolmaster was to teach the elements of cottage and allotment gardening, say, to adult pupils, then one would not take exception to the nature of the questions set in the examination, but, as they stand, they convey the impression that they were drawn up by someone who knew little or nothing of the way gardening is taught in the elementary school.

PICTURESQUE GARDENERS' COTTAGE, OXENFORD CASTLE.

It is very important, of course, that the schoolmaster who teaches gardening should have a practical knowledge of horticulture as applied to a school garden, but it is even more important that he should know how to teach the subject, be able to interest his boys in it, make them inquisitive, self-reliant, and observant, and possess the capacity for correlating the work of the garden with that of the school, so that the two work in harmony together to the educational benefit of the child. I see nothing in the questions set in the R.H.S. examination which have any direct bearing on the methods of teaching gardening, but, on the other hand, there are many intelligent allotment holders who would probably be able to answer all the questions, but who would be absolutely at sea if they were asked how they would arrange a school garden and teach a class of boys, say, for a year, on the best educational lines. If the R.H.S. examination is to be of any real value it must not only be a test of practical knowledge, but also of capacity for teaching school gardening, and making the most of its varied possibilities.

Some of the questions have very little to do with school gardening. Here is one: "What are the best times for pruning Jasminum nudiflorum and Jasminum officinale so as to ensure a profusion of flower, each in its season? Explain the best methods of pruning in each case." This sounds very like a trap question for an unwary teacher to fall into, and I wonder how many school gardens there are in the country in which the above jasmines grow at all.

Here is another question: "Why are plums so often non-productive in a cottager's garden?" It would probably be news to nineteen out of twenty teachers that such is the case, and is there any conclusive evidence of it? because there are dozens, probably hundreds, of cottage gardens in which plums are as productive as they are anywhere else.

The only question out of the fourteen in which the word "school garden" appears at all is No. 10, which runs as follows: "Given an average school garden plot of, say, one-eighth of an acre, suggest how it may best be worked for the instruction of the pupils in both fruit and flower cultivation over a period of three years at least." Mind you, there is no reference to vegetables, and I wonder in how many schools there are, or likely to be, twenty perches of ground set apart for the culture of fruit and flowers. Even if such were the case, why say anything about three years, because one would have to wait pretty well that time before much was made out of the fruit?

These are a few of the questions taken at random, but I do not see a single one asking the teacher how he would make use of his school garden, and employ the material in it for teaching purposes in drawing, composition, arithmetic, Nature study, mensuration, etc. There is no question asking how a teacher would arrange his school garden, crop it to the best advantage, and make it a place of educational interest, not only for the actual boys forming the class, but the whole school.

I may say, however, that there are teachers who actually do all this, who not only arrange and crop the school garden admirably, but use it in a dozen ways, and you see evidence of the garden all over the school. A large number of teachers now sit for the R.H.S. examination, and what is wanted is that passing at the examination should make them better teachers of gardening. This being so, something more is wanted in the examination than a few elementary questions on cottage and allotment gardening.

G. H. Hollingworth.

Nephrolepis exaltata. — Introduced into this country over a century ago, Nephrolepis exaltata, although a fairly popular fern showed no marked divergence from the normal form till within the last decade or thereabouts, when a form originated in America with divided pinnæ. Once started the change has been extraordinary, and we have now a great number of varieties, some of them so far removed from the type that it is difficult to look upon them as but seminal variations thereof. The latest development is N. exaltata Marshalli compacta, given an Award of Merit on April 11. This represents a dense mass of bright green moss rather than a fern of any kind. As there is in these varieties a certain amount of individual variation, the long list of names is now somewhat puzzling.—W. T.

AVAILABLE PLANT FOOD.

(Continued from page 362.)

All plants are very dependent structures; they must be supplied with water and certain soluble salts—potash, soda, lime, magnesia, etc.—which are derived from the soil, together with oxygen and carbonic acid obtained from the air, in addition to sunlight and a certain amount of heat. When all these conditions are fulfilled, somewhat as the plant's ancestors have been accustomed to them, the plant must grow, increase in size and texture, and become productive, provided no diseases or accidents overtake it.

These facts make it plain that a growing plant is influenced by all of the external conditions about it; for example, its environment and the availability of certain chemical substances which act as plant food.

To study how a plant lives therefore, one must consider the factors of growth, both the actual growth processes which go on within the structure of the plant, and the conditions to which such growth is sensitive.

Factors of Plant Growth.

One of the first things that call for attention in the question of how a plant lives is that of water. The rigidity or stiffness of any plant or succulent part of such plant is largely dependent upon its water content. If a succulent branch or leaf is severed from the parent, it soon loses its water by evaporation and the severed portion becomes flaccid or wilted. The proper extension or turgidity of the cells of plants with water is absolutely necessary for active plant growth, and points to the fact of the immense importance of the subject of artificial watering. The passage of soil water into the plant and afterwards of its transfer from cell to cell is accomplished by what is known as the principle of osmosis, which is the diffusion of liquids through the plant membranes and tissues.

Surrounding each rootlet for some distance behind the tip is a fringe-like growth of delicate root hairs. These hairs are single tubular cells, each one containing within its walls (as do all active cells), living matter called protoplasm, along with cell sap.

In a well-cultivated soil these delicate root hairs pass readily among the soil particles and cover an immense area. Owing to the dense cell sap of the root hairs and other surface cells, the water is taken into these cells by osmosis action, and along with the water are minute quantities of food substances in solution.

The absorptive activity of the root hairs is so great that water may be extracted from a soil which is apparently dry.

Plants contain much water, and it requires a considerable amount of artificial heat to drive out all the moisture from plant substance. The total water in some garden plants, as determined by the chemist, may be stated as follows: In one ton weight of cabbage heads there is 2,016 lbs. of water; in one ton of potato tubers there are 1,725 lbs. of water, and in one ton of potato haulm 321 lbs. of water. In a ton weight of carrots will be found 1,904 lbs. of water, and in a ton of onion bulbs 1,926 lbs. of water. One ton of celery will contain 1,884 lbs. of water, one ton of lettuce 2,106 lbs., and one ton of asparagus 2,090 lbs.

These facts show how largely kitchen vegetables are composed of water, and very clearly point to the fact that if the gardener is to ensure vigorous and uninterrupted plant growth he must have a sufficiency of moisture in the soil in immediate proximity to the mass of root fibrils and root hairs which branch out from the root stock.

Effect of Farmyard Manure.

It is probable, therefore, that independently of the liberal supply of all necessary plant-food constituents in well-made farmyard or stable manure, its beneficial effects are in a considerable degree due to its influence on the mechanical condition of the soil, rendering it more porous, hence more moisture sustaining, and therefore more easily permeable to surface roots, upon the proper development of which the success of so many horticultural productions depends.

The absorptive activity of all plant roots gives rise to a pressure within the plant tissues which tends to force the sap currents upwards. In fact, root pressure, together with other natural forces, especially that of transpiration, causes the crude sap to ascend through the woody cell bundles of the plant, and by means of these cellular bundles soil water is absorbed by the roots, which soil water contains minute quantities of available mineral salts necessary for plant growth. This solution is carried upward through all parts of root and stem, through the leaves and stalks, and finally through the blossoms, fruit, and seed.

J. J. Willis.

(To be continued.)

AVENUE OF WELLINGTONIAS AT OXENFORD CASTLE.

R.A.S. "Journal," 1910.—The issue of the "Journal" of the Royal Agricultural Society for the past year is now before us, and while necessarily of chief interest to agriculturists, it contains much that is deserving the attention of horticulturists. Especially noteworthy in this respect is Dr. E. J. Russell's contribution on "The Production of Plant Food in the Soil," which should be of considerable assistance to cultivators in the solution of problems associated with the soil. The reports of Dr. J. A. Voelcker, Professor R. H. Biffen, and Mr. Cecil Warburton, the consulting chemist, botanist, and zoologist respectively, are of interest to horticulturists from the fact that they refer to matters which concern gardeners as well as farmers.

ACER PLATANOIDES VAR. SCHWEDLERI.

There are numerous ornamental varieties of the Norway maple which might with advantage be included amongst select collections of trees more frequently than they are at present. Of the number, the variety under notice is certainly one of the best. Its most picturesque time is spring, just as the young leaves are developing, for both the leaves and shoots are of a pretty reddish-purple hue, which contrasts finely with the various shades of green seen on surrounding trees and with its own yellow blossoms which appear at the same time. Its period of beauty lasts longer than is the case with the young foliage of some trees, for the dark purplish-green peculiar to the variety at a later date is not assumed until after the leaves have reached their full size. It is a quick-growing variety, and apparently as vigorous as the type, hence its suitability for avenue planting in addition to its value as an ornamental tree. It is also worth planting as a group in a conspicuous position, for when at its best its rich colour is conspicuous from a considerable distance. As is the case with other maples, it is not fastidious regarding soil, though it thrives best in a fairly good deep loam.

D. W.

The Flame Flower (Tropæolum speciosum) is frequently spoken of as the "Glory of the Scotch Highlands," from the fact that it luxuriates in the cool, moist climate of the northern parts of Scotland, and where it appears in loveliest contrast against the white-washed walls of many a humble cottage. It is a coveted plant in southern gardens, but often proves troublesome to establish, the difficulty being not entirely one of soil alone, as position is also an important factor, the latter should be selected where some light shade will be cast over the ground, such as the north side of a holly hedge, which invariably gives good results, as the vine finds its way through to the sunny side, there to develop its flowers. It succeeds in ordinary garden soil that is trenched and manured previous to planting; the rhizomes should be placed horizontal in the soil, and at a depth of nine inches, making the ground perfectly firm after planting. —Thomas Smith.

NEW PLANTS, ETC.

ONCIDIODA CYBELE.

A most interesting orchid, obtained by crossing Cochlioda Noetzliana with Oncidium sarcodes. The plant and spike show the influence of the oncidium parent in a marked degree, the latter being branched in true oncidium fashion. The flowers, too, approach those of the oncidium parent in size and form, and they are of a curious shade of light brown, suffused with scarlet, and freely marked with yellow on the lip. A.M., R.H.S., June 6. Messrs. Charlesworth and Co., Haywards Heath. (See figure on p. 439 of our issue of June 10.)

CATTLEYA MOSSIÆ AUREOLA.

A very beautiful variety with large blooms. The sepals and petals are rosy-blush, and the big wavy lip is light rose-purple with a soft yellow area over the centre and throat. A.M., R.H.S., June 6. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

GREVILLEA ROBUSTA COMPACTA.

This is a very distinct variety of a most useful and popular foliage plant, and one that differs from the type in having its leaves placed more closely together, and of a richer shade of green. If it can be propagated readily the variety ought to prove a good market plant. We understand but one plant of this character was found in a large batch of seedlings. A.M., R.H.S., June 6. Mr. R. B. Leech, Woodhall Gardens, Dulwich.

CRINUM JOHNSTONI.

A very fine crinum from Tropical Africa, and one that succeeds out of doors at Burford Lodge, planted close to the foot of a south wall. The spike exhibited carried about two dozen flowers and buds, all white, with a tinge of rosy-blush down the centre of each segment. A.M., R.H.S., June 6. Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain), Burford Lodge, Dorking.

IRIS VARIEGATA MISS EARDLEY.

The variegata group of the extensive family of germanica irises contains many gorgeous varieties, and one of the most brilliant is this newcomer. It has bright yellow standards, and rich red-purple falls, the latter veined and studded at the base with yellow and white, and set off with a showy orange-yellow crest or beard. A.M., R.H.S., June 6. Mr. Amos Perry, Enfield.

HEUCHERA SANGUINEA NANCY PERRY.

A beautiful and graceful variety with pink red-tipped flowers, borne freely on spikes about eighteen inches high. A.M., R.H.S., June 6. Mr. Amos Perry, Enfield.

PRIMULA PULVERULENTA HIDCOTE STRAIN.

A distinct and effective strain of the mealy stemmed primula that is closely allied to P. japonica. It has white stems, soft rosy flowers with a brighter ring around the yellow eye. A.M., R.H.S., June 6. Mr. Lawrence Johnston, Hidcote, Campden, Gloucester.

GREVILLEA ROBUSTA COMPACTA.
A graceful plant, with elegant green leaves. A.M., R.H.S., June 6. Mr. R. B. Leech, Woodhall Gardens, Dulwich.

NOTES FROM SCOTLAND.

Severe Drought.

Not for many years has such a severe drought as now prevails in many parts of Scotland been experienced, and at the present date, June 8, there is not the slightest indication of a change, while the brilliant sunshine daily throughout the whole period and an accompanying breeze of wind day after day as its meridian is reached, makes it very trying for vegetation. A month ago, with a fair amount of warmth and abundant moisture, everything was very promising, but already the hopes then engendered are largely dispelled, and unless rain comes very soon, some crops, as strawberries, potatoes, peas, and a few others that are shallow rooting will be injured beyond remedy. In regard to newly-sown seeds the matter is still worse, and farm crops of turnips and mangolds make no progress, consequently the turnip fly works havoc, thus making resowing imperative.

Fruit trees and bushes that a short time ago were free from insects and healthy in appearance are now quite the reverse, and where spraying or other forms of washing are unavailable the foliage is infested with insects, and nothing short of a heavy rainstorm can effect a riddance.

Fortunately, this adverse state of matters is not general, as in some districts thunderstorms have provided all the moisture needed, and where these have not been too severe to cause any great amount of damage to the foliage, or by washing the soil from the roots of plants, the present warmth both by day and night, provides cultivators with a pleasure seldom experienced in the north country.

The Early Potato Crop.

This having advanced almost unchecked by frost is considered about ten days earlier than usual, and were it not for the drought which on the light, sandy soils of the seaboard of Ayrshire and Wigtownshire has been severely felt, the crop would have been a bountiful one. As it is, the first consignment of tubers in quantity to the Glasgow market was made from the Girvan district on June 6, which is nearly a fortnight earlier than last year; it is seldom that the auction sales take place until the third week of the month, and lifting the crop immediately follows, though, as in the case mentioned, extra favourable situations may accelerate this by a few days.

The well-known Epicure appears to be still the earliest, and grown upon a soil that suits it, the quality is tolerable, but if the reverse of this, or the season should prove very moist, the less said about its good points the better. Such, however, is the constant longing for the first fruits of the season, in commercial as well as private life, that the gratification of the desire rather than the palate would appear to be most in evidence, and tasteless and immature though potato tubers may be at this early season, the market returns to the fortunate possessor of an extra early crop is a great consideration.

James Day.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

EARLY-SOWN CYPRIPEDIUMS of the winter-flowering section will, in many instances, have advanced sufficiently far to be producing their roots. Providing the seed bed is in a good state it is not always necessary to remove them, but I consider the sooner seedling cypripediums of this class can be given a separate existence the better progress they make. Where potted separately they are treated individually, which is impossible where the plant has to be cared for around which the seed bed has been made, and the seedlings are liable to suffer from excess of moisture. Where seedlings are pricked off at the present season they make considerable growth during the next two months, and they become so far established that they are enabled to withstand the trying months, and make considerable headway during the early spring.

THE COMPOST suitable for any of the plain-leaved cypripedium seedlings consists of about equal parts of fibrous loam, peat, and sphagnum moss, with sufficient rough sand or finely-broken crocks to render the compost free and porous. The compost should be pressed moderately firm. For any of the tessellated-leaved section we dispense with loam, and use only peat and sphagnum. chopped fine, in equal proportions. The size of pot used should be governed by the strength of the seedling plants. The pots should be clean, and filled to about one-half their depth with clean broken crocks. After the seedlings have been pricked off water with rain water passed through a very fine rose, thoroughly wetting the compost through. The plants should then be placed in a position within reasonable distance of the roof glass, either by raising the staging, suspending several together in a pan or basket, or, better still, on a shelf, with a thin layer of broken coke to afford ample drainage. They must be protected from the direct rays of the sun, but otherwise they should have the benefit of all the light obtainable. Occasional spraying overhead will be found beneficial in hot, dry weather, and with careful attention to watering little difficulty will be found in their successful cultivation.

OLDER PLANTS.—Plants of one or two years' growth that have not sufficiently advanced to be likely to produce flowers this winter should also be repotted at the present season, for it will be found in most cases root action has commenced, and when in this state, with favourable outside conditions, they quickly become established in the new compost. The potting compost mentioned above, but of a coarser nature, is suitable for these also. It should be pressed moderately firm, and less drainage should be used as the plants gain strength. The more delicately constitutioned kinds, such as the hybrids of C. niveum, C. bellatulum, and its allies, also root at the present season, and where any repotting is necessary they should be attended to at once. These should have ample drainage, and a liberal proportion of lime rubble intermixed with the potting compost will be beneficial.—H. J Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

SOUV. DE LA MALMAISON CARNATIONS.—When these plants have finished flowering they should be sorted over and stood outside to harden before layering. For this purpose choose the most suitable plants, which, above all, must be clean and healthy. The present time is an excellent one in which to order new varieties of Malmaisons. Even if no new varieties are required, it is advisable to secure young plants from a different locality, as Malmaisons are apt to weaken if the stock is not changed occasionally. The grower may be guided in his selection by the list of varieties given here.

Princess of Wales is undoubtedly one of the most useful pink varieties in cultivation, and, together with Old Blush and Duchess of Westminster, will be sufficient in this shade of colour. Nell Gwynne is the only reliable white as yet introduced. In the yellow section, too, there is not much choice. Yaller Gal is a good colour, but we prefer to grow the two border carnations, Cecilia and Miss A. Campbell to fill this vacancy. If these two are grown under the same conditions as Malmaisons for two years, a good display of large blooms can be obtained, those of Cecilia being especially fine. Maggie Hodgson only requires to be seen to recommend itself to any cultivator. A good grower, of a rich velvety crimson, and very sweetly scented, it soon becomes a favourite. King Oscar may be said to be the best of the scarlets, and Lady Mary Hope is the best in terra-cotta shades. Of the red varieties The Colonel is very good for general purposes, but is far superseded by Lady Coventry, which is the best red Malmaison of recent introduction. The growth and habit are strong, and the plant is not much troubled by disease. The flowers are of a gigantic size, with a most exquisite scent, and altogether it is a variety which can be strongly recommended to those who have not seen or tried it.

PERPETUAL - FLOWERING CARNATIONS.—Constant care and attention must be given to the young plants to ensure good strong growth. If the final potting is not finished it should be done without any further delay. Pinching and stopping must be discontinued at the end of the present month. As soon as the plants have recovered from the check sustained in the potting they may be stood outside. When removing the plants examine each one for any signs of rust, which, if found, must be picked off and burnt. Avoid overcrowding, allowing enough space for the air to circulate freely between the plants. After a hot day the whole stock may be syringed with very weak soot water, from which they will greatly benefit.—A. Grubb, Porter's Park Gardens.

HARDY FRUITS.

THINNING FRUITS. — Practically all varieties of apples that are in a healthy state have set a heavy crop of fruit this year, at least in this locality, and where possible partial thinning should be commenced as soon as time will allow. Too much stress cannot be laid on the importance of this operation, both as regards future crops and the well-being of the trees. No doubt great damage is caused by overloading some varieties in a fruitful year, and especially is this so with young trees. Lane's Prince Albert may be taken as an example: if judiciously thinned, the trees may be grown as fine as many others, but if allowed to do so the trees will almost crop themselves to death. At the first operation, if an exceedingly heavy crop is set, whole bunches that are misplaced may be cut away with a sharp penknife as a quick and simple means of relieving the trees. Where quantities of apples and pears are grown thinning will need to be done systematically, or many trees may be overlooked. Large fruiting varieties need to be more freely thinned than those of medium size. The health of an individual tree should also be considered in regard to the number of fruits to be left to ripen.

WATERING.—The continued drought will cause many fruit growers anxiety, and fortunate is the grower who has a good water supply conveniently laid on. Fruit trees on walls will well repay fortnightly soakings during spells of very dry weather. Fig trees, especially if rooting space is confined, will need heavy soakings of water, for if the trees are allowed to suffer at the present time the fruits may fail to mature. Opportunity should be taken to apply manure or soot water after a soaking of clear water to weakly or heavily-cropped trees, as this will help wonderfully towards fine and well-finished fruits of all descriptions.

STRAWBERRIES.—Layering for the purpose of providing plants for new plantations should be taken in hand as soon as the layers are large enough; the best plants are usually obtained by layering in pots. Large 60's should be filled to within half an inch of the top with a mixture of rich loam and sifted spent hotbed material; the pots may be grouped as much as possible to form protection for each other against the sun, and the drying influence of the wind, and also as a convenience for watering. One layer only from each runner should be laid on the soil, and weighted down by a stone that will fit conveniently inside the rim of the pot. Stones are preferable to pegs, as they retain the moisture and keep the plants cool at a very drying time. The soil should at all times be in a moist state, watering being done as late in the afternoon as possible. The layering of the later varieties may be postponed another fortnight or so, Laxton's Latest and Waterloo being much later in sending out their runners than the early and midseason varieties; the first-named promises to supersede Waterloo entirely, as it crops a little later, and much more heavily, and its flavour and constitution is all that can be desired.

SMALL RAMBLING FRUITS. — The strong growth of loganberries, blackberries, wineberries, etc., will need a little attention, and may be tied carefully to separate stakes, or, if on fencing trained as much as possible clear of the fruiting canes, or the tender young growths may become damaged during fruit gathering. — J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

LEEKS.—The plantation to form the principal winter supply should be made now; over large produce is not to be desired, but useful good-sized leeks in quantity are the aim of most kitchen gardeners in private places. Like the majority of other crops, leeks require ground in a fertile condition to secure satisfactory results. Put out the plants at about eighteen inches from row to row, and about fifteen inches apart in the row, preserving the young fleshy roots from damage in transplantation, and not allowing them to become dry.

PARSLEY.—About this date it is advisable to making a large sowing of parsley to provide for the main winter crop. Before sowing see that the soil is charged with sufficient moisture to ensure germination, and that precautions are taken as far as possible against wireworms, which are very destructive to the crop.

ASPARAGUS.—It is inadvisable to cut asparagus very heavily after this date, but much more profitable to build up the plants for next season's supply. Give a good dressing of some approved manure to the beds, and if the rainfall is not ample water it well in to the roots, and repeat the dose again in a few weeks when growth is vigorous and new crowns are being made. Weeds often take possession of the beds from now if not checked; a dressing of salt keeps them down, and assists to build up the asparagus plant.

CABBAGE.—The autumn-planted cabbages are now turning in fast for use, and will carry the supply on for a considerable time. If a sowing of seeds was made this spring a stock of young plants will be at hand for planting now, which will turn in about the end of August and onwards through the winter. These may be cleared from the ground as soon as cut, allowing the old stock of plants to develop quantities of heads, which will give a profitable yield well on in the new year during a scarce time.

TRANSPLANTING.—In most parts of the country vegetation is suffering very much through want of rain, and transplantation is very difficult; where possible sow crops where they are to remain, in preference to removing them, and thin them out to the desired distance apart. In cases where transplanting has to be carried out liberal treatment must be given or serious checks will follow.—Charles Flack, Cholmondeley Castle Gardens.

ROYAL SHOW

PRACTICE WITH SCIENCE

NORWICH,
June 26th to 30th, 1911.
President—HIS MAJESTY THE KING.
£10,600 in PRIZES.
Horses, Cattle, Sheep, Pigs, Poultry, Produce, Implements.
JUMPING, RIDING AND DRIVING.
FOUR-IN-HAND TEAMS,
Horse-Shoeing and Butter-making, Competitions, Agricultural Education and Forestry Exhibitions.
FLOWER SHOW.
The Band of the 16th (The Queen's Lancers).

Prices of Admission: Monday, June 26th, 5s.; Tuesday and Wednesday, June 27th and 28th, 2s. 6d.; Thursday and Friday, June 29th and 30th, 1s.
THOMAS McROW, Secretary.
Royal Agricultural Society of England,
16, Bedford Square. London, W.C.

NORTH OF ENGLAND HORTICULTURAL SOCIETY.

AUGUST 15th (Tues), at HARROGATE, in conjunction with Harrogate Agricultural Society. R. H. S. Delegates will award their Medals.

Trade exhibits and Horticultural Sundries welcomed.

SEPT. 20th (Wednesday), at Leeds.
OCT. 18th (Wednesday), at Leeds.
NOV. 15th and 16th (Wednesday and Thursday), at Newcastle, in conjunction with NEWCASTLE CHRYSANTHEMUM SOCIETY, and the NATIONAL FRUIT CONGRESS.
DEC. 13th (Wednesday), at Leeds.

All particulars from Rev. J. BERNARD HALL,
Rawdon, Leeds.

BECKENHAM HORTICULTURAL SOCIETY.

GRAND SUMMER SHOW.

WEDNESDAY, July 12, 1911.

OPEN CLASSES, ROSES, Etc.

MILITARY BANDS, PASTORAL PLAY, ETC.

7, Silverdale Road, Southampton.

EXHIBITIONS AND MEETINGS.

◆

The International Horticultural Exhibition at Florence.

An International Exhibition of Horticulture and Allied Industries was held recently at Florence, in celebration of the fiftieth year of Italian Independence, and brought together a large and brilliant display. The schedule included 450 classes, and in these over 280 awards were made, besides 53 prizes awarded to groups staged not for competition, and some twenty-five prizes of honour awarded by the Executive Committee, and by the R. Societa Toscana d'Horticulture. This will give some idea of the importance of the event, for it is impossible to give anything like a detailed account of the exhibition. The classes were grouped in thirty-one sections, about one-third of which were open to International competition, the rest being limited to native products. The jury consisted of over 150 members of Italian, French, German, Dutch, Belgian, and British nationality, the latter being represented by Mr. R. Allen Rolfe, president of the orchid section, and Mr. Stuart H. Low. The exhibition was opened by their Majesties the King and Queen of Italy, who made a tour of the exhibition and were highly pleased with the fine horticultural display, though the event was accompanied by a heavy downpour of rain which continued throughout the greater part of the first two days, and must have made an enormous difference to the attendance.

Coming to the exhibits we may state that the first section was devoted to new plants, for which gold, silver-gilt, and silver medals were offered in fifty-two classes, though awards were made in only thirty-one of them, and these chiefly were the novelties of garden origin, as anthuriums, caladiums, dracænas, and crotons, in all of which the R. Scuola di Pomologia, Florence, secured premier honours, their exhibits invariably reaching a high standard of excellence. Six classes in this section were devoted to orchids, and only produced a single exhibit, a fine seedling from Cypripedium Lawrenceanum x Rothschildianum being shown by Signor Ferdinando Scarlatti, Florence, in the class for a new cypripedium, but the gold medal offered had to be withheld, on the ground the plant was already in commerce under the name of C. Mahleræ. No new species, no new hybrid odontoglossum, no new hybrid of the cattleya group, not even a hybrid sent out during the last five years were forthcoming, though six gold medals were offered, and the whole section was open to International competition.

The orchid section was also International, and did rather better, though eight out of thirteen classes were blank. The prize offered for 100 distinct species and varieties —an ornamental vase, value 200 lire—was awarded to Messrs. Theodore Pauwels and Co., Meirelbeke, Ghent, for a very fine group, including a few odontiodas, many beautiful odontoglossums, Renanthera Imschootiana, some good cattleyas and allies, forms of Miltonia vexillaria, a number of good dendrobiums, cypripediums, cymbidiums, oncidiums, etc. For a group of fifty diverse kinds the large gold medal was awarded to Signor R. Mercatelli, Florence, his group including some good cattleyas and lælio-cattleyas, several dendrobiums and cypripediums, Anguloa Clowesi, Aërides odoratum, Odontoglossums luteopurpureum, Pescatorei, and citrosmum, bulbophyllums, Phaius Norman, Oncidium sphacelatum, etc. For twenty-five diverse kinds there were three competitors, the R. Scuola do Pomologia, Florence, gaining the gold medal for a group of well-grown plants, in which vandas and varieties of Lælia purpurata were conspicuous, while the Marquis Carlo Ridolfi, Meleto, was awarded the silver-gilt medal for a more varied group of smaller plants, mostly warm house kinds. Signor R. Linari, Florence, staged a group of well-grown specimens, including Cœlogyne pandurata with a spike of eight flowers, Cattleya Lawrenceana and intermedia, a fine Cymbidium Lowianum, Lælia purpurata, Lycaste Skinneri, and a number of good cypripediums and selenipediums, but the group included duplicates, and had to be passed over.

For a group of cypripediums and selenipediums Signor F. Scarlatti, Florence, staged a group mostly of familiar kinds, to which the second prize, a silver-gilt medal, was awarded. For a collection of cypripediums and selenipediums, a good group of familiar kinds was exhibited by Signor F. Scarlatti, the second prize, a silver-gilt medal, being awarded. For a vanilla in flower or fruit the first prize was awarded to the Marquis Carlo Torrigiani, Florence, for a fine plant bearing seven racemes, mostly of young fruit.

The aroid section was International, and contained eleven classes, in eight of which awards were made. The gold medals offered for the best fifty caladiums, the best group of Anthurium Andreanum, and for the best collection of aroids (excluding the preceding and A. Scherzerianum), were all won by the Scuola di Pomologia, Florence, with excellent groups, while that for a group of A. Scherzerianum went to Signor F. Scarlatti, for a large and brilliant exhibit. The silver-gilt medal for the best specimen of the latter species was won by Count Ugo Cahen, Allerona, with a fine plant bearing a dozen magnificent spathes.

Only one of the thirty-five classes devoted to palms was marked as International, that for thirty species and varieties, in strong examples, but the two gold medals offered went no further than Florence, the first prize being won by the R. Orto Botanico, and the second by Signor R. Mercatelli. The palms formed a large and beautiful series, and prizes were awarded in twenty-five other classes. In that for kentias, in strong examples, a fourth prize had to be given, the order being: Signor R. Mercatelli, first; G. Turri, second; P. Capecchi, third; and G. Luigi, fourth, all of Florence. For the best specimen of Latania borbonica the R. Orto Botanico, Florence, won the silver-gilt medal with a magnificent specimen bearing three panicles of fruit, while Baron de Gunderrode was first for a specimen of Licuala grandis. For the best spinose palm the first prize went to Signor B. Gattai, Florence, for a very beautiful example of Astrocaryum mexicanum. In five classes a third prize had to be given.

The next five sections were not International, and may be passed over quickly, though in each there was a very fine display, about which much might be said. The section devoted to hothouse plants contained forty classes, twenty-four of which were filled. That for the best collection of ferns and lycopods produced a keen competition, and two additional prizes had to be awarded, making five in all; the premier group, staged by the firm of G. Bonfiglioli e figlio, Bologna, being magnificent, both in composition and arrangement. For the best thirty distinct hothouse plants, the Scuola di Pomologia, Florence, was first with a fine group, also for a magnificent specimen of Acalypha hispida, and for collections of crotons and dracænas, while Signor R. Mercatelli was first for ornamental-leaved begonias. There were forty-one classes for greenhouse plants, of which twenty nine were filled, the pelargoniums being specially fine, as might be expected in such a climate. In the class for 100 distinct zonals four prizes were awarded. Conifers, trees, and shrubs contained forty-five classes, twenty-seven of them being filled, and among them we noted the azaleas, rhododendrons, and hydrangeas as being excellent. There were eleven classes for roses, of which two only were blank, while the quality was excellent and the competition keen, in one case one, and in another two additional prizes being given. Herbaceous plants and bulbs were good, but only twenty-nine out of fifty-three classes were filled, the carnations, sweet peas, cinerarias, calceolarias, petunias, and mignonette calling for special mention. Four

International classes were set apart for aquatics and marsh plants, but did not yield an exhibit.

The sections devoted to fruits, fresh and preserved, and to vegetables, were in part International, some good collections appearing in the former, particularly of the citrus family, and in the latter there were some very fine exhibits of asparagus. Cut flowers, artificial flowers, and decorations produced an extensive display, and many of them were very artistic, but we cannot attempt to enumerate them. Lastly, must be mentioned the exhibits of horticultural appliances, literature, photographs, and horticultural instruction, which were very interesting, and for which a large number of awards were made. A large gold medal, offered for an orchid house built for utility and economy, was won by Messrs. Houtsch and Co., Dresden, with a well-built structure.

Among the numerous awards made to groups exhibited "not for competition" must be mentioned two large gold medals, value 200 lire, given to very beautiful groups of orchids sent by Messrs. Charlesworth and Co., Haywards Heath, and Messrs. Stuart Low and Co., Enfield, in which cool-growing species were largely represented, and thus forming a marked feature of the show, for cool orchids are not much grown in Italy, chiefly for climatal reasons. In these groups odontoglossums, species and hybrids, were represented by a very fine series, with a few brilliant odontiodas, masdevallias, dendrobiums, oncidiums, cattleyas, Lælio-cattleyas, cypripediums, and several other interesting things, the groups being greatly admired. In Messrs. Charlesworth's group was a beautiful hybrid from Brasso-cattleya Veitchi x Cattleya Trianæ alba, which was named Brasso-cattleya Queen Elena, in honour of the Queen of Italy, and the King and Queen graciously shook hands with Mr. Bohnhof, Messrs. Charlesworth's representative, in recognition of the favour.

The members of the jury were entertained at luncheon, and there were several other interesting functions in which the jury and exhibitors took part. The meeting was a great horticultural success, and will long be remembered with pleasure by those who had the good fortune to be present.

Birmingham Botanical and Horticultural Society.

The annual show of orchids and early summer flowers was held on June 8, under ideal show weather conditions. Strangely, however, there was a very sparse response to the committee's invitation to growers (trade excluded), to compete for the monetary prizes for orchids, stove and greenhouse plants, carnations, and violas, the latter only being represented. The absence, however, was amply compensated for by the splendid non-competitive contributions of orchids, roses, ferns, and herbaceous flowers by the amateurs and the trade.

The centre of attraction was the magnificent collection of orchids occupying 36ft. by 12ft., from Southfields, Edgbaston, the seat of W. Waters Butler, Esq.; it was most artistically arranged by the head gardener, Mr. R. H. Jones, and was pronounced to be the finest exhibit of orchids ever exhibited in Birmingham; the society's gold medal was awarded. Cattleyas, odontoglossums, cymbidiums, miltonias, and lælio-cattleyas, were presented, and included many rare forms.

Silver-gilt medals were awarded to Messrs. H. B. May and Sons, Edmonton, for a very choice collection of exotic ferns; to Messrs. Gunn and Son, Olton, for climbing roses in pots, Oriental poppies, sweet peas, and alpine plants.

Silver medals were awarded to Messrs. Sander and Sons, St. Albans, for orchids and their Marguerite Mrs. F. Sander—a fine double-flowered variety; to Messrs. J. Cypher and Sons, Cheltenham, for a small but choice collection of orchids; to Mr. E. V. Low, Haywards Heath, Sussex, for a collection of orchids; and to Mr. George Prince, Oxford, for cut roses.

Bronze medals went to Mr. G. W. Miller, Wisbech, for pyrethrums; and to Messrs. J. Bastock and Sons, Moseley, for an effective arrangement of violas, conspicuous amongst which was their well-known Moseley Perfection, probably the finest yellow variety extant, and a fine acquisition.

In the competitive classes violas were comparatively poor and sparse. For twelve varieties second prize was awarded to Mr. S. Smith, Bournville, the only competitor. For six varieties the first prize was awarded to Mr. F. Riley, King's Heath; second to Mr. H. Anderson, Shirley; and third, Mr. T. E. Winterlogg, Yardley.

Votes of thanks were accorded Mr. Godfrey Nettlefold, South Bank, Edgbaston (gardener, Mr. J. Higley), for a small collection of sweet peas, grown under glass, and to Mr. George Cadbury (gardener, Miss Cope) for a large specimen of the cocoa plant in flower, and bearing one oblong yellowish fruit, growing from one of the lower main branches.

In the society's committee room a meeting of the County Committee, formed in connection with the International Horticultural Exhibition of 1912, to be held in London, was held; Mr. Neville Chamberlain was elected chairman, and Alderman Holt, Leamington, vice-chairman.

National Hardy Plant Society.

At the meeting held in Anderton's Hotel on May 24, 1911, Mr. A. J. Macself presided, and members were present from Scotland, Ireland, the North, South, and Midlands of England.

Saturday, July 8, was fixed for the visit to Friar Park, Henley-on-Thames, by kind invitation of Sir Frank Crisp. It was decided to send a deputation to the North of England Horticultural Society's Show at Harrogate, on August 15, also to renew the offer of prizes and medals offered for the June show, which had been postponed. Delegates were appointed to attend York Gala. Delegates were also appointed for Cardiff and Leamington Shows. It was decided to advertise the objects of the society in the "Gardeners' Chronicle," "The Garden," the "Gardeners' Magazine," and "Journal of Horticulture." A long and useful discussion took place on the model schedule suggestions sent by several members of the Council unable to attend. The matter was deferred to a future meeting. Mr. E. H. Jenkins was added to the Publications Committee.

Dr. Macwatt sent a seedling white viola (violetta type), which was of excellent habit and flowers in July and August. Mr. Hawes kindly undertook to conduct a trial of the same for the Council, who expressed the wish to see it again later. Mrs. H. L. Scott, Cadeby Hall, showed Smilacina racemosa, a pure white form, very strongly scented, from three to four feet in height. The thanks of the society were awarded to these two exhibitors. Messrs. Artindale and Co., Sheffield, staged a fine collection of violas and pansies. The names of several varieties were noted of which it was desired to see growing plants. It was decided to offer medals at several other shows in 1911, and this was left to the chairman and secretary to arrange.

Scottish Horticultural Association.

The June meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 6th inst. Mr. Massie, the president, was in the chair, and there was an attendance of 75 members.

The meeting was an open one, and the evening was devoted to the discussion of questions by members. These were—(1) Had Mendel's law been applied to any plant belonging to the compositæ, and with what result? (2) What was the best means of combating the chrysanthemum leaf-mining maggot; and (3) the vine weevil? (4) How did the Americans get their stock of apples? (5) What was the most profitable crop to grow under glass? And (6) Would not fruit and vegetable culture form a necessary adjunct in the working of the small holding of the future?

In answer to the first question, Mr. Cuthbertson pointed out that Mendel made many experiments with the Hawkweeds (Hieracia), but that, owing to the extreme delicacy of the flowers and the minuteness of the operations, he had to abandon them. Some experiments had been made in the genus gerbera, and in these it had been found that red colour was dominant. There was agreement that the best way to combat the chrysanthemum leaf-mining maggot was by spraying with quassia extract and soft soap, and Mr. Berry pointed out that the highly concentrated extract known as "Cirengol," a sixpenny tube of which was sufficient for twenty gallons of water, was the best form to use. Picking off the affected leaves was also essential. Mr. Nicoll, Rossie, one of the leading chrysanthemum growers in Scotland, considered from what he had observed that the marguerite, or "Paris Daisy," played an important part in propagating the pest, and Mr. Comfort stated that he had observed the variety "Queen Alexandra" was very liable to attack. As regards the vine weevil, spreading sheets of white paper underneath the vines, and, in the evening, when all was quiet, giving the stems a sharp knock so as to dislodge the insects, and collecting and destroying them, was the plan which found most favour. Mr. Kirk, Alloa, stated that the weevil always sought a dry hiding place, and he warned growers against allowing the borders to become dust dry in winter. The substance "Phospho nicotyle" was also recommended, and Mr. Kirk gave the following as a good preparation for coating the stems of the plants: Clay, five parts; gas tar, one part; add sufficient boiling water to bring to consistency of paint, and put on with ordinary paint brush. Mr. Berry mentioned that the clay-coloured weevil (Otiorrhynchus picipes) was doing enormous havoc in some of the raspberry crops by eating the tips of the unopened flowers, which invariably produced malformed fruit after being so attacked. Arsenate of lead spraying, he said, was the best preventive, and this should be done as soon as the young shoots appeared.

As regards the most profitable crop to grow under glass, Mr. King, nurseryman, Edinburgh, stated that it all depended on circumstances. In some parts one crop might be the most profitable, in other districts another; but the question was not so much what to grow as how to grow it. A well-grown crop would always sell, but not a badly grown one. Violas and lobelia were about as profitable things to grow as any, provided it wasn't overdone. There was no time to discuss the question relating to fruit and vegetable culture in connection with small holdings.

The exhibits were: Sweet peas, from Messrs. Dobbie and Co., Edinburgh (Cultural Certificate); new hydrangeas and Statice Dickensoni, from Mr. John Downie, Edinburgh; hydrangeas, Solanum Wendlandi, and Cytisus Adami (three kinds of flowers), from Mr. R. H. Cockburn, Gartmore, Perthshire (Cultural Certificate for hydrangeas); Clarkia elegans "Firefly," from Mr. J. Alexander, Niddrie, Midlothian; sweet peas, from Mr. Jas. Staward, St. Fort, Newport (Fife); late chrysanthemums "Niveus" and "Western King," and sweet pea (sport from Countess Spencer), from Mr. P. Slater, Leebrae, Galashiels; new pyrethrum, "Stenhouse Beauty," seedling pyrethrums, and Ox-eye daisy "Early Queen," from Mr. F. Baillie, Liberton, Edinburgh; tree pæonies, from Mr. James Fraser, Bonally Tower, Colinton; Viola gracilis purpurea, from Messrs. Todd and Co., Edinburgh; Rhododendron Pink Pearl, from Mr. J. K. Brown, Dunnikin, Kirkcaldy; Rhododendron cinnabarinum, from Mr. W. Williamson, Edinburgh; Phyiocactus Ackermanni, from Mr. A. Johnstone, Hay Lodge, Edinburgh; calceolarias, from Mr. A. Smibert, Leith.

Eleven new members were elected.

The paper on July 4 will be by the secretary, the subject being "Some Recent Additions to Our Knowledge of Trees."

GRAND YORKSHIRE FLORAL FETE AND GALA.

(Continued from page 444.)

such things as inulas, achilleas, heucheras, etc. About a dozen varieties of new and popular strawberries were staged by Messrs. Laxton Bros., Bedford. Bedford Champion, Laxton's Count, Epicure, and Reward were probably the best of the collection.

Messrs. Webb and Son's exhibit was, as usual, a display of vegetables, flowers, and fruits of the highest quality, displayed in a manner that betokens the practised hand. Gloxinias were the chief feature among the flowering plants used, and the melons were exceptionally good. Water lilies, rushes, sarracenias, and other moisture-loving plants were shown by Messrs. Bakers, Wolverhampton, in particularly appropriate fashion. Big bunches of delphiniums, pæonies, Spanish irises, and other border flowers were also shown by the Wolverhampton firm.

A collection of violas from Messrs. W. Artindale and Son, Sheffield, was well put up, and included some of the latest as well as the best of older varieties. The group of flowering shrubs and ornamental trees arranged in the open by Messrs. J. Backhouse and Son, Lim., York, was a feature of the show. The front of the group was gay with roses, azaleas, and rhododendrons, and the standard privets, box, and bay trees in the rear were good specimens.

The floral designs staged by Messrs. J. Backhouse and Son, Lim., York, were massive and of original character. A Royal Throne in double white pyrethrums, a cross of double stocks, and a crown of pinks were the formal pieces, with baskets of roses, bouquets, etc., grouped around. A table of pot roses, cut carnations, and other decorative subjects, admirably put up by Messrs. W. Cutbush and Son, Highgate, N., contained among other notable things some excellent plants of Dracæna Bruanti variegata, Marguerite Mrs. F. Sander, and the gay flowers of Rose American Pillar.

Clipped trees in all manner of quaint shapes were shown by Messrs. Piper's, Floral Establishment, Bayswater, London. Some of the birds, animals, and other objects into which the trees were cut were very cleverly worked out. A big exhibit of pillar roses, hydrangeas, liliums, and other flowering plants, with acers, conifers, and other shrubs in the background, came from Messrs. Kent and Brydon, Darlington, who also showed alpines on a model rockery of excellent design. Ferns were nicely shown by Messrs. H. B. May and Sons, Edmonton.

Excellent groups of orchids were staged by the leading firms, from both north and south of the country. The fine group at the end of a central stage, put up by Messrs. Charlesworth and Co., Haywards Heath, contained some exquisite odontiodas, cattleyas, and miltonias. Lælio-cattleya Feronia, L.-c. Fascinator, and Brasso-cattleya Veitchi were also conspicuous. A large and interesting group came from Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds; miltonias and odontoglossums being the predominant features, together with Lælio-cattleya Aphrodite and L.-c. Canhamiana.

Perpetual carnations were admirably displayed by Mr. C. F. Waters, Balcombe, the variety named Edith Waters being very prominent. Messrs. Jarman and Co., Chard, displayed centaureas, etc., and Mr. C. W. Breadmore, High Street, Winchester, contributed good sweet peas, with Lavender George Herbert, Mrs. C. W. Breadmore, and Stirling Stent as notably good varieties.

The contribution from Messrs. W. and J. Brown, Peterborough, embraced roses and hardy herbaceous flowers, the former being particularly strong, and Mdme. Ravary, Joseph Hill, Mrs. Peter Blair, and Mdme. Melanie Soupert were notably well shown. Mr. Elisha J. Hicks, Twyford, Berks, was another large exhibitor of roses, and one who made an attractive display of bright blooms. Messrs. Seagrave and Co., Sheffield, staged violas in quantity, and the flowers of a whole host of delightful varieties were most effectively displayed. Messrs. G. Massey and Sons, Spalding, were represented by popular varieties of pæonies, pyrethrums, and irises.

Mr. C. Engelmann, Saffron Walden, brought up a contribution of carnations, in which the crimson Carola was a special feature. Messrs. Young and Co., Hatherley, presented finely-grown perpetual carnations in good style, and their hanging baskets were delightful; we noticed especially good flowers of May Day and Rose Pink Enchantress.

From the Six Hills Nursery, Stevenage, Mr. Clarence Elliott brought a collection of herbaceous and alpine plants, and arranged these to form a most interesting and attractive rock garden; quite choice and rare plants were displayed. The sweet peas from Messrs. Dobbie and Co., Edinburgh, were very beautiful, and we noticed good vases of such new varieties as Melba, May Campbell, Mrs. Cuthbertson, Marion, Elfrida Pearson, Dobbie's Cream, and the bright orange-shaded Edrom Beauty. Messrs. Batchelor and Sons, Harrogate, presented a pleasing exhibit of plumose ferns, and Messrs. R. H. Bath, Lim., Wisbech, contributed a bright and fragrant display of popular and useful herbaceous pæonies, with single and double pyrethrums.

Mr. Maurice Prichard, Christchurch, and Mr. G. W. Miller, Wisbech, were both exhibitors of hardy flowers, and Mr. J. Wood, Boston Spa, had a big rock garden, so arranged that visitors could walk along its winding paths and closely inspect the many beautiful alpine and herbaceous plants therein planted. A fine strain of Canterbury bells, from Messrs. W. J. Godfrey and Sons, Exmouth, added to this firm's Oriental poppies in many art shades, made up a large exhibit. Mr. George Prince, Longworth, exhibited roses in pleasing fashion, and his tea-scented varieties were especially bright.

MEDALS, ETC.

Premier prize, presented by Lord Middleton, to Messrs. Mansell and Hatcher, Rawdon, Leeds, for the most meritorious exhibit in the show—a group of orchids.

Special Gold Medals for Trade Displays.—For orchids, to Messrs. Mansell and Hatcher, Rawdon, Leeds; for stove and greenhouse plants, to Messrs. J. Backhouse and Sons, Lim., York; for decorative plants and flowers, to Messrs. W. Cutbush and Son, Highgate, N.

Large Gold.—To Messrs. Sutton and Sons, Reading; to Messrs. Webb and Sons, Stourbridge; to Messrs. James Backhouse and Sons, Lim., York; to Messrs. W. Cutbush and Son, Highgate; and to Messrs. Kent and Brydon, Darlington.

Gold.—To Messrs. W. Artindale and Son, Sheffield; to Messrs. Mansell and Hatcher, Leeds; and to Messrs. W. and J. Brown, Peterborough.

Large Silver-gilt.—To Messrs. Charlesworth and Co., Haywards Heath; to Messrs. J. Piper and Son, Bishops Road, Bayswater; to Messrs. R. H. Bath, Lim., Wisbech; to Messrs. H. B. May and Sons, Edmonton; to Mr. Clarence Elliott, Stevenage; to Mr. E. J. Hicks, Twyford; and to Messrs. Laxton Brothers, Bedford.

Silver-gilt.—To Mr. C. F. Waters, Balcombe; to Messrs. James Backhouse and Sons, York; to Mr. G. Yeld, Burton Lane, York; to Messrs. Dicksons, Chester; to Messrs. Bakers, Wolverhampton; to Messrs. Dobbie and Co., Edinburgh; to Messrs. Batchelor and Sons, Harrogate; to Mr. J. Wood, Boston Spa; and Messrs. Sander and Sons, St. Albans.

Large Silver.—To Mr. C. W. Breadmore, Winchester; to Mr. C. Engelmann, Saffron Walden; to Messrs. Young and Co., Hatherley; to Messrs. James Kelway and Son, Langport; to Mr. Maurice Prichard, Christchurch; and to Messrs. W. J. Godfrey and Sons, Exmouth.

Silver.—To Messrs. J. Backhouse and Sons, Lim., York; to Messrs. Seagrave and Co., Sheffield; to Messrs. G. Massey and Sons, Spalding; to Mr. J. E. Sadler, Newbury; and to Mr. George Prince, Longworth.

ANSWERS TO CORRESPONDENTS.

ROLLED-UP ROSE LEAVES.—E. L. L., Hampstead: The roses are suffering from a very bad attack of the Leaf-rolling Sawfly (Blennocampa pusilla), a pest that appears during May and June, and often causes a great deal of damage. A period of dry weather appears to aggravate the trouble, as the leaf growth is somewhat slow. The little green larvæ were present in each rolled leaf sent, and the irritation they set up then causes the leaflet to roll up cylindrically. Spraying with a nicotine solution directly a leaflet is seen rolled up would prevent a great deal of mischief; indeed, where the pest is prevalent regular spraying should commence early in May. When an attack has developed the rolled leaves should be picked off and burned. Full-fed grubs go down into the soil during August, form a cocoon, and winter thus, but about February they pupate, and the mature sawflies appear in May and June, and quickly commence to deposit eggs, from which the green larvæ (greyish at first) hatch out.

ELM TREE INJURED BY LIGHTNING.—C. C., Elmstead: If any branches were broken these should be cut back to the uninjured portion; the cut surface should then be carefully smoothed over with a spokeshave and tarred. Where only a strip of bark has been torn off there will be little need to do more than carefully trim the torn edges of the bark, and then dress the exposed surface with a moist mixture of clay, etc., such as is used for grafting; this would encourage the formation of new bark.

MANURES FOR TOMATOES.—A. P., Acton, wishes to know the amount of superphosphate of lime, bonemeal, and basic slag Mr. A. Petts uses in the soil for tomatoes; the figures were not given in the article that appeared in our issue of May 20. Will Mr. Petts please oblige, giving the amount of each substance per bushel of loam.

QUASSIA DRESSING FOR GREEN FLY.—O. R.: Place half a pound of quassia chips in two gallons of water, soft water if possible, and allow them to soak for twelve or fifteen hours; then bring the whole slowly to the boil, and allow it to boil for ten minutes. Strain the mixture, and while it is still hot, add half a pound of soft soap and stir well. Use while warm, not hot, spraying the infested plants all over, and half an hour later well syringe the sprayed plants with clear water.

SULPHIDE OF POTASSIUM FOR MILDEW.—C. H. H., Leicester: Dusting the foliage with flowers of sulphur immediately there are indications of mildew is a very good remedy for that disease, but spraying with a solution of potassium sulphide (liver of sulphur) is more effectual. The solution should consist of [illegible] of potassium sulphide dissolved in a gallon of water; the potassium sulphide readily dissolves in hot water, which should be allowed to cool before the solution is used for spraying. This is one of the best fungicides for use in plant and fruit houses, and it has much value in preventing and checking attacks of mildew on rose and other plants growing in the open.

BIRDS CAUGHT IN NETS.—A Liverpool correspondent writes as follows with reference to the desirability of at once dealing with birds that are caught in nets used for the protection of fruit: "Will you allow me to suggest to the bird-lovers among your readers that during the summer season they should make a point of periodically visiting their fruit nets, and so insure against such of our little songsters as may have been caught there dying a slow death by hunger and thirst. It is quite a common thing to find the dead body of a bird entangled in the meshes of a strawberry net, and one does not like to think of the lingering death to which the little thief has [illegible] by his very natural greediness. Will you also let me take this opportunity of reminding their friends of the difficulties our birds experience during very dry weather in finding food and water, many of them suffering keenly from the want of it, and beg that their tin of water and allowance of 'scraps' may be given them during summer droughts as well as during winter frosts."

COTTON WORM.—A. J. H., Windsor: We should be glad if you will send us one or more specimens of the worm, should you again find any in your garden.

NAMES OF PLANTS.

Telegrams: "Hortulanus, London."
Telephone: 5047 Westminster.

The First Established Horticultural Building Firm in 1808. Foremost in 1911.

PATENTEES AND MAKERS OF WEEKS' PATENT "DUPLEX" UPRIGHT TUBULAR BOILERS.

ERECTED FOR CAPT. DALGETTY, LOCKERLEY HALL, ROMSEY.

THE MOST PERFECT SYSTEM of GLAZING

is our latest "Challis" system, as illustrated

NO BARS. MORE LIGHT. NO DRIP.
NO OUTSIDE ROOF PAINTING OR PUTTY.

It has not the disadvantages of some other systems which involve great loss of heat, rattle in windy weather, and broken glass.

THE COST IS LESS THAN OUR STANDARD CONSTRUCTION. LET US SEND YOU A PRICE TO COMPARE WITH OTHERS.

We only use best materials, and spare no effort to uphold our reputation for first-class work, at lowest prices.

HAYWARD'S *Eureka* WEED KILLER

insures clean paths, best known and most satisfactory. It is no new experiment. A Weed Killer that can be thoroughly relied upon to keep paths clear for 12 months with one dressing is most helpful, but under-strength articles with no reputation are an aggravation. The "Eureka" is sold everywhere, 1/9 for 100 sq. yards, 6/- for 400 yards, 49/- for 4,000 yards; intermediate sizes at suitable prices. The "Eureka" Lawn Sand, Soilfume, Quassia Extract, Bordeaux Mixture, etc., have been in regular use for years, and there is no better value. If any difficulty in obtaining apply only makers, **TOMLINSON and HAYWARD, Ltd., Lincoln.**

NOTE OF THE WEEK.

◆

The Water Supply of Gardens.

MR. NORMAN DAVIS.

Although the comparatively long period of dry weather that has been experienced over a wide area this summer has not been so injurious in its effects upon garden crops generally as some of the droughts of the past decade, it has been sufficiently harmful to seriously affect most kinds of vegetation, and to materially add to the anxiety and the work of those engaged in garden management. The crops of several kinds of hardy fruits have in many cases been appreciably reduced by the trees shedding many of their fruits owing to an insufficiency of moisture in the soil, and the injury arising from this check has been accentuated by the infestation of the new growth by insect pests. In the kitchen garden some of the crops, and especially where the value of deep cultivation is not fully appreciated, have experienced so severe a check as to leave no doubt as to their being below the average, both in quantity and quality. The effect of the drought is not less pronounced in the flower garden and pleasure grounds than in the kitchen garden and fruit plantations; and hardy herbaceous plants are showing signs of distress which, we trust, may be greatly mitigated by the showers that are falling as we write. Lawns that should now be of the richest green and in the best possible condition for garden games have become somewhat bare, and assumed a colour that is far from pleasing to the eye and quite unsuitable as a setting to ornamental plants, whether remarkable for the beauty of their flowers or the distinctive character of their leafage. Deep cultivation, by enabling plants to send their roots down into the soil, is of immense value in relation to the amelioration of the effects of long-continued dry weather, and the frequent stirring of the surface with the hoe will render valuable aid in checking excessive evaporation, and thereby conserving the moisture in the soil. We have abundant evidence in this, as in previous seasons, of the value of deeply stirring the soil when in process of preparation, and of maintaining a loose surface during the season of growth; but there is a point at which they cease to render much assistance, and that is when the moisture contained in the soil is practically exhausted. To ensure a full measure of success in the cultivation of useful crops and ornamental plants there must be a liberal amount of moisture within reach of the roots, and for this reason, as soon as the rainfall becomes insufficient for the needs of the plants, the deficiency must be made good by means of water obtained from artificial sources. This, under the most favourable conditions entails a considerable amount of labour, but when, as in many gardens, the supplies have to be obtained from some distance and applied with a watering-can, the work of watering is very heavy. Having regard to this fact, it is surprising the water supply of gardens should in so many cases have failed to receive the attention its importance would justify. Much good work is annually done with the water-barrow and watering-can, with a distant pond or pump as the source of supply; but the use of such old-fashioned appliances involves a very heavy expenditure of labour—and in this connection labour means money—as compared with a modern system by which the greater proportion of the watering in the open can be done with no more labour than is involved in the manipulation of the ordinary garden hose. The difference in the cost of supplying the occupants of the garden with water under the old and the modern systems is great, but this is not the only point that should have careful consideration. The chief point is the efficiency of the supply, and it is well-nigh impossible in the case of fruit and other trees, and some of the deep-rooting crops, to give supplies that are equal to their needs. It may, of course, be done, but in periods of drought the demands upon the water supply are so great that it is difficult for those in charge to avoid having their attention diverted from those objects requiring exceptional quantities before their requirements have been fully satisfied. To ensure the watering in gardens being done cheaply and efficiently, a well-devised system of water distribution that is in accordance with the more advanced views on garden planning must be provided. This need not be costly, but it should be so far complete as to render it unnecessary for water to be carried any considerable distance when there is an occasion for its application by means of a watering-can, as in the case of newly-sown seeds, and to admit of watering generally being done with a hose. To accomplish this it will be simply necessary to have a system of pipes extending over the whole of the area, and fitted with standards about two feet in height at convenient distances apart, to which the hose can be fitted or from which water can be drawn as may be desired. With such a system it will not only be possible to readily supply growing crops, fruit trees, ornamental plants, etc., with water at the roots, but it will be possible to thoroughly wash fruit and other trees, shrubs, etc., overhead with but little trouble, and thus rid them of insect pests that in a period of drought do so much damage. The source of the water supply will depend upon circumstances, but in country districts a wind motor of a suitable size will be invaluable for raising large quantities from deep wells at a small cost, while various other motors may be utilised. In such cases, the water should be pumped into a tank formed high enough to ensure its flowing by gravitation over the garden, with sufficient pressure to admit of it being utilised in the overhead washing of trees of moderate height. In suburban districts the public supply will, as a rule, be utilised; and, with reference to gardens in such districts, it may be said that seldom is the moisture in the soil during the season of growth equal to the requirements of the majority of the objects that come under the gardener's care, owing to the rapidity with which rainwater is carried off by the surface drainage. The more thorough watering of trees, shrubs, plants, etc., growing in the open in suburban and town gardens would remove many of the difficulties with which gardeners have to contend; and in country gardens fruit trees and ornamental climbers trained to walls would derive much assistance from more liberal supplies of water than it is possible to give them under the old methods.

Mr. Norman Davis, of Framfield, Sussex, bears a name that is famous wherever chrysanthemums are grown. He is not only a splendid cultivator of the Autumn Queen, but he is a capital exhibitor, and a prominent raiser of fine exhibition, as well as useful decorative varieties. Many years ago he had a nursery at Camberwell, but ere long he entered business on a large scale, and amid the brighter surroundings and kindlier climate of Framfield. Here, ably assisted by his son, Mr. Algernon Davis, the business has developed, and other things besides chrysanthemums are grown, and with equal skill. Mr. Davis has won gold medals galore, and many lovers of chrysanthemums will remember his delightful groups at the old Royal Aquarium, at the Crystal Palace, at Birmingham, and elsewhere. Certificates and Awards of Merit have also fallen to his share in large numbers. Mr. Davis has always taken a keen interest in the work of the National Chrysanthemum Society, and from time to time has rendered valuable assistance to that body. He has a strong belief in the future of "big blooms," and his very able paper on "Japanese Chrysanthemums for Exhibition," contributed to the N.C.S. Conference, held at Essex Hall last autumn, and published in our issues of December 24 and 31, 1910, is the last word on a subject with which Mr. Davis is quite au fait, for no one has continuously shown fine blooms over a long series of years like he has. We hope to see many fine flowers and fine varieties develop under Mr. Davis's care at Framfield.

Coronation Floral Gifts.—On Monday last the Master and Clerk of the Gardeners' Company presented to Queen Mary the floral gifts that Her Majesty had graciously consented to receive from the company on the occasion of her Coronation. These gifts comprised two bouquets and a basket of carnations.

New Roses at Bagatelle.—The new roses submitted for trial in the gardens of Bagatelle adjoining the Bois de Boulogne, near Paris, were judged on the 14th inst., and Mr. Arthur W. Paul, who assisted, as in previous years, at the judging, kindly sends us the following notes on the new varieties that received awards: The interest in the annual trial of new roses in the beautiful gardens of Bagatelle continues to be well maintained, and this year 162 varieties of the past two years were entered in the official lists. These are sent by various raisers in different parts of the Continent, Great Britain, and the United States of America, and are planted and tended with the greatest care by Mr. Forestier, the conservateur of that section of the park in which Bagatelle is situated. Considering the somewhat unfavourable season, which has been very dry and hot in Paris, a good proportion of the novelties of 1910 were in excellent condition at the time of judging, and gold medals were awarded to Beauté de Lyon, a very showy coppery-red flower of the hybrid-briar class, and to Jonkheer J. L. Mock, an excellent hybrid tea of Dutch origin, somewhat resembling, but superior to, Farbenkonigin, with large red and pink flowers produced on long, upright stalks, ideal for cutting purposes. Certificates of Bagatelle were awarded to Viscountess Enfield, a flower somewhat resembling Lyon Rose; to May Millers, a blush-white hybrid tea; and to William Speed, also a pale-flowered hybrid tea. An extra certificate was awarded to the climbing Wichuraiana hybrid Desiré Bergera, the orange-yellow flowers of which were very effective. Some other good sorts of the same year, all hybrid teas, were Prince E. C. d'Arenberg, Bertha Gautis, Nathalie Bottner, Lieutenant Chauré, and Mrs. Arthur Munt. The varieties of 1911, owing, no doubt, to the recent planting, were not so fully in flower, but Rayon d'Or received the maximum of 10 points, and Orleans Rose (Polyantha) 9 points. Some other promising kinds that received 8 points each were the crimson-flowered hybrid tea President Vignet and two exceptionally healthy and vigorous kinds from Denmark, the one a rosy-crimson hybrid tea named Fru Margrethe Moller, and the other a hybrid polyantha Rodhaette, with crimson flowers, both flowers and foliage being large for its class. The general collection of roses in the gardens, including the tall weeping standards, are very finely in flower at the present time and attract large numbers of visitors daily from Paris.

Presentation to Mr. Mackenzie.—On the 15th inst. a very pleasant function took place in the Royal British Hotel, Edinburgh, when Mr. Donald Mackenzie, the popular secretary of the Royal Caledonian Horticultural Society, was made the recipient of a wedding gift, in the form of a purse of sovereigns, subscribed by friends in the Royal Caledonian and Scottish Horticultural Societies. The presentation was made on behalf of the subscribers by Mr. McHattie.

Experiments in Gooseberry Pruning.—Since 1908 some gooseberry bushes planted in 1905 for the purpose of experiments in pruning, have been subjected to two distinct methods of pruning, under the direction of the National Fruit and Cider Institute. Hard pruning consists of cutting leading and lateral growths hard back, while light pruning is shortening the leading growth, and cutting the laterals back closely. For the latter method ease and economy of time in gathering, together with finer berries, are the advantages claimed; during the two years 1,531lb. of fruit have been gathered from the hard-pruned trees, and 1,404lb. from light-pruned trees.

Great Flower Show at Norwich. That there will be a great flower show at Norwich in connection with the exhibition of the Royal Agricultural Society in the ensuing week, is quite certain. One big tent has been provided for the local competitors, while the general display will need one tent 200ft. by 85ft., and two tents, each 220ft. by 50ft., to accommodate it. Mr. Peter Blair, the show superintendent of the horticultural section writes that his difficulty is not to provide a great exhibition of plants, flowers, fruits, etc., but to find accommodation for those who desire to exhibit.

Sale of the Crystal Palace.—We have received a notice to the effect that at a date to be fixed later, the Crystal Palace, Sydenham, with its terraces, fountains, pavilions, cricket and football grounds, machinery, statuary, pictures, books, furniture, and general effects, will be sold by auction, pursuant to an order of the High Court of Justice. The gardens and grounds cover 182 acres, but the Crystal Palace estate, including the frontages let, comprises just over 200 acres. Sir Joseph Paxton laid out the grounds, and the Crystal Palace was opened by Queen Victoria in 1854. Since then eighty millions of people have paid for admission. In the notice a hope is expressed that someone may come forward and save the Crystal Palace for the people.

Lt.-Col. D. Prain, F.R.S., Director of the Royal Gardens, Kew, has been nominated president of the Congress of the South Eastern Union of Scientific Societies for 1912.

North of England Horticultural Society.—This society has made arrangements for an exhibition at Harrogate, on August 15, in connection with the Harrogate Agricultural Society; a deputation from the Royal Horticultural Society will attend and award medals. Shows will be held at Leeds on September 20, October 18, and on December 13, and there will be one at Newcastle on November 15 and 16, in conjunction with the Newcastle Chrysanthemum Society and the Northern Fruit Congress. Full particulars may be obtained from the Rev. J. Bernard Hall, Rawdon, Leeds.

Spraying for Potato Disease.—The Board of Agriculture is doing excellent service in drawing the attention of potato growers to the importance of spraying their crops with Bordeaux mixture as a protection against potato disease. In wet seasons spraying is of great value, while even in dry seasons when no disease is apparent the treatment is found to be beneficial, producing a longer period of growth and an increased yield. The crop should be sprayed twice, and the first spraying should take place as soon as there is a good development of haulm, towards the end of June or early in July, according to the locality and season. About three weeks later the treatment should be repeated.

Rosa hemispherica.—To a recent meeting of the Scientific Committee of the Royal Horticultural Society, the Rev. Canon Ellacombe sent flowers of the sweetly-scented Rosa hemispherica from a plant growing on a wall in his garden. This yellow rose, which is rare in gardens, is said to flower only in very dry seasons.

Shadwell Market as an Open Space.—We gather from the "City Press" that the Bishop of Stepney suggests the utilisation of the derelict market at Shadwell as an open space, and throws out the hint that it would form a magnificent memorial of King Edward. The idea is not, our contemporary observes, a new one by any means. A definite scheme is, in fact, already under consideration, and, all being well, will, in the comparatively near future, be made public. The Corporation of the City of London, in spite of the huge loss it has incurred on the enterprise, may be relied upon not only to concede generous terms, but to make a substantial contribution to the purchase fund. At present Shadwell stands in the loan ledgers at a sum of £140,000, and repayment of the bonds will only commence in the year 1927

Crawley Gardeners' Visit to Headley Park.—A visit that proved of great interest and educational value was paid to Headley Park, near Epsom, by the Crawley Gardeners' Association a few days ago. The gardens belong to J. Newton Mappin, Esq., whose gardener, Mr. Beeson, conducted the party round. The alpine, water, and wild gardens are particularly good at Headley Park, but everywhere there is evidence of very high cultural skill.

National Chrysanthemum Society's Outing.—The usual summer outing of the N.C.S. will take place on Monday, July 17, when the members and friends will pay a visit to the famous gardens at Cliveden, Taplow, by kind permission of W. Astor, Esq. The party will travel from Paddington to Windsor by rail and thence to Cookham and Cliveden by steam launch. The whole outing will occupy twelve hours, as the train leaves Paddington at 9.15 a.m. and returns at 9.10 p.m. Tickets for the outing are 10s. 6d. each (which includes rail fare, launch, luncheon, and tea), and can be obtained on application to the secretary, Mr. R. A. Witty, 72, Savernake Road, Gospel Oak, N.W.

Tree Planting in Uruguay.—The Board of Agriculture have received through the Foreign Office a copy of a memorandum from H.M. Vice-Consul at Montevideo, in which it is stated that the newly-appointed Uruguayan Minister of Industries, Dr. Eduardo Acevedo, is anxious to foster the agricultural development of the country in the direction of tree planting. With this object he intends to organise a competition at which twenty prizes of the total value of about £40,000 will be given for plantations of woods and artificial parks. He has brought in a Bill which will probably be sanctioned, making it binding on every proprietor of pastoral land to plant five trees for every hectare (equivalent to two trees for every acre). H.M. Vice-Consul is also informed that the Government School of Agronomy will be put in a position to supply trees for those who require them. British horticultural firms who might wish to supply part of the demand thus created should put themselves in communication with Senor Pablo Varzi, Presidente del Consejo de Administracion y Patronato, Escuela de Agronomia, Montevideo.

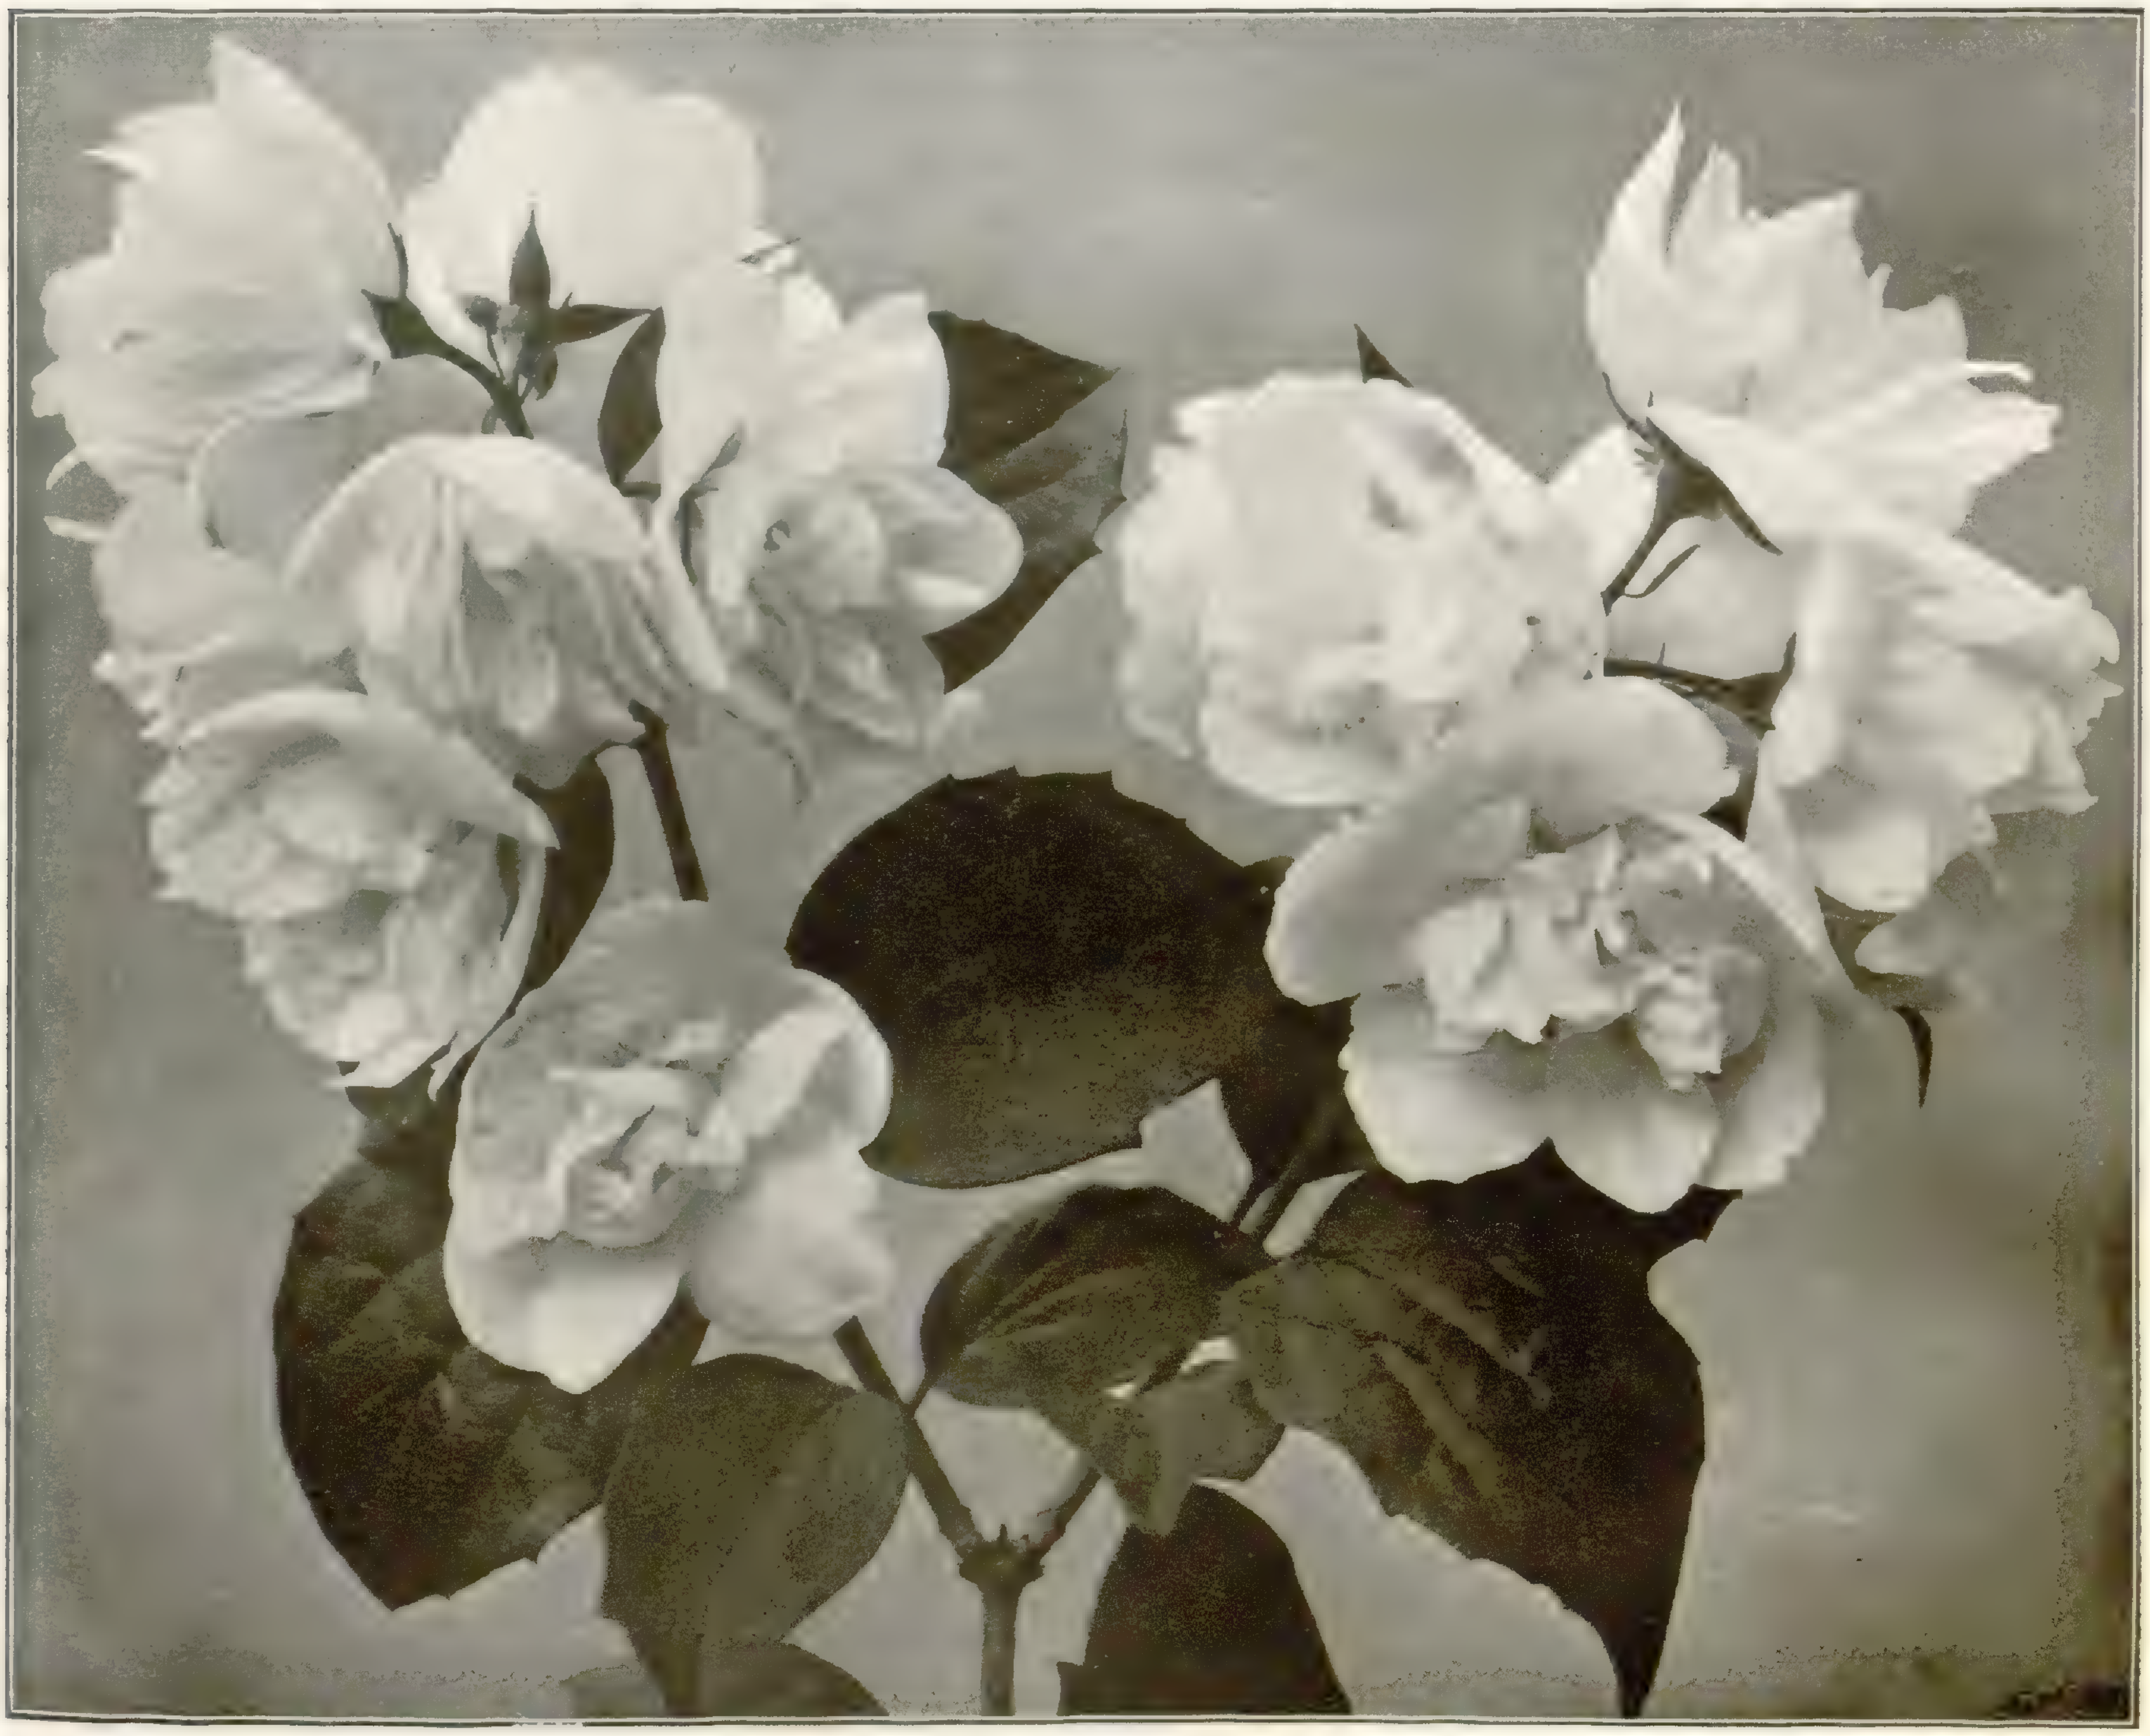
HARDY PLANT CHAT.

Lactuca alpina.

We frequently observe this blue sow thistle catalogued as Mulgedium alpinum, but it is not now so much cultivated in gardens as at one time. I am not surprised at this, as it has, with all its colour value, a bit of coarseness about its appearance, and is hardly a plant for the most select border. Its true rôle is for the wild garden, where a good crop of this plant, with its tall stems and blue flowers, makes rather a conspicuous feature, especially in a piece of rich soil, where it will soar to three, four, or even five feet. But the writer has seen it in an old garden, where it has to fight its way among old roses and a host of other border plants, and where it really looked well in its semi-wild surroundings. The blue flowers are rather dandelion-like in their formation, and as a feature of the wild garden or the rough border outside the choicer parts of the garden this blue sow thistle has a value. It must not, however, be supposed that it has all the fecundity of the common sow thistle, the name being only a conventional one.

Pentstemon Menzieisi.

Some of the dwarf and shrubby pentstemons afford us plants of much beauty, and highly suitable for the border or the rockery. Their true place in the former is



PHILADELPHUS LEMOINEI VIRGINAL.

Flowers double, pure white, fragrant. F.C.C., R.H.S., June 20. Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain), near the front, and they are undoubtedly of more effect when placed in a good position in a well-ordered rock garden. They do not too often appear at shows, but Messrs. Bunyard had P. Menziesi, with other plants, in their exhibit at the last Temple Show. Those who only know the border pentstemons are amazed when they see for the first time one of these shrubby pentstemons, with their low growth and their pretty flowers. They can hardly conceive that these belong to the same genus as the stately pentstemon of the florist, with its showy flowers, especially in the modern type of the pentstemon of the florist.

The one exhibited at the Temple called P. Menziesi is a pretty plant indeed, with low habit—with me about six or nine inches high—and having glossy leaves and wonderfully large purple flowers. The expression respecting the size of the blooms is comparative, as they seem really large for a plant of its height and habit. As regards its hardiness, I think that it does not care for a moist winter climate, and that it prefers a dry autumn to enable it to ripen its growths. Yet in a place where there is not too much wet in winter I believe P. Menziesi can stand a very low temperature with impunity. My own plant came to me from the garden of a friend in a cold part of Scotland, where, however, the cold of winter is accompanied by a dry atmosphere—drier, in fact, than that here. But I have no reason to doubt its hardiness with me, where it is grown among sandstone chips and with a full south exposure.

A GROUP OF HANDSOME CUPS TO BE OFFERED AT THE FESTIVAL OF EMPIRE ROSE SHOW.

Tiarella unifoliata.

This handsome Foam Flower seems to be gaining ground but slowly, although when well cultivated it is a fine plant indeed. It originally came to me from a North of England source, under the name of Tiarella rosea, so named, I consider, from the rosy appearance of the stems and the slight tinge of colour on the flowers at certain stages. A year or so afterwards it was shown in a good group at the Temple Show, but there it did not attract so much notice as it deserved, probably because it is not a showy plant, but, like the better known Tiarella cordifolia, the ordinary Foam Flower, it is seen at its best in the garden.

Compared with its ally, T. cordifolia, T. unifoliata is a more effective plant, the spikes of flower being taller and longer in their inflorescence. They are, as has been indicated, not quite so pure in colour at certain stages, but the aspect of this foam flower is really beautiful.

It appears to do best in a somewhat moist place, but for experiment's sake I have been trying it in a dryish and sunny place at the base of a rockery. The latter is low, so that the drainage from it may be said to be practically disregarded as a factor in the growth of the plant. Here it flowers very freely, and reaches a height of fully a foot. It is less inclined to roam about than T. cordifolia. It comes to us, so the "Index Kewensis" informs us, from North-west America. In a shady, moist soil it assumes a bolder aspect than that suggested by its behaviour in the dry place spoken of above. S. Arnott.

A GREAT ROSE SHOW AT THE CRYSTAL PALACE.

This is a great year for pageants and festivals, and flower shows, and, that being so, it is a pleasure to find that the Crystal Palace, Sydenham, is not behindhand in either of these matters. We have attended great flower shows at the Crystal Palace over a very long period of years, and some of them have been so fine that their extent and beauty remain a pleasant memory. But for the moment we are concerned with the present and the future rather than with the past, and the schedule before us proves that the Administration of the Festival of Empire fully recognises the great attraction flowers possess, and have given the Horticultural Department of the Festival a very free hand in the preparation of a suitable programme.

The date fixed for the forthcoming exhibition is June 29, and no fewer than forty-nine classes have been provided for the rose, the Queen of Flowers. There ought to be a glorious exhibition, as the classes have been arranged and graded so carefully that almost everyone who grows roses has an opportunity of competing. Entries must be sent to T. Geoffrey W. Henslow, Esq., Horticultural Department, Festival of Empire Offices, Crystal Palace, Sydenham, S.E., and must reach him not later than Saturday, June 24. Although this latter date is the same as that of our present issue, our readers will receive their copies of the Gardeners' Magazine by Friday morning, June 23, and so will have ample time then to make their entries.

As to the place of the show, there is probably no finer building for a flower show than the Crystal Palace, and there is ample room for everyone to set up their blooms carefully. Further, when the work is done, judgment has been pronounced, and the excitement of the competitors has abated, there are other and wonderful attractions this year at the Crystal Palace, both for competitors and for visitors who may go chiefly to see the roses. The Great Festival of Empire and the Pageant of London will provide all that the most energetic or fastidious visitor could well wish for either in interest, instruction, or amusement.

As to the schedule of the great rose show, we have already pointed out its comprehensiveness. The first division comprises twenty classes open to nurserymen, and there ought to be a rare tussle for the Canadian Pacific Railway Company's £50 silver trophy for the best four dozen blooms, and probably an equally good fight for the silver cup for the best three dozen blooms, presented by the Festival of Empire. Lord Northcote and the Earl of Plymouth give silver cups, and the National Rose Society also add a silver cup in this division. There are no cash awards whatever, the prizes being cups and medals of various grades. Messrs. Clay and Son, Stratford, offer a special gold medal for the best bloom in the whole show. Amateur rosarians are presenting a silver cup to the members of the trade, and it is to be won on points, every first prize counting three points, a second prize two points, and a third prize one point.

In the amateur division there are prizes of silver cups from the Festival of Empire, the Duke of Fife, Lord Northcote, King's Acre Nursery Company, Hereford; Messrs. J. Cheal and Son, Crawley; and the National Rose Society, the latter award being for a dozen distinct varieties of decorative roses, not fewer than three or more than seven trusses of each variety, arranged on a space not exceeding five feet by three feet. Then the trade growers present a cup to the amateurs, to be won on points, as in the case of the trade division.

Then there is the Ladies' Artistic Section of six classes, wherein the ladies will compete with each other in the artistic disposition of roses in baskets, vases, bowls, buttonholes, and sprays, and also on a dinner table. Finally, there are the non-competitive displays, and here the Festival of Empire offer a cup for the best exhibit.

If a good schedule, a well known venue, and multitudinous attractions beyond the flowers, can produce a great flower show, then the Rose Exhibition of June 29, with its £500 worth of cups and medals as prizes, ought to be the finest ever yet held in this country. So hurry up with your entries, and help to make it such.

PAPAVER ALPINUM.

Nothing more enchanting than Papaver alpinum is found among alpine flowers. The lowly stature of the plant and fairy-like elegance of the flowers never fail to captivate, and this innate charm is greatest when disclosed from plants enjoying unrestrained freedom on the rock garden. It is a species readily raised from seed at all seasons, and may be sown either in boxes of prepared soil or in shallow drills in the open ground, the seedlings being subsequently transferred to their flowering position when large enough. The type bears flowers of a yellow shade, but in a good strain of P. alpinum, as represented in gardens, a considerable range of colour is present, and is represented by yellow, white, and red, with many delicate shades between. The foliage is broken into narrow, irregular lobes, and is of a glaucous green colour, yielding a soft harmony to the flowers.

P. alpinum succeeds best in well-drained soil, preferring such having plenty of stone chips, and, as already indicated, it is admirably at home on the rock garden. In rock walls having wide interstices with plenty of soil, it makes itself quite at home, and under these conditions is most reliable as a perennial. From a botanical point of view P. alpinum and the well known P. nudicaule are really the same species, but whereas the latter generally exceeds a foot in height, alpinum more frequently averages six inches, and from a garden standpoint both are distinct enough to merit widest recognition, as they yield a lavish display of richest colour, and as cut flowers their light and elegant appearance places them in the foremost rank.

Thomas Smith.

STOPPING PERPETUAL CARNATIONS.

There is a twofold object in stopping perpetual carnations. The first is to regulate the season of flowering and to preserve the plants energy, the second is to build up a shapely plant.

The perpetual carnation is perpetual-flowering because it is perpetually growing, but to allow a plant to produce a large crop of flowers at one time is unwise, inasmuch as it places undue strain upon the plant, and the flowers themselves cannot be nearly so fine. Furthermore, it is encouraging the old hereditary "cropping" tendency, which raisers for over half a decade have been endeavouring to eliminate from the race. Naturally, if you stop all the growths on a plant at once, they will flower at the same time, so that it is most essential that we should work in the opposite direction, and so break up the "cropping" tendency.

We will presume that the young plants were stopped at the fifth or sixth joint from the surface of the soil, and now carry some five or six good growths. In the natural course of events these young side growths produced after the first stop do not all grow away evenly, and in the case of perpetual carnations this is a decided advantage. As the leading side growths reach the required length, which, as a general rule, is six joints, or sets of leaves, from the main stem, they should be stopped. Go over the plants systematically each week, just stopping those which have reached the correct length, if possible never stopping more than one growth at a time, thus minimising the check.

The opposite method to this would be to allow the shoots to grow away until one day you would make a wholesale slaughter of them, but such a method cannot be logically upheld.

The absurdity of just pulling out the point of the growth instead of removing the entire top with a set of developed leaves intact is that the remaining eyes are more or less in the same degree of maturity, and so break more evenly, whereas if only the point of the growth is removed, the tendency is for only one or two breaks to be produced at the top of the shoot.

If a plant is allowed to get into a poor starved condition it cannot break freely, and the breaks on several varieties are not so numerous in a spell of very dull, wet weather or during a period of drought. The crux of the whole matter, in the eyes of many gardeners, will be to regulate stopping so as to ensure flowers in October, and the following dates are given with this end in view, if the irregular system of stopping is followed.

I always consider it is best to cultivate many of the rather slow-growing but very free-breaking British-raised varieties such as Britannia, Mrs. Burnett, Fortuna, Rival, Royal Purple, Rose Doré, Black Chief, Carola, etc., by potting the young plants as required, and not stopping them until they are about from seven to nine inches high. If they are all stopped, then you obtain some dozen or so young growths from many of them in the first place. Some of these would commence to flower too early if not stopped a second time, and also have a tendency to "crop," whereas if some of the more forward growths are stopped this is prevented. This method of handling British-raised varieties is, I am sure, the best, and more flowers are thus procured. Under the ordinary system time will not allow us to stop all the growths a second time, hence one does not procure so many growths by the fall, which means less blooms.

The following varieties should not be stopped after the present date: Britannia, Bay State, Carola, Fire Glow, Mikado, Mrs. Burnett, O. P. Bassett, Black Chief, Rival, Rose Doré, Royal Purple, Marmion, and Mrs. Raphael.

Varieties which should not be stopped after July 1: Admiration, Afterglow, Colossus, Fortuna, Harlowarden, J. W. Riley, Lady Alington, Lady Bountiful, Mrs. Chas. Knopf, Mr. C. W. Ward, Mrs. R. F. Felton, Mrs. Tatton, Pink Delight, and Wanoka.

Varieties which should not be stopped after mid-July: Beacon, Dorothy Gordon, Enchantress, Helen M. Gould, Lady Alington, May Day, Mrs. Lawson, Rose Pink Enchantress, Rex, Scarlet Glow, White Enchantress, White Perfection, Winona, and Winsor.

Of course, there are innumerable other varieties, but these lists include the best.

Montagu C. Allwood.

ROSE AMERICAN PILLAR.

Few roses have caught the popular fancy so strongly or so quickly as this splendid single-flowered climber. It was first introduced by Messrs. H. Cannell and Sons, of Swanley, who made a great feature of it at the Temple Show three years ago. Since then it has been multiplied enormously, and when well shown it captivates everyone who sees it. The large flowers, of rich rose colour with paler centre, last a quite long time for a single rose, and the broad petals are thick and firm. Further, the trusses of bloom are very large, from twenty to thirty flowers being clustered together. Of good growth and free-flowering habit, American Pillar seems to have all the points a good garden rose should possess. As a pot plant it is glorious, and the fine examples, one of which we illustrate herewith, that were exhibited by Messrs. William Paul and Son, Waltham Cross, at the recent Temple Show, obtained a full share of attention and admiration, especially from those interested in roses.

SINGLE-FLOWERED ROSE AMERICAN PILLAR.
A beautiful variety with large blooms that are bright rose with paler centre.

FORESTRY IN SCOTLAND.

The composition of the committee just appointed to report upon the establishment of a demonstration forest area in Scotland, writes our Aberdeen correspondent, has given great pleasure to all interested, as it is felt that the presence of such men as Lord Lovat, Sir John Stirling Maxwell (who is to act as chairman), and Mr. Munro Ferguson, of Novar, will secure for the committee beforehand the confidence of the public. The appointment of the committee marks a distinct advance, and all concerned are to be heartily congratulated. Forestry, be it noted, is one of the subjects which come within the scope of the Development Fund, and it has been properly enough felt that, instead of a number of separate and conflicting claims being submitted to the Development Commissioners, an effort should be made, if possible, to formulate a single and comprehensive scheme which could be laid before the Commissioners, and supported with the full weight of the Secretary for Scotland behind it.

There is no getting over the fact that if proper afforestation is to come in these islands, Scotland is the area where the bulk of the work will be done. For it is in Scotland the greatest area of vacant land for the purpose lies, and particularly in the northern half. Indeed, it may fairly enough be said, that afforestation in Great Britain is primarily a Scottish question, and those who deal with it will be bound to focus their attention, to begin with at any rate, upon Scotland, and especially the Scottish Highlands, where the potentialities of success in afforestation mainly lie.

Of course, the immediate point upon which the new committee is asked to report is the establishment of a demonstration forest area, the best site for it, and the uses to which it could be put. This, one naturally infers, means a considerable tract of ground where planting and forestry can be carried out upon a commercial scale, and the best methods of afforestation be tried and demonstrated under conditions analogous to those obtaining on ordinary estates. Research work, in the scientific sense, would probably fall to be done at the forestry teaching centres. The first centre in Scotland to establish a course of instruction for working foresters was the Aberdeen College of Agriculture, which is affiliated to Aberdeen University—the Lamp of the North. It is all the more satisfactory, therefore, to know that the membership of the committee includes Sir John Fleming, the head of an eminent firm of Aberdeen timber merchants, and Mr. R. M. Sellar, vice-convener of the County of Aberdeen, and a noted educationist. Both these gentlemen are governors of the Aberdeen College of Agriculture. But there is yet a fly in the ointment. Surprise and not a little disappointment is being felt in the North at the omission of the name of Mr. Sydney J. Gammell, of Drumtochty and Countesswells, also a governor of the Aberdeen College. For many years this gentleman has taken a very warm interest in forestry, his extensive and finely-wooded estates offering him every facility for the study of his favourite science. Sir John Fleming and Mr. Sellar are looked upon as splendid acquisitions from the commercial and educational point of view, but the inclusion of Mr. Gammell would, it is felt, have added another member thoroughly au fait with the practical work of forestry. Indeed, it may be noted that the forestry department of the college is the one which chiefly—it may be said entirely—engrosses his interest.

Coming now to where a suitable afforestation area site could be found, there are strong arguments pointing to the selection of a district somewhere in the Northern Highlands, and no better district could be found than Speyside. Such an area as the Valley of the Spey would be typical of the Highlands, which, as I have said, will of necessity be the scene of practical afforestation in this country. It is a lovely district, and our late King Edward, and King George, when Prince of Wales, have spent many happy hours in it, as the guests of the Duke of Richmond and Gordon, at Gordon Castle, and of Mr. Sassoon, at Tulchan Lodge. Besides, it has the advantage of being central and easy of access, not only from the south, but also from the north-east, and from the north, which, let us not forget, are regions which contain enormous potential resources for timber growing.

SOME JUNE FLOWERS.

Soon will the high midsummer pomps come on;
  Soon will the musk carnations break and swell;
Soon shall we have gold-dusted snapdragon,
  Sweet william with his homely cottage smell,
    And stocks in fragrant blow.
—Matthew Arnold.

With the poets June is par excellence the month of flowers, and so it is in the meadows, and even, though to a less extent, in the typical cottage garden by the country roadside, where old-fashioned things like single pinks, European pæonies, short-spurred columbines, red and white daisies, forget-me-nots, valerian, Jacob's ladder, snapdragons, foxgloves, soapwort, and sweet williams usually grow in the greatest luxuriance. The flowering trees and shrubs too, such as thorns, chestnuts, guelder rose, lilacs, and laburnums, are generally still in their full splendour at the beginning of the month, and are folowed later by the mock orange, honeysuckle, and the great family of the queen of the garden.

In the generality of gardens, however, June, or at least the first half of it, is reckoned by the few only as a good month for the garden, as the spring flowers are over, and the great mass of the perennials are not yet out, while the summer bedding plants for the most part make but little show before the end of the month. Yet, leaving out of account the roses, which, with the exception of the Banksias and a few others on the wall, are not generally in full display much before the turn of the days, there are a few subjects, apart from those old-fashioned inhabitants of cottage gardens referred to above, which, by their luxuriance and brilliancy of effect do much to lighten up the garden, and make it quite unnecessary that it should be dull at any time of the month.

One of the glories of the month is the Chinese pæony in all its wonderful variety of colouring. It is true it does not last very long in flower, seldom more than two or three weeks, but afterwards varieties make handsome foliage plants for the rest of the summer, taking on crimson and bronze tints as the summer draws to an end. A walk flanked on each side by clumps three feet in height, and more in diameter, with fifty to a hundred blooms on a clump, forms one of the sights of the gardening year. They should never be moved while doing well, but should be fed with a well-balanced manure, phosphate in some form being applied to counteract the foliage-producing effects of heavy mulchings of stable manure. When they must be moved for any cause, as, for instance, owing to their deterioration, the work should not be deferred till the general renovating operations of October and November, being better done as soon as possible after the end of August, when some amount of flower may be obtained the following season. They are not a success on a very retentive soil, one inclining to lightness suiting them best, though it must not be too hot and dry.

Another wonderful effect of the month, about a fortnight earlier than the preceding, is that produced by the tree lupin, both yellow and white. It is not suitable for wet soils, as it does not stand the winter well enough in such conditions; but on medium loam it makes a bush four or five feet in height, and as much in diameter, the whole being thickly covered with racemes of yellow or white flowers. It should be planted in the spring, or it will very likely die in the winter. It is a curious thing about this lupin that, instead of becoming more resistant to the winter as it gets older and more woody, its vitality seems to lessen, and consequently its power to resist the cold and wet. Another branch of the lupin family which has revived in popularity of late years is Lupinus polyphyllus, the old-fashioned garden lupin. Its long, handsome spikes often come in very useful to brighten up herbaceous borders which would otherwise be dull.

Having called in question the flowering character of the month, it seems scarcely consistent to mention the iris, which, in one or other of its forms, keeps up a succession of beauty throughout the month. The German irises of May linger on into June, followed by I. neglecta, squalens, and others, which ultimately become contemporary with the Spanish irises, while these in turn, with other less known species, keep up the tale till the English iris begins to show at the end of the month. The "orchid of the garden," like its more exclusive namesake of the house, is a flower for specialising, their diversity being not less than their beauty. One word to those who are not specialists—do not move the evergreen species in late autumn if it can be helped, but, as a general rule, somewhere about a month after flowering.

The delphinium can hardly be regarded as a June flower, as it comes so late in the month, but there is another flower besides the iris which has some claim to be called the orchid of the garden, and that is the long-spurred columbine. The short-spurred types are nearly over before these delicate hybrids come into general bloom, but they last throughout June and even longer, and if flowers for cutting should happen to be deficient any part of the time, nothing fills the gap better. A packet of seed obtained from a good collection of hybrids should be sown in March every year, and the young plants given good cultivation for the following season. Unless the soil contains plenty of humus and is rather light, many will not do much good the second year, though some are unaccountably capricious in every respect.

Space forbids the enumeration of all the possible glories of the June garden. It is not only the month of roses, but of poppies—Shirley (if sown early enough), Iceland, and Oriental; while of hardy annuals generally we can have the finest displays during this month by sowing them in the later summer and autumn. Sweet peas should always be included among these, as they may be had in flower at the end of May by sowing them in September, either in the open, or in pots to be stored in the frame during the winter.

Alger Petts.

Weigela Eva Rathke.—As an outdoor shrub this variety of weigela is much appreciated for the rich colour of its blossoms and its continuous flowering qualities, compared with many other varieties. Beside this, it is one of the most popular for forcing into bloom as it readily responds to the treatment. Numerous examples of this may be seen at the different spring meetings of the Royal Horticultural Society, where it often forms a noticeable figure among flowering shrubs. For the outdoor garden a good distinct three are this variety, with claret-crimson flowers; Abel Carrière, pink, and Candida, a particularly free-growing form with white blossoms.—W. T.

CULTURE OF CELERY.

This important crop has frequently been discussed in the pages of the Gardeners' Magazine, but that there are many new readers must be my excuse for again touching upon a subject in which I have taken considerable interest now for quite a number of years, as I firmly believe that if there is one crop which pays for thorough cultivation it is celery. For more reasons than one is this so, for not only by the best culture is larger growth obtained, superior in flavour to the small second-rate material, but the better and more thorough the attempt to excel with this plant the deeper cultivated and richer is the ground left for the succeeding crop.

Celery, whatever the size of the garden may be, is frequently in great demand, and is much esteemed early as well as late in the season, so that where kitchen garden space is limited every effort should be made to grow good material, as one perfect stick is worth three inferior ones, as well as being of far superior flavour.

Celery, when well finished, cannot be too large either for kitchen purposes or for exhibition. To obtain perfect specimens of good size the keynote of success is to keep the plants growing freely throughout the whole season of growth. It frequently happens that plants, especially in the young state, are allowed to become too large, and, consequently, starved, whilst in the seed bed or boxes. Such treatment is detrimental, and must be avoided. Copious supplies of water also are required to bring this plant to perfection, and drought is one of its worst enemies.

To provide a good succession of celery two or three sowings should be made. For the earliest supplies the sowing should have been made about the first week in February, in pans or shallow boxes in a light sandy compost passed through a fine-meshed sieve. Do not sow too thickly, as celery usually germinates freely. Raise the seedlings in a gentle heat, and as soon as these are visible put them near to the glass. Transplant into other boxes when large enough, and keep them sprayed over with the syringe, and gradually inure them to cooler conditions.

For later supplies make another sowing a month later, and raise as previously advised. Transplant the larger seedlings into boxes, afterwards pricking out a sufficient quantity into skeleton frames, or shallow pits. Keep close for a few days, and damp over with a rose-can as necessary, and keep the growth free from weeds to prevent their receiving a check.

The preparation of the ground is an important item to be observed, and it should be made as rich as possible. The method I adopt is to take out trenches to a depth of twelve inches, then break up the bottom as deeply as possible with a fork, and fill up with good decayed farmyard manure to within a few inches of the top. Tread firmly, and then cover with some of the finest and best of the soil thrown out on to the sides. Planting must be carefully done, and the roots kept intact by lifting with a good ball of earth; plant firmly and well with a garden trowel at a foot or so apart, and, except for the latest supplies, I prefer single rows. Upon the completion of a row make the surface neat and tidy with an iron rake, and give the ground a good watering. Encourage growth afterwards by occasional sprinklings in hot weather, and when the weather is showery give a dusting of soot. This does much to promote growth and also to render the plants immune from the attacks of the celery fly and other insects, which in some seasons and districts do much injury to the crop.

As the growth matures remove the side growths and any leaves that are split, and, whether required for exhibition or for the house, I prefer to blanch the growth with strips of brown paper, that is in the case of the earlier batch. For the former purpose this has much to recommend it, as the growth is kept free from the attacks of slugs, and it is further possible to undo the paper at any time and examine the stick to see that everything is proceeding well, while a further advantage is gained in that copious supplies of water and stimulant can be applied close to the roots. The strips of paper we use are about five inches in width, and, of course, as the length of the plant increases an extra strip is added, the whole thing being done piecemeal, and care taken not to injure the foliage or tie it in tightly.

The earthing up of the later supplies should not be commenced too early. Give plenty of manurial assistance, and thorough soakings of water in dry weather, especially just before beginning to blanch the plants with earth. Make sure, however, that the foliage is quite dry before doing this, otherwise failure may result, so, if possible, select a fine day. Stretch a garden line down on either side of the row, break up the soil finely, and place it well all round the stem of each plant. Do not use too great a bulk of soil at first, but do the work at intervals until the final earthing is completed.

The celery fly is in many places an abominable nuisance, and, as I have previously stated, soot I consider a hindrance to the fly, as is also an emulsion made by boiling a pound of soft soap in a quart of water, to which add half a pint of paraffin, and then dilute with eight gallons of water. Spray the plants with this, keeping the mixture well stirred.

There are many varieties on the market, and excellent strains, and if good celery is wanted seeds must be obtained from a reliable source. Cheap seeds are false economy. For general purposes Invincible White, Standard Bearer, and Aldenham Pink are each excellent. Major Clark, a red variety, is good for late supplies, and it is of importance that it should not be blanched too early. Edwin Beckett.

A FINE EXHIBIT AT TAGG'S ISLAND.

It was a capital idea to provide a big class in connection with the recent fine flower show held at Tagg's Island, Hampton Court, because such a class, as arranged, gave the nurserymen and market growers an opportunity to compete with each other on generous lines. The space allowed was 200 square feet, and the premier award was a silver cup, valued at £20, and given by Mr. H. O. O'Hagan. There were no fewer than six entries, and the cup was won by a well-known local grower, Mr. W. H. Page, Tangley Nursery, Hampton, with a splendid exhibit, in which pillar and weeping standard roses were the leading feature. Grouped under these were masses of pink spiræas, white liliums, yellow richardias, scarlet Pelargonium His Majesty, and carnations in great numbers, the latter disposed in vases. The front of the group was finished off with festoons of pink and white rambling roses. In these later days, when nurserymen and market growers appear, with rare exceptions, to be afraid of competing with each other, it was refreshing to find such a good turnout.

MR. W. H. PAGE'S SILVER CUP GROUP AT THE RIVER THAMES FLOWER SHOW, HELD AT TAGG'S ISLAND ON JUNE 7.

Rex Begonias. — These ornamental fine foliage plants well deserve special attention, and I am not acquainted with any which, considering their easy culture, so thoroughly merit the little extra attention. For autumn and winter decoration they are most valuable, and for grouping purposes they add a charming ground work for orchids, caladiums, etc. Rex begonias succeed best in a rich compost, and in order to bring out their best and brightest colours, they may be alternately supplied with liquid manure and clear water as soon as they have filled their pots with roots. A moderately shaded position in the intermediate stove will be found to be an ideal position for them. Their propagation may be easily effected at any season of the year by inserting the leaves singly in small pots and keeping them shaded for a few weeks; they will quickly form roots and develop into useful specimens in a very short time. If the leaf is laid upon cocoanut-fibre refuse, and the ribs nicked with a sharp knife on the under side, several plants may be raised from each leaf so treated.—J. D.

AMONG THE ROSES.

Although June is frequently called the month of roses, we do not have our full show of bloom until early in July during the average season, and it looks like being the same this year With the older roses we doubtless had a greater proportion of early bloomers, especially among the damasks, Bourbons and other ancient classes. The reputedly more tender teas and noisettes were also almost entirely confined to wall culture, and so were, necessarily, more early than the great quantities now grown in the open.

The present outlook is not bad, if we could be favoured with a few more genial showers. We have had but little rain for several weeks, and an easterly to north-easterly wind during the greater part of the time. This has undoubtedly had much to do with the enormous numbers of insect pests. Green-fly is so prevalent that the insects are actually pushing each other off the shoots, as they grow faster than the rose itself.

In spite of warm sunny days, the east wind and number of insects have not been very favourable to rose growth: the weather has been rather keen here at night and early in the morning, before the sun gains power. It has, however, been a grand season for killing weeds, and a constant use of the hoe has certainly helped the rose growth. I do not remember our surface soil being so dry and dusty at this season before. At the time of writing we have four inches of fine dust where the hoe has been freely used.

We found it necessary to water late-planted roses, also cuttings of roses and rose stocks put in during the autumn. A good soaking now will be a great help to these cuttings, as the present weather is drying up the moisture in them more rapidly than it can be replaced by the small quantity of new roots, and many might be saved by care now in the matter of watering and careful mulchings.

The standard stems of two-year-old plants are putting out an extra number of side growths below the point at which the rose was worked. These should be removed as quickly as possible or they detract from the support needed by the rose and soon starve it. I notice that a number of the points of young rose growth are so crippled by insects and the cold winds as to be quite spoilt; these had better be picked out or "headed" at once, when they will soon break again from the lower eyes with a much better prospect of success. Of course, washing must be practise more assiduously than ever during this trying plague of insects. Even if clear water alone is used, during evening or early morning, a great deal of good will result.

Shoulders upon standards that were not budded last summer may be worked this month, as they will run well now, and the one-year-old bark is sufficiently ripe for the purpose; buds from under glass should be available. Most of the pot roses should be ripening or finishing their growth in the open, being half plunged in a somewhat sheltered position.

We already have quite a show of the Scotch and Austrian briars, while Lady Penzance is quite a picture. Aglaia, Electra, and Gardenia, all primrose-yellow ramblers, are quite gay. So, too, is Tea Rambler and Paul's Carmine Pillar. One of the best whites in flower now is Waltham Bride, a grand rose for pillars. Chinas and dwarf polyanthas are also coming out rapidly while the earliest will soon be a mass of flower.

Upon walls we have quite a number of blooms, especially among such early climbers as Gloire de Dijon, Rêve d'Or, and Reine Olga de Wurtemburg. Dwarfer-habited varieties found so useful at the base or between these, like Madame Falcot, Rubens, Marie Van Houtte, Madame Lambard, and Anna Olivier, are in full beauty, where syringing and hand picking was closely attended to. ROSARIAN.

DOUBLE-FLOWERED PELARGONIUMS AT YORK.

First prize six, shown by Mr. J. W. Clarke on right hand, and the second prize six, shown by Mr. W. F. Crowther on the left.

FITTONIAS.

The admirable cultural notes on these beautiful foliage plants contributed by your correspondent "W. M.," page 412, leave nothing to be desired, but it may be as well to direct attention to a mistake in the nomenclature. In the first place, the species with the beautiful silvery veins is F. argyroneura; in fact, this feature is expressed by its specific name. That in which the leaves are of a very dark green, veined and reticulated with bright red, is F. Verschaffelti, known also as F. Pearcei. There is yet a third species, namely Fittonia gigantea, with larger leaves, and a more vigorous grower than either of the others. The leaves of this are green, with pale red veins, and altogether it is less effective than either of the two previously mentioned. These are the three species of the "Kew Hand List." The fittonias belong to the order Acanthaceæ, most members of which are remarkable for their showy blossoms, whereas in this genus the flowers are not at all attractive. The fittonias are all natives of Peru, and, as befits plants from that region, I have grown them beautifully without any fire heat whatever during the summer months. The main point to remember is that in a state of nature they occur in shady woods, hence plenty of atmospheric moisture and ample shale are necessary to their well-doing. Considering the great beauty of the fittonias and their adaptability for many purposes, it is a matter for surprise that they are not more often grown, but I suppose it is the old, old story—they are no good for cutting from.

W. T

GREENHOUSE MANAGEMENT.—THE AMATEUR'S GREENHOUSE, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

ISLE OF WIGHT BEE DISEASE.

The following particulars relating to the disease of bees, which is now inflicting such heavy losses upon beekeepers, has been issued by the Board of Agriculture, and should have the attention of all who keep bees.

For some years past an epidemic disease has attacked bees in the Isle of Wight, and has since reached the mainland, where it appears to be spreading. The epidemic has been under investigation for some time by the Board of Agriculture and Fisheries, but though a good deal of information has been accumulated, and some progress made with the study of the disease, it is not yet possible to say definitely what is the original cause of the disease, or how it may be checked, or even prevented. The investigation, however, is being continued, and it is hoped that eventually a remedy will be found.

In the meantime, it is important that beekeepers should watch their bees, and on the appearance of the symptoms described below, proceed to—

(1) Destroy the diseased colonies, and all combs, stores, and quilts.

(2) Paint the hive and all woodwork twice at intervals of 24 hours with a solution of one part strong carbolic acid and two parts hot water, and then expose the inside of the hive to light and air for several days. Alternatively the surface of the woodwork may be burnt by means of a painter's spirit lamp.

(3) Collect and burn the dead bees found on the ground. The ground should then be sprayed with some strong disinfectant, such as 8oz. carbolic acid to a gallon of water; or it may be covered with quicklime.

Symptoms.

1. The first symptom usually noticed is a disinclination of the bees to work. They fly about aimlessly and do not gather stores.

2. A little later they lose their power of flight, and are unable to travel more than a few yards without alighting.

3. As the disease progresses the bees are only able to fly a few feet, when they drop and crawl about the ground. They may be seen crawling up grass stems or other upright objects, such as the supports of the hive, but they soon fall down and die. Towards night some may be seen gathered in groups, but these usually die before morning.

4. The abdomen or hinder part of the body is often swollen, and the extreme segments or rings droop and are bent underneath the rest of the body.

5. The wings often appear to be disconnected, the upper wings lying flat above the body, while the lower wings stand out from the body as in flight. Sometimes the legs seem affected, and the bees stagger along in their attempts to walk.

6. Finally the whole colony of workers is found massed together in front of the hive or on the ground, except a few which are found crowded round the queen.

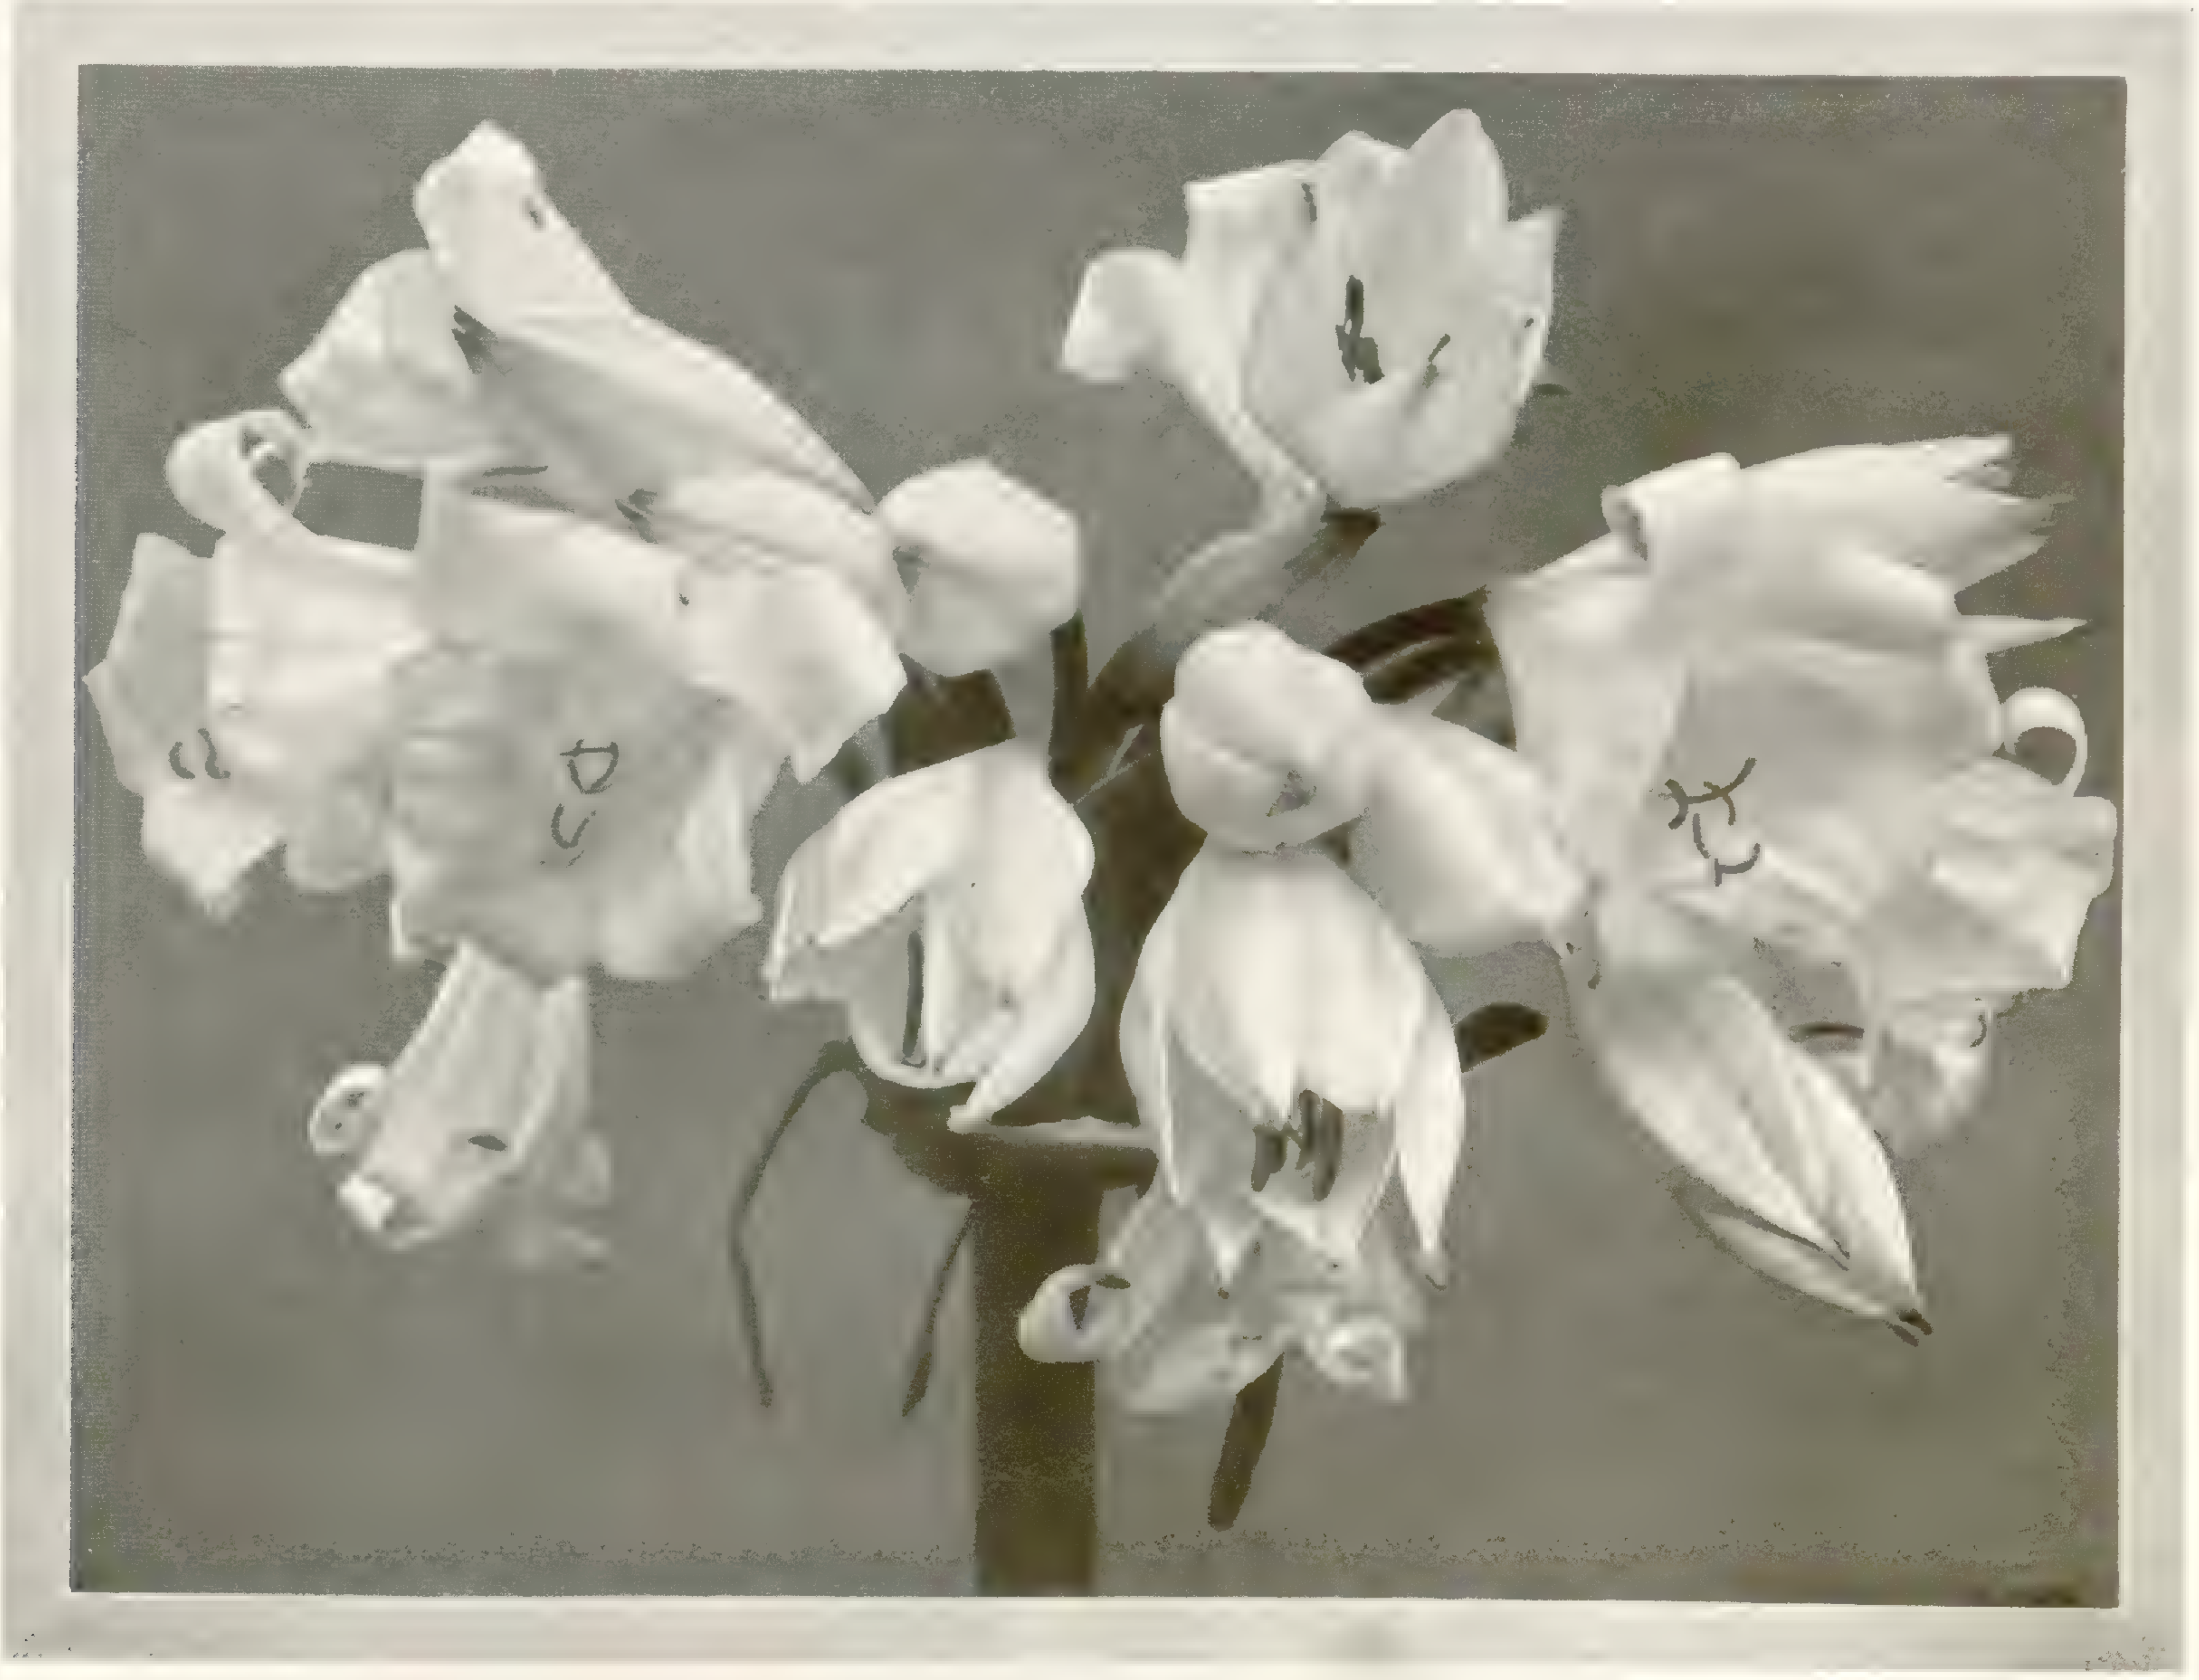
7. The foragers are always the first affected. The queen and the brood are not attacked, though "chilled brood" often appears subsequently, owing to there being insufficient bees to keep the hive warm.

8. In winter and early spring, when bees are often attacked, the walls, combs, and alighting board are frequently soiled by the bees. This seldom, if ever, takes place in the summer.

Although it is not certain what is the direct cause of this disease, it can be distinguished from some of the other diseases to which bees are liable. Thus, in cases of bee paralysis, the hinder part (abdomen) of the bees is discoloured and blackish. The bees tremble, and the wings are bent up in a way that is not the same as the distortion visible in Isle of Wight disease. In cases of "May pest" both young and old bees are affected, and their bodies are covered with a light grey dust. In cases of dysentery the bees soil the combs as in Isle of Wight disease, but the droppings are dark and muddy, and not of the yellow colour that is usual in the present disease. A course of treatment for all these diseases is given in the text books on beekeeping.

CRINUM JOHNSTONI.

This particularly fine species may be grown out of doors in the South of England in a sheltered and sunny border, such as is often available in front of a plant stove or other heated structure. At Burford Lodge, Dorking, Sir Trevor Lawrence's capable gardener, Mr. W. Bain, manages it well, and recently exhibited a grand inflorescence, carrying about two dozen flowers and buds. An Award of Merit was granted the specimen by the Floral Committee of the Royal Horticultural Society on June 6, and probably no one would have grumbled had the higher award of a First Class Certificate been granted. Our illustration shows the inflorescence staged on this occasion.



CRINUM JOHNSTONI.
A fine species, with white flowers tinged with rosy blush. A.M., R.H.S., June 6, Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain), Burford Lodge, Dorking.

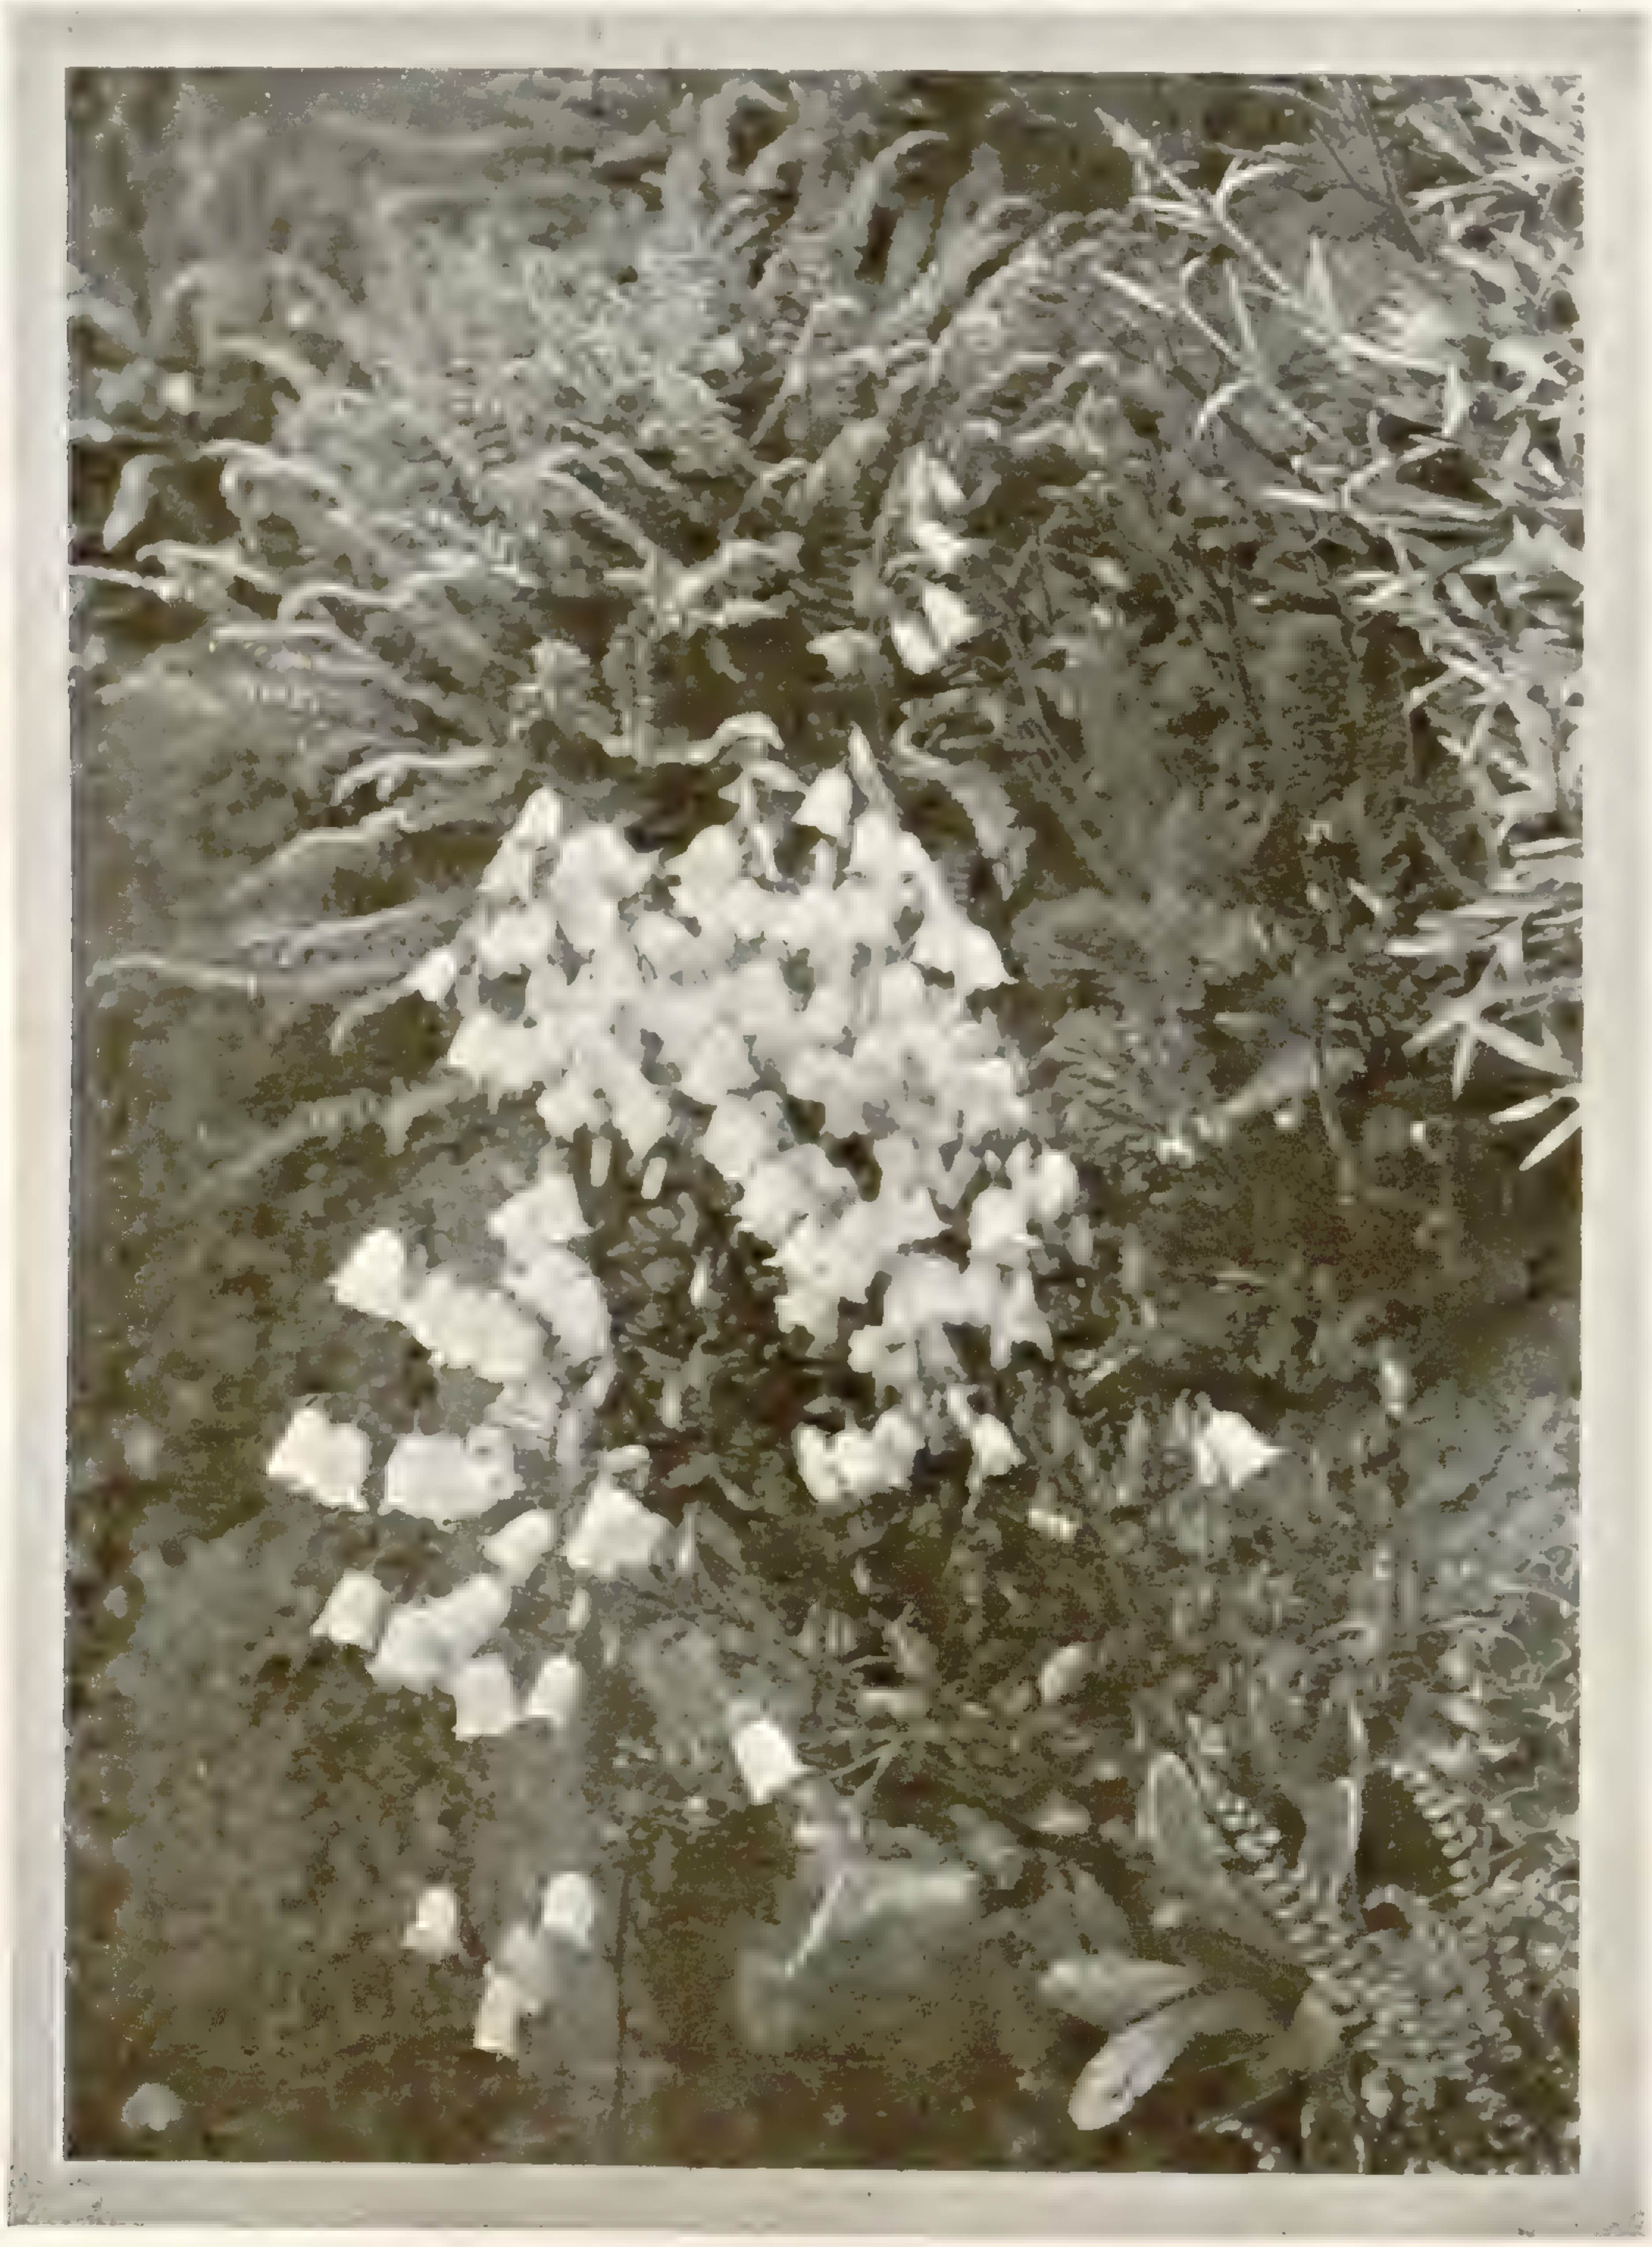
Crinum Johnstoni is a native of British Central Africa, and bulbs were first sent to Kew from Mount Zomba by Mr. McClonnie, in January, 1899. The species is intermediate between C. latifolium and C. longifolium, and its leaves are five or six feet long by two or three inches wide. The globose bulbs are of considerable size, but do not develop a neck, as in other well-known species. The flowers, each four inches or more in length, are white, tinged with rosy-blush, and are very beautiful. Crinum Johnstoni was named in compliment to Sir Henry H. Johnston, who has done good work in Central Africa.

CAMPANULA PUSILLA.

Dwarf campanulas nowhere appear to such charming advantage as when grouped in the rock garden. The beauty of form and graceful habit that invariably characterise the bellflower is present in most charming miniature in Campanula pumila, best known perhaps as C. pusilla. This dainty plant is variable both in the form and colour of the flowers, in the latter respect being represented by deep blue, lavender, and white varieties. The difference in form is not so readily apparent; in one form the flowers appear about equal in length and width, and have an inflated appearance; in the other form the length of the bell is greatest, so that it appears slender in comparison with the other; both come naturally from self-sown seed, and in this respect no plant exceeds them in rapidity of freedom in reproduction. Originally I had only the dark blue and white forms, which were planted in ordinary positions on the rock garden, and in a few years they became widely distributed, self-sown seedlings appearing in quite unexpected positions. Numbers clothed the sides of the paths, others strove to maintain a foothold among more vigorous subjects, while a few ensconced themselves in cracks and fissures among the rocks, and, when in flower, the dainty bells appeared to be tumbling in wildest profusion from many different points.

Campanula pusilla appears to succeed best in positions that are cool and well drained; in such it withstands the maximum amount of sun, and where it secures a suitable foothold it swells out into luxuriant cushions of low dense leafage, which later become aglow with flowers, the wealth of blossom presenting in its season a quite notable floral triumph.

Thomas Smith.



A SELF-SOWN CAMPANULA PUSILLA ALBA AMONG HARDY FERNS.

VEGETATION.

In considering the evolution of organic life on this wonderful world of ours, animal life, culminating in man himself, naturally occupies in our minds the first position, and vegetative life is equally naturally regarded as a mere means to an end, viz., the sustenance of the higher grades of existence. The scientist, however, recognises the fact that organic life in its origin must have been vegetative and not animal, since nutritive material must have existed in a digestible form suitable for the animal organisation when primal life branched off into the two directions, animal and vegetable, since it is the plant alone which can assimilate inorganic matter, and, by virtue of such assimilation, create animal food. Throughout creation, so far, at least, as this globe is concerned, the plant therefore constitutes the very foundation of life, and a world is perfectly conceivable in which animal life might be entirely absent, while an animal world by itself is an impossibility, since, though many animals prey upon each other or exist at their expense, the victims or hosts are primarily dependent upon vegetable food for their existence, and hence it is only a step from the carnivorous or parasitic animal to the primary necessity, viz., the food producing plant.

The cell which, by its capacity for absorbing nutrition and multiplying itself, is, throughout Nature the immediate formative agent, can only perform its functions, directly or indirectly, through the agency of chlorophyll, undoubtedly the most wonderful and most essential substance in the world, though popularly it is merely regarded as the green colouring matter common to the greater part of the plant world, and only absent in the rest of it by virtue of what we may term a parasitic capacity of utilising it indirectly. It is chlorophyll, and chlorophyll alone, which is gifted with the subtle power of utilising the vital energy of the sunbeam to break up and decompose purely inorganic material, carbonic acid gas and various salts into their constituents, and then to rearrange these into almost infinite combinations to form the building materials requisite for their multifarious work. No animal has this power; and, although every form of animal life exists by virtue of some sort of digestive apparatus which is capable of withdrawing the material its system requires from the food obtained, that food must first have been created by chlorophyllic action, and cannot possibly be assimilated in the raw form with which chlorophyll so successfully deals. It is obvious, therefore, that so far from vegetation being of secondary importance in the great scheme of Nature, it is really the first essential to organic existence.

From another point of view, viz., of ubiquity and abundance, vegetative life must certainly take precedence over animal life. Viewing the earth's surface as a whole, we see, practically everywhere, save in the Polar regions and on the watery areas which occupy so large a part of it, a practical infinity of forms of vegetation, from enormous areas densely clothed with forests millions of square miles in extent, to areas of mountain, valley, and plain of equal or greater area also covered with vegetation, to say nothing of the vast extent of cultivated land devoted to agriculture. Taking these land areas as a whole, the evidences of man's existence consist but of mere dots of cities and tracks of traffic, while if we descend to form a comparative estimate of the rest of animal life, it is found to be but a fraction in proportion to the abundance of vegetation.

Vegetation, indeed, more or less pervades immense regions scarcely trodden by the foot of man whom it far and away excels in the capacity of adaptation to adverse conditions, and thus holds its own practically everywhere where the sun can shine and a little rain can fall, or the dews of heaven can replace it. In taking a purview of the vegetation on the earth's surface, we have excepted the oceans and lakes, but even here, though less visible, vegetation must be on an enormous scale, the great Sargasso Sea, for instance, must form a fair aquatic parallel in the ocean to the huge areas of terrestrial forests, to say nothing of the coastal weeds and those which are known to prevail in deeper waters. Over and above all these, we have also to reckon with the microscopic plant world which to this day doubtless represents the progenitors of all existing life in these forms of simple and complex cellular organisms, diatoms, desmids, and an inconceivable host of others which inhabit every body of water, whether large or small, and play a by no means unimportant rôle, not merely as food for the animal section of creation, but even as contributing to the rock formations of the distant future by their insoluble secretions.

Chas. T. Druery, V.M.H., F.L.S.

CHRYSANTHEMUM PREALTUM.

Among the members of this genus are many useful and ornamental summer and autumn-flowering plants, not to mention the popular "mums." Probably the most familiar are the many forms of C. maximum, which is so popular as a border plant, and so useful for its cut flowers. C. lacustre and the tall-flowering C. uliginosum also claim their share of attention, the latter being valuable for its late autumn flowers.

The present species is closely allied to the well-known Feverfew (C. parthenium), being, in fact, the Caucasian form of it. It is a very attractive and free flowering plant, and is well worth a place in the herbaceous border, providing a profusion of flowers during the summer and autumn months. Of well-formed bushy habit, freely branching, it grows from two feet to three feet high, with flower heads about one inch across. Coming freely from seed, which is produced in abundance, C. prealtum is one of the easiest of plants to grow in any open, or even shady, border, while it is not at all particular as to soil. Seeds may be sown in the early autumn to produce plants for early summer flowering, while seeds sown in spring produce plants that will flower in the autumn.

C. prealtum differs from the European C. parthenium in having less finely-divided foliage, a stiffer, more erect habit, and larger flowers.

W. Irving.

CHRYSANTHEMUM PREALTUM.

SWEET PEA NOTES.

The long-continued spell of dry weather is in many districts causing considerable harm to vegetation, and as the sweet peas are moisture-loving plants, they, among other things, will be suffering, though probably not so much as the shallower-rooting subjects.

It is at such times as these that the benefits of deep cultivation are felt, and where the soil has been worked to the depth of two feet or more the plants should not be really suffering, although the abnormal heat of the last few days cannot have failed to test the plants severely, and the exhibitor especially cannot afford to lose any ground, so every effort must be made to keep the plants growing nicely.

On light shallow soils watering must be taken in hand at once if the vigour of the plants is to be maintained. If the plants have commenced to bloom, which they should by this time, weak liquid manure may be given them at each watering, say, twice a week, and though I am not generally in favour of very early feeding, yet a season such as this demands treatment quite out of the ordinary, so I would advise, in addition to the liquid manure, which may be made from either horse, cow, or sheep manure, a slight dressing of artificial once every week or ten days; but should the plants or flowers become too gross this latter should be discontinued for a time, or, in the event of a moist period intervening, it might not be necessary to give quite so much.

On heavier soils it may also not be necessary to water quite so often, but I have noted that many heavy soils have a decided tendency to crack during dry weather, and, consequently, lose a great deal of moisture by evaporation, and, though appearing moist, are in reality even drier than the lighter class of soils; in such cases frequent hoeings are absolutely necessary unless the ground has been mulched, and then one must not be lulled into too great a sense of security, but make quite sure that the ground is actually moist by examining the soil some little distance away from the plants.

Green-fly and thrips are often troublesome pests to the plants during hot dry spells, and as a preventive I would suggest that they be given a good syringing overhead after a hot drying day, the garden hose being the best thing for the purpose, and one can cover a lot of ground with this in a short time. If this is done two or three times a week it will go a long way towards keeping the pests down, but should it prove insufficient a light spraying with some insecticide should soon settle the matter, not forgetting that the young points of sweet peas are fairly tender subjects, and must not be treated to the same strength as one would use for fruit trees, etc.

Thomas Stevenson.

Lockerbie Sweet Pea Association.—A society, under the above title, commenced its existence a short time since as the result of a meeting held at Kintail Hall, Lockerbie. Sir George Watt presided, and was elected president of the new venture. Mr. G. L. Moffat, Lockerbie, was appointed secretary, and an exhibition is to be arranged for August.

Shrubberies.—This is a good time for giving the beds and borders a thorough cleaning. Some of the early-flowering shrubs will benefit by a little judicious pruning where the growth has become too thick. The old flowering wood may be thinned out in the case of the ribes to advantage, to allow the young growths more light and air. The early-flowering spiræas, such as Thunbergi, arguta, prunifolia fl. pl., and confusa, may be slightly thinned out after flowering, and where strong shoots are observed breaking at the base of the growth the same growth should be pruned down to the young shoot. The sucker growths which frequently appear round the stems of lilacs should be cut away, or they will eventually take possession. A liberal top-dressing of decayed manure is of great assistance to the lilacs, if given them when they have finished flowering. During dry spells all late-planted shrubs will require thorough soakings. Laurel hedges and screens will need to be trimmed occasionally to keep them tidy, also privet, box, and ivy. The strong flowering shoots of Buddleia variabilis, and its varieties magnifica and Veitchiana will also need support.—E. C. P.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COOL HOUSE. — The excessive dryness prevailing for such a lengthened period, combined with hot scorching sunlight, renders it more than usually difficult this season to retain a desirable condition of the atmosphere inside the houses, such as is best suited to the different occupants of this division. Frequent damping of the floors, syringing between the pots, and spraying overhead have been necessary with us, notwithstanding we have had a permanent shade on the glass in addition to the ordinary blinds. We have found considerable advantage in that we have been able to dispense with all artificial heat at night, and with a liberal use of the lower ventilators a good amount of atmospheric moisture has been acquired by damping outside the houses with a hose during the evening, and I would advise, where this can be conveniently done during the summer months, to water each evening the paths and borders, and whatever space may be around the outsides of the orchid houses. The only disadvantage we have experienced from the dry weather is in the durability of the flowers, the blooms of Odontoglossum crispum seem no sooner expanded than they present a thin and transparent appearance, and only remain in good condition a very short time. I have no doubt we shall ultimately derive considerable benefit from the unusually dry period by the more robust appearance of the growths just advancing. There can be no doubt that the want of light, which was so pronounced last season, resulted in the production of more or less immature and unripened growths and pseudo-bulbs, and consequently, the quality of the flowers throughout the whole season has been more or less thin in texture, and in many cases wanting in the colour.

REPOTTING COOL HOUSE ORCHIDS —It frequently occurs that some of the odontoglossums require attention immediately after they pass out of flower. I do not consider that plants take any harm from repotting at this season of the year, providing they are actively rooting, and that conditions suitable to their requirements can be provided. I do not consider it advisable to repot when the conditions outside are such as we have experienced recently, scarcely any rain for five or six weeks. It is better to delay repotting until moister outside conditions obtain, and then during the summer the plants must be kept well shaded, and the atmosphere moist until the roots become established in the fresh compost. A sharp lookout must now be kept for thrips and other insect pests, but spraying with some safe insecticide at regular intervals will keep these pests in check.—H. J CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

ALLAMANDAS are now making rapid growth, and the best shoots should be trained in their permanent positions, previously removing all the weakly and undesirable wood. This latter operation will well repay the cultivator while improving the general quality of the blooms, and, in addition, will greatly benefit the occupants of the plant stoves by allowing them more light. Plants that are grown for the purpose of forming specimens on balloon or other shaped trellis should have their growths removed from the strands of twine, and trained to the trellis as soon as sufficient flower buds are formed, and previous to their showing colour. A plentiful supply of water is now required, and good results will follow judicious feeding with some approved fertiliser with alternate applications of clear soot water and weak liquid manure.

THE VARIEGATED PINEAPPLE is exceptionally useful in decorations, and adds a distinct as well as interesting appearance to collections of stove plants. Its culture is comparatively simple, being much the same as that of the well-known pandanus. Suckers with a few roots attached may be removed at any season of the year, and if they are put into small thumb pots, and the pots plunged in a brisk hotbed, they will become well established in a few weeks. In order to ensure the development and rich colouring of the leaves the plants must have their roots somewhat restricted.

ASPARAGUS PLUMOSUS.—Spring-raised plants are now growing freely, and attention to repotting is advisable so as to have the plants thoroughly established before autumn. Fibrous loam and peat in equal parts with a small amount of dried sheep dung that has been rubbed through a fine sieve, and about one-fifth part of silver sand will make a suitable potting compost.

EDGING PLANTS.—In order to maintain a stock of these in a thrifty state for the stages it is necessary to propagate a few at intervals, the number being regulated by the demand. The following are especially useful: Selaginella cæsia, S. arborea, Panicum variegatum, fittonias, and tradescantias. Cuttings of these inserted in small pots from six to nine in each, and kept close for a few weeks, will quickly attain to a decorative size. —JOHN DONOGHUE, Bardon Hill Gardens, Leeds.

FRUITS UNDER GLASS.

EARLY GRAPES —The hot sunshine at the end of May and early in June, caused the crop of Black Hamburgh to finish up quickly, and now if any uneasiness prevails about the grapes keeping, let the roof be shaded either with netting or a little lime-wash, perhaps the latter is the more easily applied, and if it is washed off by a storm it can very soon be replaced. In dull weather shading is not required. Keep down the fire heat as advised in previous notes, only using a little in dull or damp weather, or of a cold evening. White grapes, such as Foster's Seedling or Buckland Sweet Water, require all the light possible to ensure their finishing properly, but direct exposure to the sun is harmful, especially after a dull spell, as we are apt to get.

MID-SEASON VINES.—Admit an abundance of air on all favourable occasions, and do not allow the temperature to rise too high before this is done. A little air should be admitted during the night, and in bright weather commence the ventilation as soon as possible in the morning, and increase it gradually, and damp the floors at once, as there is always a stuffy temperature in the morning, and this should apply to all fruit houses. Strict attention must be paid to syringing all available space under the vines, such as staging, floors, etc., at shutting-up time.

LATE GRAPES.—Pay attention to the final thinning, especially Alicante and Gros Colmar, and allow plenty of room for the berries to swell. When the bunches are overcrowded the grapes do not keep well. If one berry should, perchance, go wrong, the whole bunch quickly becomes affected. The berries should be about half an inch apart now, which will be about the amount of space requisite for these two grapes to have shapely bunches when finished. Market growers do not allow quite so much room on account of obtaining extra weight, and from these growers one can easily obtain some good lessons, as they obtain far more weight per foot of rod than do private growers.

LATE PEACHES AND NECTARINES must be brought along steadily to meet the demand, or for any special time or purpose. This can be regulated by airing and fire-heat. Late houses must have an abundance of air throughout the night, or the crop will be brought along too rapidly. Keep the growths thinned, and tied regularly, and do not tie in any more branches than is absolutely required for the well-being of the trees.

EARLY PEACHES.—When the crop has been gathered open the ventilators to the fullest extent, and if the roofs are movable take the lights off. This ripens and makes the wood quite hard. Keep the foliage well syringed twice daily, and attend to the watering with the same care as when the fruits were on the trees, as the latter are now completing their growth.

FIGS.—The hot sunshine of May and early in June caused the fruits to be very delicious. Gather the fruits as soon as they are ripe, and send them in for dessert fresh from the trees. Figs do not improve by being kept. Give abundance of water to the roots where a good second crop is in process of development, and shut up with a good brisk temperature; succession houses may be treated similarly. Figs in pots may be plunged to the rim in a bed of ashes outside in a sunny position, and must be regularly syringed. — W. A. COOK, Leonardslee Gardens.

THE FLOWER GARDEN.

FLOWER BEDS AND BORDERS which have been recently planted with the summer subjects will require copious waterings during dry weather. All plants needing support must be attended to at once before the winds break them down. All decaying flowers and foliage should be picked off to promote a tidy appearance, and the verbenas, phloxes, etc., pegged down. In places where there is sufficient room to work the hoe the surface of the beds should be stirred occasionally. The various designs in the carpet beds must be maintained in clear outline by pinching the plants to keep them in their places. Begonias of the tuberous rooted section will derive much benefit from mulching, and decayed hotbed material is excellent for the purpose. It conserves the moisture, and keeps the roots cool.

HERBACEOUS BORDERS.—The staking of the various plants must be attended to before they become too heavy. The methods of staking and supporting the growths have been advised in earlier calendars. The spent flowers and decaying foliage should be removed from all subjects which have finished flowering, excepting those of a bulbous nature. The dead blooms may be picked off, but the stems should be allowed to mature, as they prove of great assistance in ripening the bulbs. Abundance of water will be necessary during dry weather to keep the plants growing freely, and phloxes should be heavily mulched, especially on hot borders. Occasional hoeings are beneficial to all plants. The flowering period of pansies may be considerably extended if the seed pods are not allowed to remain on the plants.

RHODODENDRONS AND AZALEAS.— Immediately these cease flowering the old trusses should be removed from the plants so that the young shoots may obtain the benefit. The trusses will readily snap off immediately above the young growths if the operation is carefully carried out, and this also gives the shrubs a neat and tidy appearance. A top-dressing of peat should be given to all those which require it. Failing peat, leaf-soil, loam, and a small quantity of decayed cow manure provides an excellent substitute

WALLFLOWERS.—Seeds sown in May will by this time have produced plants large enough to transplant. If the young plants are to be put out now, where they are to remain until required for the beds in the autumn, then they must have from twelve to fifteen inches of space between them. When it is intended to transplant twice in the growing season they may be put out this time about four or six inches apart, lifting and planting again later on when they have filled out the space allowed. The advantage in transplanting twice is that more fibrous roots are obtained than when they are only shifted once. Whichever method is adopted it is necessary to put wallflowers in good soil that has been previously enriched with decayed manure.—E. C. POOLEY, [illegible] Gardens, Plymouth.

BATH CARNIVAL.

BATH GRAND ROSE SHOW
and
GENERAL SUMMER EXHIBITION.
WEDNESDAY and THURSDAY, JULY 12th and 13th.

Classes for Roses, Nurserymen and Amateurs.
Bouquets, Cut Flowers, Sweet Peas, Strawberries, and Tuberous Begonias.

Entries close Friday, July 7.

For Prizes, Schedules, etc., apply
B. R. F. PEARSON, Secy.
Office: 17, Argyle Street, Bath.

BLETCHLEY AND FENNY STRATFORD HORTICULTURAL SOCIETY.

BLETCHLEY PARK, BUCKS.

Magnificent grounds, adjoining Bletchley Junction, L. and N.W. Rly.

SECOND ANNUAL SHOW,

August 7th, 1911, Bank Holiday.

LARGE SPECIAL PRIZES
for
ROSES, CARNATIONS, TABLE DECORATIONS,
etc., etc.

ADDITIONAL CLASSES.

Schedules on application to Secretary,
THOS. BEST,
Bletchley.
June 16th, 1911.

CARDIFF FLOWER SHOW.
By kind permission.
SOPHIA GARDENS, CARDIFF.
WEDNESDAY and THURSDAY, July 26th and 27th, 1911.
The renowned Full Band of H.M. 19th Queen Alexandra's Own Royal Hussars.
Grounds and Tents brilliantly Illuminated.
Mr. John Studt's Complete and Extensive Amusements.
Every Particular and Schedule, Apply
A. MAURICE BAILEY, Secretary,
24, Duke Street, Cardiff.

HANLEY PARK, STAFFORDSHIRE.
JULY 5th and 6th, 1911.
FIFTEENTH GREAT
ANNUAL FLORAL FETE.

£650 in Prizes, Silver Cups, Gold and Silver Medals. Silver Challenge Cup, value £10 10s., offered for TRADE EXHIBIT.
(For particulars see page 8 in Schedule.)
Valuable Special Prizes offered by the Principal Firms in England.
Schedules post free on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

LEICESTER.—ABBEY PARK FLOWER SHOW, 8th and 9th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

NORTH LONSDALE ROSE SOCIETY,
ULVERSTON.
28th ANNUAL EXHIBITION of Roses, Sweet Peas, Violas, etc., Swarthdale Park, Ulverston, Wednesday, July 19th, 1911.
PROVINCIAL SHOW OF THE NATIONAL ROSE SOCIETY.
£5 and Gold Medal for a Single Bunch of Sweet Peas.
Over £300 in Cups, Medals, and Cash will be awarded.
Entries close July 15th.
For Schedules, etc., apply Hon. Secretaries,
County Square, Ulverston.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.
THE ANNUAL FLOWER SHOW will be held in the DUTHIE PARK, ABERDEEN, on the 17th, 18th, and 19th August. Prize Schedules may be had from the Secretary, J. B. RENNETT, Advocate and C.A., 231, Union St., Aberdeen. Entries close on 10th August.

SHREWSBURY GREAT FLORAL FETE.
AUGUST 23 and 24, 1911.

£1,200 in Cash Prizes.

Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs.,
Shrewsbury.

SALTAIRE, SHIPLEY, AND DISTRICT ROSE SOCIETY.

NINTH ANNUAL EXHIBITION
OF ROSES AND SWEET PEAS.

TUESDAY, JULY 11th, 1911.

TROPHIES, MEDALS, AND MONEY PRIZES TO THE VALUE OF £500.

Schedules and further particulars from
E. WRIGHT,
Hon. Secretary.
Rosedene, Shipley Glen,
Saltaire.

NATIONAL SWEET PEA SOCIETY.
ELEVENTH GREAT EXHIBITION AT ROYAL HORTICULTURAL HALL,
WESTMINSTER, JULY 11 and 12.
Entries Close July 5.
Join at once. Minimum Annual Subscription, 5s.
Schedules on application.
"Sweet Pea Annual" free to members; 2s., post free to non-members.
CHARLES H. CURTIS, Hon. Sec.,
Adelaide Road, Brentford, Middx.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

Notwithstanding the attraction of Coronation decorations, the fact that this was Coronation week, and a very little in front of the forthcoming great Olympia Show, there was a full exhibition at Westminster on Tuesday, June 20, and a large attendance of Fellows and visitors. Hardy flowers, carnations, and roses were the great features of the meeting, and they were well shown. There were not many novelties, but one stood out conspicuously, and this was Philadelphus Lemoinei Virginal, a lovely, sweetly-scented, tree-flowering variety, shown by Sir Trevor Lawrence, Bart.; the flowers are large, pure white, and just double enough to give substance without detracting from the elegance of the bloom. This gained a F.C.C. Odontoglossum Europa, of bluish-purple hue, from Mr. Gurney Fowler, was also a distinct novelty, and Mr. Ferguson's Primrose Queen delphinium was very pretty.

The medal awards ranged rather lower than usual on this occasion, not because there was any lack of merit, but because the Council of the R.H.S. had reminded the committees that bronze medals might be awarded more often, so that the merit value of silver and higher medals might be enhanced.

FLORAL COMMITTEE.

Messrs. Barr and Sons, Covent Garden, were forward with a pretty exhibit of delphiniums, phloxes, the lovely pink Astilbe Arendsi Ceres, A. Arendsi grandis, a selection of English irises, with bunches of Iris ochraurea, I. Dorothy Foster, I. spuria, I. orientalis Snowflake, Lilium croceum, L. Szovitzianum, some graceful heucheras, and bright gerberas, and other good things.

Messrs. Dobbie and Co., Edinburgh, presented large stands of such fine sweet peas as Melba, May Campbell, Lady Knox (cream), Mrs. Cuthbertson, and Mrs. Heslington.

Messrs. Jas. Veitch and Sons, Chelsea, made a feature of standard fuchsias, the drooping flowers of Mrs. Marshall, Mrs. Rundle, Scarcity, Olympia, Charming, and Starlight attracting a great deal of attention; brilliant cannas with perpetual and Malmaison carnations, and the graceful Begonia Lucerna, which carries dense panicles of rich red-pink blooms.

Carnations from Mr. Charles Blick, Hayes, Kent, were attractively staged, and the group included excellent bunches of King Arthur, Solfaterre, Cyclops, Mikado, Sea Swallow, crimson and white fancy; Acheron, King Oscar, Nautilus, and the big yellow Cecilia.

Old-fashioned as are Canterbury Bells, they never fail to attract attention when a fine strain is well displayed, as was the case on this occasion, when Messrs. W. J. Godfrey and Sons, Exmouth, presented a big group of fine spikes of cup and saucer varieties; though blue shades and white varieties were good, probably the beautiful pink shades were the most admired.

The beautiful bright blue delphinium Rev. E. Lascelles, with its striking white, blue-speckled eye, was shown by Messrs. Alfred Walters and Son, Bath, who set up a score or more of vases of spikes of this variety.

Messrs. Stuart Low and Co., Enfield, filled the space across the top end of the hall with carnations. Malmaison and perpetual varieties in pots were chiefly staged, and these were set in little groups of a variety, in moss and ferns. A few palms were effectively used as a general background; notably fine varieties well represented in this way were Grace, C. P. Little, Jane Seymour, Sunset, King Arthur, Irene, H. J. Jones, Lady Rose, Nautilus, Horace Hutchinson, Duchess of Westminster, and the old Princess of Wales.

Roses from Messrs. B. R. Cant and Sons were of beautiful colour, and especially attractive were the vases of Madame Ravary, Nance Christy, La Tosca, Souv. de Catherine Guillot, Lady Hillingdon, Antoine Rivoire, the bedding semi-double variety, Rose de Barri, Betty, and Harry Kirk.

Messrs. Paul and Son, Cheshunt, submitted a collection of interesting garden roses that included Ariel, Crested Moss, Richmond, Purple East, The Wallflower, Sweet Lavender, Leuchtstern, etc. The same firm filled out a long table with sweetly-scented pæonies, elegant heucheras, verbascums, gaillardias, and other good hardy flowers.

Sheaves of delphiniums, and big branching inflorescences of Ferula glauca, were the features of the exhibit from Messrs. T. S. Ware, Lim., Feltham; gaillardias, phloxes, Campanula Moerheimi, and pæonies were also included.

Messrs. William Paul and Son, Waltham Cross, contributed beautiful roses, chiefly in baskets of a variety; Lyon Rose, Le Progres, Mdme. Segond Weber, Alice Cory Wright, the famous Juliet, and Florence H. Veitch, with pillars of Elsie behind the baskets.

Mr. G. Reuthe had a goodly display of pæonies, irises, ixias, Eremurus Bungei, Escallonia phillipinense, liliums, etc.

Mr. Maurice Prichard, Christchurch, made a bright show of good varieties of delphiniums, campanulas, liliums, etc.

Mr. James Box, Lindfield, put up a large bank of choice delphiniums, and sheaves of Spanish irises, pæonies, poppies, pyrethrums, and gaillardias. Mr. James Box also contributed a group of sweet peas, in which were Blue Flake Spencer, Constance Oliver, Zarina, Dazzler, Scarlet Monarch, Colleen, and Mrs. Townsend.

Mr. Robert Bolton, Warton, Carnforth, brought up a small exhibit of well-grown sweet peas, that included Chas. Foster, Thos. Stevenson, Clara Curtis, Earl Spencer, Stirling Stent, Tom Bolton, Mrs. Hardcastle Sykes, and the brilliant Dazzler.

Messrs. Whitelegge and Page, Chislehurst, showed a berry, a free fruiting and strong growing fruit after the character of Phenomenal berry, with long deep red fruits that are said to be sweeter than the logan and similar berries.

Adiantum cuneatum Matador and the new Glory Fern were shown by Mr. Fabius, Emsworth.

Mr. Clarence Elliott, Stevenage, presented a rock garden, with Campanula pulla, C. pulla Miss Willmott, Nierembergia rivularis, and Aster sub-caeruleus, in fine condition.

Mr. Amos Perry, Enfield, had a rare display of delphiniums, putting up huge sheaves of spikes, and arranging these in pleasing fashion. Perfection, King of Delphiniums, Rev. Lascelles, Mrs. Creighton, Julia, La France, St. Paul, Dragon Fly, Persimmon, and Carmen were a few of the more prominent varieties.

Mr. C. F. Waters, Balcombe, showed perpetual carnations in his usual good style, setting up big vases and stands of leading varieties.

Messrs. Phillips and Taylor, Bracknell, contributed a little water and bog garden, with beautiful nymphæas, irises, and other moisture-loving subjects; they also showed a bank of delphiniums, etc.

Mr. F. W. Smith, gardener to G. Ferguson, Esq., The Hollies, Weybridge, brought up a fine lot of new delphiniums, in which the improvement in the cream and yellow shades were very noticeable; Pandora, Primrose Queen (A.M.), Gentianella, Enchantress, Avalanche, Cecilia, and Anona were a few fine forms in these colours.

Tall stands of roses, from Messrs. W. Spooner and Son, Woking, were well set up, General McArthur, Le Progres, Mrs. A. R. Waddell, and Mrs. Alfred Tate being very prominent varieties.

Messrs. W. and J. Brown, Peterborough, were large exhibitors of roses, and they staged their flowers very effectively in vases and stands of varying heights; we noted Mildred Grant, Mrs. D. McKee, Marquis de Sinety, Wm. Shean, Mdme. Ravary, and Mdme. Melanie Soupert as especially bright.

Messrs. Frank Cant and Co., Colchester, presented such roses as Madame Ravary, Mdme. Melanie Soupert, Countess of Derby, J. B. Clark, Rouge Angevine, and Lyon Rose in excellent form.

Messrs. G. Jackman and Son, Woking, put up popular roses, chiefly in tall bamboo stands, with some flowers on boards and in small vases in the foreground; Lady Hillingdon was charmingly shown; this firm also contributed a bank of hardy flowers.

Messrs. George Mount and Sons, Canterbury, showed roses finely, and had Mrs. George Shawyer, General MacArthur, and Richmond in good condition.

Messrs. H. Cannell and Sons, presented cannas and Hydrangea paniculata grandiflora, and Calceolaria Triumph of the North, all good things.

Messrs. J. Cheal and Sons, Crawley, exhibited cut sprays of ornamental trees and shrubs, and these proved very interesting, especially the golden-leaved elder, elm, cornus, oak, etc., while kalmias, Azalea viscosa vittata, Robinia viscosa, and Olearia dentata were conspicuous among flowering shrubs.

The bold bank of hardy flowers from Messrs. G. Bunyard and Co., Maidstone, was gay with delphiniums, Campanula macrantha, Sidalcea candida, Spanish irises, Iris Monnieri, I. Dorothy Foster, ixias, and varieties of Lupinus polyphyllus.

Mr. H. Barnett, Guernsey, again made a rare show of carnations, his blooms of Marmion, R. F. Felton, Mikado, Mr. C. Raphael, and Mrs. C. W. Ward compelling admiration.

Choice ferns, with abutilons, crotons, Hibiscus Cooperi, and fragrant heliotropes made up an exhibit from Messrs. H. B. May and Sons, Edmonton.

The stately delphiniums from Messrs. R. H. Bath, Lim., Wisbech, proved a great attraction, especially the big spikes of Mrs. Creighton, Pannonia, Patansa, General Baden Powell, Donald McPherson, and Lize.

Among the carnations staged by Messrs. W. Cutbush and Son, Highgate, we were specially struck with Frank Galsworthy, Mrs. Fortescue, Alma Ward, Fortuna, and Mrs. Burnett.

Mr. E. J. Hicks, Twyford, contributed a goodly display of roses, and Mr. W. Easlea, Eastwood, Essex, filled a table with bright blooms, and trailing sprays of beautiful varieties of roses.

Messrs. Jones and Sons, Lim., Shrewsbury, displayed sweet peas prettily, and contributed popular varieties.

Mr. W. E. Alsen, Denmead, Hants, had a very effective exhibit of sweet peas, and made a good show of Stirling Stent, Tennant Spencer, Countess Spencer, Moneymaker, Dazzler, and Senator Spencer, all in fine form.

Mr. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge, presented fine flowers of such nymphæas as N. atropurpurea, N. chromatella, N. Marliacea albida, N. Gladstone, and N. M. carnea, in trays of water.

Messrs. G. and A. Clark, Lim., Dover; Messrs. Wells and Co., Lim., Merstham; Mr. A. J. Harwood, Colchester; the Guildford Hardy Plant Co.; and Messrs. Carter Page and Co., London Wall, also made contributions of cut flowers.

Mr. J. MacDonald, Harpenden, made a very interesting exhibit of grasses, both mounted specimens and young seedlings, representing those kinds of special value for golf courses, tennis courts, croquet lawns, etc.

ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, had an orchid group that was interesting by reason of its specimens of Cycnoches pentadactyle, with four spikes, each nearly a yard long, Maxillaria Sanderiana, Broughtonia sanguinea, Odontioda Bradshawiæ, the beautiful Dendrobium thyrsiflorum, Brasso-cattleya Veitchi, and Odontoglossum ardentissimum Queen Alexandra.

Messrs. Charlesworth and Co., Haywards Heath, had a quite small group, but it contained the pretty brown and white Odontioda Lairessei, Mormodes pardinum unicolor, Angræcum Chaillanum, Chondroshyncha Chestertoni, Trichopilia Backhousiana, and Cypripedium Mrs. Lloyd magnificum.

From the Burford Lodge collection Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., brought up Catasetum Cliftoni, with a broad, flattish, greenish-yellow lip.

Cattleya gigas was a strong feature of Messrs. J. and A. McBean's group, from Cooksbridge; with these were Cattleya Mossiæ Wagneri, C. M. Reineckiana, and white forms of Odontoglossum crispum.

Messrs. Armstrong and Brown, Tunbridge Wells, showed a fine specimen of Masdevallia Harryana splendens, with thirty-four richly-hued flowers.

Mr. W. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks, showed the fine Odontioda Rosefieldiensis, with large bright flowers; and Odontoglossum Queen Alexandra.

Mr. A. Young, gardener to E. R. Ashton, Esq., Broadlands, Camden Park, Tunbridge Wells, displayed Odontoglossum Williamsiana, Epidendrum vitellinum majus, Lælio-cattleya Canhamiana, L.-c. Martinetti, and the bright L.-c. Lady Miller, yellow and crimson, and Odontoglossum Fascinator.

Messrs. Stuart Low and Co., Enfield, contributed Odontoglossum Pescatorei, Oncidium macranthum, Cœlogyne pandurata, Renanthera Imschootiana, and the chaste Dendrobium nobile virginale, etc.

Mr. Edward V. Low, Haywards Heath, put up Cattleya Mossiæ Wagneri, C. M. Frou Frou, and a fine specimen of Cœlogyne pandurata.

Anguloa Cliftoni and Catasetum Clifton, both with yellowish flowers, were staged by Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate; Sobralia Colmanæ, with four open, soft buff-coloured flowers, also came from Gatton Park.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. J. Veitch and Sons, Chelsea, presented a very fine collection of vegetables, representing excellent varieties in good style; Wheeler's Imperial and Market Garden cabbages were excellent; Quite Content, Earliest Marrow, and Langley Gem peas; Improved Telegraph and Sensation cucumbers; Hastings and Golden Jubilee tomatoes; Parisian Forcing carrots; Early Dwarf Forcing carrots, and a host of potatoes, beans, radishes, and other good things were presented in the pink of condition.

Mr. S. Mortimer, Farnham, showed excellent fruits of Cynosure, Unrivalled, and Coronation, cucumbers.

CERTIFICATES AND AWARDS.

First Class Certificates.—To Philadelphus Lemoinei Virginal, from Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain), Burford Lodge, Dorking; to Odontoglossum Europa, from J. Gurney Fowler, Esq., Glebelands, South Woodford.

Award of Merit.—To Odontioda Rosefieldiense Crawshayana, from De Barri Crawshay, Esq., Rosefield, Sevenoaks; to Delphiniums Primrose Queen and Mauve Queen, from G. Ferguson, Esq. (gardener, Mr. F. W. Smith), The Hollies, Weybridge; to Sweet Pea R. F. Felton, from Mr. Robert Bolton, Carnforth; and to Carnations Charlotte Bronte and F. W. Goodfellow, from Mr. C. Blick, Hayes.

MEDALS.

Gold.—To Messrs. James Veitch and Sons, Chelsea, for vegetables.

Silver-gilt Flora.—To Mr. Amos Perry, Enfield, for delphiniums.

Silver-Gilt Banksian.—To Mr. J. Box, Lindfield, for sweet peas and hardy flowers; to Messrs. W. and J. Brown, Peterborough, for roses; to Messrs. G. Jackman and Son, Woking, for roses; to Mr. J. McDonald, Harpenden, for grasses; to Messrs. Stuart Low and Co., Enfield, for carnations.

Silver Flora.—To Mr. W. E. Alsen, Denmead, Hants, for sweet peas; to Mr. Chas. Blick, Hayes, for carnations; to Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; to Messrs. J. Cheal and Sons, Crawley, for trees and shrubs; to Mr. E. J. Hicks, Twyford, for roses; to Messrs. Paul and Son, Cheshunt, for roses and hardy flowers; to Mr. Maurice Prichard, Christchurch, for hardy flowers; to Mr. G. Reuthe, Keston, for hardy flowers; to Mr. F. W. Smith, gardener to G. Ferguson, Esq., The Hollies, Weybridge, for delphiniums; to Messrs. Jas. Veitch and Sons, Chelsea, for carnations, fuchsias, etc.

Silver Banksian.—To Mr. H. Burnett, Guernsey, for carnations; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. Frank Cant and Co., Colchester, for roses; to Messrs. William Paul and Son, Waltham Cross, for roses; to Mr. L. R. Russell, Richmond, for trees and shrubs; to Messrs. W. Spooner and Sons, Woking, for roses; to Mr. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge, for water lilies; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Mr. Young, gardener to E. Ashton, Esq., for orchids; and to Mr. S. Mortimer, Farnham, for cucumbers.

Bronze Flora.—to Messrs. Barr and Sons, Covent Garden, for hardy flowers; to Messrs. R. H. Bath, Wisbech, for delphiniums; to Messrs. W. Bull and Sons, Chelsea, for irises; to Messrs. W. J. Godfrey and Son, Exmouth, for Canterbury bells; to Messrs. George Mount and Sons, Canterbury, for roses; to Messrs. Phillips and Taylor, Bracknell, for water lilies, etc.; and to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers.

Bronze Banksian.—To Messrs. H. Cannell and Sons, Swanley, for cannas, etc.; to Messrs. Carter Page and Co., London Wall, for dahlias, etc.; to Messrs. Wm. Cutbush and Son, Highgate, for carnations.

Yorkshire Floral Fete and Gala.

The following few items in connection with the great York Flower Show were unavoidably held over from our issue of June 17:

HARDY FLOWERS IN BUNCHES.

Mr. Walter Pybus, Monckton Moor, secured a first for twenty alpine and herbaceous plants, in pots or pans, and he had good examples of Mimulus Tillingi, Saxifraga pyramidalis, and Delphinium nudicaule. Mr. J. Pickering, Clifton, second; and Mr. J. Nicholson, White Cross Road, York, third.

There were numerous collections of hardy flowers, each arranged on a space 18ft. by 6ft., and here Mr. F. M. Bradley, Peterborough, gained first prize for a contribution that included a large number of roses, disposed in vases and tall stands; irises and pyrethrums, verbascums, scabious, and delphiniums were also effectively displayed. Messrs. G. Gibson and Co., Leeming Bar, were placed second for a fine bank, in which pæonies, Oriental poppies, Incarvillea Delavayi, and Eremurus robustus figured prominently; Messrs. Harkness and Sons, Bedale, third; and Messrs. W. Artindale and Son, Sheffield, fourth.

Messrs. C. Longster and Sons, Malton, secured premier award for twenty-four bunches of hardy flowers, and did so with grand bunches of poppies, pyrethrums, Japanese irises, gaillardias, Nepeta violacea, Inula glandulosa, etc.; Messrs. Harkness and Sons second with rather tightly-packed bunches; and Messrs. G. Gibson and Co. third.

PELARGONIUMS.

Though these were not shown so largely as of old, there were some good contributions. Mr. J. W. Clarke, Skelton Street, York, scored for half a dozen double zonal pelargoniums with grand flat examples of R. D. Sayers, F. Raspail, E. South, Mdme. Thibaut, Royal Star, and King of Denmark; he was followed closely by Mr. W. F. Crowther, Wigginton Terrace, York, whose Decorator and Gloire de France were particularly good; Mr. H. Pybus third. The best three specimen ivy-leaved pelargoniums were fine pyramidal examples of Joseph Hatfield, Baden Powell, and Souv. de Chas. Turner; Mr. H. Pybus, Wormald Green, Leeds, second, and Mr. J. W. Clarke third.

Mr. H. Pybus was to the front for three examples of zonal pelargoniums, and his 4ft. wide plants of Lady Reed, Lord Hopetoun, and Mrs. Kelly were smothered with flowers; Mr. Jas. Sunley second with smaller plants and finer trusses; Mr. J. W. Clarke third. Six single-flowered zonal pelargoniums were best staged by Mr. H. Pybus, whose varieties were Lady Reed, Wm. Newdigate, and Doris Clark; Mr. Jas. Sunley second, and Mr. J. W. Clarke third. Mr. Pybus scored for a dozen zonal pelargoniums, but his specimens were scarcely so good here as in other classes; Mr. J. Sunley second

Mr. W. F. Crowther, Wigginton Terrace, York, was the only exhibitor of six show pelargoniums, and he was worthily awarded the chief prize for his handsomely grown and freely-flowered specimens of Mrs. Pett, Ed. Perkins, Mdme. Thibaut, Countess of Warwick, Duchess of Teck, and Tommy Dodd.

VEGETABLES.

Mr. James Gibson, Welbeck Abbey Gardens, secured the first prize for six kinds of vegetables, in the class provided by Messrs. Sutton and Sons, Reading; he showed beautiful examples of Canadian Wonder dwarf beans, Ideal potatoes, Magnum Bonum cauliflowers, Perfection tomatoes, Favourite carrots, and Centenary peas; Mr. A. R. Searle, Castle Ashby Gardens, second; and Mr. W. Nicholls, gardener to the Hon. Lady Beaumont, Carlton Towers, third.

There was a similar class, in which prizes were provided by Messrs. Webb and Sons, Stourbridge, and here Mr. A. R. Searle led with Viceroy tomatoes, Defiance carrots, Early Mammoth cauliflowers, fine Stourbridge Marrow peas, very fine Supreme dwarf beans, and Colonist potatoes; Mr. W. Nicholls came second, and Mr. Hague third.

Mr. Brotherston, gardener to F. Samuelson, Esq., Breckenbrough Hall, Thirsk, led for a dish of tomatoes with capital smooth fruits of Brotherston's A1; Mr. J. Gibson second with Perfection, and Mr. Hague third with Regina.

National Vegetable Society.

The following preliminary report of the trials that are being conducted by this society has been received from Mr. Alexander Dean, V.M.H., chairman of committee:

These are now being conducted at Sutton Green, Surrey, at the "Times" Experimental Station. On the occasion of my visit early in June I found Mr. Harry Foster, the son of our deceased friend Mr. Charles Foster, who is now in charge of the trials, to have prepared them with much ability and care. The carrot trials comprise 61 stocks, from 20 seedsmen. Each stock was represented by two rows, each about 30 feet long. In scarcely a single instance was there other than a good plant, and at that moment men were engaged in thinning the rows. Generally the plants were about two inches in height. The entire breadth was very clean. I look for a specially important trial of carrots in due course.

Following the carrots came the beets, sown in two rows to each stock, of which there were 52. Of these there were 19 round or globe beets, the rest being long rooted. The plants were in every case good, and were about 1½ inches in height, all being very clean. The rows in both cases were about 15 inches apart. Again a very valuable trial of stocks should be, in due course, provided.

Of early peas there were 50 stocks, but in numerous cases varieties expected to be dwarf in habit, and staked accordingly, proved to be tall growers, being from 24 to 30 inches in height, and promising to go much higher. The greater portion of the stocks were well in bloom. Relatively but few were quite dwarf. In spite of the possible difficulty presented by this dwarf staking of tall growers there is every prospect of a most excellent trial.

With respect to cauliflowers, of which there were growing the astonishing number of 88 stocks, many of which were necessarily the same, the autumn-sown trial was unsatisfactory. The sowing of the seed for that trial was made on September 24 last, the plants being wintered in frames, and were planted out this spring. A considerable number of the stocks gave blind plants, thus showing that the varieties were unsuited for autumn sowing, as also were the first Early Snowball, Early Forcing, or Matchless type, several heading in whilst small. Just a few proved to be fairly good in growth.

With respect to the spring-sown trial of cauliflowers, that, I am pleased to say, seems full of promise. Of the plants there is quite a huge breadth, and should, in due course, present a trial of the greatest interest and value. The plants were put out on May 10, hence, when I saw them, they had been planted about 16 days. The ground throughout was very clean.

Whilst it may be possible to examine the autumn-sown trial of cauliflowers when inspecting the peas, I asked Mr. Harry Foster to kindly make notes in his trial book of those blind, or those with small heads, or of other defects, which we could later have for guidance. Still, I think for purposes of publication most weight should attach to the spring-sown trial. I need hardly say that it may be needful to pay some three or four visits to Sutton Green to see the trials, and it may be needful also to ask members of the committee to make some sacrifices to enable that to be done.

It may be added that an additional trial of beets is being conducted from the same stocks by Mr. W. Poupart, Marsh Farm, Twickenham, and an extra one of all the carrot stocks on stiff soil by Mr. G. Wythes, V.M.H., at Bovingdon, Hemel Hempstead, Herts.

East Anglian Horticultural Club.

There was a large gathering of members at the June meeting of this club to hear a paper given by Mr. John Clayton upon the subject of "Hardy Bulbs for Summer and Autumn Flowering." The essayist started with June flowers, and finished with September ones, covering a very wide range of subjects, including many of the rarer gems of this class of flower, which are only met in favourably situated gardens. He especially referred to the fame Mr. George Davison, Westwick Gardens, Norfolk, had achieved in the horticultural world with his montbretias. He—the essayist—also said that in travels in many counties up and down the country he had come across no county that lent itself to this class of flowers as Norfolk did. Notes on culture were listened to with deep interest, because they were so lucidly put before the members. A vote of thanks was heartily accorded Mr. Clayton after the subject had been well debated.

The club this year is fortunate in having permission to have its summer outing at the Royal Gardens, Sandringham, Thursday, August 31, being the date fixed. Mr. Thos. Cook, the head gardener, has promised to do all he can to make the visit interesting.

There were good exhibits in the several classes for the month, special mention being due to the several brace of cucumbers, Messrs. Daniels Brothers' variety Lord Roberts, for which they offered prizes. This is a clean, smooth, short-necked type. In the class for strawberries the colour of Kentish Favourite was a great feature.

Bournemouth Gardeners' Association.

At the recent meeting of the members Mr. Tompkins, gardener to the Dowager Lady Miller, presided.

Some very good exhibits were staged in competition for the principal prizes offered at the end of the year. The competitors who receive the highest number of points will be the winners. Mr. C. Nippard had some very finely-grown plants of Hydrangea hortensis in pots, also spiraeas in comparatively small pots. These were awarded the maximum (three) and two points, respectively. The spiraeas were S. Professor Sturingard, S. Queen of Holland, S. astilboides, and S. W. E. Gladstone. The maximum number of points were awarded the same exhibitor for a grand fern growing in a 12in. pot.

Mr. Tompkins staged forced vegetables and strawberries, also a grand vase of Incarvillea Delavayi. The crimson-purple of the flowers was very rich, the stems strong, and the individual blooms large. Three points were awarded for this, and also to his dishes of Royal Sovereign strawberries and Winter Beauty tomatoes. For Early Giant peas and Ninetyfold potatoes two points were awarded.

The evening was devoted to "Questions"; these being written on slips of paper and placed in a box for the purpose. "Should Potatoes be Earthed up in Dry Weather?" was the question which caused most discussion, the members being in favour of such earthing up. The Chairman was heartily thanked for presiding.

Dundee Horticultural Association.

The ordinary monthly meeting was held in the Technical College, and was devoted to questions by members. Four questions were asked, and fully debated upon. The first was in relation to "Cultivation and Cleaning of Honesty for Winter Decoration"; the second in relation to sea holly for the same purpose, both from the Secretary; while Mr. William Grant wished to know "The Possibilities of Streptocarpus as a Bedding Plant." He had information that in the Forres district they did remarkably well. The consensus of expressed opinion was that there was little chance of success except in some sheltered nook in and around Dundee.

Mr. James Bethel asked if it was necessary to delay bedding out until rain came? He said this question was forced upon him partly from weather conditions, waste of water, and the interest of the plants. At present the ground was very dry, and the heat was abnormal. There were two evils facing them, one in the boxes, and the other in the beds. He chose the lesser one, and was practically finished; briefly, his method was to water the beds, dig them over, do the planting, water each plant, let the soil settle, then hoe the spaces between, and in this way little difficulty was experienced in keeping the soil in a moist condition until root action had been well commenced; if watering had to be afterwards indulged in, his practice was to use the hoe to loosen the surface and check evaporation, as soon as the soil would work without clogging.

On the afternoon of the 10th inst. the members were afforded the opportunity of visiting the grounds of the University College. With Professor P. Geddes as guide and instructor a pleasant afternoon was spent.

NEW BOOKS.

THE BOOK OF HERBS.

By Frances Bardswell. (A. and C. Black, London and Edinburgh.) Price, 7s. 6d.

Of late years largely increased attention has been given to the cultivation of herbs that are useful medicinally or of value in the culinary art, and several books possessing much merit have been published on the herb garden and its occupants within a comparatively recent period. It is well that the more useful of the herbs should be held in higher estimation than was for a long time the case, and it is certainly desirable the cook should depend more upon fresh herbs culled from the garden for flavouring than upon the dried herbs that are now obtainable from grocers, and the various preparations that owe their origin to the recent advances in synthetical chemistry.

The fact that several additions have within recent years been made to the literature of herbs does not in any way detract from the merits of the book from the pen of Mrs. Bardswell, on the contrary, the works that have preceded it add to its value. The writers on herbs have been more fortunate than some of those who have contributed to the literature of other aspects of gardening, inasmuch as instead of following similar lines, they have dealt with the subject from wholly different standpoints. As the result the several works are distinct in character, as well as style, and in instituting comparisons between them it at once becomes evident that all might with advantage have a place on the same bookshelf. Mrs. Bardswell deals more with the practical side of the herb garden than do the other modern authors to whom we have access, but on every page there is evidence of her charming style and thorough acquaintance with the literature of herbs.

BRITISH FERNS AND THEIR VARIETIES.

By Charles T. Druery, V.M.H., F.L.S. (George Routledge and Sons, Lim., London and New York.) Price, 7s. 6d.

The cult of British ferns is rapidly attaining to the position it should occupy in the gardens of this country, and no better evidence of this could be desired than the substantial volume from the pen of Mr. Druery which is now before us. Many books on British ferns have been published during the half-century or so that have elapsed since the choicer varieties have been cultivated in gardens, but it is many years since a book of the size of that which we owe to Mr. Druery's untiring energy in the cause of his favourites has been issued from the printing press With a full acquaintance with the literature of British ferns we do not hesitate to say that no book has possessed the value, so far as the general body of cultivators is concerned, that this unquestionably possesses. Our pages testify in no uncertain manner to Mr. Druery's remarkable acquaintance with all that relates to British ferns and their cultivation, and to his ability in imparting his knowledge. It is, therefore, quite unnecessary to say that the pages of the book are equally remarkable for their brightness and for the value of the information they contain. The book contains about five hundred pages, and the reader will find therein all the information that could well be desired, both on selection and cultivation. The descriptive list of species and varieties occupies a large portion of the book, and is of much interest, and of great value to the cultivator who is anxious to limit his collection to the finest of the many varieties of the more valuable species. The illustrations form an important and attractive feature, as will be gathered from the statement that it contains forty coloured plates, ninety-six Nature prints, and three hundred and nineteen woodcuts and photographic reproductions. The Nature prints have been selected from some three hundred printed from the fronds by the late Colonel A. M. Jones, of Clifton.

ANSWERS TO CORRESPONDENTS.

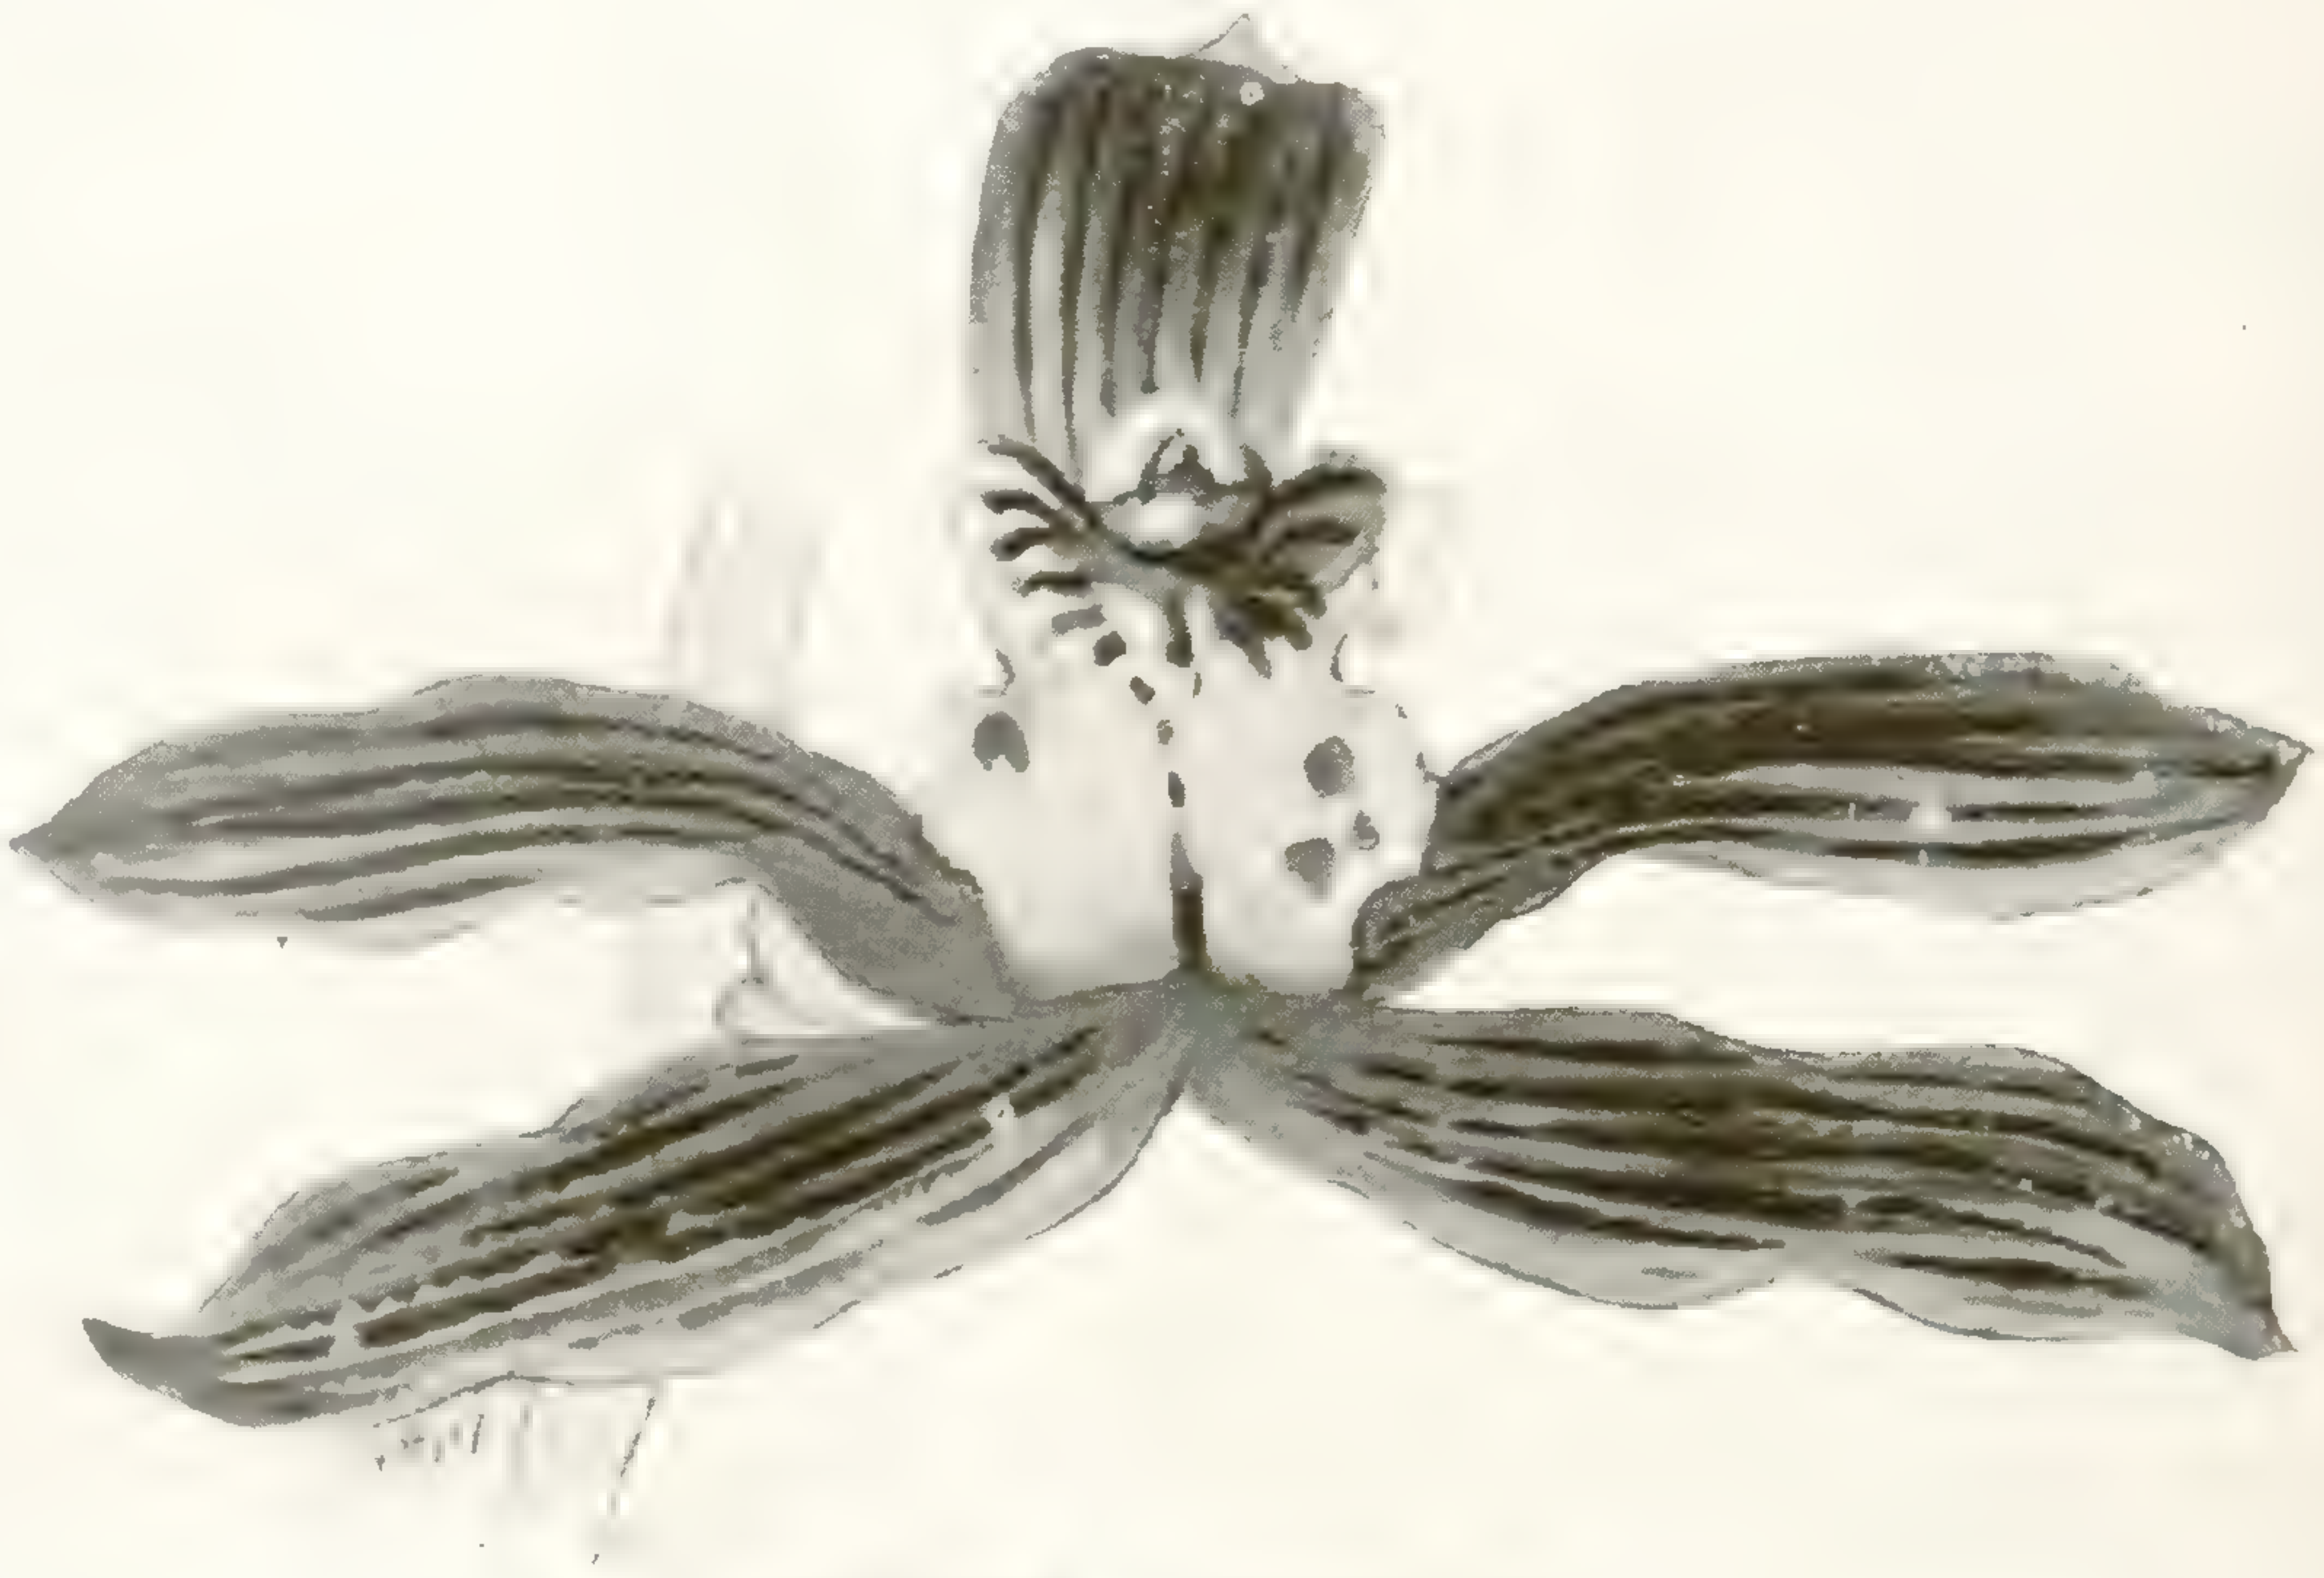
Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

CYMBIDIUM LONGIFOLIUM.—M. B. S., Oxford: This is not one of the most common of orchids in collections. It was introduced about 1873 from Northern India, and usually flowers towards the autumn. The flowers are of medium size, and are coloured green and brown, with a whitish ground colour to the lip; the general form of the flower is shown in the accompanying illustration. C. longifolium may be grown under the same conditions as C. Lowianum, where the latter is successfully managed.



CYMBIDIUM LONGIFOLIUM.

VIOLAS.—G. H. E., Caversham: Violas are remarkably good-tempered plants, and if sturdy plants wintered well, or young stock was planted out in well-prepared soil early in the spring, there should be no great difficulty in persuading them to continue flowering for several months yet. We are assuming you want a continuous display, rather than a few blooms for exhibition purposes. Cut off the dying flowers as regularly as possible, so as to prevent the formation of seed pods; keep the surface soil stirred as long as it is possible to work between the plants; water freely in dry weather, and at this time of the year a thorough soaking may well be followed by a light dressing of nitrate of soda, half an ounce to the square yard, this in turn being watered in. Follow with the hoe as soon as the soil can be worked, and then apply a mulch of old crumbly manure to reduce loss of moisture by evaporation. Weekly soakings of weak liquid cow manure will keep the plants growing well in dry weather. Remove some of the old growths occasionally, especially those that become straggling and give tiny flowers only.

DAMSONS NOT FRUITING. — E. W., Notts: As the trees have grown well without producing rank growth, it follows that something in the soil or climate is responsible for the lack of fruits over several years. Test the soil for lime, and if this is lacking apply a good dressing over the area occupied by the roots; use air slaked lime, and spread it half an inch thick, lightly forking it in at a later date. It is quite possible that the trees are in a position where keen cold winds affect them at flowering time; we have noticed on many occasions that cold winds and dull weather are almost as prejudicial to damson and plum crops as are frosts at flowering time.

LACK OF BEES.—B. R., Guildford: Probably the absence of bees in the garden is due to the disease that has destroyed so many of these little workers in the southern counties. Many of our correspondents have noticed the lack of bees among the flowers this year, and the shortage was especially noticeable in the springtime, when the fruit trees were in bloom.

FUNGUS ON ORCHIDS.—J. D., Uckfield: We hope to reply fully in our next issue.

LIFTING TULIPS.—C. S. J., Oswestry: As soon as the foliage has changed colour, and begun to shrivel up, and when a very slight pull will release the stem from the bulb, the tulips may be lifted. The work should be done carefully, and the bulbs should not be unduly exposed to strong sunlight. Remove them to an airy shed, place in single layers, and when the skin or tunic of the bulb is firm, the stock may be cleaned. Take care the varieties are kept distinct, and properly labelled.

GENETICS.—F. W., Aylesbury: You will find a great deal of information on this matter in several of the journals of the Royal Horticultural Society, notably in Volume XXIV., 1900; Vol. XXVI., 1901; Vol. XXVII., part 4, 1903; and The Genetic Conference Report, 1906.

RETARDING SWEET PEAS.—B. C. B., Skipton: Paradoxical though it may seem, yet the best way of retarding sweet peas is to keep them growing freely, but at the same time directing their energies into two or three leading stems. Remove all the side growths, and also every spike you can see, however small it may be, and then by watering, the application of liquid manure once a week, hoeing and mulching, strong growth will ensue, and provide good flowers towards the top a few weeks hence.

WATERPROOF COTTON FOR FRAMES.—J. C. D., Northumberland: Your best plan will be to find the exact area of the frames you wish to cover, and then purchase the requisite amount of waterproofed paper or calico through one of the sundriesmen who advertise in our columns; Willesden waterproof paper would answer your purpose. You can waterproof fine calico by loosely stretching it on a framework and brushing it over with a hot mixture composed of three pints of old linseed oil (pale), one ounce of powdered sugar of lead, and four ounces of white resin. The mixture must be used hot and

Lucidly Written! Profusely Illustrated!!

it is a good plan to dress the calico a second time as soon as the first application is thoroughly dry.

NAMES OF PLANTS.

M. J. W., Homersham.—1, Scabiosa caucasica; 2, Iris florentina; 3, I. sibirica; 4, Vitis armata.

F. L. C., Launceston.—1, Menyanthes trifoliata; 2, Stylophôrum japonicum; 3, Phacelia campanularia.

J. L., Bucknell.—Laburnum alpinum; the variety sent is frequently grown under the name of L. hirsutum.

F. E. B., Monmouth.—1, Euphorbia splendens; 2, Gillenia trifoliata; 3, Hemerocallis flava; 4, Anchusa italica, Dropmore variety.

D. P. C., Shrewsbury.—1, Impatiens Sultani; 2, Trachelium cœruleum; 3, Bomarea Carderi; 4, Oncidium sphacelatum; 5, Spiræa ariæfolia.

H. H. C., Canterbury.—1, Schizanthus retusus; 2, Anchusa italica; 3, Thalictrum adiantifolium; 4, Stachys lanata; 5, a Hieracium, species not recognised.

A. B. C., Lincoln.—1, The white form of Polemonium cæruleum; 2, probably Orobus atropurpureus; 3, Viburnum plicatum; 4, Spiræa ariæfolia; 5, S. confusa; 6, not recognised; 7, probably Megasea Stracheyi—should be sent when in flower.

METEOROLOGICAL OBSERVATIONS.

TAKEN IN THE ROYAL HORTICULTURAL SOCIETY'S GARDENS AT WISLEY, SURREY.

ILLUSTRATIONS.

Portrait of Mr. Norman Davis, 457; Philadelphus Lemoinei Virginal, 459; A Group of Handsome Cups to be offered at the Festival of Empire Rose Show, 460; Single-flowered Rose American Pillar, 461; Mr. W. H. Page's Silver Cup Group, 461; Double-flowered Pelargoniums at York, 464; Crinum Johnstoni, 465; A Self-sown Campanula pusilla alba among Hardy Ferns, 466; Chrysanthemum prealtum, 467.

NOTES OF OBSERVATION.

Kerria japonica flore plena.—If this shrub was new it would form the subject of numerous eulogistic notes, for we have nothing else with which it can be compared at the present time. The pretty rose-like blossoms are of a rich shade of gold, and, what is more, they are borne in great profusion. True, when grown in the open the blossoms are sometimes crippled by late frosts and cold winds, but as a wall plant it is delightful. A peculiarity of this kerria is that the double-flowered form is altogether a far more vigorous plant than the typical kind with single blossoms, which is comparatively uncommon. There is a variety of this last with variegated leaves, but of them all the old double-flowered form is far and away the best.—W. T.

Tropæolum tricolorum.—This is one of the oldest of the South American tropæolums, and in days gone by it was frequently grown as a specimen plant. Like most members of the genus, it is of a climbing nature, and it may be trained in such a way as to cover a trellis of any particular form, or it can be treated as a rafter plant in the greenhouse. It produces quite a firm tuber from which is pushed up in autumn an exceedingly slender growth which lengthens rapidly and to a certain extent thickens. The small bright green leaves are composed of five or six divisions, and the flowers orange-scarlet tipped with black, are in the spring and early summer borne in great profusion. To succeed in the culture of this tropæolum it needs care, especially during the winter months, when it is growing.—W. T.

Saintpaulia ionantha.—This delightful little gesnerad, which was introduced from Eastern Tropical Africa in 1893, forms a charming feature in the stove or intermediate house, it being very rarely without blossoms. After its introduction it soon became popular, and is now extensively grown. The leaves are arranged in a rosette manner, and the pretty violet-like flowers nestle among the foliage in a charming manner. There are now several colour forms, some of a particularly rich tint. This saintpaulia is readily raised from seed, and the young plants quickly attain flowering size, but it can also be increased by single leaves, after the manner of a gloxinia. This last mode of propagation is particularly useful when a plant shows especial merit.—W. T.

New Hydrangeas.—New or comparatively new varieties of hydrangeas were much to the fore at the Temple Show. The variety Madame E. Mouillère, which was given an Award of Merit both last year and this, was shown in quantity. It is certainly a very desirable form, with massive heads of white or almost white flowers. The old and well-known H. paniculata grandiflora was as usual, well represented, but it has, at all events for flowering at this season, a formidable rival in that variety of the North American Hydrangea arborescens known as grandiflora. The typical H. arborescens has only a few large sterile flowers, the head or cluster being principally made up of insignificant fertile blossoms. In the variety grandiflora the sterile flowers form a large rounded cluster, and a specimen of it is remarkably effective. It was sent here from the United States a few years ago, and has since then been gradually advancing in popular favour. Being hardier than the common hydrangea it is also valuable as an outdoor shrub. I noted two varieties were placed before the Floral Committee, but neither of them gained an award. The best, to my thinking, was Mlle. Renée Gaillard, a large white flower with the edges of the petals much toothed. It, however, seemed to me a good deal in the way of the variety Ornement, which was given an award last year. The second variety noted was Bouquet Rose, like a rather deep-coloured form of the common hydrangea. The variegated Hydrangea nivalis, whose leaves have a large creamy-centre, was also shown, but the light-coloured blossoms were not particularly effective.—W. T.

Daily Mail

£1000

Sweet Pea Prize

IMPORTANT NOTICE.

ENTRY FORMS ARE NOW READY, AND INTENDING COMPETITORS SHOULD APPLY FOR THEM AT ONCE.

WHEN the time approaches practical advice on all the details of packing and preparing for packing will be published in the "Daily Mail," and the many competitors who will compete from Ireland and the west of Scotland need have no fears of inequality of opportunity.

THE THREE COMPETITIONS.

Competitors must remember that there are three competitions, and they must make clear for which they are entering. The three are:

The competition for the £1,000 prize show, at which second and third prizes of £100 and £50 respectively and 1,000 medals are offered.

The children's prizes.

Prizes for bunches of artificial sweet peas made of British material in Britain.

Intending competitors should write as soon as possible to this effect: "Will you send me an entry form for the £1,000 prize competition," or for the children's competition, or for the artificial sweet pea competition, as the case may be.

The letter must be addressed to the Secretary, The Sweet Pea Show, Carmelite House, London, E.C., the name and address of the sender must be clearly written, and a stamped addressed return envelope MUST be enclosed.

VOL. LIV.—No. 3,009. SATURDAY, JULY 1, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

◆

Fruits and Seeds.

To the botanist the seed alone is properly the fruit of a plant, and what are popularly considered fruits are mere adjuncts provided by Nature in association with the seed in order to assist in various ways in their distribution. Seeds thus fall into two classes, viz., those which are unassociated with attractive pulp and those which are so associated to form the manifold fruits with which we are familiar. Of the former, the cereals are undoubtedly the most important, embracing as they do wheat, oats, barley, rye, rice, and other nutritious grains which form the mainstay of human food stuffs. Here it is the seed proper, which, by selective cultivation, has been induced to include within itself a larger and larger mass of starchy material primarily intended for the nourishment of the young plants when germination takes place, but which is diverted by man into a source of nourishment for himself. In this connection it is marvellous what selection has done in enlarging the normally small seeds of the wild progenitors, and so increasing the yield of nutritious matter. Turning to the other section, the popularly known "fruits," we see a similar effect on dissimilar lines, since here the selective cultivator practically ignores the seed proper, and has even, in some cases, contrived to eliminate it altogether by diverting all the vital energy to the formation of the pulp, which alone he aims to increase in bulk and improve in quality. In this way, we have acquired seedless oranges, cucumbers, bananas, etc., while, by dint of heterogeneous crossing and hybridising the seeds of many other fruits, though produced, are quite incapable of reproducing the parental type. To form an idea of what has been done in this way we have only to compare the wild fruits, cherries, sloes, crab apples, and so on, with the innumerable varieties of their kin in commerce, to see that a parallel between the small wild grass seeds and those of, say, pedigree wheat, has not only been reached, but has been virtually surpassed. It is a curious fact, seeing that the production of the pulp of an edible fruit is normally a secondary effect of the fertilisation of the seed, the envelope of which is thereby induced to grow into the many forms we know of, that in the case of seedless fruits the seed itself should be practically abortive, and the plant devote its energies to forming a purposeless product, the primary object of which has gone. The production of a seedless cucumber, for instance, is, from the point of view of the plant, absolute waste of energy and good material so far as reproduction is concerned, which is the primary object of the plant's existence. In the nut tribe we regard the seed as the fruit, and a different set of conditions prevail. As with the cereals, we have, but on a larger scale, a mass of nutritive matter of value to man, but in this case more exposed to the attacks of birds and other animals, and thus necessitating greater protection. Hence, the all-important seed is sheathed and armoured defensively, and in the process of evolution this sheathing and armouring has kept pace with the ever-increasing capacity for attack on the part of nut-devouring animals, much on the lines of the competition between greater guns and thicker armour in the realm of warfare. In our native nuts, we find the hazel, filbert, or cob sheathed with an intensely sour outer green husk until the inner shell has hardened, and when the nut falls, it is no longer green, and therefore conspicuous among dead leaves or on the soil, but has assumed a brown tint to fit its surroundings. The chestnut adopts similar tactics, with a densely thorny green envelope to match the foliage and a tough brown shiny coat within. The walnut has three defences, a bitter green husk, an adamantine brown inner shell, and within that an acrid skin over the seed itself. All these provisions must assist materially in protection of the precious kernels from injury here, but would little avail in the tropics where the ingenious monkey regards the nut tribe as legitimate provender. Here, then, we find the most formidable nut-armour in the world. There is the cocoa-nut, with its thick fibrous coating, inches thick, covered with a tough skin, and within that a thick shell as hard as iron, while the brazil nut packs its angular iron-plated seeds tightly within so bombshell-like a receptacle that Nature has practically overreached herself in the protection line, the majority of the seeds perishing through inability to break through their prison walls and germinate in the open; as an antithesis to these fruits are the inner tough seeds associated with pulp-forming fruits, which actually invite apparent demolition by fruit devourers, but, defying digestion, become eventually distributed far and wide, thus making their would-be destroyers unwitting agents in the survival of their race.

G M 1809

MR. WILL TAYLER.

Mr. Will Tayler, of Hampton, Middlesex, has for a long number of years greatly interested himself in all phases of rose culture, and has long occupied a seat on the managing body of the National Rose Society. He is a regular competitor at the exhibitions held by the latter body, and frequently brings roses and fruits to the meetings at Vincent Square. In the production of fruit trees for planting, and in the general business of fruit production, he is very keen, and behind his modest and unassuming manner he possesses a great fund of information that is readily set free for the questioner who is seeking for knowledge from a practical man. Mr. Tayler has introduced several new fruits, and in any fruit he distributes as a novelty one may expect high quality; two such fruits come to our mind just now, and they are the Reine Olga de Wurtemburg grape, a capital outdoor variety for the Southern Counties, and Libra peach, a variety that, as was recently shown in these columns, is fine in size and quality, and crops freely.

R.H.S. Flower Show at Olympia.—The summer exhibitions that have for many years past been held by the Royal Horticultural Society in the grounds of Holland House, have from the first been remarkable for their extent and excellence, and when it became known that these grounds were no longer available for the society's summer shows, some apprehension was felt by many horticulturists as to the effect a change of place would have. It is, therefore, especially gratifying to be in a position to state that the exhibition for the current season, which will be held at Olympia on Tuesday next and the two following days, has the promise of surpassing the finest of those held at Holland House. When it became known that the grounds of this historic mansion would be no longer available, the Council, anxious that the summer show of this year should be on a scale of magnificence and comfort hitherto unapproached, engaged Olympia, which possesses the advantages of affording abundant space and of being convenient of access. The body of the main hall, the annexe, and the balcony will be filled with exhibits on a fixed plan, whereby harmony of outline and arrangement will be secured. Summer being at its height, the exhibits will largely comprise plants, trees, and shrubs that thrive in the open, rock gardens, and water gardens. The whole of the annexe is to be devoted to rock gardens and rose gardens, while an amphitheatre of tiered groups, 15ft. high, of stove, greenhouse, and other plants, will form a distinct feature in the arena. On the first and second days the exhibition will remain open until 10 p.m., and on each day the admission will be one shilling after 6 p.m. We shall, as a matter of course, give a full report of the exhibition, with illustrations, in our next issue.

An Interesting Civic Ceremony.—A few days since a deputation from the Court of the Gardeners' Company waited on the Lord Mayor and Lady Mayoress, at the Mansion House, for the purpose of presenting flowers and fruit, in accordance with the ancient custom which was revived a few years since. The presentation was made by the Master of the Company, and to the Lord Mayor he offered English-grown flowers, such as were grown at the time when the company was incorporated, some two centuries ago, and to the Lady Mayoress he presented a bouquet of orchids. In accepting the gifts the Lord Mayor expressed his regret that the apples were not English, and he thought the matter was one which deserved the serious consideration of fruit growers. In his youth he understood that no country in the world could produce apples like those of home growth. Since the days to which the Lord Mayor referred, there has been an enormous development in apple culture in foreign countries, and in our Colonial possessions, but nowhere are apples of such high quality produced as in Great Britain. It should, however, have been remembered that, with the exception of two or three culinary varieties, apples cannot be kept in really good condition for a longer period than five or six months. The fact that Tasmanian apples were substituted for English fruit on this occasion does not in any way indicate a decadence of apple culture in this country.

The National Rose Society's Exhibition.—Writing to us with reference to the National Rose Society's Metropolitan Show, which will be held in the gardens of the Royal Botanic Society on Friday next, Mr. E. Mawley, V.M.H., observes: "All but the ladies' decorative classes and the new roses, for which separate tents will be provided, will for the first time be staged in one large and lofty canvas structure, recently used as a ballroom, and consequently having a level boarded floor. Therefore, however adverse the weather, it will be perfectly dry underfoot. This will allow for the first time of a view being obtained of virtually the whole of the exhibition. As the season is early this year, the coming show is likely to be a more representative one than usual, and that roses from all but the coldest districts of the British Isles will be staged. The new seedling roses will probably be more numerous than last year."

Exhibition of Gladioli.—Cultivators of these flowers will be interested in the announcement that the newly constituted National Gladiolus Society will hold its first exhibition at the Royal Horticultural Hall, Vincent Square, Westminster, on Tuesday, July 18. The schedule contains nine classes, six of which are limited to nurserymen, and the others are open, and entries should be sent to the secretary, National Gladiolus Society, The Flagstaff, Locksheath, Southampton.

Legacy for a Gardener.—The late Dowager-Duchess of Northumberland left a number of legacies to the heads of departments at Stanwick Park, and among them was a legacy of £500 and a year's wages to Mr. William Higgie, who has occupied the position of head gardener at Stanwick Park nearly fifty years. A correspondent who served under Mr. Higgie several years, and now occupies a prominent position in the world of horticulture, writes: "Mr. Higgie well deserves his legacy, for he was an excellent servant to the Duchess and a good master to his men."

School Gardening in Oxfordshire.—School gardening has undergone considerable development in Oxfordshire within recent years, and it is interesting to learn from the report that has been recently published by the Education Committee for the county that the interest in gardens attached to schools is fully maintained. Mr. S. Heaton, the horticultural instructor for Oxfordshire, states in his report that the school gardens have made unabated progress, and that the teachers, scholars, and parents have taken the greatest interest in all that has been done. Many useful and interesting experiments are now being carried out in the school garden and schoolroom by many of the teachers, which should prove of great help in educating the children. As the result of the progress that is being made, the use of, and the work done in, the demonstration garden becomes, in Mr. Heaton's opinion, more indispensable each year. There is now in this garden, in addition to trained and bush fruit trees, a number of flowering and foliage plants, both outside and in the greenhouse, which are specially suited for teaching purposes. Many of these have been propagated in quantity for distribution among the teachers. Tables of much interest are given, and of these one shows the points obtained by the several gardens for cropping, and for the produce from them contributed to competitive classes at the exhibitions. Gardens receiving the highest number of points for cropping and cultivation did not invariably obtain the highest number of points in competition, but they did remarkably well at the shows.

Dangerous Elms. — A Barming correspondent writes as follows with reference to the danger associated with old elm trees that occupy much frequented spots: "I should like to direct attention to the great danger there is in allowing elm trees to stand too close to the church and churchyard. The other Sunday evening, just before the evening service, some of our bellringers had a really wonderful escape. They were entering the churchyard about 6 p.m., when one of them had his attention called to a small piece of bark which fell from an elm tree, and they looked up, expecting to see a boy there. It appears that this was the only warning they had, as immediately after a bough some 30ft. in length, with a circumference of 40in. where it had broken off the tree, fell across the path with a great crash. The men, who barely escaped, were much shaken by what had happened, and had to wait to recover themselves before chiming. The elm tree from which the bough fell stands close to the path and entrance to the churchyard, and considering how many people have to pass it going to and from church it is wonderful that the accident should have happened without fatal results."

Strawberry Runner Experiments. — Trials conducted by the National Fruit and Cider Institute were begun in 1906 for the purpose of determining the relative merits of first and second runners, i.e., the first or second plantlets produced on a runner. A larger yield has been obtained from the first in all three years, 1907-9, and the difference in the last year was more pronounced than in either of the two previous years, so that the result is not merely on account of the "seconds," which, as might be expected, were more backward at the start, taking longer to reach full vigour. The total crop for the three years with five different varieties of strawberries was 1,517lb. from "first" runners, and 1,207lb. from "second" runners. Taking the varieties separately, President gave the greatest difference; while Royal Sovereign and Latest of All gave results definitely in favour of the "first" runners. There was a slight balance in favour of the "first" in the case of Monarch, but Paxton's gave practically the same yield for both sets. There is therefore good evidence that "first" runners tend to be more fruitful than "second," and there is a sufficient margin of difference in the yields to make it a matter of practical importance to the grower to select only "first" runners for planting.

New Remedies for Apple Sucker.—One of the inspectors under the Board of Agriculture has found two remedies very useful during the past few years in connection with attacks of the Apple Sucker (Psylla mali). These are, respectively, a nicotine wash of strength about 0.075 per cent., and a lime-and-salt wash containing 20 per cent. of lime and 2 per cent of salt. The nicotine wash has proved superior to paraffin emulsion, and is absolutely innocuous to leaves and flowers. It should be used after the young begin to hatch out. A solution of this strength was found very successful at Woburn in 1908, 99 per cent. of the psylla being killed in the case of ten dwarf apple trees sprayed on May 17, when the blossom buds were just open. The wash does not appear to be injurious to bees. The lime-and-salt wash should be applied in the middle of March, or even later. Theobald recommends its application between the time of the opening of the buds and about two weeks beforehand. The action of the wash is described as forming a coating over the egg, and so preventing the breaking of the shell and the escape of the young insect. Trees that have not borne fruit for several years have yielded after the use of this wash.

Centenary of the "Bloemhof" Nurseries.—In April last Messrs. E. H. Krelage and Son, of the Bloemhof Nurseries, Haarlem, celebrated their centenary, and within the past few days we have had the pleasure of receiving an illustrated brochure containing a historical sketch of the firm since its foundation in 1811. The author is Mr. Ernst H. Krelage, the present head of the firm, and it is of much interest for the light it throws upon the development of bulb-growing in Holland during the past 100 years. The hyacinths, which in the 18th century were chiefly double varieties grown for exhibition, became popular at the beginning of the 19th century for forcing for indoor decorations, and at the same time the single varieties began to receive the increased attention they so well deserved, and the cultivation of hyacinths generally rapidly extended. In 1808, or three years before the firm was founded, there were thirteen large bulb merchants at Haarlem. Mr. Ernst Krelage, the founder of the firm, and the father of the present proprietor, was the younger son of a farmer resident at Bramsche, in Hanover. On the death of his father, the farm passed into the possession of the eldest son, who sent his brother Ernst to Holland. The latter arrived at Haarlem in 1804, and here he occupied various positions as a head gardener until 1811, when his employer became bankrupt. Instead of his salary he obtained some pot plants, and these formed the modest stock with which he commenced business on April 11, 1811. Ernst H. Krelage must have possessed abilities of a high order, for in 1829, when Loudon described his nursery in the Gardeners' Magazine, he was well known throughout Europe, and enjoyed considerable fame as a raiser of new hyacinths. In 1850 his only son, Mr. Jacob H. Krelage, then in his twenty-first year, became a member of the firm, which has since been known as E. H. Krelage and Son. Five years later Mr. E. H. Krelage died, and his son, Mr. J. H. Krelage, became the head of the firm. The business rapidly extended under his management, and for forty years the greenhouse and stove plants were great features, and conifers, camellias, paeonies, and strawberries were specialities. Mr. J. H. Krelage did not devote his whole attention to his nurseries, but took a leading part in the various movements for the advancement of horticulture. In 1856 he organised the first flower show in the Haarlem deer park, and in 1865 he started the Dutch Bulb Growers' Society. Some four years later he founded the Bulb Exporters' Union and the Netherlands Horticultural and Botanical Society. He also devoted much attention to garden literature, and in the course of his long and active life formed a library that has long been famous for the old herbals and the books on bulbs that it contains. In 1901 Mr. J. H. Krelage passed away, and was succeeded by Mr. Ernst H. Krelage, who is worthily maintaining the traditions of the firm.

Yorkshire Gala.—Financially, this great horticultural event, of which a report was given in our issue of June 17, was not equal to some recent years, but this must not be taken as a decrease in the interest that is being taken by the Northern people in their great floral festival. On the first day the number of visitors was 9,804, as compared with 11,281, which established a record for the first day. The visitors numbered 24,415 on the second day, as compared with 27,349 the corresponding day of last year. The receipts were £546 and £740 on the first and second day respectively, as compared with £620 and £840 on the corresponding days of last year. The decrease in the attendance may be attributed in part to the fact that the Whitsun holidays were held in the previous week, and in part to the attention that was then being given in the North to the preparation for the Coronation festivities.

GOURDS IN THE GARDEN.

Considerable diversity is seen, in both the shape, colouring, and size of the various species of gourds, which form highly decorative material, and should be represented in every garden. Their value is clearly demonstrated at Kew, and a large collection may be seen in the herbaceous ground every summer, and the same applies to other botanic and many private establishments. Their cultural requirements are of a simple character, and given fairly good soil in which to grow, together with a sun-bathed position, success is ensured. Further, they are seen to advantage when trained to spurred poles, and then we may utilise them to cover mounds, banks, arbours, pergolas, arches, and outhouses.

The time has arrived when they should be placed in position, or permanent quarters, and immediately they become established, and commence to develop at a rapid rate, a dressing of any approved artificial manure should be applied, to be repeated at intervals of three weeks, until the fruits approach maturity. Overhead waterings are also decidedly beneficial, preferably in the evenings of hot days, and it is a very easy matter to give them, either with a syringe or hand pump. Having seen a number of very fine specimens completely destroyed by the wind in a Surrey garden last season, this leads me to say that steps should be taken to make every growth secure, and where poles are employed they must be of a fairly substantial character, because the strain is considerable when the plants are fully developed.

With regard to species and varieties, a few first-rate large-fruiting kinds are found in the Turk's-cap gourd, Hercules' club gourd, and bottle gourd, while the comparatively small-fruited kinds are well represented in the white pear, orange, snake, egg, bicolor, green-striped, and warted gourds. It is superfluous to say that the pumpkin must be accommodated on the ground, as it would be a source of danger if suspended from pergolas, arches, etc., unless very securely fixed.

Walter H. Aggett

MR. J. GIBSON'S FIRST PRIZE DISPLAY OF RIPE FRUIT AT NORWICH.

Mr. William Deal, F.R.H.S., "Brooklands," Kelvedon, Essex, gives a cordial invitation to all interested in sweet peas to inspect his crops growing for seed. He has about 12 miles growing on sticks, stocks equal to any in the country. Crops are about half-a-mile from Kelvedon station.—[Advt.]

ROSES AT KEW.

Of late years the roses at Kew have formed a far more attractive feature than was at one time the case, and a visit there during the rose season is time well spent, for not only are the finest of the popular varieties to be found there, but many of the more uncommon kinds are well represented.

While roses are scattered more or less freely over the greater part of the gardens, the three principal features of attraction are the numerous beds in the vicinity of the Palm House, the fine show of climbing roses adjoining the herbaceous ground, and the sunken rose garden near the Pagoda.

This, which occupies the site of an old gravel pit, forms a delightful feature that appeals especially to one by reason of its unorthodox arrangement. The sloping banks are furnished with large masses of the best of the rambler class, and others of a loose informal manner of growth, the foreground and the bays between some of the clumps of ramblers being occupied with others of a more bushy habit of growth, including many varieties very rarely met with.

Such well-known kinds as Crimson Rambler and Dorothy Perkins are not yet in bloom, but even without these there is even now (June 21) a magnificent display. Even without flowers the beautiful shining foliage of Dorothy Perkins is very handsome, and in direct contrast to a large bush of Rosa Soulieana, whose leafage is, when seen in a mass, of a peculiar greyish tint.

Of the roses in large masses especially attractive just now may be mentioned The Garland, with its masses of small semi-double white flowers; Tausendshon, glorious in its large soft pink flowers; Una, that delightful single hybrid briar, with its large single white blossoms, a hybrid between Rosa Wichuraiana and General Jacqueminot, a charming pinkish flower; Jersey Beauty, with rich leathery foliage and pale yellow blossoms; Alberic Barbier, whose semi-double flowers are of a canary yellow, with deeper coloured buds; American Pillar, with its large single rose-pink flowers; Claire Jacquier, whose small nankeen yellow flowers are borne in great profusion; Psyche, white, with salmon-pink centre; Edward Proust, whose pretty coppery-carmine flowers are just commencing to unfold, and the well-known Queen Alexandra, with its profusion of pale tinted blossoms. The crimson-lake flowers of the bush-growing variety Fellenberg also make a goodly show, and various uncommon kinds are the old York and Lancaster, Fimbriata, pink, much fringed, the old crimson and old purple Moss; Irish Brightness, a charming single rose, and Rose de Meaux, a delightful little Pompon variety. Rosa rugosa, with its varieties, and the hybrid kinds in the production of which it has played a part, form an attractive group at the entrance to the Rose Garden, and not far removed therefrom a large standard of Rosa rugosa repens alba shows this variety at its very best.

A special note must be accorded that distinct rose Soleil d'Or, which, with its long shoots pegged down, is flowering freely, the blooms showing the striking coppery-orange tint in a very pronounced manner.

The beds near the Palm House contain a grand selection of Hybrid Perpetuals, Teas, and Hybrid Teas, suitable for this mode of culture. The bright colours of Hugh Dickson and Liberty cause them to stand out in a very conspicuous manner, while the large bed of Gruss an Teplitz on the terrace of the Palm House, with its two or three flowers expanded, gives one a foretaste of what may be expected in a short time. K.

HARDY PLANT CHAT.

Anemone ranunculoides plena.

Those of us who have studied hardy flowers for a goodly number of years are occasionally amused to observe among the lists of "novelties" offered the names of some very old plants indeed. Some of these have been known long, long ago, but have become forgotten, although they may have been in some old garden where they were but seldom seen. Someone comes upon these old flowers, and they are put into the hands of the trade, and frequently appear among the new plants, although occasionally the qualifying phrase may be put after the word "novelties," to the effect that the list includes both "new and little-known plants." Now, the double variety of the ranunculus-like wood anemone, A. ranunculoides, is again making its appearance among the "novelties," although it was a plant known, and even figured, more than three hundred years ago. It has, however, been very scarce, and it was only in 1909 that I was able to purchase it, although I had long been on the look-out for this little flower. Opinions will certainly differ respecting its value as compared with that of the ordinary single A. ranunculoides or the still prettier A. r. pallida, to my mind the most beautiful of the three, but lovers of the uncommon flowers will be glad to avail themselves of the reappearance of the double one in the trade lists. It has small, very double bright yellow flowers, and has otherwise all the ordinary appearance of its single sister flower. It likes a cool position in a shady spot, and roots can be procured in autumn, or may even be purchased in pots now.

Larkspur Fanny Stormonth.

It is rather dangerous to write and single out for notice any special perennial larkspur or delphinium, but that called Fanny Stormonth is really worthy of the esteem of all who admire the old D. Bella Donna, which was for long unsurpassed for its beauty, but whose constitution was not all that could be desired. Many attempts have been made to raise one equal in beauty but of better constitution. Some promising seedlings have not maintained their high promise, but have proved too short-lived for ordinary garden conditions. In Fanny Stormonth, however, we have a variety which has stood the test of several years, and has come through it with flying colours. It is a seedling from Bella Donna, differing a little in its tone of colour, which is slightly deeper than that of the parent, and which shows up well the large white eye. Its gracefully arranged flowers, quite different from those of the close spikes so common among the modern delphiniums, render it valuable for cutting, this closeness of spike, although excellent for garden effect, being against the usefulness of some of the varieties for cutting for the decoration of the home. I have watched D. Fanny Stormonth for a few years, both in the nurseries of the raisers, and in several private gardens, and it appears to justify the claims made for it, the slightly different shade of colour not being sufficiently away from the old Bella Donna to materially reduce its value. It grows from three to four feet high.

Verbascum A. M. Burnie.

Assuredly the paths of the hardy plantsman of the future are laid through a pleasant land, although this fact in itself is not devoid of danger to his future. His Elysium is beset with the dangers of having too many varieties, inasmuch as there appears to be no limit to the new varieties of hardy flowers which will soon be within his command. The hybridiser of hardy flowers is evident everywhere, and in every genus of worth hybrids now begin to abound. The mulleins have lent themselves to his skill, and a goodly number of hybrid verbascums now appeal to the purchaser. One of the prettiest of these which has come under my notice has been that named A. M. Burnie, which is not an absolute novelty, as it was brought under my notice several years ago by the firm who sent it out, and in whose nursery, I think, it originated. This variety is making way, and its favour is deserved by the appearance of its long dense spikes of flowers of a rosy-fawn. The description may hardly convey the precise tint, but no more apt one occurs to me as I write this. It is one of the taller verbascums, and grows from five to six feet high. One cannot venture to suggest which mulleins are its parents, but V. phœniceum is probably one of these.

The Montpelier Flowering Rush.

Not a new plant, the Montpelier Flowering Rush, Aphyllanthes monspeliensis, keeps rather scarce, probably owing to the fact that it is not always planted in a happy position. The purchaser generally associates the name of rush with a moisture lover, and forthwith goes and plants his aphyllanthes in a moist part of the garden, as frequently as not one in which there is a considerable amount of shade. This is a mistake, as this native of the South of France delights in a dry soil and a sunny position. The writer well recollects an interested group of hardy plantsmen, most of them of considerable experience, who were gathered round a plant of this flowering rush in a northern garden, where it was perched high on a sunny rockwork bank, and growing and flowering with a freedom unknown to most of them. The fact is that it likes nothing well as a dry soil and plenty of sun, and that with these it is much hardier than its southern habitats would indicate. But it is not a showy plant, growing only to a foot or so in height, and giving rush-like leaves and stems tipped with nice blue flowers. It is a flower for the lover pretty, although not showy flowers.

Campanula turbinata Dicksoni.

An old, but little-known form of Campanula turbinata is that called Dickson which is not easily surpassed by any the rather numerous varieties of the dwarf bell-flowers of the carpathica type. It has been for a good number of years in the hands of a few of the trade, but has not received of late the recognition it deserves from the public. Its flowers are large, well-formed, and of a pure white, and the plant, as a whole, is one deserving of the consideration of those desiring to add to their dwarf campanulas for front of the border or the rockery. cultivation calls for no comments, that any good garden soil, not too heavy, will satisfy its requirements, and that can be cultivated in partial shade quite well as in sun, while in the former flowers last longer.

Festival of Empire Awards.

Mr. H. Hemsley, of Crawley, has been awarded by the Council of the Festival of Empire the silver cup offered for the best rock and water garden, and also the gold medal for his fernery.

NEW PLANTS, ETC.

◆

PHILADELPHUS LEMOINEI VIRGINAL.

This splendid new flowering shrub, figured in our issue of June 24, is sure of a rare welcome in British gardens. It flowers with the freedom of the majority of philadelphuses, and its spikes of pure white blooms give out a delicious fragrance. Individually, the flowers are large for the genus, and they are double, but the doubling has not been carried so far as to make the blossoms heavy, yet far enough to give them substance and still retain a full measure of elegance and daintiness. F.C.C., R.H.S., June 20. Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain), Burford Lodge, Dorking.

ODONTIODA ROSEFIELDIENSIS CRAWSHAYANA.

This is one of the largest flowering odontiodas yet seen, and it is the result of crossing Cochlioda Noetzliana with Odontoglossum triumphans, the latter doubtless being represented by one of Mr. Crawshay's fine varieties. The flowers are about 3½ inches across, rounded, and of a curious orange shade, this hue practically covering the whole of the segments. A.M., R.H.S., June 20. De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.

ODONTOGLOSSUM EUROPA.

A remarkable odontoglossum, the parentage of which was given as O. gandavensis and O. crispum F. K. Sander. This newcomer was referred to on June 20 as the "blue odontoglossum," but, though the prevailing colour was bluish-purple, with shading of crimson-purple, it is evident a really blue odontoglossum is still to seek. The flowers were of medium size and good shape, and all the segments were edged with white, the lip having a white apex and deep yellow crest that well set off the purple middle portion. F.C.C., R.H.S., June 20. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

DELPHINIUMS.

Primrose Queen.—A beautiful and stately double-flowered variety, with massive spikes of regularly placed flowers. The colour is primrose yellow, and this renders the variety particularly distinct among the myriads of blues and purples. A.M., R.H.S., June 20. G. Ferguson, Esq. (gardener, Mr. F. W. Smith), The Hollies, Weybridge.

Mauve Queen.—This is a handsome and elegant variety, with large spikes of big, rich mauve coloured flowers. The variety is evidently vigorous as well as handsome. A.M., R.H.S., June 20. G. Ferguson, Esq., Weybridge.

CARNATIONS.

F. W. Goodfellow.—This is a very fine yellow-ground picotee with a heavy rose edge, and a beautifully smooth petal, that will appeal strongly to florists. A.M., R.H.S., June 20. Mr. C. Blick, Warren Nurseries, Hayes, Kent.

Charlotte Bronté.—A clear and deep rose self, the flowers of fine size and substance, being borne on good stiff stems. This variety is very sweetly scented. A.M., R.H.S., June 20. Mr. C. Blick, Warren Nurseries, Hayes, Kent.

SWEET PEA R. F. FELTON.

This is a fine waved sweet pea of deep lavender shade; many ladies call the hue pale mauve. The flowers stand up well, and on the numerous spikes shown, they were well placed. A.M., R.H.S., June 20. Mr. Robert Bolton, Warton, Carnforth.

CLADOTHAMNUS PYROLÆFLORUS.

An Alaskan shrub, with light green leaves and buff-red solitary flowers, borne on the short and new leafy branchlets; is said to succeed under conditions found favourable to the growth of Rhododendron hirsutum. The species was found on the Isle of Sitka as far back as 1828, but it is a plant rarely found in gardens. "Bot. Mag.," t. 8,353.

DENDROBIUM DARTOISIANUM.

A rare and beautiful Indo-Chinese orchid, discovered in 1905 by Mr. G. Bronckart. It flowers with great freedom, and thrives under the same conditions as D. nobile. The yellow flowers, with purple tips to the sepals and petals, and purple marks at the base of the lip. Both sepals and petals are more or less twisted, and the latter have undulate margins. "Bot. Mag.," t. 8,352.

DELPHINIUM PRIMROSE QUEEN.

Flowers double, primrose-yellow. A.M., R.H.S., June 20. G. Ferguson, Esq. (gardener, Mr. F. W. Smith), The Hollies, Weybridge.

HOW TO GROW SWEET PEAS.—"Sweet Peas and their Cultivation," by C. H. Curtis (Secretary of the National Sweet Pea Society) is a complete guide to the successful culture of sweet peas for home or exhibition. Price 1s. net, by post 1s. 2d., or bound in cloth 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London

THINNING HARDY FRUITS.

The training of hardy fruit trees, especially the young ones, is now an important operation. Similarly, attention must be paid to the thinning of the shoots and the fruit. Rarely is the thinning of hardy fruits practised to the extent it ought to be, and this has been held responsible to some extent for the many poor samples of British-grown fruit which find their way to the markets. Fruits, such as grapes, peaches, nectarines, and others that are commonly grown under glass are always treated with due attention in regard to this important operation. Vines are only allowed to develop one bunch to a shoot, and as soon as the fruit is set, a moderate thinning is given. Similarly with nectarines, if the trees are in excellent health, the fruit is thinned out to about two or three to the square foot, and the young shoots to about five or six inches apart. These are pinned or nailed in as required.

No doubt, the quality of the hardy fruits, such as apples, pears, plums, gooseberries, raspberries, strawberries, etc., could be vastly improved if means were taken to prevent them becoming overcrowded, whereby they are reduced in size and deteriorate in quality and flavour. Instead of allowing these fruits to develop and ripen in this careless manner, they should be thinned out with a pair of scissors, leaving about three of the best fruits on a cluster; these must be left at proper distances apart in order to allow plenty of room for development. Thinning must, of course, be more severe in the case of young trees which are just commencing their fruiting stage, for the latter will then be assisted in the development of good healthy wood for future cropping. Apples, whether as standards, bush, espalier, or wall trees, should now receive attention in this way, both as regards the young wood and the fruit. Old and young trees that have been transplanted should be mulched and supplied with a judicious quantity of suitable liquid manure. The fruits and shoots of apricots may be thinned more freely, but the work must be done gradually. Two fruits to a square foot is considered a fair crop, and to leave the well-placed buds or shoots at the back will often be found to develop more than a sufficient supply of young wood. Cherries require a final dressing and netting, the latter in order to protect the fruit from birds. In the case of wall trees, forked sticks about eighteen inches long may be used against the walls, so as to keep the netting from pressing against the trees.

In order to secure large fruits of black, red, and white currants, similar attention must be paid to thinning, and the fruits will be enabled to swell more freely if a little liquid manure is supplied at the same time. Gooseberries bear their best fruits on the thickest and hardest portions of the branch, and the poorest on the partially ripened end of that branch. It is a good plan to take those required for such purposes as tarts by means of thinning, and a further thinning may be performed a little later on so as to reduce the number of fruits by about half. Pears must be denuded of all suckers, the grafts examined, and support given to any that need it. Plenty of young wood should be encouraged on those kinds which bear their fruit in this way. Plums require special attention in the way of thinning where the fruits are borne in clusters.

Every grower should carefully examine the crop that each tree is bearing, and any signs of overcrowding must be at once noted, and the surplus fruits cut off. These clusters are generally borne on spurs, a number being clustered together. The side ones should be removed by thinning, and the central ones retained. Raspberries should be securely staked and tied, and the suckers thinned out to about four or five. Seldom are the fruits of this bush given any attention in the way of thinning. The method to adopt in this case is to remove any surplus berries which are to be found at the extreme end of the cluster, for these do not ripen into fully-flavoured fruit, and also hinder the ripening of the better fruits on the cluster. Strawberries also respond to thinning, and if large splendidly-flavoured fruits are required, it will be well to thin out all the trusses of fruit, leaving those which give promise of making the best show.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

GALEGA OFFICINALIS COMPACTA.

The original form of this plant was introduced into this country from Spain in Elizabethan times, and is still grown a good deal in cottage and other old-fashioned gardens, but the more compact form, growing about three feet in height, is much to be preferred, being not unworthy of a place in the hardy flower border. Like the type, there are both lilac and white forms. They are excellent for cutting, especially in sprays a foot or more in length, and as they continue in flower for a long time—June to August—they are often very useful, not so much for themselves, as a foil or foundation for other flowers, the lilac-mauve flowers of one making very pleasing harmonies with some of the numerous yellow flowers of summer.

The galega will grow in any ordinary garden soil, but, like most herbaceous perennials, does best in a deep rich loam in a sunny position, when it makes fine shrub-like bushes. As, however, such conditions are too precious, as a rule, to be spared for common plants, it may be grown in shady or damp positions if the ground is well cultivated, when it will do very well for a time, though it sometimes succumbs in an ill-drained soil in a damp winter after the first or second flowering season.

In any case, it does best when taken after the second season in late summer early autumn, and replanted in some fresh soil after being divided. It is one of the easiest things to raise from seed, spring seedlings flowering well the following year, and making fine plants. One essential in its cultivation is to give it support it falls down, as it soon does even the summer has come. A well-grown three feet in diameter, covered racemes of pea-shaped blossoms, is be despised.

ALGER P

Flowers bluish-purple, crimson and white. F.C.C., R.H.S., June 20. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

SWEET PEA NOTES.

The cooler weather recently experienced has had a very beneficial effect on the sweet peas, although more rain is needed to give them that vigorous growth which is quite necessary to produce the flowers such as we saw at the shows last season, not but what a little refinement was very necessary in a great many instances. Nothing can be done now to keep them growing other than giving plenty of water, with the weekly or bi-weekly feeding.

It seems hardly necessary to add that on no account should the plants be allowed to seed, as this is quite the beginning of the end in such a season as this. Therefore, the old flowers should be removed regularly two or three times a week, and even if they are attended to as often as this, such is the rate they are blooming that many will be found over and fast filling the seed pods.

The season is now far enough advanced for us to see how true our stocks are, and personally I am very pleased to find a decided improvement in many instances. There are still several very fine varieties that are very, very bad—in fact, practically hopeless. I am growing two or three such varieties this season, but they are now condemned.

A few varieties that are true, or practically true, may be worth noting even at this early season, and they include Earl Spencer, Evelyn Hemus, Edrom Beauty, Helen Grosvenor, Thomas Stevenson, Doris Burt, Sunproof Crimson, Maud Holmes, Edna Unwin, Clara Curtis, Winsome, Scarlet Monarch, Bertha Massey, Isabel Malcolm, Black Knight Spencer, Charles Foster, Red Chief, Hercules, Elsie Herbert, Dainty Spencer, Queen of Norway, Princess Victoria, Mrs. R. J. Hallum, Asta Ohn, Gladys Burt, Mrs. Hugh Dickson, Mrs. W. J. Unwin, Anglian Blue, and Doris Usher. There are probably several more, but the above come to mind as I write, and it is really pleasant to find that we have even such a list as this of really fine varieties that are true, as they include some of the best in each colour. Unfortunately, we cannot rely on them from year to year, as even after being true for one or two seasons they occasionally break up again.

In conversation with a large grower for market the other day on the subject of sweet peas, he mentioned that it does not pay to grow those varieties that fail to come true, as the extra labour involved in gathering the mixed ones is so great that it runs away with all the profits, and finished up by saying he would not buy any variety again where the seller would not guarantee the seed to produce a quite true stock. This is as we should like to have all the varieties, but I am afraid it might severely tax our patience when waiting a season or two for some really striking novelty that we had noted, but it would be a decided advantage in the long run

Thomas Stevenson.

Zonal Pelargonium Maxime Kovalevski.—This distinct pelargonium, which was given an Award of Merit by the Royal Horticultural Society on April 11, was looked upon by many as an absolute novelty, but, as a matter of fact, it was sent out by MM. Lemoine et Fils, of Nancy, in February, 1906. I obtained it in that year, and was much struck with its distinct orange shade, combined with a particularly good shape. I have not tried it for bedding purposes, but as a pot plant for greenhouse decoration it is a very desirable variety. It is very probably destined to find a place with the many high-class varieties that we owe to the house of Lemoine.—W. T.

THE DECORATIVE USE OF DRY WALLS.

An old moss-grown wall, with its natural covering of wild things springing spontaneously from the joints and courses, is at once suggestive, and forms a practical illustration in which we trace the origin and conception of all that is good in wall gardening. The idea of a wall garden or "dry wall," as it is more correctly styled, is but a modified form of the rock garden, inasmuch as the successive strata, or layers of rock, that in the former are more or less widely separated and spread over a larger surface in irregular larger masses, are here more uniform, and brought into close relations, so that they lie almost directly above each other. They thus form nearly a vertical wall, differing only from the familiar type in that soil displaces mortar; the stone courses represent rock strata, and the constricted face of the wall is the rock garden in miniature. Obviously "dry walls" may have a place in gardens when space cannot be found for the more elaborate style of rock garden, and the most acceptable form it may take is that of a retaining wall, as the mass of soil that the wall supports yields a constant degree of moisture that the majority of its occupants enjoy, while in the case of the sun-loving section the wall face enables them to obtain the maximum amount of sunshine.

The best constructive material for "dry walls" is rough, unhewn stone, of varying sizes and unequal lengths, as this material is both attractive in appearance, and the roots of plants enjoy contact with the cool surface. The foundation layer consists of the largest and roughest pieces, which are firmly embedded in the soil, the joints being packed with soil, while all vacancies behind are likewise filled and firmly rammed. An inch or two of good soil is then added, and the second layer placed in position, each successive layer being treated in a like manner until the desired height is obtained. "Dry walls" built for plants should not approach too near the vertical, nor have the courses laid absolutely level; in each case allow a slight dip backward, so that all moisture coming in contact with the wall will naturally find its way to the roots of the plants.

ANDROSACE SARMENTOSA GROWING ON A DRY WALL.

The planting of "dry walls" should take place concurrently with building, as this admits of larger plants being employed, and the roots being spread out into the soil behind begin to run freely at once, and the plants become established in a very short time. It is also a wise plan to have a rough sketch prepared showing the main groupings contemplated, particularly with reference to the colours, as then mistakes are less likely to occur; moreover, a well thought out system of planting, in which due recognition is given to the diversity of plant growth, is always more satisfactory as a composition than that obtained by haphazard planting.

One advantage of wall gardens over level planting is the ease with which many plants pass through the winter, starting away strong in spring, when those less happily placed are still dormant, and it is also noticeable that plants grown in a "dry wall" are less adversely affected by the changes of weather, which generally occur at this season to mar their beauty; further, "dry walls" offer the most economical way of growing a collection of rock plants, and exhibiting them to the fullest advantage.

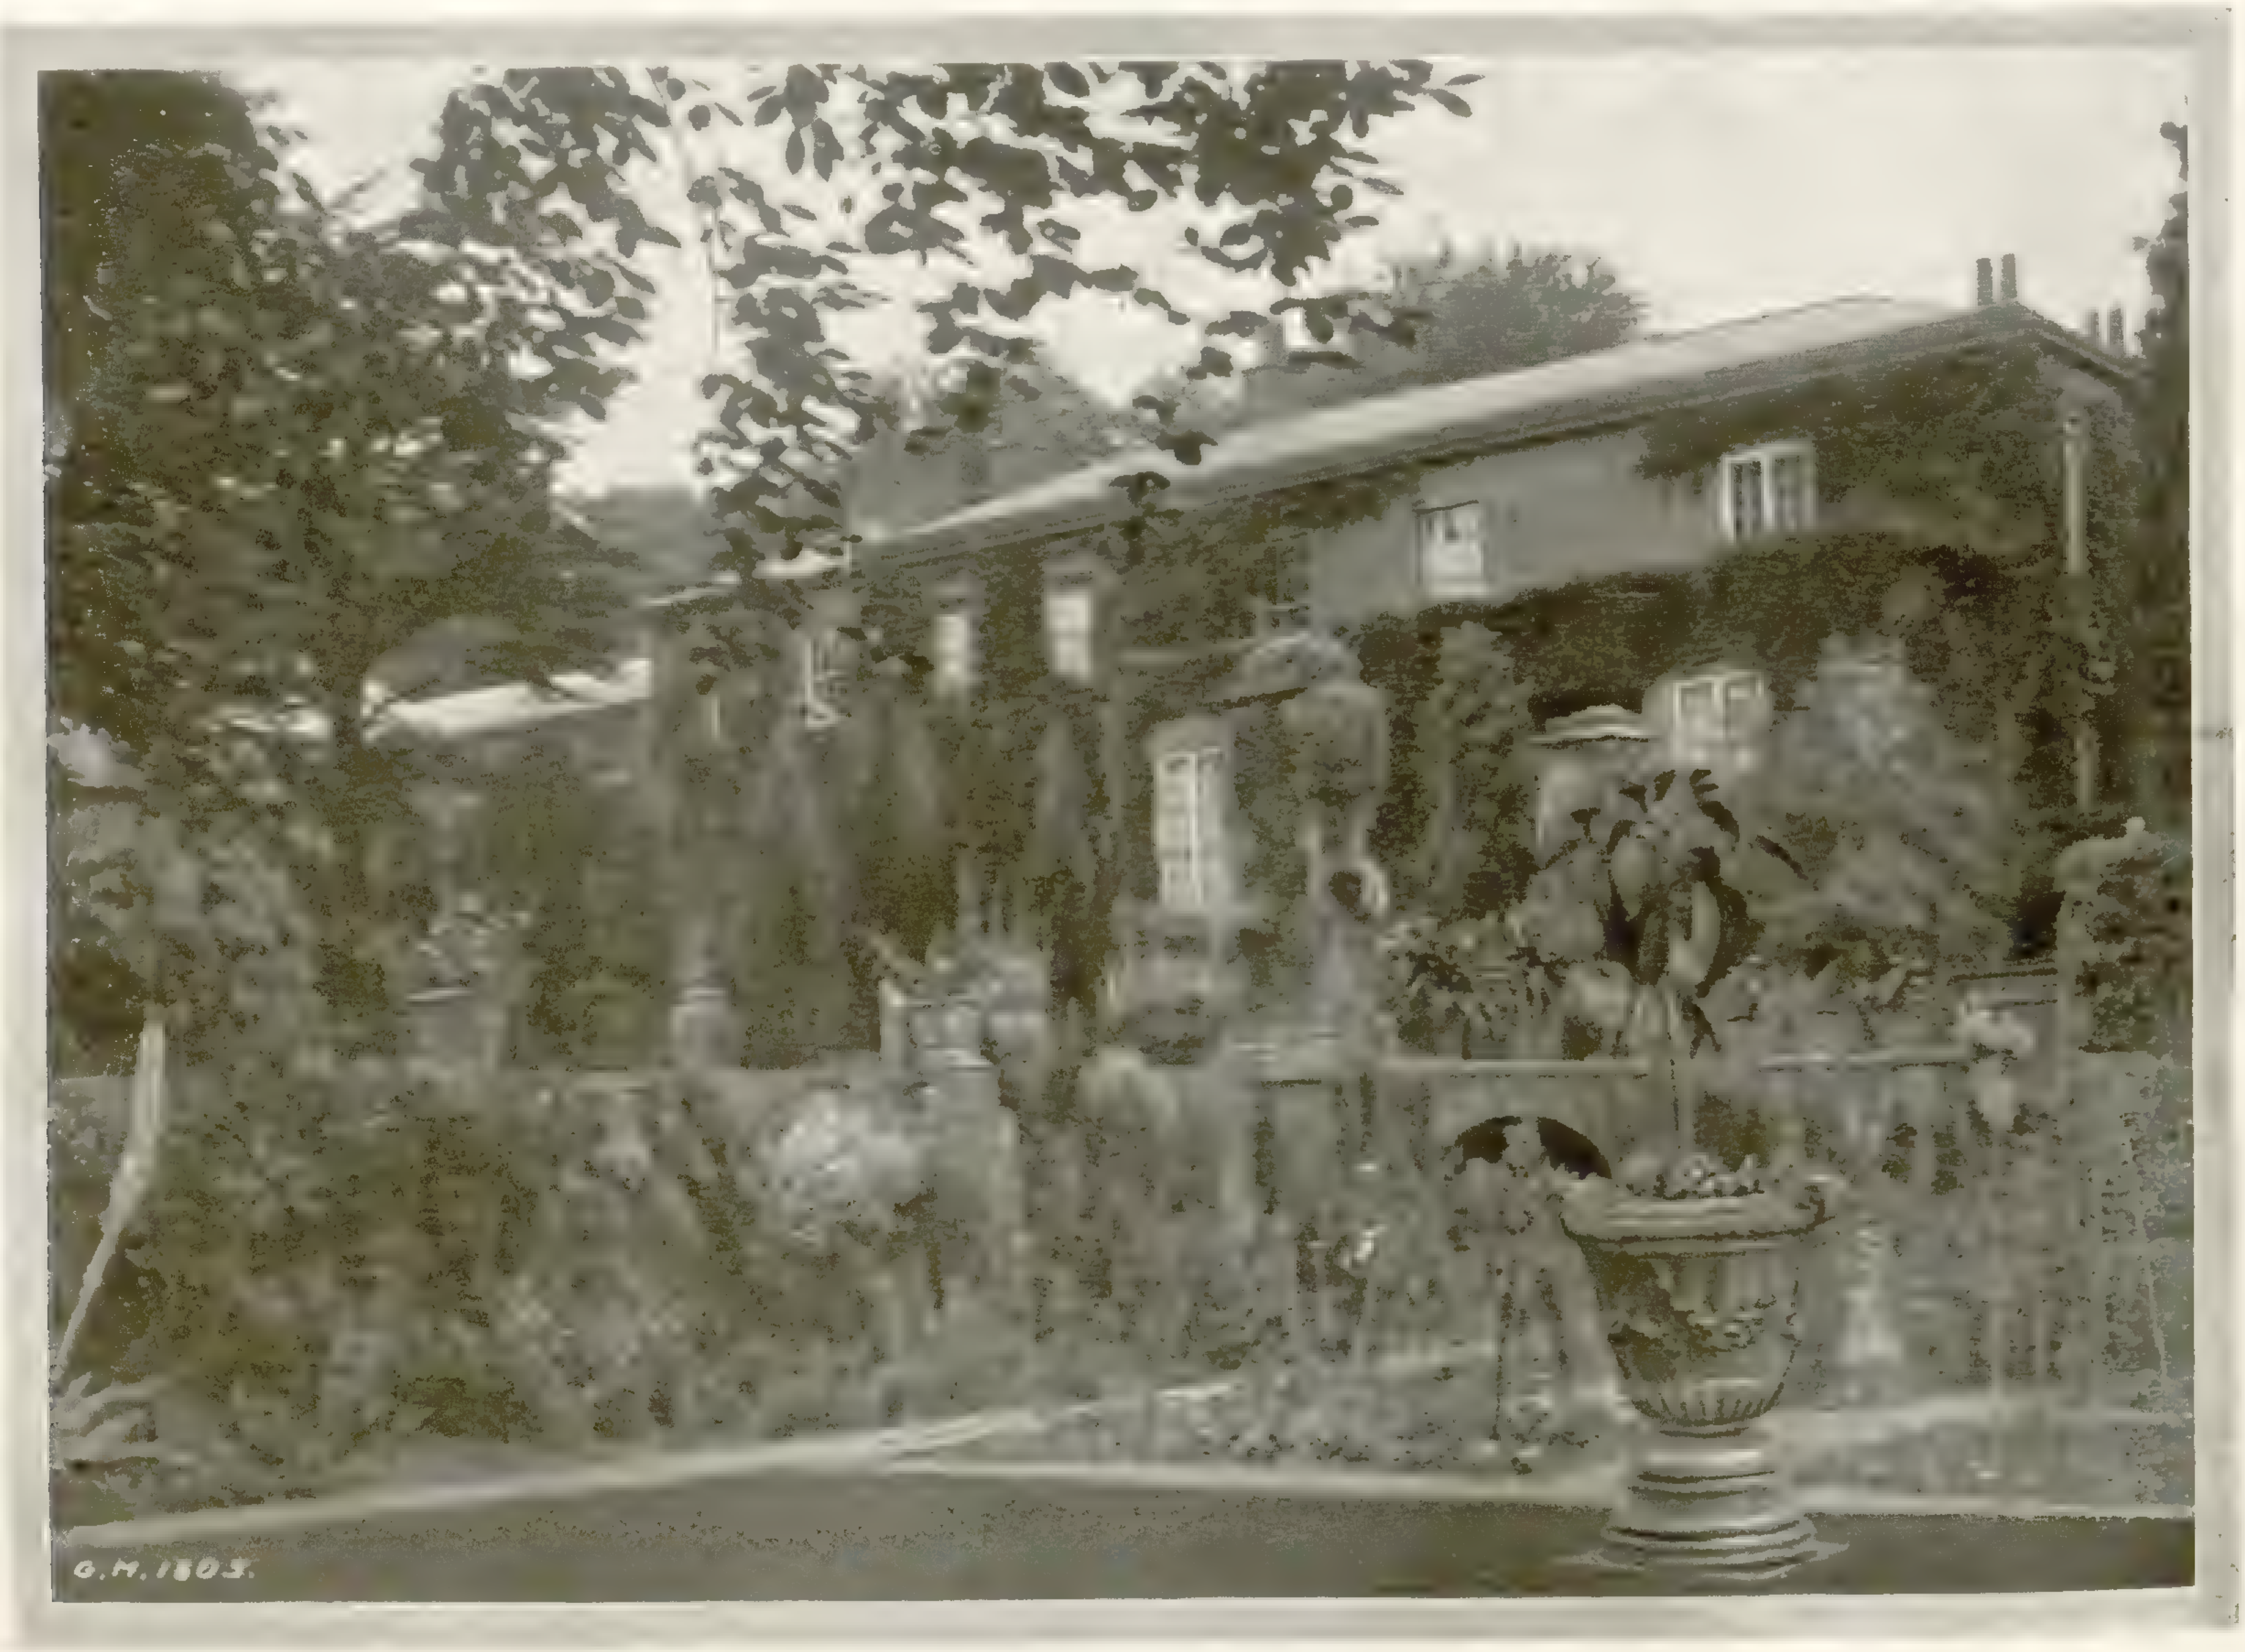
In regard to the plants that may be grown in "dry walls," there is no limit, for all the common kinds of rock plants revel under these conditions. Among those less frequently seen is Antirrhinum glutinosum, a trailing species, with grey-green hirsute leaves and medium-sized flowers of a cream-white colour, and of true snapdragon form; Artemisia brachyphylla splendens, a subject with intense grey leaves that spread out flat over the surface of the wall; Hypericum reptans, a charming miniature St. John's wort, whose leaves turn brilliant crimson in autumn, and in summer bears comparatively large yellow flowers on the terminal points of the branches; Androsace sarmentosa, with charming pink flowers in clustered heads; the lovely blue Lithospermum Gastoni, L. graminifolium, L. prostratum, and L. rosmarinifolium; silenes, onosmas, Dianthus deltoides and D. neglectus, and Tunica saxifraga fl. pl., accommodate themselves to the conditions of a dry wall, and the fascinating flowers of edelweiss are borne by plants that are true perennials in a sunny "dry wall."

With the rock wall in shade the character of the planting changes, for while sun plants will often succeed, yet so great is the material at command that repetition is best discouraged. Scolopendriums, Adiantum pedatum, trilliums, and Lenten roses are excellent subjects for the cool wall foot; while in the joints and courses asplenium, trichomanes, polypodium, ceterach, among ferns, and such flowering subjects as ramondias, haberlea, Campanula pusilla, Erodium Richeri, and Saxifraga longifolia, will find a place. The delicate stems of Arenaria balearica will clothe the wall face with exquisite tracery, and, in a lesser degree, Mentha Requini will effect a like purpose, the latter redolent with perfume when lightly bruised.

Where the rock wall is continually damp opportunity will occur to introduce Primula viscosa alba, P. farinosa, and P. Cockburniana, while at the wall foot Primula rosea, P. japonica, and P. sikkimensis, with American dodecatheons, will find a place.

Where the scheme of planting is restricted to a limited number of well-chosen subjects capable of adapting themselves to the prevailing conditions, a never-failing interest invests the garden, and the transition from one part to another will often be imperceptible, and the garden take on a charm that becomes perennial in the fullest sense.

Thomas Smith.



PART OF THE DRY WALL GARDEN AT WALMSGATE HALL.
The Residence of T. Dallas Yorke, Esq.

Ochna multiflora.—Several plants of this striking stove shrub were shown at one of the spring meetings of the Royal Horticultural Society. According to the authorities, it was grown in this country nearly a century ago, but it was quite unknown when shown by the late Mr. B. S. Williams, of Holloway, in 1879. It forms an upright shrub whose shoots are pushed out almost horizontally. The flowers are yellow, but do not last long. After they are over, however, the receptacle increases in size, after the manner of a strawberry, and becomes of a bright red colour. The seeds, which remain attached to the outside of the receptacle, are at first green, then purple, ultimately becoming black. This ochna is a native of the Sierra Leone district.—W. T.

GOOD GARDEN FEATURES.

The more the art of making gardens is learnt and practised, the greater becomes man's love for, and ability to enjoy, the open-air life that strengthens the body, clears the mind, and invigorates the soul. Every effort should be made by gardeners to create pleasure-grounds that are beautiful at all seasons, and that invite persons to spend leisure hours within them. The perfect culture of special trees, shrubs, plants, vegetables, and fruit is one branch of the art, but another, perhaps greater, aim, is the revealing the loveliness that can be written upon earth's surface by "those living tools, the flowers."

In order to fashion a garden well it must be built up of many features, some of them familiar, others perhaps novel. The shrubbery is a necessity in various positions; the rosery is excellent as affording a means of cultivating roses where soil, shelter, and situation have been obtained in as suitable a condition as possible; but for this object it may be doubted whether roses do not show themselves to greater effect when dotted over the garden, rising singly from lawns, springing up behind blossoms of gorgeous hues, trailing down old walls, or clambering up bank-sides. A pergola is now regarded as a fair feature that should not be lacking; the herbaceous border has become an institution; and upon visiting a large estate it is natural to ask, Where is the rock garden? Yet, in spite of all that the floriculturist's genius has invented, and the eager imitatory cleverness of working gardeners has achieved, the grounds might have so many beautiful adornments that do not appear.

Firstly, the best methods of conquering, or at least holding in check, the enemies of the garden, should be studied; not those insect pests and diseases to which so much attention is given, but the atmospherical influences and results before which man is too apt to own himself powerless. It cannot be summer always, spring winds are frequently bitter to the human being as well as devastating to vegetation; winds weary and depress mortals, even if they do not tear down climbers and uproot young trees; damp is a foe that no half measures can keep at bay. Is it possible to create a damp-proof garden? No; but the walks should be faultlessly hard and so drained that they can be happily traversed at times when roads and lanes are almost quagmires. There should be a special part of the grounds, too, adapted for exercise-taking between storms of rain, where wide paths are unshadowed by trees or arches that can precipitate damp, shielded on the south-west and north-east sides by high trellises set back in borders in which hardy plants, aye, and roses too, will revel. If this walk runs from north-west to south-east it may be draughty, but the protection afforded by those twelve-foot trellises will make up to the trees and plants for this slight evil, and if the path and borders are all wide there will be ample sunshine.

It should be remembered that this will be a garden spot of especial merit during spring and autumn. Summer has her own best places; winter, when frosty and bright, is best enjoyed in the open, or against a south wall shelter. All the fairest spring-blooming trees, shrubs, and perennials, with bulbous favourites by the thousand, should be massed.

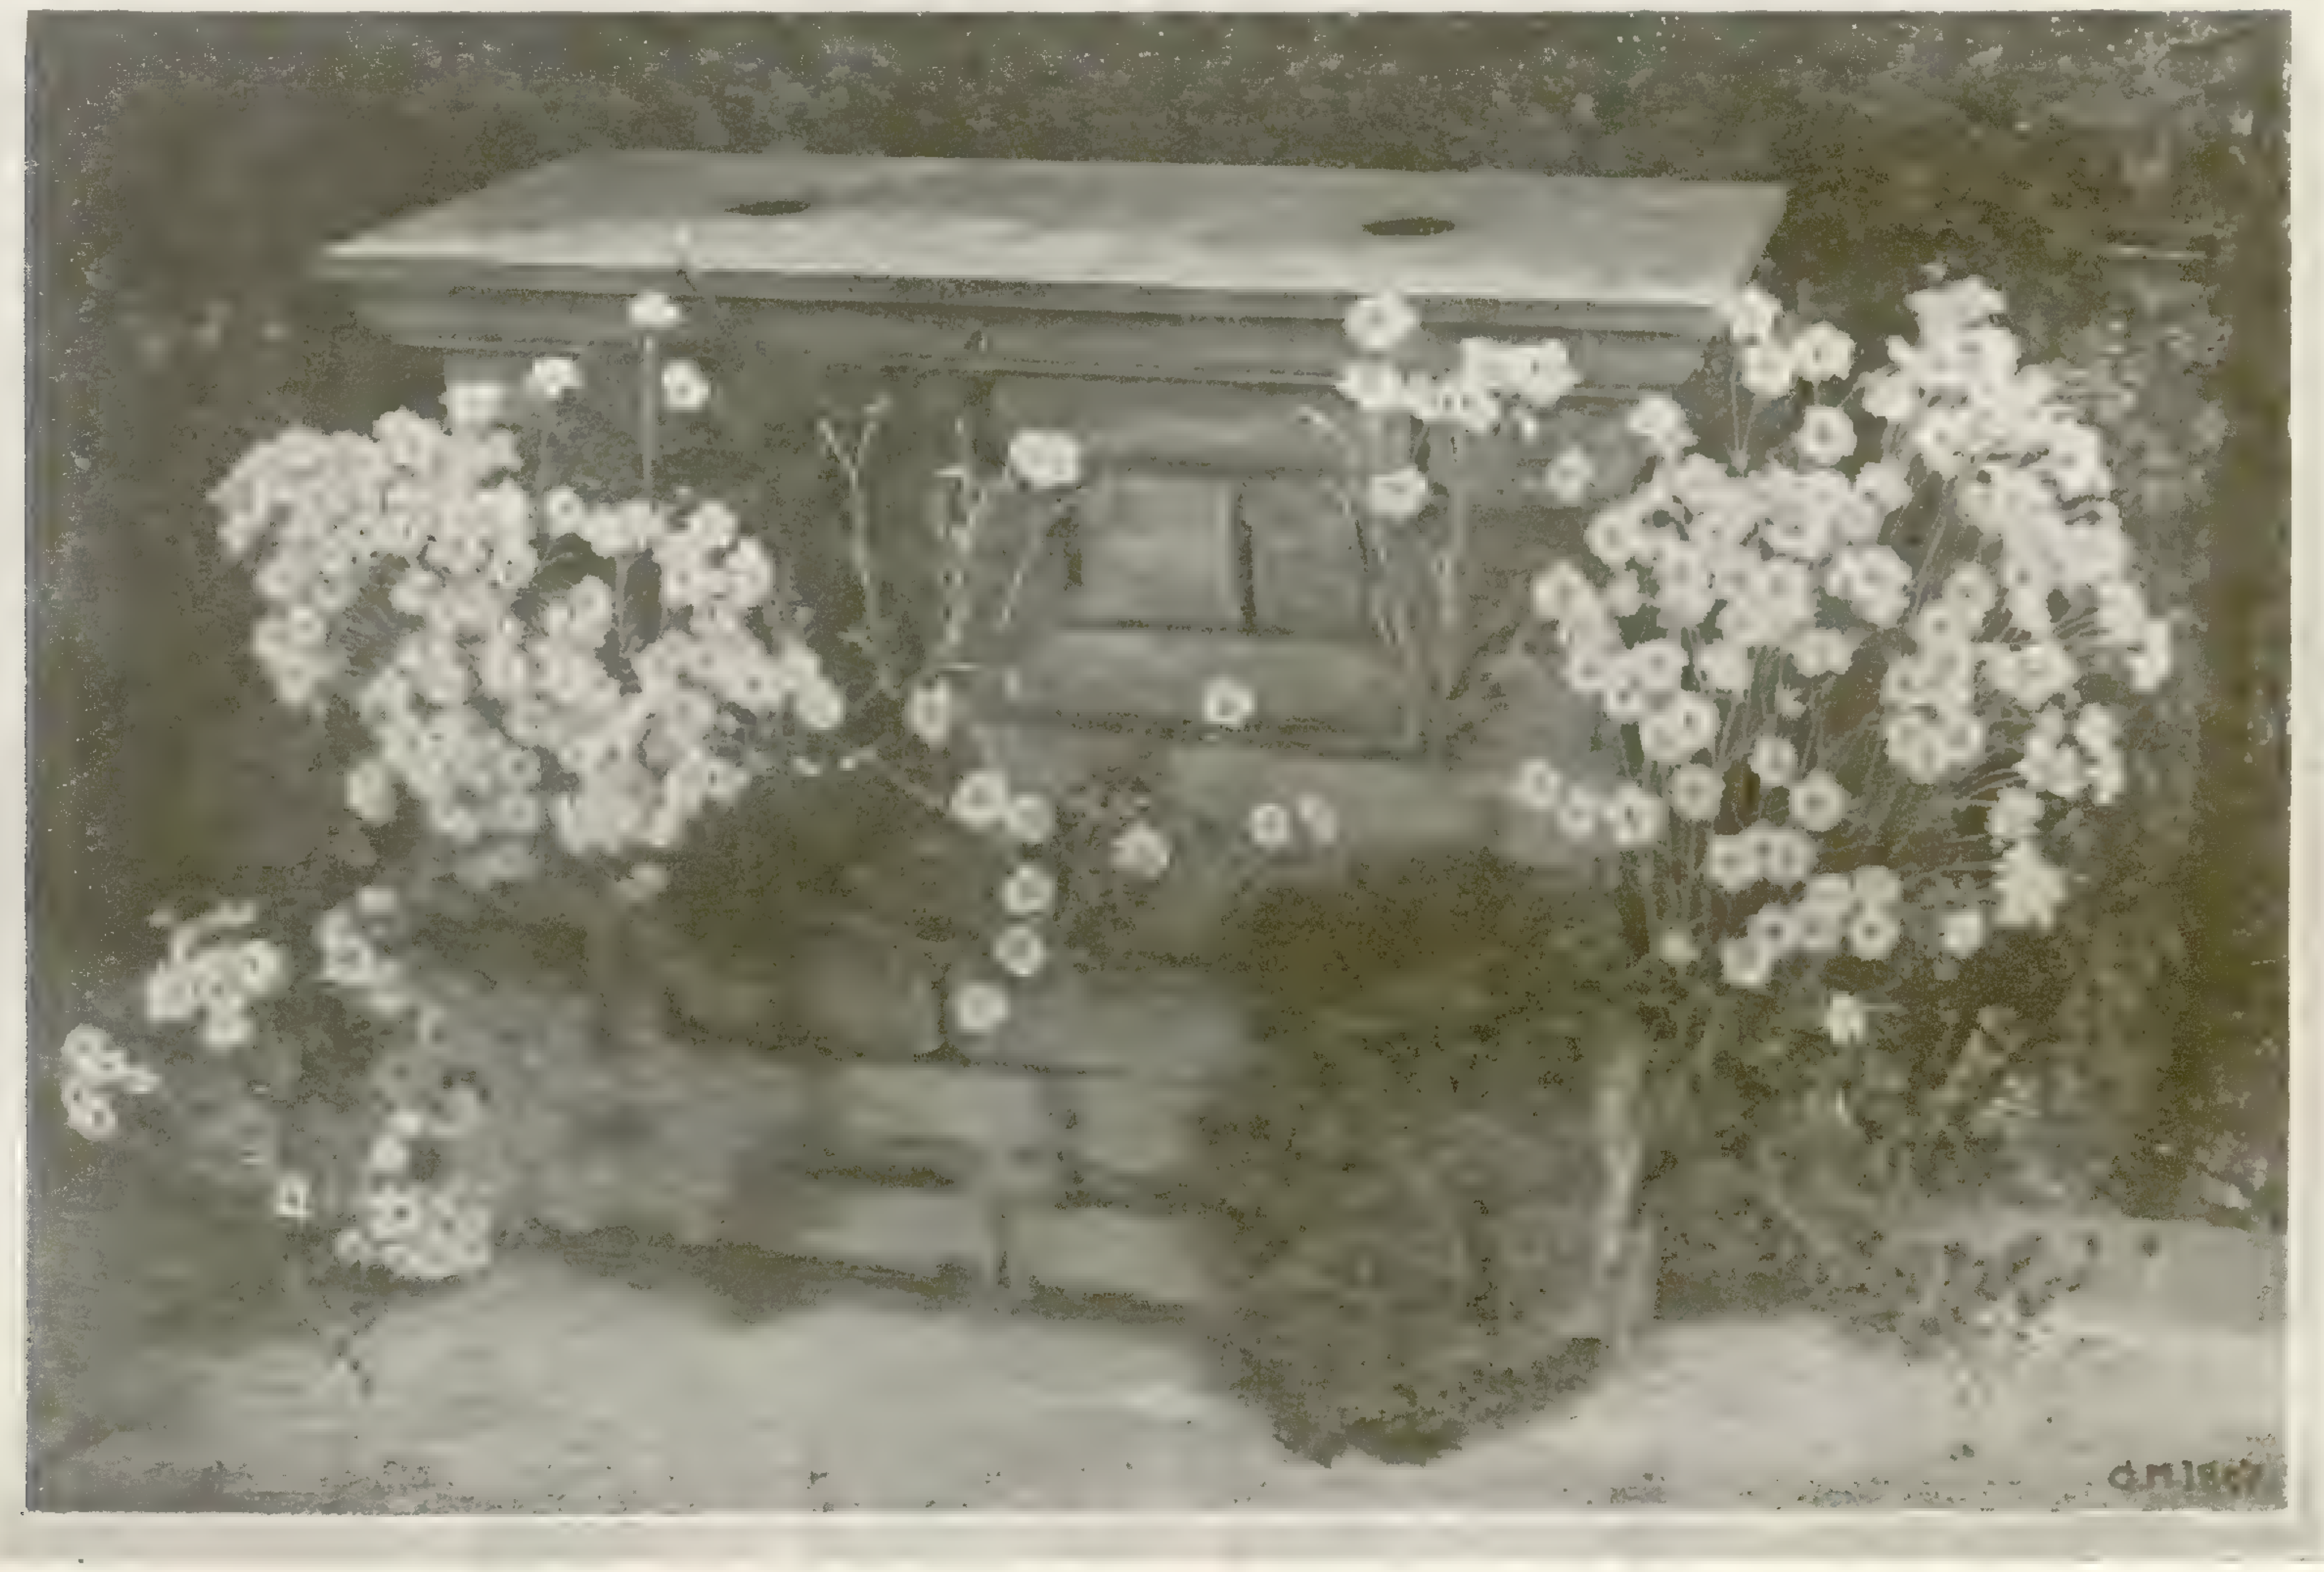
In the autumn the more beautiful trees, shrubs, and plants will include dahlias, chrysanthemums, Olearia Haasti, Veronica Traversi, Veronica glauco-cærulea, brooms, Michaelmas daisies, Pyrethrum uliginosum, late-flowering roses, briar and rugosa roses, sunflowers, clematises, and phloxes. So many of the shrubs and climbers are suitable also for the decoration of the winter garden that their merits are better mentioned in connection with this.

Where it is possible to set up a ten-feet brick or stone wall, running from east to west, with a wide border on the side facing south, and a hard concrete, well-drained path against this, a great deal will have been done to make life enjoyable during November, December, January, and February. The wall must not be built of crude new brick, however, a tall fence of old weather-stained wood will answer the purpose almost as well, while the next best substitute is a trellis twelve feet high, made of so fine a mesh that the apertures are very small, and boarded up three or four feet from the base. On the wall or fence many shrubs and climbers can be trained that would not be able to live, or certainly fail to give mid-winter blossom, on the trellis.

Upon the opposite side of the walk a shrubbery belt is safest, made chiefly of evergreens, none of them higher than four feet; in front of these low bulbous and other flowers should blossom early. The exquisite hues of some shrubs are not sufficiently recognised. We may have the Shrubby Honeysuckle, Lonicera Morrowi, carrying crimson berries on into winter; the Sea Buckthorn, Hippophae Rhamnoides, orange-fruited; the Red-stemmed Dogwood, Cornus siberica; Cotoneaster rigida, vermillion-berried; the greenish-catkined Garrya eliptica, and the fine Japanese Cherry, Cerasus serrulata alba fl. pl., that blossoms in white clusters each April, and produces a distinct effect.

Cool grottos and glens as retreats from summer heat must be fully considered, for the garden that is being planned, or is in due season to be should be so prepared as to give pleasure. A rocky glade, ten to twelve feet high in places, not running straight, but meandering, set lavishly with ferns and trailing plants, forms a feature of exceeding beauty. The perfect addition is, of course, a miniature stream running at the base of one rock-side, fed by a waterfall arranged to trickle from above over big slabs of stone fringed by greenery and flowers. For the larger spaces of the glade cotoneasters, and here and there Wichuraiana roses should be prominent. A group or two of the Royal fern and pampas grass, varied by bamboos and polygonums, will give dignity to the scene. Mosses, stonecrops and saxifragas may clothe whole stretches of the lower rockery; the golden-leaved Creeping Jenny is also a notable plant for this purpose. The end of the glade, giving the wandering path an object, may well be a grotto, within which is a stone seat boarded on the top, the wood painted to match the stone.

There can be a garden within a garden, designed especially to be a joy in foggy, dull days either of spring, summer, autumn, or winter. A trim series of bright red brick walks, set among neatly-kept grass plots and beds of the very gayest of dwarf shrubs and plants will answer the purpose best. Orange, scarlet, gold, should be the chief colours. Scented flowers will supply another kind of satisfaction, and not a decaying bloom or leaf should ever be left to drop to earth—indeed, earth had better not be visible, the whole surface being carpeted with such dwarfs as are always cheerful to look upon—sedums, variegated arabis, mossy saxifrages, etc. Golden privet, maple, euonymus, and Spiraea opulifolia, variegated veronicas, and aucubas, will be found serviceable for forming screens.



ALPINE PINKS ESTABLISHED ON A DRY WALL.

Iris Diseased.—A rhizome of Iris pumila attacked by "rhizome rot" was recently submitted to the R.H.S. Scientific Committee. This disease is due to a bacillus, and is very difficult to cure. The parts of the rhizome affected should be removed and burnt as soon as the disease appears.

DRY WEATHER JOTTINGS.

As I write these notes I look out over a garden that has known no rain for six weeks or more, which is a state of affairs I never remember before on the spring side of midsummer day. Not even a thunderstorm has come our way, though we have heard the rumblings, seen the flashes of lightning, and felt a few big spots of rain occasionally which we thought was the beginning of a downfall, but each time the clouds rolled away again, and left us with the sunshine and the drought. What a strange old unaccountable climate this is, to be sure! This time last year it was raining almost daily, and in between the storms we were shivering with cold and moping under cloudy skies, longing for a summer day. Now the whole country presents a thirsty, parched-up appearance, crops say, Water us, or we shall die, and we welcome with open arms one of those spells of rain which we grew so heartily sick of a year ago.

Look round at the lawns. Did you ever see lawns so brown and dry and parched up in the month of June? Which lawns are the worst in this respect? The poor lawns, of course, which are under the care of people who think that a lawn is like a paved yard, and never wants anything but sweeping. There are lawns poor in the herbage of which a lawn should be formed, destitute of clover, and what grass there is present is poor and of a coarse nature. It is all a story of neglect and want of manure, and what can be expected under such circumstances when even the very best kept lawns are suffering through the drought? On the other hand, of course, mowing is not the business it was last year when the great trouble was to keep the grass down, and for this gardeners are secretly thankful, for what with the watering and other extra work entailed by the dry weather, they would be overwhelmed if lawn mowing required the attention of a normal season.

What shall I do with them? said a neighbour to me the other evening. He had been away for a week's holiday. When he went he left a couple of promising rows of broad beans, and came back to find them sticky, dirty masses of black aphis all down the stems. What was he to do with them? There was only one course, i.e., consign them to the rubbish heap, which is the fate of many a broad bean row this year. When the aphis appears pinch off the tops of the broad beans, is a well-known garden precept, but not applicable in dozens of cases this year where the plants were infested with "blight" almost before flowering commenced. But, in spite of this general scene of woe one sees good rows of broad beans, with plenty of pods and very little aphis. In these instances, you see the results of sowing broad beans early, because they were well grown before the aphis appeared, and could be pinched without sacrificing the crop; and again there are those who have thought it worth while to syringe their beans with an insecticide. By doing this they checked the blight, saved the plants, and have got a crop.

In the case of certain vegetable crops one may notice this year the beneficial results of early sowing. Taking onions as a case in point, there are gardeners who follow the rule of sowing their onions on the first occasion in the year when the weather is favourable, and the soil dry enough. They do the same with parsnips and broad beans, but there are others who are not so particular, and argue that it is better to wait until the soil has become warmer. The laugh this time, however, is on the side of the early sower; the former paragraph states what he has gained in the matter of broad beans, and as I write early sown onions and parsnips are healthy and vigorous, while late sown onions are blue, puny, and maggot-ridden, and poor little parsnips, struggling to make headway, are blistered by the grub of the parsnip fly, and the young leaves are curled up with aphis. In this and other ways the drought has its lessons to teach, and the season proves the soundness of some of the rules which were established by gardeners who experienced dry seasons in the long ago.

It is in dry summers when we see more than at other times evidence of the correctness of the theory of the survival of the fittest, and a strawberry bed we saw the other day had its lesson to teach. This bed was made up partly of young plants and partly of older specimens which, in the ordinary way, should have been dug in, but they looked so well that it was decided to give them one more year. The old plants flowered as profusely as the young ones, and up to a certain point looked equally promising, but the dry weather found them out; they collapsed under the burning sunshine, and have produced nothing, while from the younger plants a good crop has been picked. The grower's excuse is that the old plants would have been all right if rain had come, which is logical, of course, but then we never know when we are going to have a dry time, and what is the good of running risk of failure by keeping old strawberry plants growing when the propagation of young stock that will repel drought is so little difficulty.

While trees and crops have languished under the scorching influence of the sunshine, insect pests in general, and aphides in particular, have had a glorious time of it, and I never remember seeing apple trees more badly infested with American blight. In some old orchards I have visited the hateful white cotton wool like substance simply hangs in huge bunches from the branches, and, though the injury it is capable of causing to these old specimens may not be very great, American blight spreads from old trees to young ones, and evidence of its effect will be seen later on in stunted growth and swollen nobs on the young shoots. Spraying with lime-wash and other preventive mixtures has had no effect on American blight, probably because the insects were safely secreted in the crevices and under rough bark, where they could not be touched, and encouraged by the warm sunshine they came out later and multiplied in overwhelming numbers. It is in this way that we observe how the old, gnarled apple trees in orchards are a source of danger to the young and valuable specimens growing near at hand.

Another lesson taught by the drought is the advantage of early digging in the case of soil that is retentive and clinging. Let me give an instance. In the same field are two big pieces of land which are used as garden ground. The occupier of one slogged away in the late winter, turned his ground up roughly, and at sowing time it broke down like powder, but for some reason or other the next man left his digging till the spring. I questioned the wisdom of it, but he assured me that the rough lumps would come down all right after the next shower. Doubtless, they would have done, but the man is still waiting for that shower, and, after delaying his seed sowing as long as he dare, his crops had to go in on a rough lumpy seed bed, with the result, of course, that half of them have failed, and the contrast between the two plots of ground is decidedly marked. In one case, the things have had to be left to struggle on as best they could; in the other flat hoeing of the crumbled surface has been possible throughout the dry spell, and the crops are coming gallantly through the crisis.

I hardly dare mention sweet peas when some friends of mine who have ambitions centred on the £1,000 prize are surveying their plants, all a-blooming in June, and wondering what the state of affairs will be at the end of July. It would look almost as if Dame Nature had herself ordained that the sweet pea should be the Coronation flower and had sent the sunshine on purpose to bring them on for the great event, for never in the history of modern sweet peas has there been such a display of flower at this time of the year. Would-be prize winners at July shows raised their plants early in pots after the orthodox way, and planted them out, and in many cases they are not half-way up the sticks, but in full flower. Will the July flowers be as large and good as these first editions? Much depends on the weather, of course, and, though I make no prophecy in respect of the £1,000 prize, I venture to express the opinion that some of the sweet pea awards at July shows will be won by flowers from plants that were raised from seed sown outdoors in March or April.

Apart from disappointments and worries the drought has brought a mountain of extra work to gardeners, who, after putting off the unwelcome task as long as they could, had to resort to outdoor watering What does this mean? Simply that gardeners have put in hours of overtime to which the majority of them neither get no expect any extra pay. Why do they do it For their own credit's sake, because th cannot stand by and see things suffe through drought if there is a hose-pip and water supply available. Sometimes hear pessimistic croakers comparing ga deners of to-day very unfavourably wi their predecessors, but the drought of 19 proves that they are suffering from warp and prejudiced minds. Head gardene and under-gardeners, journeymen, and some cases, garden labourers as well, ha spent their evening hours this sum manipulating the water-can or the h pipe, just as cheerfully and willingly their forebears did in the droughts of ye ago, and with the hope of no reward cept that they might keep crops grow and show as good results as possible un the adverse circumstances.

H

[The publication of this communicat has been unavoidably delayed.—ED.]

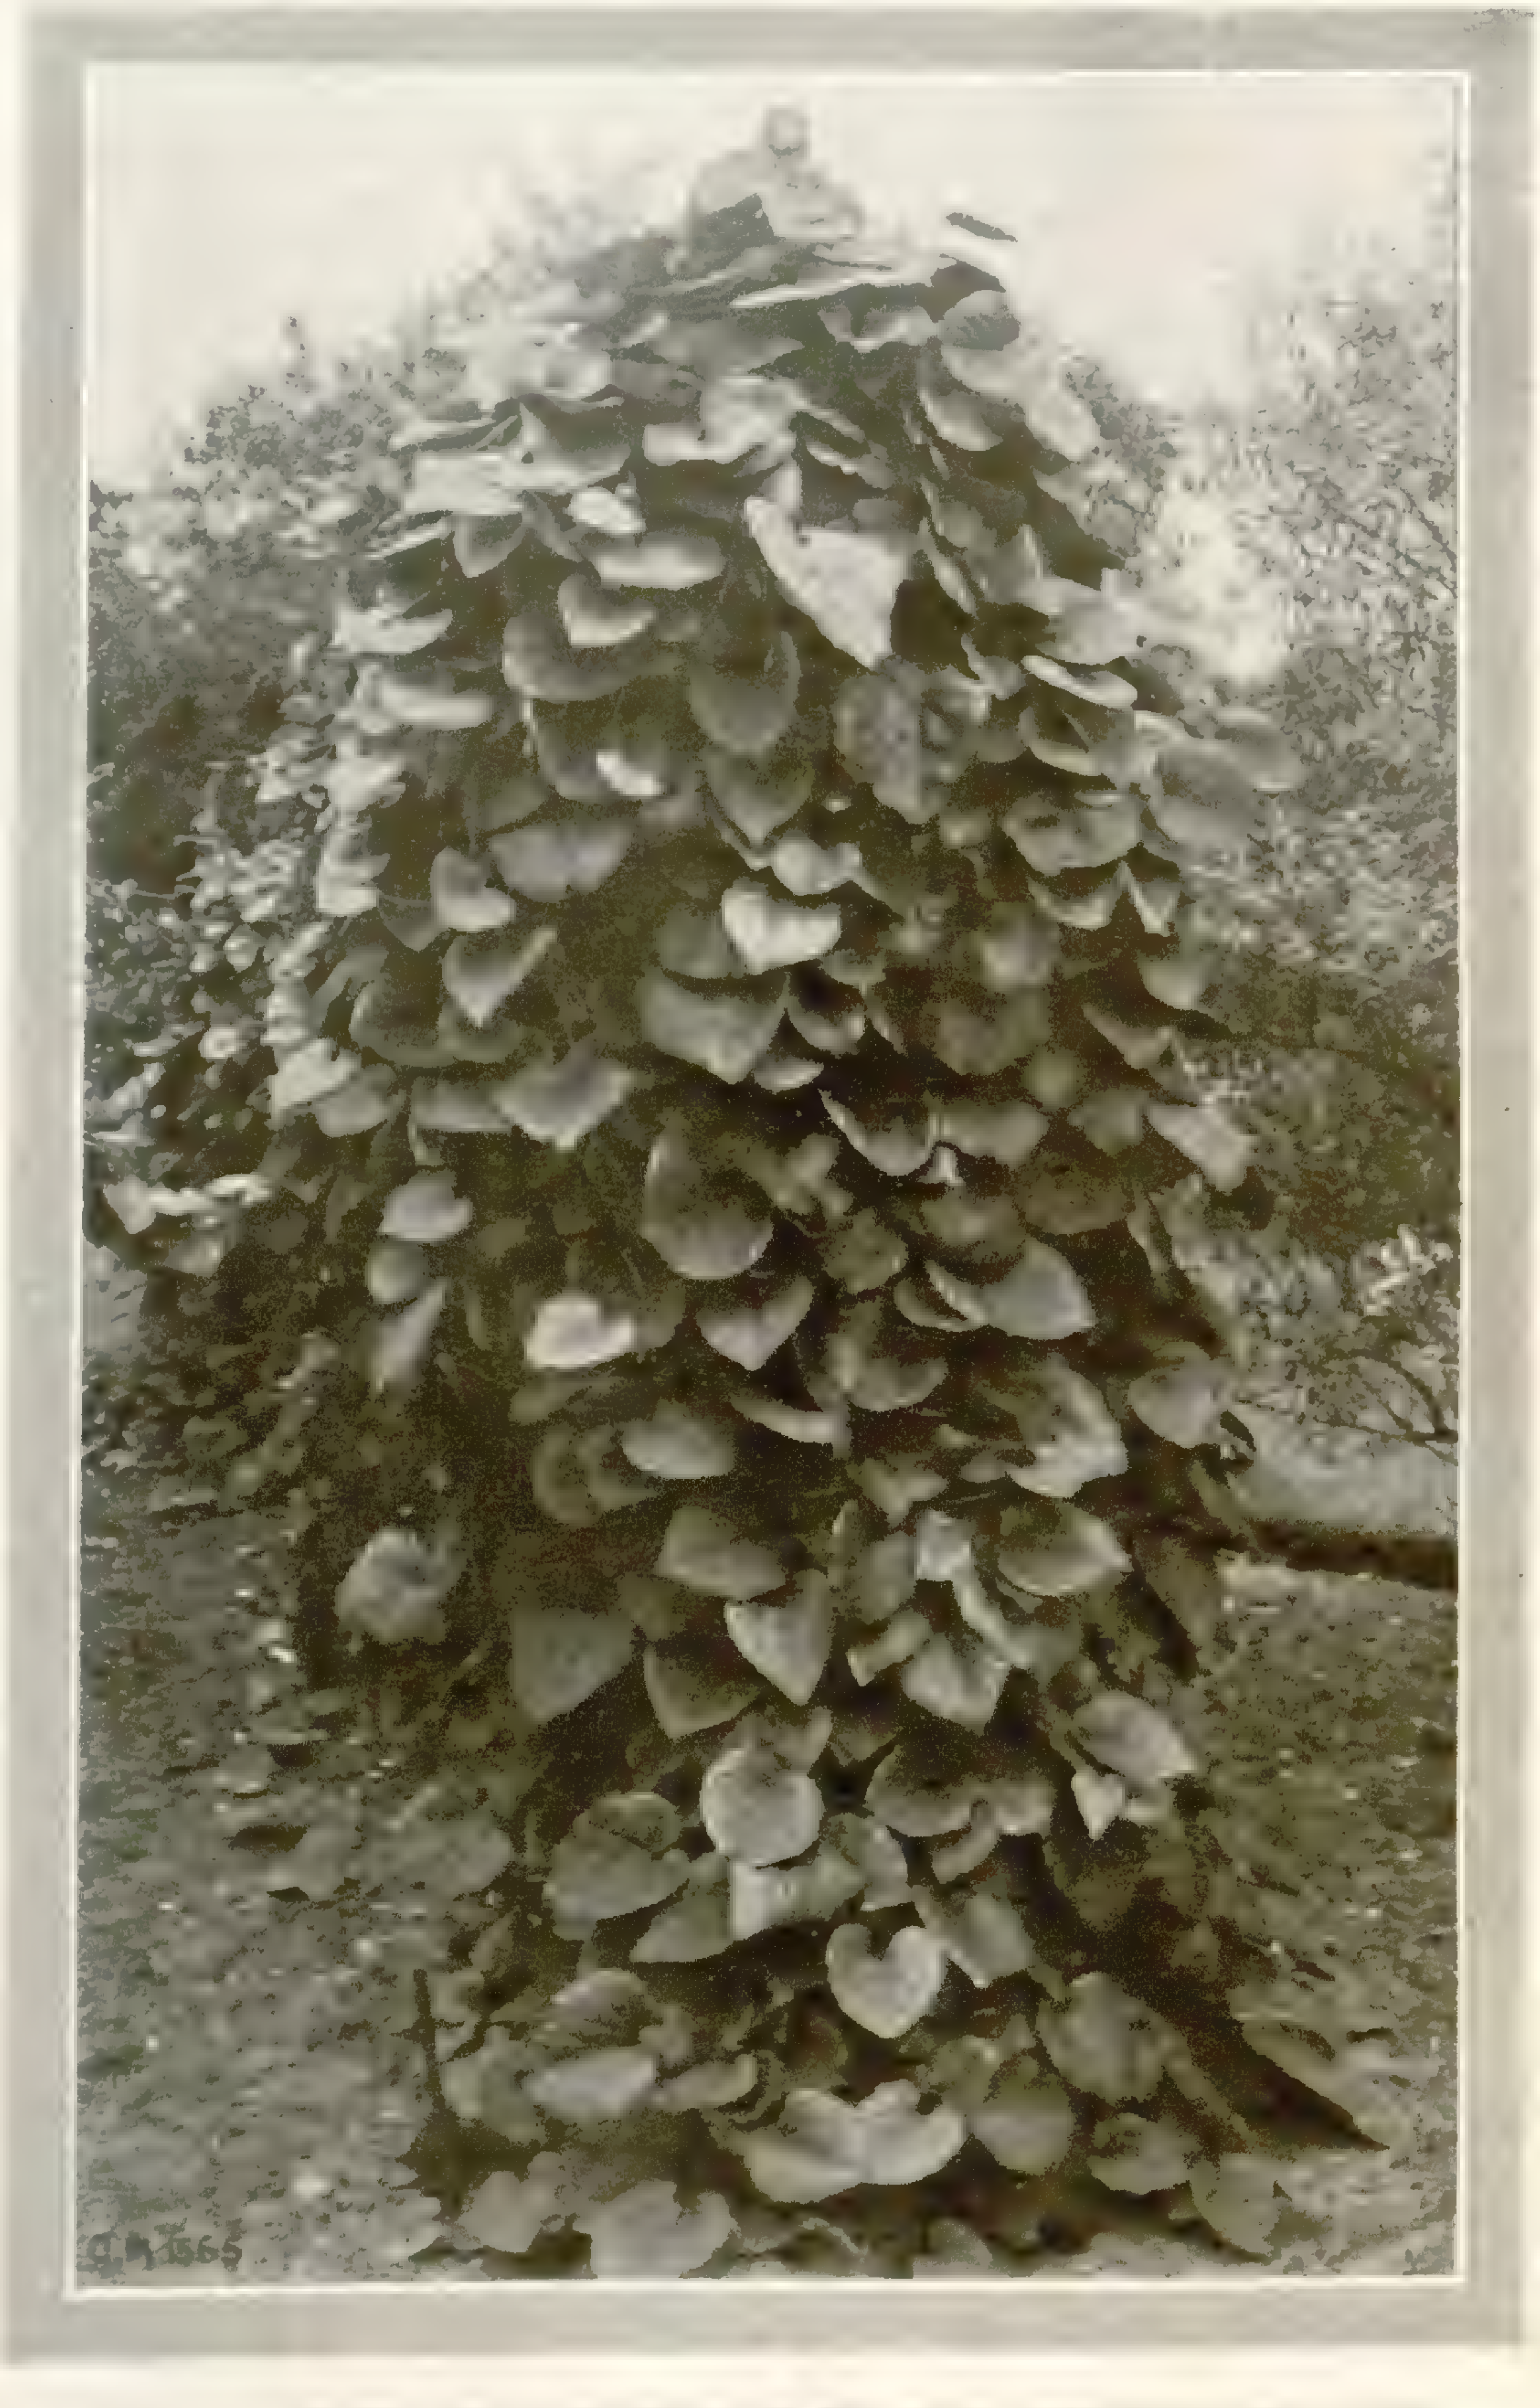
Rubus bambusarum.—To t who appreciate the distinctive forms of l age as aids to garden decoration, the ject under notice has much to comm Unlike the majority of the rubi, the l are the greatest attraction, the seg being exceedingly narrow, simple in and varying up to 8in. and 9in. in l thus rendering the plant most distinct. growths are extremely slender, and a off to best advantage when lightly tra over trellis work or allowed to ramble f over stumps, as in the case of clemati allied subjects. In a young state it is paratively slow of growth, but when e lished the shoots are developed with freedom. Ordinary soil and an ope tion in the shrubbery are its cultur quirements.—L. O. V.

THE HARDY ARISTOLOCHIAS

The several kinds of aristolochia which may be grown outside in this country form an interesting group of climbing plants, for, in addition to the peculiarity in shape and the curious colouring of their flowers, the foliage of one or two sorts is very handsome. Moreover, their culture does not offer any serious difficulties, for, given moderately good loamy soil, they grow vigorously, and soon clothe an unsightly fence or block out an undesirable object. They are also useful for planting on pergolas and summer-houses, while they may be planted at the foot of a large bush or low tree and allowed to cover it with their long slender branches. They are not very easy plants to propagate, though with a little care cuttings may be rooted if inserted in sandy soil in a close case in summer. Young plants ought to be placed in permanent positions as early in life as possible, and until sites for them are selected, it is just as well to keep them in pots.

There are only a few kinds of aristolochia which may be grown successfully out of doors, and the principal one is A. Sipho, of which an illustration is given. It is a native of the United States, and is recognised by its large, dark green, heart-shaped leaves and small yellowish-brown flowers, which have the appearance of a siphon or curly-stemmed pipe, and are responsible for the common names of Dutchman's Pipe and Siphon Flower, which have been applied to the species. The flowers are small, and not very conspicuous, as they are often shaded by the foliage; hence, if a person does not pay special attention, he might easily miss seeing them. Except in their peculiar shape and markings, they bear little resemblance to the immense showy flowers of some of the tropical species, for in the case of the tropical American A. gigas var. Sturtevanti, a single flower, including its tail-like appendage, may be anything between 3½ and 4½ feet long, and 12 to 15 inches wide in the widest part. A. Goldieana, again, from Old Calabar, is another with immense flowers. These large-flowered kinds are, however, more offensive than the small-flowered hardy ones, for the disagreeable carrion-like odour of the blossoms is very pronounced in their case, whilst it is not present to any great extent in the hardy ones.

A. californica and A. tomentosa, from California and the southern United States respectively, are two other species which are worthy of notice. They may be separated from A. Sipho on account of their hairy stems and leaves, but the differences between themselves is not well marked. Though two of the three species here mentioned have been in cultivation for more than a century they cannot be said to be common, though their bold foliage and curious and interesting flowers warrant them attention from garden lovers. A. altissima and A. sempervirens are sometimes spoken of as hardy plants, but there are few places where they grow satisfactorily. W. D.



A FORMALLY TRAINED SPECIMEN OF THE DUTCHMAN'S PIPE (ARISTOLOCHIA SIPHO).

Mushrooms.—During the autumn months mushrooms will probably be asked for, and preparation will have to be commenced to secure fermenting material for them. A north position is preferred during the hot months for preparing the material, and for the making-up of the beds, which may either be formed in trenches under a wall or made up in ridges in the usual way. See that the manure is thoroughly sweetened by continually turning it for at least a fortnight. It is apt during dry weather to become too dry, and in this case a slight watering during the process of making-up the bed is necessary.—C. F.

MOISTURE IN VINERIES.

The opinion of some of your able contributors who are noted grape growers on this subject would be both interesting and instructive. I have grown grapes on a fairly large scale (in private gardens) for twenty-five years, and have, during that time, been a close observer of the growth and condition of various sorts in different circumstances, and I have come to the conclusion that some varieties suffer somewhat if subjected to a certain amount of atmospheric moisture, while others growing under similar conditions appear to be receiving just what they require.

The majority of gardeners must be content to grow several varieties in the same house. Now it is accepted generally that certain varieties do very well indeed in the same structure. But it sometimes happens that the collection contains some varieties that do not thrive well together. Of course, I am not here referring to early and late grapes, but to varieties that ripen about the same time under identical treatment. We must consider ventilation along with the subject of atmospheric moisture. As regards warty leaves. The varieties Gros Colmar and Lady Hutt, grown under the same treatment as that meted out to Muscat of Alexandria, Lady Downes, and Alicante, have warty leaves, while the leaves of the three last named are free. The leaves of Appley Towers are also quite free from warts, while those of Gros Maroc are affected. Black Hamburgh foliage is affected very slightly indeed, while that of Madresfield Court is clear.

It seems to me to be a fact that some varieties require less moisture both at the roots and in the atmosphere than others. Ventilation is a very important matter, and has a very direct bearing upon the subject of warts on vine leaves. But I have long noticed the fact that under similar cultural conditions the leaves of some varieties become warty, while those of others do not, and I was always taught that warts on the leaves were the result of much atmospheric moisture and lack of sufficient ventilation. I confess to being rather puzzled about the matter. Geo. Garner.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

IMPORTED ORCHIDS.—Importations of Cattleya Mossiæ arrive at intervals during the summer season. Providing the plants have reasonable treatment after they have been taken from the cases, this species may be induced to establish itself under artificial conditions without much difficulty. The plants should be cleaned of all dead and decaying matter about the roots and bases of the pseudo-bulbs. Examine carefully beneath dead sheaths and leaf bracts for insect pests, and should any of the plants show signs of having been attacked with cattleya fly (which is easily distinguished by the perforation in the pseudo-bulbs), such plants should be isolated until they have grown sufficiently to show that they are free from the pest. Choose pots just large enough to contain the plant comfortably, drain to about one-half the depth with clean drainage, and fill in the remaining space with compost consisting of about equal portions of fibrous peat, osmunda fibre, and sphagnum moss, with ample broken crocks and charcoal added. The plants will not require much root moisture at first, but as soon as the new roots are growing freely and the young growths appear, it is necessary to increase the root moisture according to the requirements of the plants. It is a good plan to protect the foliage from strong light, as plants are liable to lose their foliage if exposed to excessive light.

PHALÆNOPSIS SCHILLERIANA, as well as P. grandiflora, P. amabilis, etc., are arriving in an imported condition at this season of the year. It is unfortunate that these lovely orchids are not more generally cultivated, but the condition suitable cannot always be found or provided in even our most up-to-date collections. It is all very well to say the plants do well under such-and-such conditions, but after a year, or perhaps two years, it is generally found that trouble is experienced in spite of all care bestowed on the plants. I remember taking charge of one collection where there were numerous plants of different kinds of phalænopsis, but for years before and for a considerable time after they came into my charge they just made a new leaf and lost the previous one, and so did not progress. A plant was hung from the roof of the house—only a matter of a few inches above the stage on which it had been before, and it found the conditions suitable, and grew away rapidly; needless to say, the remaining plants were transferred to similar conditions, with the result that the difficulty of years was removed. In dealing with imported phalænopsis, shallow pans should be used, and these well drained with clean crocks. The potting compost should consist entirely of chopped sphagnum moss and silver sand. Keep the plants in a hot, moist, shady position until the new roots get well away.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

ZONAL PELARGONIUMS.—Plants intended for winter flowering ought now to be ready for standing outside to receive the full benefit of the sun, which is a great factor in building up the plant for the production of fine blooms. A good ash bed should be provided on which to stand the plants. Keep all flower buds picked off during the summer, and stop all shoots which are growing out of proportion to the plant. Weak liquid manure may be given occasionally when the pots are filled with roots. Show pelargoniums should also be stood outside as soon as they have finished flowering. Gradually reduce the amount of water, so that by the end of July the wood is thoroughly ripened and ready for pruning back.

SALVIA SPLENDENS GRANDIFLORA.—This is most useful for providing a good display of colour in autumn and winter, when it is most needed. On no account must the plants be allowed to receive a check through being root bound, but they must be shifted into larger pots as soon as they require it. Liberal watering is necessary when the plants are in full growth, and, being a gross feeder, liquid manure may be given frequently. Red spider is a great enemy to salvias, and must be kept in check by syringing the plants at least twice a day.

BOUVARDIAS.—These may now be either shifted into their flowering pots or planted out in a frame. Very little ventilation will be required for a few days after planting, but this must be gradually increased as the plants grow, until the lights may be left off entirely. Solanum capsicastrum may be treated in the same manner.

ARUM LILIES.—Those plants which have been stood outside for a time may now be shaken from the soil, split up into single crowns, and planted out. Allow plenty of space between both rows and plants to enable the ground to be well worked with the hoe during the growing season. Arums delight in plenty of water.

HARD-WOODED PLANTS having now completed their growth, may be stood outside to mature. Select a situation which is shaded during the hottest part of the day. Careful watering is necessary, especially with azaleas. Strict attention must be paid to the insect pests which attack these plants. Thrips, scale, or red spider, if allowed to go unchecked, will soon render a plant useless.

GREENHOUSE CLIMBERS are now growing vigorously, and need regulation. Thin out any growths that are weak, and avoid overcrowding. Manurial assistance will be required in most cases.—A. Grubb, Porter's Park Gardens.

HARDY FRUITS.

TRAINING FRUIT TREES.—Young trees of any kind of fruit, and more especially trees that have been planted to provide espalier, cordons, etc., will need attention at this stage of their growth. The previous year's growths of horizontal trained trees should have been tied out at an angle of 45 degrees with the stems and the present growths lightly looped at the same angle, pinching the points of all strong growths to throw vigour into the leading shoots. In training cordons to form arches or pergolas, this will be found almost the only means of getting the trees to furnish the tops satisfactorily. All trees that are not well regulated may be set in order with much better effect by pinching at the present time than by pruning in winter. All side growths of strong branches may be pinched at the fifth or sixth leaf, allowing all growths on the weaker branches a full season's run. Trained apple trees are a prominent feature here, and on these are grown the best fruit, generally speaking; a few of the very strong varieties have been found not to succeed as trained trees, notably Bramley's Seedling, Striped Beefing, and one or two others; but others thrive and fruit abundantly, although many of them are aged trees. Apple trees trained as gridirons, with from ten to fourteen leads, or cordons, according to the vigour of each individual, are found most satisfactory; many of these are trained over pergolas, and are most attractive at blossoming time, form shady walks during the summer, and provide extra fine and well-coloured fruits in the autumn.

GRAFTED TREES.—These should now be examined, cleaning away with a sharp knife all parent growth, so that the growing grafts may receive the benefit of the full flow of sap. Standard trees that were grafted in the spring will soon need supports for the grafts, or much damage will be caused if rough winds are experienced. If American blight is prevalent this is almost sure to find its way to wounds on newly-grafted trees, and should be kept in check with methylated spirits slightly diluted with water, and applied with a stiff paint brush.

BORDEAUX MIXTURE.—Where scabby fruit has been the rule, a last spraying of Bordeaux mixture may now be given to apples or pears, using the finest nozzle possible to produce a mist-like spray. The mixture may be used as per my previous notes, using a weaker solution for Cox's Orange Pippin and other varieties with delicate foliage that are known to scald. The fine, dry weather experienced has been a great check to fungus growth, and where spraying with Bordeaux mixture has been well carried out for a year or two, further spraying may not be considered necessary for this season.

PEACHES AND NECTARINES.—Trees are now making clean and healthy growth, and these may now be tied, regulating them evenly over the trees so that overcrowding may not occur. Weak and useless growth should be cut away so that all parts of the tree may have the benefit of all possible light. Special attention should be paid to the borders in the way of watering; light dressings of an approved fertiliser will be of great benefit from now onward. When the weather is bright and warm syringe or hose down the trees with reasonable force to keep them free from red spider or aphis. The earlier varieties may have their fruits exposed by picking away a few leaves so that the sun and air may reach them.—J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

LATE PEAS.—Although so much depends upon the weather, generally speaking, peas do not pay for sowing much after this date. Therefore it is advisable to make a large sowing in prepared trenches of one of the following varieties—Autocrat, Gladstone, or Late Queen. If the soil is dry give it a thorough soaking previous to sowing the seed, or germination may probably be defective. It is wise to avoid crowding the plants, especially at this season, as light and air build up strong foliage to stand against mildew, which is so liable to attack late crops.

VEGETABLE MARROWS.—These plants are now making robust growth, and to secure a free set of the flowers and the rapid swelling of the fruits they will require a good soaking of water at intervals of about a week, accompanied by some manurial help. To prevent the plants becoming a dense mass of growth remove all useless shoots, and expose the vines and leaves to the sun. Cut the marrows as soon as they are of a usable size, so that they do not unnecessarily weaken the plants.

CUCUMBERS.—The early raised cucumbers will probably be getting past their best, and show signs of weakness; if so, sow seeds at once to secure strong plants for succession. Any plants that are in free bearing should be liberally top-dressed with good loam, and frequently watered with liquid manure; pay attention to syringing, and keep a moist atmosphere in the house.

SPINACH.—Fcr next winter's use make a sowing of perennial spinach; if sown now it attains to a good size before autumn. As every gardener knows its value, should the other spinach fail during the months of scarcity. Perennial spinach is not fastidious as to soil or position, and will thrive in moderately conditioned ground. Plant out the young plants as soon as possible, about a foot apart. Make frequent sowings of summer spinach in cool positions, such as north borders, during the next two months.

GENERAL REMARKS.—Remove the [illegible] plants of early cauliflowers as soon as the heads are cut, and have the ground manured and dug over to receive another crop. [illegible] other piece of land should be occupied in providing supplies for winter, as far as possible, as soon as it become vacant, until sufficient quantities are assured. Pull up shallots and lay them out in the open to dry previous to storing them. Remove all weeds before they reach seeding size, and keep the surface of the soil worked amongst growing crops as much as time will allow.—Charles [illegible], Cholmondely Castle Gardens.

THE GREAT ROSE SHOW OF THE YEAR
Will be held by the NATIONAL ROSE SOCIETY
in the
ROYAL BOTANIC GARDENS,
REGENT'S PARK, N.W.
ON FRIDAY, JULY 7TH.

The two Champion Challenge Trophies will be competed for, also numerous other Cups and Pieces of Plate, and Money Prizes to the value of £400.

NEW SEEDLING ROSES in a SEPARATE TENT.

BANDS OF SCOTS GUARDS AND ROYAL ARTILLERY.

Luncheons, Teas and Other Light Refreshments.

ADMISSION.
Noon to 3 p.m., 5s.; 3 to 5 p.m., 2s. 6d.; to 7 p.m., 1s.

E. MAWLEY, Hon. Secretary,
Rosebank, Berkhamsted.

BATH CARNIVAL.

BATH GRAND ROSE SHOW
and
GENERAL SUMMER EXHIBITION
WEDNESDAY and THURSDAY, JULY 12th and 13th.

Classes for Roses, Nurserymen and Amateurs. Bouquets, Cut Flowers, Sweet Peas, Strawberries, and Tuberous Begonias.

Entries close Friday, July 7.

For Prizes, Schedules, etc., apply
B. F. F. PEARSON, Secy.
Office: 17, Argyle Street, Bath.

HEREFORD AND WEST OF ENGLAND
ROSE SOCIETY.
THE 45TH ANNUAL EXHIBITION OF ROSES
(open to the United Kingdom)
Will be held in the SHIRE HALL, HEREFORD,
On WEDNESDAY, JULY 12th, 1911.
£120 in Prizes, and Four National Rose Society's Medals.

Prize Schedules, Entry Forms, and further particulars may be obtained from the Hon. sec., Mr. F. A. SPEER, Street Court, Kingsland, Herefordshire; or from Messrs. Jakeman and Carver, Booksellers, Hereford.

LEICESTER.—ABBEY PARK FLOWER SHOW, 8th and 9th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

MALVERN
ROSE AND SWEET PEA
SHOW.
THURSDAY, July 13th.

TWO £5 NOTES FOR SINGLE BUNCHES OF SWEET PEAS.

TEN CLASSES FOR ROSES.

EIGHTEEN CLASSES FOR SWEET PEAS.

THREE CLASSES FOR CARNATIONS.

Send for Schedule to:
S. A. GRIFFITHS,
Assembly Rooms, Malvern.

Entries close Monday, July 10.

WOLVERHAMPTON.
GREAT FLORAL FETE,
July 11, 12, and 13, 1911.
[illegible] in Prizes.
Entries close July 3rd.
Schedules on application to the Secretary.

YORKSHIRE AGRICULTURAL
SOCIETY.

GREAT HORTICULTURAL EXHIBITION
WILL BE HELD AT
ROTHERHAM,
ON JULY 27th, 28th, and 29th, 1911.

For Schedules apply
PETER BLAIR,
Trentham Gardens, Stoke-on-Trent.

ENTRIES CLOSE JULY 8th.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

HANLEY PARK, STAFFORDSHIRE.
JULY 5th and 6th, 1911.
FIFTEENTH GREAT
ANNUAL FLORAL FETE.

£650 in Prizes, Silver Cups, Gold and Silver Medals. Silver Challenge Cup, value £10 10s., offered for TRADE EXHIBIT.
(For particulars see page 8 in Schedule.)
Valuable Special Prizes offered by the Principal Firms in England.
Schedules post free on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

CARDIFF FLOWER SHOW.
By kind permission.
SOPHIA GARDENS, CARDIFF.
WEDNESDAY and THURSDAY, July 26th and 27th, 1911.
The renowned Full Band of H.M. 19th Queen Alexandra's Own Royal Hussars.
Grounds and Tents brilliantly Illuminated.
Mr John Studt's Complete and Extensive Amusements.
Every Particular and Schedule, Apply

24, Duke Street, Cardiff.

EXHIBITIONS AND MEETINGS.

◆

The Royal Show (Norwich).

HORTICULTURAL SECTION.

If evidence were required of the ever-increasing popularity of horticulture in Britain, we might well instance the rapid and remarkable progress of the horticultural section of the Royal Agricultural Society's shows. But a few years ago little or no thought was given to horticulture by the organisers of the "Royal," but during the past few years the section has grown in importance and interest, and the exhibition of plants, flowers, and fruit which opened at Norwich on Tuesday last, and continued until Friday, was undoubtedly worthy a place among the finest flower shows in the kingdom, and constituted one of the most attractive sections of the whole show.

The Horticultural Committee, with Sir Gilbert Greenall, Bart., at its head, and Mr. Peter Blair, the genial and energetic manager, had everything arranged in a highly satisfactory manner, a word of praise for the latter being on everyone's lips, and the large body of exhibitors brought of their best, and transformed the large marquees into a perfect paradise of floral beauty.

The opening class was for a group of miscellaneous plants in and out of bloom, occupying 300 square feet of space. Messrs. J. Cypher and Sons, Cheltenham, took the lead with a very bright and lightly arranged group, in which highly-coloured crotons played an important part. A wide-spanned arch in the background surmounted by a noble Kentia Fosteriana, made a capital feature toward which the kalanchoes, orchids, ixoras, anthuriums, and fine foliage plants rose in billows, making what might in imaginative language be termed a sea of loveliness. Mr. W. A. Holmes, West End Nurseries, Chesterfield, was a very good second; he had excellent crotons, a good palm as a centrepiece, tall rambling roses, ivy-leaved pelargoniums, and a few nice orchids, all of which were used to the best advantage.

Messrs. Cypher were the only exhibitors of a table of orchids occupying 100 square feet, but their exhibit was worthily awarded first prize. Some large and well-flowered examples of Cattleya gigas, Miltonia vexillaria, Oncidium macranthum, and nice spikes of Epidendrum vitellinum majus were among the more prominent of the choice things staged.

A great deal of interest centred in the class for an exhibit of hardy plants and flowers arranged on ground space 30ft. by 10ft., the schedule stipulating that rock stone or other material might be used to obtain effect. Messrs. W. Artindale and Son, Sheffield, were victors, their efforts being in the way of a rocky bank furnished with a great assortment of alpine and herbaceous plants, with a water pool in front; nymphæas, arums, Japanese iris, sarracenias, and astilbes were used in and around the water, and variegated funkias finished off the edging in front. Second place was taken by Messrs. W. and J. Brown, Stamford, who carried out an entirely different plan with mounds of gaillardias, liliums, eremurus, Ostrowskia magnifica, and other good border flowers, arranged over a groundwork of heucheras, potentillas, dianthus, and other dwarf-growing subjects. Third went to Messrs. Whitelegge and Page, Chislehurst, who made a capital attempt at reproducing a bit of a herbaceous border.

Another highly successful class was that for a collection of cut hardy perennials arranged on table space 30ft. by 5ft. There were six competitors, every one of whom staged in a manner that was most praiseworthy. The first prize was won by Mr. G. Davison, gardener to Colonel B. J. Petre, Westwick House, Norwich. This exhibit was one of the finest displays of hardy flowers we have seen; such charming things as Orchis foliosa, Primula sikkimensis, Tropæolum polyphyllum, and Onosma taurica in front, were backed by Gillenia trifoliata, Lilium Hansoni, Iris spuria, and other equally good kinds, with delphiniums, Campanula latifolia, and a glorious mass of Tropæolum speciosum right at back. Messrs. G. Gibson and Co., Leeming Bar, Bedale, came second with a stand of excellent flowers. A number of new seedling gaillardias and campanulas were of much promise, and the newer delphiniums and poppies were prominent on the stand. Messrs. J. Harkness and Sons, Bedale, were third, their stand also being excellent.

Mr. Jas. Gibson, gardener to his Grace the Duke of Portland, K.G., Welbeck Abbey, Worksop, staged a fine collection of fruit which obtained first prize. Madresfield Court and Black Hamburgh grapes were well shown, with four large melons, and several dishes of highly-coloured apples, excellent peaches, strawberries, cherries, plums, and figs. Mr. Gibson also scored for a collection of eight vegetables, staging produce of a high degree of excellence. The cauliflowers, Centenary peas, and Perfection tomatoes were really splendid.

Two entries for a group of begonias found Messrs. Blackmore and Langdon, Bath, the leaders, and it may be said that the quality of their blooms was exceptionally high. Messrs. T. S. Ware, Lim., who followed, also staged really grand plants carrying immense, beautifully formed and delightfully tinted flowers. The exquisite Lady Cromer was prominent in the centre of the stand, where its delicate flesh-pink flowers showed up well.

Five excellent entries were made in the class for a collection of sweet peas occupying 100 sq. ft. of staging, and the exhibit of Mr. Robert Holmes, Tuckswood Farm, Norwich, stood well ahead. The quality of the flowers was exceptionally good, and the arrangement was very pleasing. A pea of brilliant colour labelled Seedling B 78, a vase of the salmon-coloured Earl Spencer, and some good flowers of Edith Taylor, particularly pleased us. Second prize went to Messrs. E. W. King and Co., Coggeshall, who had fine vases of such varieties as Queen Mary, Anglian Orange, Earl Spencer, and Mrs. William King. Messrs. S. Bide and Sons, Farnham, came third.

Mr. F. M. Bradley, Peterborough, took premier place for an exhibit of cut roses, occupying 15ft. by 5ft. Prominent in the centre was a tall stand of J. B. Clark, supported by Mdme. Ravary and Harry Kirk. The Lyon, G. C. Waud, and Mdme. Jules Gravereaux were other very beautiful things on the stand. Second prize went to Messrs. W. and J. Brown, Stamford, and Messrs. G. Mount and Sons, Canterbury, third.

Carnations were beautifully shown by Mr. C. F. Waters, Balcombe, Sussex, who was awarded first prize in the class for collections. Edith Waters, Carola, Rose Pink Enchantress, and most of the favourite varieties were well put up. Second prize went to Mr. W. Allan, gardener to Colonel the Hon. C. Harbord, Gunton Park, Norwich, whose flowers of Cecilia and King Arthur were simply superb. Mr. A. V. Coombe, gardener to the Right Hon. Lord De Ramsey, Haverland Hall, Norwich, was third.

NON-COMPETITIVE.

Excellent as were the exhibits in the scheduled classes they were quite surpassed by the great numbers, infinite variety, and charm of the non-competitive exhibits, chiefly from trade growers. From far and near, the leading firms in the United Kingdom brought of their best, and the result was a display of all classes of flowers and plants that could scarcely be surpassed anywhere at any time.

Messrs. James Veitch and Sons, Lim., Chelsea, staged a table of stove and greenhouse plants in exquisite taste. A central mound of orchids, backed up by Solanum Wendlandi, and supported on either side by crotons, kalanchoes, ferns, etc., constituted the more striking features of the group. A nice group of carnations, spiræas, roses, and decorative plants was put up by Messrs. W. Cutbush and Son, Highgate, N. The bright Orleans Rose contrasted well with White Pet; Hiawatha made a brave show in the background, and the tall vases of The President, Lady C. Waring, Mrs. Fortescue, and other carnations were arranged most effectively. Ornamental trees and shrubs were shown by Messrs. John Waterer and Sons, Lim., Bagshot. Kalmia latifolia in full bloom, acers with elegantly cut and beautifully tinted foliage, standard hollies, and clipped yews were all interesting items in the exhibit.

Messrs. Daniels Bros., Lim., Norwich, defended the honour of their city in a worthy manner, and arranged across the end of the big tent a grand display of rambler roses over a ground work of dwarf polyantha varieties and maidenhair ferns. Big banks of brilliant azaleas were placed beside the roses, with double stocks in the foreground. A crown of sweet peas was another attractive feature of this firm's elaborate exhibit. In another tent Messrs. Daniels showed a group of Hydrangea paniculata and a big bank of sweet peas.

Messrs. Sutton and Sons, Reading, made a bold and striking display of gloxinias and begonias. Each subject was arranged in a circular mound, and with ferns and small palms as a groundwork, the brightly-coloured flowers made a grand show. The begonias were all seedlings of the year, and the gloxinias were also flowering at less than six months old. Conifers and shrubs in excellent variety were grouped across the end of one of the tents by Messrs. Fisher, Son, and Sibray, Lim., Handsworth, Sheffield. Tall plants of rambler roses, with cut blooms and dwarf plants in the foreground, were put up in fine style by Messrs. A. J. and C. Allen, Earlham, Norwich. Hobbies, Lim., Dereham, had a rose garden with arches, pillars, and a central temple. The plants in pots were arranged in a manner that produced a very pleasing effect, and cut blooms of hybrid teas were deftly placed just where they showed to best advantage.

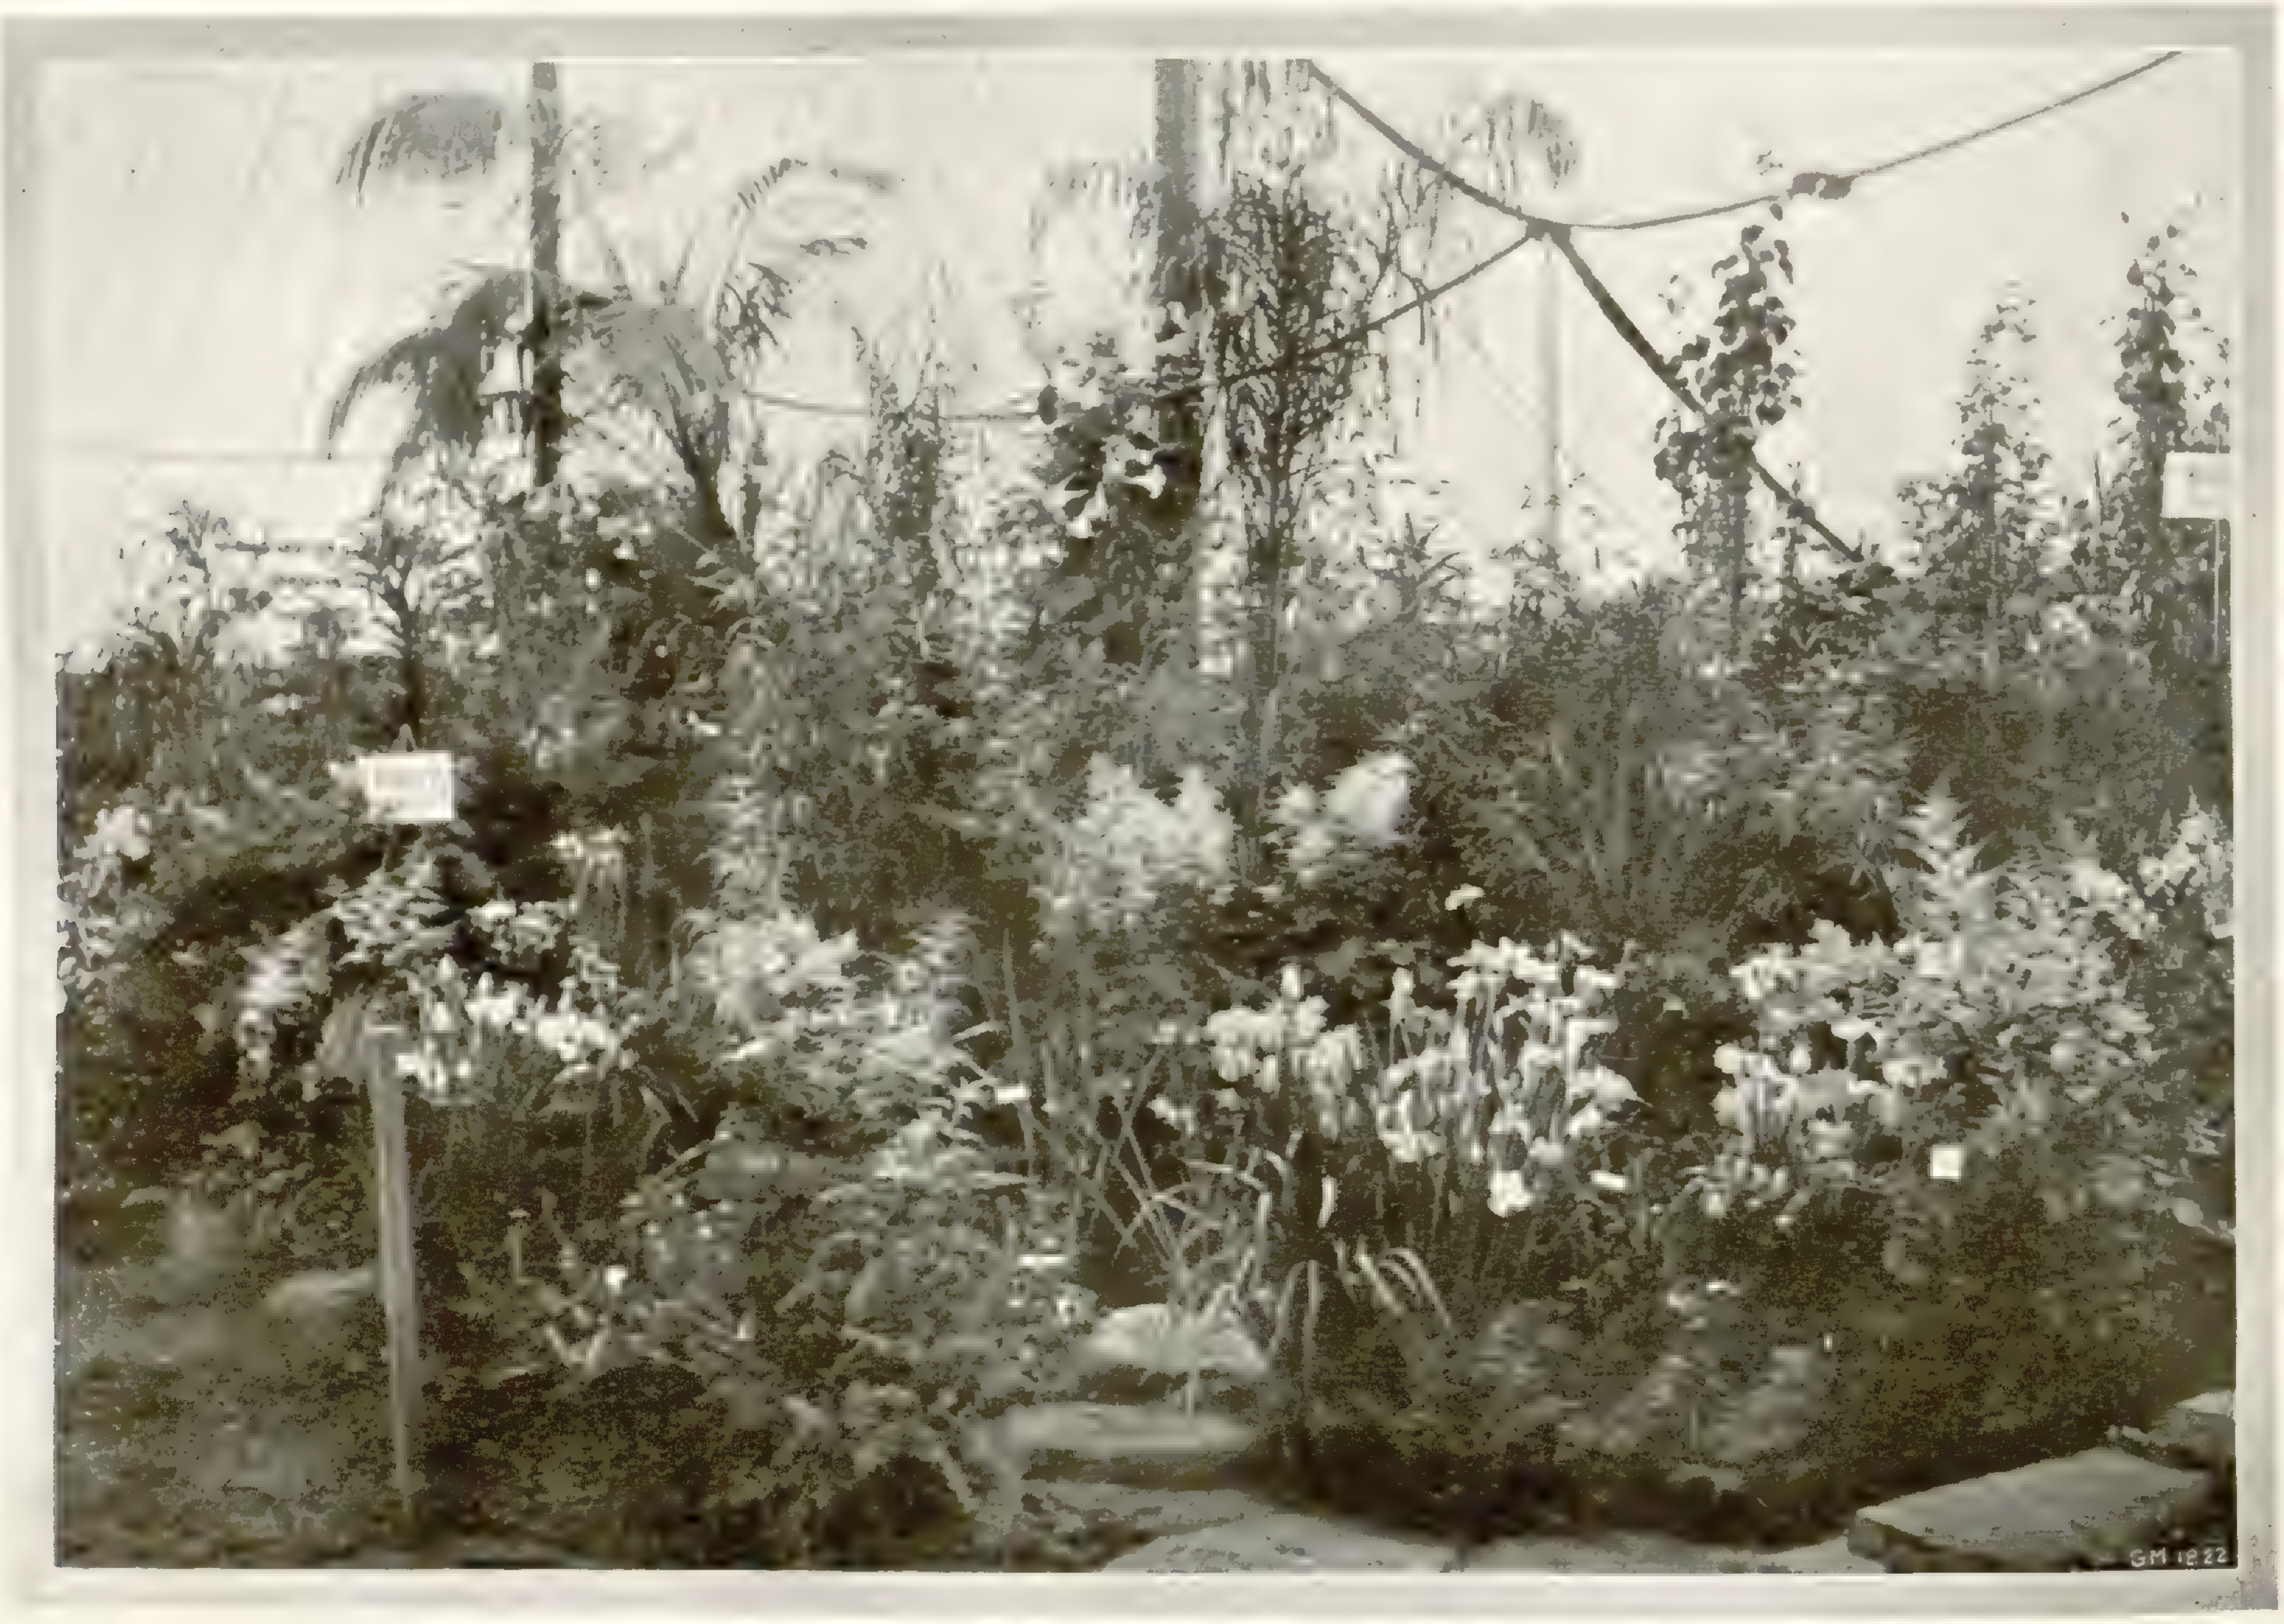
Messrs. R. Wallace and Co., Colchester, arranged a model garden of great extent and greater interest and merit. To fully describe the varied features of this exhibit would occupy more space than we can afford, but it may be said that it was without doubt one of the finest show gardens we have ever seen. At one end was a grass plot backed by a paved walk and stone wall, the walk leading to a raised terrace, which in turn led on to a water garden. In the crevices of the stone wall grew charming little alpines in endless variety, and above the wall was a border of choice hardy flowers such as Eremurus Bungei, and several varieties of distinct character; Lilium Hansoni, delphiniums, and a host of other good things. In the water garden stood a new astilbe named A. hybrida Crown Royal, a plant of great promise.

Roses and delphiniums were shown by King's Acre Nurseries, Lim., Hereford, who also had a big and attractive exhibit of pot fruit trees. Standard peaches and figs, pyramid plums, cordon apples, and trained currants, all carried excellent fruit. Messrs. Lilley, Guernsey, were exhibitors of early-flowering gladioli. Mr. H. Morse, Westfield Nurseries, Eaton, Norwich, brought a collection of roses, and Mr. W. J. Godfrey, Exmouth, showed pelargoniums, including a number of old-fashioned scented-leaved sorts not often seen nowadays. The Canterbury bells from the last-named firm were shown in fine style, and attracted much attention.

A beautiful table of orchids was exhibited by Mr. J. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey. There were arching racemes of odontoglossums and miltonias, massive cattleyas, and quaint bulbophyllums, brilliant odontiodas, and delicately tinted oncidiums, all arranged with artistic skill to make a glorious feast of lovely colour and graceful form. A massive bank of delphiniums came from Messrs. R. H. Bath, Lim., Wisbech. Dr. Bergmann, Lize, Donald McPherson, and Morena were a few varieties of different types, each beautiful in its way.

Perpetual carnations in all the popular varieties were well put up by Mr. C. Engelmann, Saffron Walden, his ever-popular Carola being well represented. Messrs. Forbe pentstemons, phloxes, delphiniums, an pansies were well shown. The Hawick fir maintain their position among the front ran of raisers and exhibitors of these and othe florists' flowers.

Sweet peas galore were staged in adm able fashion by our leading grower Robert Sydenham, Limited, Birmingham. up their flowers in the table decorations associated with their name. Maud Holmes, Thomas Stevenson, Earl Spencer, and other good sorts were well shown. Messrs. G. Stark and Son, Great Ryburgh, had a big stand with vases of Fair Maid, Loyalty, Hercules, and other sorts arranged with an eye to colour blending. Mr. C. W. Breadmore, Winchester, exhibited in his usual good style, his flowers being large and of capital substance. Mr. Robert Bolton, Warton, Carnforth, brought a splendid lot of flowers, Prince George, Olive Bolton, Stirling Stent, and Tom Bolton being a few among many of his good varieties. A display of large extent and superb quality came from Messrs. Dobbie and Co., Edinburgh. Big pyramids of Edrom Beauty, Lady Knox, Mrs. Hesling-



MESSRS. R. WALLACE AND CO.'S GOLD MEDAL HARDY FLOWER GARDEN AT NORWICH.

ton, and Mrs. Cuthbertson broke the level of the dwarfer vases shown in great numbers.

Mr. H. N. Ellison, West Bromwich, put up the best exhibit of ferns he has yet staged. Dicksonias and Polypodium glaucum crispum were the outstanding features, but many smaller kinds were equally beautiful and interesting, the arrangement of all being very tasteful. Messrs. Frank Cant and Co.'s roses were superb. Specimen blooms in boxes, bunches of garden roses, and tall stands of The Lyon and Hugh Dickson, all did credit to Colchester, the famous home of roses. Messrs. Pennell, Lincoln, showed a miscellaneous bank of flowers, among which English irises, roses, and hardy border flowers played their part.

Rockwork furnished with alpines, violas, and an assortment of hardy plants, came from Messrs. W. Fells and Son, Hitchin, Herts. Vegetables of many kinds were shown by Messrs. J. K. King and Sons, Coggeshall, who also had a quantity of sweet peas in the best varieties. Mr. G. W. Miller, Clarkson Nurseries, Wisbech, brought an interesting little group of orchids, among which odontoglossums and cattleyas were conspicuous. Hardy flowers, including Gaillardia Lady Rolleston, Dianthus Napoleon III., delphiniums, etc., were put up by Messrs. W. and J. Brown, Stamford, who also showed a collection of roses. A fine show of roses was made by Messrs. J. Burrell and Co., Cambridge. American Pillar, Trier, Mdme. Ravary, and Flower of Fairfield, in the background, were supported by well-known hybrid teas, both in bunches and single blooms.

MR. G. DAVISON'S FIRST PRIZE COLLECTION OF HARDY FLOWERS AT NORWICH.

The centaureas from Messrs. Jarman and Co., Chard, were as charming as ever, and on this occasion they were accompanied by a collection of zonal pelargoniums, which embraced the leading varieties of the day. A miscellaneous exhibit of flowers, vegetables, ferns, and foliage, was staged by Messrs. G. Massey and Sons, Spalding. Strawberries, such as The Bedford, Rival, Utility, and Reward were shown in capital manner by Messrs. Laxton Bros., Bedford. Mr. Theo E. Dawes, Syderstone Nurseries, Norfolk, displayed huge stalks of Dawes' Challenge Rhubarb, which were of handsome appearance.

Vegetables as near perfection as could be wished were shown by Messrs. Sutton and Sons, Reading. So many and varied were the dishes, and so good the quality of all that it would be trifling to single out one or two for special mention.

Messrs. Young and Co.'s carnations from Hatherley, Cheltenham, were once more put up in a masterly manner. The quality of flower and the artistic arrangement combined to make a capital exhibit.

One of the biggest exhibits of violas we have seen came from Messrs. W. Artindale and Son, Sheffield. The flowers were of large size and high quality, such distinct varieties as Blue King, Mrs. H. Pearce, Isolde, and Kathleen being strikingly represented. Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath, showed some magnificent delphiniums; W. T. Ware, Daniel, Osiris, and Harry Smetham were remarkable both for size and colour.

Messrs. Young and Co.'s carnations from nymphæas in an improvised water garden with sarracenias, spiræas, funkias, and other moisture-loving plants around the margins. Delphiniums and other good border plants were grouped at either end of the exhibit.

Among some choice orchids put up by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, some well-flowered examples of Renanthera Imschootiana were conspicuous by reason of the brilliant colour of the flowers. A splendid collection of Malmaison carnations and perpetual flowering varieties and some roses were other features of the extensive exhibit staged.

Messrs. Alex. Dickson and Sons, Lim., Newtownards, brought over from Ireland an exhibit of roses of good quality. Such favourites as Marquise de Litta, Marie Baumann, Ulrich Brunner, and Mrs. J. Laing, were accompanied by Mrs. Gordon Sloane, Viscount Carlow, Duchess of Westminster, and other varieties of recent introduction. Messrs. H. B. May and Sons, Dyson's Lane, Edmonton, showed some choice greenhouse ferns, the exquisite Nephrolepis Marshalli compacta being given the place of honour in the stand.

SEEDSMEN'S PAVILIONS.

The leading seedsmen in the Kingdom had, as usual, palatial pavilions, in which were displayed excellent samples of farm and garden seeds and their produce, the skilful manner in which the exhibits were displayed adding charm as well as educational interest to these stands.

Messrs. Sutton and Sons, Reading, had their well-known and spacious erection in the usual spot to the right of the main entrance. The floral decorations consisted of big batches of the beautiful Sweet William Pink Beauty, hybrid schizanthus, Canterbury bells, and other charming flowers. Melons, peas, tomatoes, and other vegetables, as well as farm roots, were well shown, and a feature of special interest was the collection of common pests which were exhibited, with concise hints as to methods of eradication.

A fine group of blue hydrangeas, and a group of English iris, with spiræas and roses behind, provided the decorative element of the stand from Messrs. Dickson and Robinson, Manchester. Growing samples of various grasses, clovers, etc., were an important feature of this firm's exhibit, and equally interesting were the plants of noxious and undesirable plants that trouble the farmer and gardener.

Messrs. E. Webb and Sons, Wordsley, Stourbridge, had a remarkable show of sweet peas, stocks, pelargoniums, lilies, celosias, and many other attractive flowers. Gloxinias were shown in glass cases, and on a tiered stage were arranged dishes of all manner of vegetables, among which may be mentioned Webbs' Improved Banbury onion, Prizewinner carrot, New Jewel and Regina tomatoes.

Messrs. J. Carter and Co., Raynes Park, S.W., decorated their extensive stand in fine style. They had a series of small groups of various floral subjects along the centre of the floor, one being filled with Calla Elliottiana, cannas, ericas, and ferns; others with irises and liliums, with arches of rambler roses. At the back were groups of sweet peas, delphiniums, clarkias, and early gladioli; and there were also collections of vegetables, melons, tomatoes, etc., put up in an attractive manner. Probably the most unique feature of the whole exhibit was a collection of about fifty varieties of potatoes of last year's growth, all in a perfect state of preservation. This is remarkable for this time of year.

Messrs. Dicksons, Lim., Chester, occupied the whole of their space with a gorgeous bank of delphiniums, a very complete collection of English iris, and groups of pelargoniums and other greenhouse plants. There were some remarkably attractive seedlings among the delphiniums, and a number of first-class named varieties.

Liliums, Spiræa Peach Blossom, and rambler roses were the floral features of Messrs. Dickson, Brown, and Tait's stand. The Manchester firm had the pillars of their pavilion nicely furnished with plumose forms of nephrolepis. There were also nice plants of Polypodium glaucum crispum and other ferns arranged in batches beneath the taller subjects, the whole providing an effective display of floral beauty. On a central stand were shown excellent examples of Victor tomato, Duke of Albany and Daisy peas, Blair's Prolific cucumber, Osberton melons, and some grand heads of White Star cauliflower. Tait's Best of All swede was represented by large, shapely roots, Conqueror being another fine type of swedes exhibited.

AWARDS TO NON-COMPETITIVE EXHIBITS.

Large Gold Medal.—Messrs. R. Wallace and Co., Colchester, hardy plants; Sir J. Colman, Bart., Gatton Park, orchids; Messrs. Sutton and Sons, Reading, flowers and vegetables.

Gold Medal.—Hobbies, Lim., Dereham, rose pergola and temple; Messrs. Dobbie and Co., Edinburgh, sweet peas; Messrs. Daniels Brothers, Norwich, cut flowers and roses; Messrs. B. R. Cant and Sons, Colchester, roses; Messrs. J. Veitch and Sons, Chelsea, stove and greenhouse plants; Messrs. Fisher, Son, and Sibray, Sheffield, hardy shrubs.

Silver-gilt Medal.—Messrs. A. J. and C. Allen, Norwich, pot roses; King's Acre Nurseries, Lim., Hereford, fruit trees and herbaceous; Messrs. Stuart Low and Co., Enfield, roses, carnations, and orchids; Messrs. H. B. May and Sons, Edmonton, choice ferns; Mr. R. Bolton, Carnforth, sweet peas; Messrs. R. H. Bath, Lim., Wisbech, pæonies and pyrethrums; Messrs. Blackmore and Langdon, Bath, delphiniums.

Silver Medals.—Mr. Engelmann, Saffron Walden, carnations; Messrs. W. Cutbush and Son, Highgate, roses and carnations; Mr. Ellison, West Bromwich, ferns and trained trees; Mr. R. C. Notcutt, Woodbridge, roses and herbaceous; Messrs. A. Dickson and Sons, Belfast, roses; Messrs. Bakers, Wolverhampton, hardy flowers; Messrs. Toogood and Sons, Southampton, sweet peas; Mr. C. W. Breadmore, Winchester, sweet peas; Mr. G. Massey, Spalding, flowers and vegetables; Messrs. Piper, Bayswater, trained box trees; Mr. G. Stark, Great Ryburgh, sweet peas; Messrs. J. K. King and Co., Coggeshall, sweet peas and vegetables; Messrs. W. Fells and Co., Hitchin, sweet peas and herbaceous; Messrs. Young and Co., Cheltenham, carnations; Messrs. Laxton Bros., Bedford, strawberries; Robert Sydenham, Limited, Birmingham, sweet peas; Messrs. W. Artindale and Son, Sheffield, violas, etc.; Messrs. J. Burrell and Co., Cambridge, roses; Messrs. Frank Cant and Co., Colchester, roses; Mr. H. Morse, Norwich, roses.

AWARDS TO NOVELTIES.

Award of Merit.—To Lilium Martagon the Hon. Mrs. Petre, from Colonel Petre; to Begonia Lady Cromer, from Messrs. T. S. Ware; to Begonia Mrs. Peter Blair, from Messrs. Blackmore and Langdon; to Sweet Pea Prince George, from Mr. R. Bolton; to the Newberry, from Messrs. Whitelegge and Page.

ANSWERS TO CORRESPONDENTS.

DISEASED CARNATIONS.—E. B., Aylesbury: We have been waiting for developments in the specimens sent, and now find that there is a slight attack of rust (Puccinia arenariæ), in addition to a weakening of the stems, and an eruption of cells at once suggest stigmonose. Remove the obviously affected portions, and then sponge the plants with a rose-red solution of permanganate of potassium, or spray with a weak Bordeaux mixture. Propagate only from clean, strong stock, and endeavour to improve the stock by obtaining new, healthy plants from a distance.

STREAK IN SWEET PEAS.—J. G. C., Limpsfield: Although the subject of "streak" in sweet peas has received the attention of eminent authorities, a definite and immediate remedy for the trouble seems yet to seek. Highly bred and highly cultivated plants often have to pay heavily to Nature for the additional size and quality of their blooms, and in this sense sweet peas do no doubt suffer in some measure and under certain circumstances from excessive cultivation. "Streak" so far appears to be nearly always accompanied by an attack of eelworm, and to combat eelworm it is necessary to sterilise the soil, and this is no easy matter in the open garden. A free use of lime certainly has a distinctly good effect, and has made it possible to grow sweet peas where they were previously not a success, and a correspondent who had "streak" badly last season and gave his ground a heavy dressing of fresh gas lime last autumn, tells us that the disease is so far conspicuous by its absence among his plants; he further adds that his sweet peas are particularly strong and healthy, and this he attributes to the gas lime, as all other cultural items have been the same as in previous years.

PACKING AND STAGING SWEET PEAS. —B. B., Derby: You will find these matters dealt with in an interesting and practical manner in "Sweet Peas and Their Cultivation," by Mr. C. H. Curtis; this you can obtain from the Gardeners' Magazine Office, 148 and 149, Aldersgate Street, E.C., post free for 1s. 2d.; or in cloth binding, post free, for 1s. 8d.

STAUNTONIA LATIFOLIA. — G. S., Ryde: Another and the more correct name for this plant is Holbœllia latifolia, and sometimes it is labelled H. acuminata. It is a free growing climber, and, doubtless, quite hardy at Ryde, but probably it would flower in a greenhouse, while content only to make growth out of doors. The flowers are green, produced in early spring, and they are not especially attractive, though their fragrance is usually appreciated. Probably your plants grow so freely that they do not find time to flower; if it is possible to do so, confine the roots of one of them by means of slates or bricks under and around it. This check to rampant growth may induce the plant to flower, provided the position is a sunny one. The Holbœllias are natives of Nepaul, and their fruits are eaten in India. Sandy loam and peat make a good rooting medium.

BEGONIA RUST.—J. H., Surrey: The trouble is due to the presence of a tiny mite, examples of which you will be able to find on the backs of "rusted" leaves by means of a lens, or even without its aid if your eyesight is good. We found numbers on the leaves sent, and some in the leafy sheaths around the joints of the stems. The pest is not an easy one to dispose of, but the frequent and regular use of tobacco powder, dusted on by means of one of the puff ball or bellows distributors, will eventually eradicate it.

SULPHUR FUMIGATION. — H. M., Hudd: You can doubtless obtain a fumigator from your nurseryman or sundriesman, with full instructions as to its use. With the grapes almost ripe a general fumigation might cause trouble. Use flowers of sulphur and dust it on the leaves, or sponge all the affected leaves with a sulphur mixture.

BLACK ROT IN CAULIFLOWERS.—F. E. S., Higham: This disease (Pseudomonas campestris) attacks various members of the cabbage family—indeed, all Crucifers are liable to attack. According to the Board of Agriculture, the lower leaves of the plants are usually infected first, the germs entering the substance of the leaf through minute openings (water stomata) situated along the margin, or through wounds caused by the punctures of insects, etc. In cases where the soil is infected the germs may gain an entrance to the plant through broken roots at the time of transplanting. When the bacteria are once inside the leaf they multiply rapidly, and are confined to the veins, from whence they pass down the leaf-stalk into the stem. From the stem they quickly pass into the stalks of other leaves, so that within a short time every leaf is infected. As the bacteria travel along the veins and the vascular bundles of the leaf-stalks and stem a dark-brown or blackish substance is deposited, which causes the veins to show up as a black network; the vascular bundles of the leaf-stalk and the stem also appear as black points or a blackened ring when cut across. The

The combination head of the Pine Spray Syringe

provides for every spraying requirement without the addition or removal of a single fitment. The change from "rose" to "spray" is made by merely turning the syringe, and delivery through either can be directed up or down by bending the adjustable joint. The

PINE SPRAY SYRINGE

can be instantly adapted to the needs of any particular plant, whether the spray required is coarse or the finest or the fine, or whether delivery of the fluid is needed straight, overhead, or underneath. Before you buy a syringe ask your ironmonger or seedsman to write to us for one on approval. The price is 10/6, the size 24in. over all, and 1¼in. diameter. Sole proprietors,

ROBINSON BROTHERS, LTD.,
WEST BROMWICH.

Robinsons'
PINE SPRAY
NON-POISONOUS
INSECTICIDE

In the Destruction of Greenfly

a little Pine Spray goes a long way. A syringe full of 1 part to 80 parts of water solution is enough to spray thoroughly an average bush rose and destroy all greenfly, while regular sprayings afterwards with the same strength wash will keep the tree free from parasites—clean, vigorous, and healthy.

Most seedsmen and ironmongers sell it, but if you have difficulty in obtaining it, send 7d. for large sample tin, to Robinson Brothers, Ltd., West Bromwich.

PINE SPRAY,
NON-POISONOUS — ABSOLUTELY SAFE.

PLEASE MENTION
THE GARDENERS' MAGAZINE
when writing to Advertisers.

presence of this blackening of the veins is a certain indication of the presence of the disease. As remedies and preventives, transplanting should be carefully done, so that the roots are injured as little as possible. Infected plants should neither be buried nor used as food for cattle or pigs, but should be promptly removed and burned, or infection of the land will follow sooner or later; and rotation of crops is advisable, cereals, potatoes, and legumes not being attacked. The following precautionary measure may also be suggested. Seed can be disinfected before sowing by soaking it for fifteen minutes in a solution consisting of one part of corrosive sublimate in 1,000 parts of water, or in a solution of 1lb. of formalin in 30 gallons of water. It is hardly to be expected that this treatment will prevent either leaf or root infection in infected soils, but it may be safely relied upon to prevent all danger from infected seed. It will not injure the germinating power of the seed.

LAYERING CARNATIONS.—P. T., Cambridge: The earlier you can layer your carnations now the better; we have an article in type on this subject.

NAMES OF PLANTS.

G. G., Chalfont St. Giles.—Orchis maculata.

E. C. C. D., no address.—Tellima grandiflora.

A. J. H., no address.—1, Bloomeria aurea; 2, Alchemilla vulgaris; 3, Geranium ibericum.

W. G. J., Ulverston.—1, Phyllanthus (or Reidia) glaucescens; 2, Cypripedium Goweri-anum.

G. S., Ryde.—1, Limnanthes Douglasi; 2, Sedum rupestris; 3, Alchemilla alpina; 4, Salix caprea.

M. E. K., Portland.—1, Statice Bonduelli; 2, Podophyllum peltatum; 3, Hydrocotyle asiatica; 4, Juniperus virginiana; 5, Buphthalmum cordifolium; 6, Butomus umbellatus.

W. C. B., Doncaster.—The broad-leaved saxifrage is S. Willkomiana, and the one with more divided leafage is S. Wallacei; the fine-leaved plant is Adonis vernalis, and the flowering specimen is Dracocephalum peregrinum.

NOTE OF THE WEEK.

◆

Town Trees.

There is now so high an appreciation of public parks and gardens by all classes of the community resident in urban areas that those in charge of open spaces have ample encouragement for making the most strenuous endeavours to render them as bright and attractive as the conditions that obtain will permit. That this fact is fully recognised by those concerned we have evidence on all sides, and those who are fully acquainted with what has been accomplished during the past quarter of a century will not be slow to acknowledge that immense improvements have been made in the management of parks and gardens that are open to the public. There may, in many cases, have been a material reduction in the area devoted to what is popularly known as summer bedding; but this would be a small matter were there no compensating advantage. As a rule, however, any reduction that has been made in the displays of summer flowers has been more than balanced by the largely increased use of bulbous and other plants that bloom during the spring months. The development of spring gardening is a distinct gain, for at no period of the year is bright colouring more highly appreciated than in April and May, when hyacinths and tulips yield of their floral wealth, and such fibrous-rooted plants as arabis and aubrietia, and wallflowers and violas, contribute liberally to the various colour schemes by great breadths of crimson, golden, and purple flowers. The greatest gain in connection with open spaces in and around towns has been the increased attention that has been devoted by those in charge to hardy trees and shrubs. As the result of this we see the commoner trees and shrubs being replaced by choicer kinds that give promise of thriving under the conditions that obtain, and it is not, therefore, difficult to realise that at no distant date the interest and attractions of public parks and gardens will be greatly enhanced. There is, however, one point in connection with tree life in towns from which it is not possible to derive a very large amount of satisfaction. It is, of course, gratifying to know that trees are being planted in the streets in much larger numbers than at any other period in the history of this country, and that the planting is done with much greater care, and efforts made to maintain them in a thriving state after they have become established. But an examination of the trees that have been planted alongside the roads in towns of importance suggests that tree life in relation to beautifying the streets has not been so closely studied as its importance would justify. We have been induced to take this view because of the small number of kinds that have within recent years been planted in towns, although the soil and climatic conditions that obtain within their areas show a wide difference. It would appear from observations made in different parts of the United Kingdom that planters have, generally speaking, followed each other much too closely in the making of selections. It has evidently been thought that because some thirty or forty years ago it was proved to demonstration that the London plane and the common lime are able to withstand the deleterious effects of the impurities with which the air of large manufacturing towns is so highly charged, they alone are suitable for planting in the streets of towns. These, and especially the first-named, with a few others known to thrive under similar conditions, should alone be planted in towns where the conditions are distinctly unfavourable to tree life. But there are hundreds of towns wherein there are no manufactures, and where the atmospheric conditions are hardly less favourable to the growth of trees than in the open country, and it should be obvious that in making a selection the planter is not restricted to smoke-resisting kinds. There is a great need for more diversity in the trees planted in the streets of towns, and even a greater need for selecting trees of a size suited to the space they are to occupy. If this were done a considerable saving in labour would be effected, and the trees will certainly present a more natural and pleasing appearance. It is well known that the London plane is one of the largest of forest trees, and yet every year hundreds are planted, the greater proportion in streets so narrow that trees of a quite small size would alone be really suitable. The London plane is indeed of so robust a growth that when in the widest of thoroughfares considerable pruning has to be done, but when in narrow streets they have to be pruned so severely that they are usually pitiable objects. It would not be difficult to enumerate a considerable number of ornamental trees of moderate stature that would thrive in towns of which the atmosphere is not greatly contaminated, but our object in referring to this question at the present time is not to give a list of trees that should be planted, but to suggest to those who are specially concerned with the arborescent features of towns the importance of carefully studying trees that are likely to be suitable for street planting for the purpose of determining the positions for which they are best adapted. For this purpose nurseries in which ornamental trees form a strong feature, and botani-

MR. F. BRIDGER.

cal gardens that are convenient of access, should be visited while the trees are in full growth, and careful note made of their characteristics. In many instances the public parks and gardens belonging to the respective towns, and private gardens within or immediately beyond their boundaries, will afford material assistance in formulating an opinion as to the relative merits of some of the kinds, and whatever help can be obtained should be taken full advantage of. It appears to us most desirable that in beautifying the streets of towns from which manufactories are absent a much larger number of kinds should be utilised than is now considered necessary, and that trees of moderate size, that are in other respects suitable for streets, should be taken full advantage of. The time has certainly arrived when the practice should be given up of planting forest trees in confined spaces, and then spending time and money in preventing their branches so extending as to impede the traffic or block out the light from business premises or dwelling houses that are alongside the streets in urban areas.

Mr. Frederick Bridger, whose portrait we have the pleasure of giving in this issue, has been so long associated with the horticultural activities of Penshurst Place, the historic seat of Lord de l'Isle, that he occupies among practical horticulturists a position that is by no means common, if not unique. For sixty-two years he has been closely associated with the gardens of Penshurst Place, and for about two-thirds of this long period he has occupied the position of head gardener. Mr. Bridger comes of a gardening stock, and in the year 1849 he left school to assist his father, who was head gardener at Penshurst Place forty-eight years, and he continued in the gardens, occupying, it need hardly be said, various positions of responsibility until 1869, when he succeeded his father. This point is of interest as a further proof of there being an exception to every rule. It is regarded as a good rule at the present time, as in the past, that every young man, when being trained for a gardening career, should have experience in several gardens in different parts of the country, and an excellent rule it unquestionably is; but we have a proof in the case of Mr. Bridger that it is possible, when the necessary ability is forthcoming, to obtain a high position without any change while in the probationary stage. Mr. Bridger's training was limited to the gardens of which he has for over four decades had charge, and throughout the thirty or more years the present writer has known them they have been regarded as prominent among the many important establishments in the district of which Tunbridge Wells is the centre. As the chief of gardens that bear the impress in a marked manner of skilful management Mr. Bridger has long been highly esteemed by those acquainted with his work, and at no period in his career has he been held in higher estimation than at the present time. There is no occasion that we should refer to the characteristic features of Lord de l'Isle's beautiful gardens, for they were described and illustrated in the Gardeners' Magazine of January 9, 1909; but it should be mentioned that they are in keeping with the ancient mansion to which they form so delightful a setting. At Penshurst we have a splendid example of the Old English garden, and this has, if we are not under a misapprehension, been created by Mr. Bridger, who has received the most generous encouragement from his noble employers. Judging by the results, Mr. Bridger must, in carrying out alterations in the flower gardens and pleasure grounds, have made careful note of the genius of the place, for everything is in keeping with a mansion whose history extends over several centuries. In other departments everything is carried out in accordance with the most modern methods.

Northern Fruit Congress.—It has been arranged to hold the Northern Fruit Congress at Newcastle-on-Tyne this year, and to carry it out under the auspices of the North of England Horticultural Society, the Newcastle Chrysanthemum Society, the Hexham Fruit Congress Committee, and the Four Northern Counties Scientific Committee in Horticulture. The congress and fruit show will be held in the Town Hall and Corn Exchange on November 15 and 16, in conjunction with the Newcastle Chrysanthemum Society's show. As at present arranged there will be afternoon and evening meetings on each of the two days. At the afternoon meeting on November 15, "Fruit Culture in the North" will be discussed. The discussion will be opened by Mr. J. S. Chisholm and Mr. W. B. Little. The evening meeting of the first day will be devoted to the all-important subject of "Horticultural Education." At the afternoon meeting of the second day there will be lectures on "Fruit Bottling," "Pruning," and "Soils and Food Supplies," and a lecture on "Diseases of Fruit Trees" will occupy the evening meeting on the second day.

Royal Horticultural Society. In connection with the Olympia Flower Show, the Council of the Royal Horticultural Society entertained at luncheon on Wednesday the Premiers, Governors, Commissioners, and other visitors from the British Colonies. Sir Trevor Lawrence, Bart., presided over a gathering that filled the Pillar Hall at Olympia, and was supported by several of the guests and members of Council. The toast list was a comparatively short one, and, as a matter of course, the loyal toast was proposed by the president. Sir Daniel Morris submitted the toast of "The Guests," and in the course of an excellent speech, referred to the work that had been accomplished by the Royal Horticultural Society in the furtherance of horticultural enterprise throughout the British Empire. The toast was acknowledged by the Premier of the Australian Commonwealth, who spoke in eloquent terms of the kindness received by the Colonial visitors during their stay in London. The other two toasts were the "Royal Horticultural Society" and "The President." The members of the gardening Press were placed in an unfortunate position, inasmuch as they were too far from the speakers to clearly hear them.

Origin of Darwin Tulips.—It is a matter of common knowledge to those who are interested in bulbous plants, that the Darwin tulips were introduced to cultivation by Messrs. E. H. Krelage and Son, of Haarlem, but the origin of this extremely beautiful section has hitherto been somewhat obscure. It is, therefore, of much interest to find in the sketch of the history of the firm during the past 100 years a reference to these tulips, in which their origin is given. Mr. Ernst Krelage, the present head of the firm, by whom the historical sketch has been compiled, writes: "The origin of this strain was a small collection of amateur tulips from the North of France, where in the 18th century the tulip had been a favourite flower. This strain, after having been improved and propagated, was quite distinct from everything known before as self breeder and mother tulips. Mr. Krelage at once realised the exquisite beauty of the dazzling colours for garden decoration and market purposes, and asked and obtained the permission to dedicate the strain to the memory of Darwin, these tulips having been improved by continuous hybridising, and so being a splendid example of the variability of plants which has been one of the important parts of Darwin's life work. Prof. Francis Darwin replied: 'If my father had been alive, I am sure he would willingly have consented to your proposal, and I think I may safely answer for the other members of the family, who, I am sure, will feel pleased, as I do, at the spirit and manner in which you propose to name your new strain.'"

Sweet Pea Outings.—Following its usual course, the National Sweet Pea Society has arranged two outings for the purpose of inspecting sweet peas. One of these will be to the "Times" Experimental Station, Sutton Green, near Guildford, on Thursday, July 13, to inspect the society's trials, nearly three hundred rows, that are being conducted by Mr. Harry Foster. On this occasion the charming gardens and grounds of Sutton Place, kindly thrown open to members by Lord and Lady Northcliffe, will prove an additional attraction. On the following day, Friday, July 14, there will be an outing to Messrs. R. H. Bath and Co.'s floral farms at Wisbech, on the invitation of the chairman of committee, Mr. G. W. Leak.

R.H.S. Exhibitions, 1912.—In consequence of the ever-increasing number of visitors to the fortnightly shows held by the Royal Horticultural Society, the Council have had under consideration for some time past the question of extending them over two days in the months of March, April, May, and June. It has been stated in some of our contemporaries that the Council have already decided to make the change, but this is not the case, for they have not as yet come to a final decision on the matter.

Blairgowrie Fruit Crops.—At the middle of June strawberries and raspberries were suffering so severely from prolonged drought that it was feared the crop would be light, and the fruit of small size. The rains that fell in the second half of the month have placed a quite different complexion on the plantations in the Blairgowrie district. The fruits have swollen up to an average size, and those that have attained maturity are of high quality. The prices of both raspberries and strawberries are higher than for several years past. At the recent sales strawberries realised £28 and £29 per ton, and raspberries from £26 to £28 per ton. The figures represent an increase of £9 or £ per ton, as compared with the prices obtained three years ago. The crop of black currants is very light in the Blairgowrie district, and the crops of apples and plums will be below the average.

Coronation Sweet Pea Buttonholes at Blackburn.—In honour of the Coronation of our King and Queen, the Blackburn and District Horticultural Society provided a buttonhole bouquet of sweet peas for each of the two hundred and fifty gentlemen who took part in the civic procession to the parish church at Blackburn on Coronation Day. The Blackburn Society has about 750 members, and it thought this would be a fitting occasion on which to show its loyalty to the throne and also its appreciation of the support it receives from the public. A few of the members provided the flowers, and the gifts were highly appreciated.

GREAT EXHIBITION AT OLYMPIA.

July 4, 5, and 6.

To take such an enormous building as the Olympia, at Addison Road, for a three-day flower show—July 4, 5, and 6—was a big venture on the part of the Royal Horticultural Society, and at the moment of writing we do not know whether it has proved a financial success. Be that as it may—and we must remember that the society has a big Fellowship to cater for, the move was enormously successful horticulturally, notwithstanding the need for improvement in arrangement and setting that became obvious when the exhibits were all staged and judged, and the people present in crowds. We congratulate the society and all its officers on the big effort made and the success achieved, and also the exhibitors for turning out in such large numbers.

The garden-like arrangement of the exhibits in the great annexe was capital, and if on a future occasion the centre of the great hall could be given up to equally artistic arrangements of plants and flowers, and the exhibits on tabling set up in the broad second gallery facing inwards to the centre, there would be a finer effect, as the lower tiered staging on which so fine an effect was produced on this occasion would then appear to join with the displays above and produce an immense bank of colour and beauty. This second gallery would even then accommodate such exhibits as were practically lost and spoiled in the top gallery on this occasion.

Those exhibitors who were placed in the upper gallery complained bitterly of their position and of the heat that so quickly spoiled large numbers of the flowers, but even greater was their complaint that so few of the people in the building came up to see what was staged.

The great building needs more or earlier ventilation in hot weather; but had the weather been cool or wet, everyone would have been loud in their praise of the warm, dry, and comfortable conditions prevailing under the great roof of Olympia. The strong light from the roof needs to be subdued something after the fashion adopted at the great Horse Show, or at the great Ghent Exhibition, while soft drapery over the girders that carry the galleries would be a further improvement, and, if centre tabling is to be followed in future, an avenue of very tall palms down the centre of the building would prove effective.

EXHIBITS IN THE GREAT HALL.

Mr. Amos Perry, Enfield, was a very large exhibitor, filling a big space on either side of the broad entrance way with huge sheaves of delphiniums, these representing a large number of the finest varieties in which, of course, the range of blue shades was very great; Amyas Leigh, Zaza, Midas, Gertrude, Belladonna semiplena, Antigone, Duke of Connaught, David, Carmen, and Portia were a few of the choicest forms, while Devonshire Cream, a cream-coloured form, was also conspicuous. Bamboos and a goodly collection of hardy ferns were associated with this huge exhibit of delphiniums and added greatly to the general effectiveness.

Messrs. James Veitch and Sons, Chelsea, contributed a large and brilliant group of stove plants, and here were grandly grown crotons, stately palms, bold caladiums, alocasias, and graceful ferns, with quaint nepenthes. There were groups of cannas, Solanum Wendlandi, anthuriums, and the bright Kalanchoe flammea, while the central feature was a showy grouping of choice orchids. Close by was a table filled with choice perpetual and Malmaison carnations, cannas, streptocarpuses, Exacum macranthrum, gloxinias, and standard and pillar-trained fuchsias; the latter trained on stakes as though on the rafters of a span-roofed greenhouse, were charming, the pendant blossoms being seen to full advantage under this system.

A particularly fragrant display of phloxes was contributed by Messrs Gunn and Sons, Olton, who always show these flowers finely. They had 6ft. high stands of such varieties as General van Hentz, Wilbur Wright, Elizabeth Campbell, Countess of Ilchester, Le Mahdi, and Molière, and great bunches of Esperance, Etna, Coquelicot, Tapis Blanc, Violet, G. A. Stroehlin, etc.; it was a very fine exhibit.

Messrs. Barr and Sons, Covent Garden, presented a rather formal bank of hardy flowers, but the several kinds were grouped together with considerable effect; tall spikes of Lilium giganteum rose in stately fashion from the centre, and there were good groups of L. Wilsoni, L. pardalinum, L. candidum, and L. croceum, with masses of Campanula pusilla, C. p. pallida, C. p. alba, C. carpatica Ditton Blue, Alstrœmeria lutea, Nepeta Mussini, Salvia virgala nemorosa, varieties of Gladiolus Colvillei, and a host of delphiniums. Just below this bank the Covent Garden firm staged a collection of dwarfed Japanese trees that appealed to many visitors by reason of their gnarled trunks and quaint forms.

Messrs. E. W. King and Co., Coggeshall, presented sweet peas in graceful style, arranging three large arches of bloom over stands and vases of such sorts as Anglian Blue, Anglian Orange, Clara Curtis, Evelyn Hemus, Helen Lewis, Mrs. Routzahn, Mrs. W. King, etc.

The roses from Mr. Chas. Turner, Slough, were associated with grouplets of Malmaison carnations, including the deep crimson Maggie Hodgson. The roses were presented in baskets of a variety, in growing pillars, standard and bush form, some of the weeping standards looking like lovely shower bouquets.

The large bank of Malmaison carnations staged by Mr. A. T. Paskett, gardener to E. J. Johnstone, Esq., Groombridge, Kent, was a fine effort from a private garden. The variety mostly in evidence was Princess of Wales, but there were a few crimson flowers here and there; with the exception of a stand of blooms in the centre, the whole group was of growing plants. The same exhibitor showed a quantity of sweet peas and per-

MESSRS. SUTTON AND SONS' SILVER CUP COLLECTION OF VEGETABLES AT THE OLYMPIA SHOW.

petual carnations. Mr. S. Larkin, Haslemere, had a few vases of good sweet peas.

A well arranged group of hardy flowers, from Mr. J. Box, Lindfield, Sussex, was a little weak in the foreground; the delphiniums were well set up at the back, and so were the gladioli, Iris Kæmpferi, and phloxes; violas and pansies were arranged in front, and if hardy instead of greenhouse ferns had been used as an edging the exhibit would have been improved.

Messrs. H. B. May and Sons, Edmonton, put up a superb group of ferns. In the matter of extent, culture, and variety this was one of the finest exhibits of its kind ever put up. In the middle were a dozen perfect examples of Nephrolepis Marshalli compacta, and all over the group were finely-developed examples of all the choicest plumose nephrolepis. Towards the back were huge plants of Davallia fijiensis, D. polyantha, D. pallida, Platycerium alcicorne, Phlebodium aureum, Polypodium Schneideri, Osmunda japonica, etc., while Dicksonias and lygodiums towered above everything else. Towards one end choice British ferns in wonderful variety, and showing the elegance and beauty of frilled hart's-tongues and plumose lady ferns, were arranged in such a way as to compel attention. This was a great effort, and well carried into effect.

MESSRS. DOBBIE AND CO.'S GOLD MEDAL COLLECTION OF SWEET PEAS AT THE OLYMPIA SHOW.

Messrs. R. H. Bath, Ltd., Wisbech, presented delphiniums in great variety, and associated these with roses and bunches of charming English irises; the cream-coloured delphiniums and the perpetual carnations were good features.

A magnificent exhibit of sweet peas from Messrs. Dobbie and Co., Edinburgh, was greatly admired, as much for its pleasing arrangement as for the fine colour and quality of the flowers. Stands of varying size, and vases of different heights were utilised with good effect, and a few small palms at the back and sprays of smilax in the front added immensely to the effect. Right in the foreground were broad baskets of beautiful blooms. A few specially effective varieties were Melba, Clara Curtis, Nubian, Zarina, Mrs. Hugh Dickson, the new May Campbell, Lady Knox, Sunproof Crimson, Edrom Beauty, Mrs. A. Ireland, and Elfrida Pearson.

A striking exhibit of roses and carnations from Messrs. W. Cutbush and Son, Highgate, occupied an end position just where the Great Hall opens into the annexe. A fine background of bamboos, and standards and pillars of Wichuraiana roses lent effect to the weeping standards and tall vases of perpetual carnations all over a carpeting of such polyantha roses as Jessie, Mrs. W. H. Cutbush, and Orleans rose. A few bright crotons and Coleus Cordelia added brilliance. Beacon, Rose Doré, White Perfection, Victory, Mrs. Belle, and Mrs. Fortescue were carnations well shown and in large numbers.

Messrs. G. and A. Clark, Dover, had a pretty little rock and water garden, and put up fine groups of Gilia coronopifolia, Lilium longiflorum, and Iris Monieri.

Sweet little violas and violettas, staged in low bowls, made up a pretty exhibit from Mr. Howard H. Crane, Highgate.

Messrs. G. Stark and Son, Great Ryburgh, exhibited sweet peas extensively and pleasingly, and had George Stark, Enchantress, Helen Lewis, and Premier in good form.

From the Tully Nursery, Kildare, came St. Brigid anemones, with batches of Campanula pusilla, C. p. alba, Hypericum fragilis, and Dracocephalum speciosum imbricatum.

Mr. L. R. Russell, Richmond, had a large group of specimen stove plants wherein the alocasias were splendid, and so were the examples of Dracæna Victoria and Anthurium crystallinum; crotons and anthuriums added rich colouring. A large exhibit of tree ivies also came from Mr. Russell.

The massive specimen caladiums from Messrs. J. Peed and Son, Norwood, were a bold feature, their huge leaves and varied and brilliant colouring, as well as delicate shades attracting great attention.

The little rock garden exhibit from The Craven Nursery Company, Clapham, Yorks, contained a collection of graceful campanulas, the pusilla forms being well represented. Ostrowskia magnifica, Lilium rubellum, edelweiss, and saxifragas were also included.

Hardy flowers in great variety, and making up a big bank, were exhibited by Messrs. T. S. Ware, Lim., Feltham. The leading features were delphiniums, Campanula persicifolia Moerheimi, Helenium Bigelowi, Aconitum napellus albus, and Malva moschata alba.

Messrs. R. Harkness and Co., Hitchin, needed a background to show off their roses effectively; they had cut blooms of prominent tea and H.T. varieties set in vases and stands.

Very fine were the double tuberous begonias exhibited by Mr. A. L. Gwillim, Sidcup, Kent, and especially good were the orange-coloured Sultan, the crimped pink Enchantress, and the salmon-pink Evening Glow.

Messrs. Whitelegge and Page, Chislehurst, contributed hardy flowers in quantity and edged their exhibit with bowls of violas. Campanula persicifolia Moerheimi, C. p. Coronata, liliums, Geum coccineum Mrs. J. Bradshaw, Dianthus Napoleon III., and Salvia sclarea were prominent subjects.

Mr. R. C. Notcutt, Woodbridge, filled a large space with hardy flowers and roses; the latter were shown in a cut state and also represented by weeping standards; Madame Melanie Soupert, Lyon Rose, and Madame Abel Chatenay were varieties well shown; while among hardy flowers we were struck by the sheaf of Kniphofia rufa.

The Misses Hopkins, Shepperton, built up a rock and water garden of large size with a winding rock pathway over it, from whence every part could be easily examined. Side by side with this and with the pathway continuing over it, was a rock and water garden arranged by Messrs. Heath and Son, Cheltenham. It was a capital idea for the two firm

(Continued on page 505.)

ROCK PINKS.

The various species of alpine pinks are extremely useful for rock garden planting and for wall gardening, in fact, many of them are more at home on the top of an old wall than anywhere else. The majority delight in a sharp gritty soil with plenty of old mortar rubble added to it, and the plants usually live longer in this than when grown in rich soil. When planting a sunny position should be selected where the soil is thoroughly drained, so that there is nothing approaching stagnation about the roots during the winter. The culture is simple, and propagation is readily accomplished both by seeds or cuttings.

In raising a stock of plants from seeds the best time to sow is the end of May or beginning of June, when a nice batch of flowering plants can be obtained either for autumn or spring planting. The seed is quick in germinating, and should be sown in light sandy soil. As soon as the seedlings attain a suitable size they should be transplanted into boxes, and if they are to be put out into their permanent quarters early in the autumn, may be safely planted direct from the boxes. Early in October is the most suitable time to do this, keeping them well watered until established.

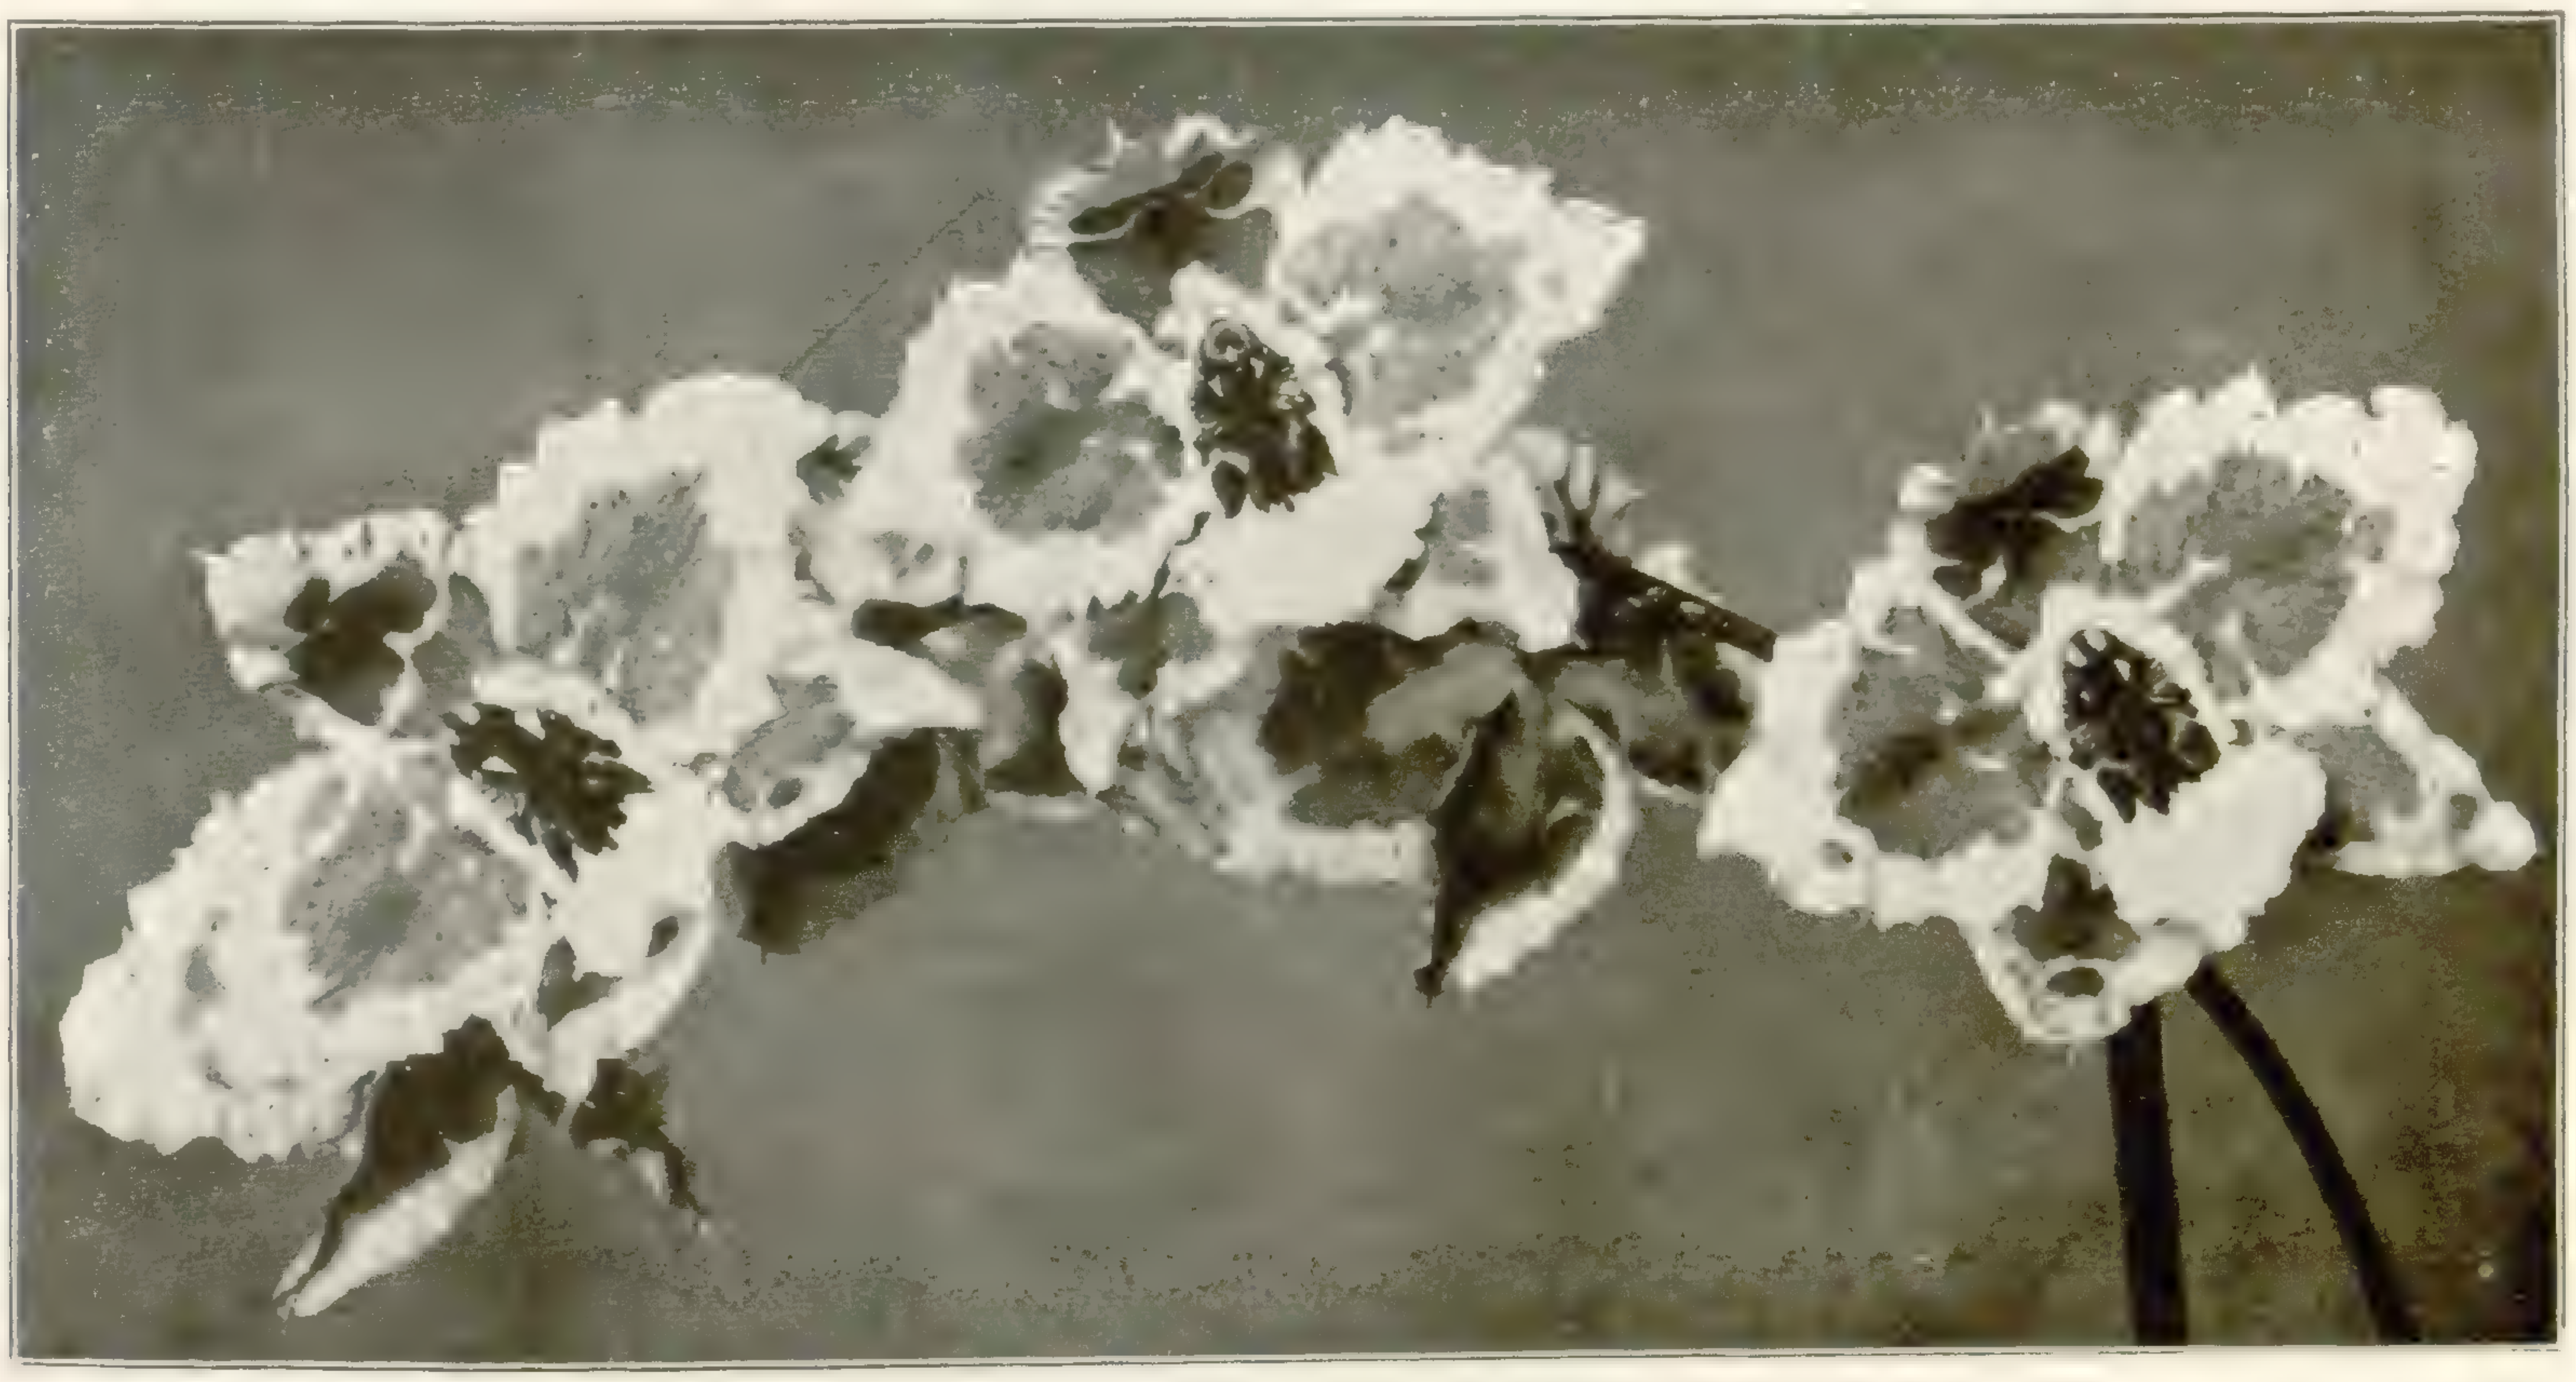
In damp localities it is often advisable to winter them in frames, and when this method has to be adopted the young plants should be potted up early in the autumn, deferring the planting until the spring. Pot-grown plants stand a much better chance of doing well when this has to be carried out, as the roots are not so much pulled about, and the plants are able to withstand the drying winds better than when taken direct from the boxes.

Increasing by cuttings or pipings is very simple, pulling off the small side shoots, in exactly the same manner as practised with the ordinary border pinks. This should be done about July, and the growths inserted in clean sand in a close frame. Here they will quickly form roots, if kept moist and shaded, and the young plants should be potted up immediately root action is seen. The most suitable potting material is a mixture of loam, leaf-soil, and old mortar rubble. In potting it is advisable to place a few pieces of limestone or mortar rubble round the collars of the plants to prevent undue moisture remaining in close proximity to the stem, for excessive moisture often causes decay in the earlier stages of growth. After potting the plants should be grown on in a frame until they are thoroughly established, after which time they may be gradually exposed to the air and sun.

In making a selection include D. alpinus, for it is one of the best; it forms neat cushions of foliage, and bears large flowers of a deep rose colour with a crimson ring at the base of the petals. In habit it is very sturdy, and hardy, also one of the easiest to cultivate. There are various forms of this species, ranging from white to deep rose. D. Cæsius (Cheddar Pink) is extremely useful for wall gardening; its rose-coloured flowers are borne in great abundance, and a good-sized group of plants will produce quite a sheet of colour. The flowers of D. deltoides are small, yet they are produced in large numbers, and it is a species well worth a place in any rock garden. There is a white form of this. D. neglectus is a choice species, with foliage resembling very fine grass. The flowers are rose on the upper side and buff underneath. This species is exceedingly liable to damping during the winter, and it is advisable to cover it with a sheet of glass to keep it drier. D. cruentus has crimson flowers, in dense heads, on stems about nine inches high. D. fragrans is prettily fringed, and sweetly scented.

Some interesting results are obtained from a batch of seedlings of D. superbus and D. sylvestris; they are beautifully fringed, and marked, and very free flowering. The flowers are borne on branching stems, and very fragrant. D. Knappi is a Hungarian species, bearing heads of pale yellow flowers. D, graniticus is similar to deltoides, both in flowers and habit. D. nitidus is sometimes said to be a form of alpinus; the foliage is similar to that of the latter, but the flowers are not so large, nor such a good colour, and the stems are longer. Whatever its origin, it is a good plant, and well worthy of cultivation.

E. C. Pooley.



ODONTOGLOSSUM ARDENTISSIMUM QUEEN MARY.

A handsome variety, the flowers rich purple with broad white margin to the petals and sepals. F.C.C., R.H.S., July 4. Messrs. Sander and Son.

THREE USEFUL BROOMS.

Many of the brooms are at their best during May, but there are a few kinds which bloom throughout June and early July. Three of these are Genista æthnensis, G. cinerea, and G. virgata. All are tall-growing species, and they form wide-spreading bushes, which, during the flowering period, are masses of gold. G. æthnensis is a native of Sicily and the adjoining mainland. It grows from fifteen to twenty feet in height, and is remarkable for its light and graceful habit, the branchlets being pendant and slender. The leaves are very small, and are sparingly produced. The golden blossoms appear with great freedom in July, and create a glorious display of colour. G. cinerea is found wild in South-west Europe. It grows twelve or fifteen feet high, and forms long slender branches clothed with small linear leaves. The golden blossoms are borne in short, axillary racemes, in June, and they create a fine display during the greater part of the month. G. virgata, a native of Madeira, is somewhat like the last-named, but is of stiffer habit. It grows into a bush twelve or fifteen feet high, and as far through. Its linear leaves are silvery on the undersurface by reason of numerous soft hairs. The golden flowers are borne freely in June, and are very effective. It is one of the best possible shrubs for planting in poor soil, and it thrives satisfactorily in the open, and also in partial shade. All three shrubs are readily increased by means of seeds, and quickly form good specimens. It is, however, necessary to transfer them to permanent situations when not more than two or three years of age, for large plants establish badly, and it is almost impossible to tranplsant a specimen six or seven years of age successfully. Plants that are newly put out establish best if supported by a stake each, in order that they may be kept quite firm. Young plants should be pruned over once or twice a year for the first three or four years to prevent their becoming leggy. Planted in the wild garden, G. virgata will reproduce itself naturally from the seeds dropped beneath the plants.

D. W.

NOTES FROM KEW.

Chrysanthemum Parthenium flore plena.

Under this name, which just signifies a double form of the common feverfew, a very ornamental plant is in flower in the Greenhouse. The plants, which are freely branched, are from eighteen inches to two feet in height, and each bears a profusion of little double rosette-like blossoms, about three-quarters of an inch across, and pure white in colour. It is a very effective decorative plant for the greenhouse at this season, and at Kew its beauty is enhanced by the fact that in a group it is associated with Clarkia elegans Firefly, the bright colours of which form a pleasing combination with the light tint of the chrysanthemum.

Sollya heterophylla.

This, the Blue Bell Creeper of Australia, is a twining plant of a ligneous character that will produce its pretty drooping bright blue flowers throughout the summer months. It may be grown in pots, trained around a few sticks, or planted out it will form a very pretty roof or pillar plant. For this last-named purpose it is employed in the greenhouse at Kew.

Diplacus glutinosus.

This old plant has flowers of a buff-yellow colour, but in the variety coccineus they are deep red with a yellow throat, and also larger in size, form good subjects for the embellishment of the greenhouse. A group of each in the house No. 4 is just now very effective, the plants being laden with blossoms, and a succession is likely to be kept up for a considerable time. Both are plants of very easy culture. Botanists now include the genus Diplacus with the Mimulus, and as such they are grown at Kew.

Hæmanthus Katharinæ.

Most of the hæmanthuses are very showy flowering plants, but many of them are not very amenable to cultivation. One of the least exacting in its cultural requirements, and also one of the finest, is H. Katharinæ, a native of Natal. Good examples of this may be grown in pots eight to ten inches in diameter, and such will produce three or four spikes of blossoms. These are of a bright red colour, and borne in globular heads. This species flowers when the handsome oblong-shaped leaves are fully developed, being in some respect totally different from some of the others. Now in bloom in the cool portion of the T range.

Anomatheca cruenta alba.

The charming little Anomatheca cruenta is a fairly well-known bulb, native of South Africa. The bulbs, which are a good deal like those of a freesia, are smaller; indeed, the whole plant when fully developed is not much more than six inches in height. The flower scape, which just overtops the sword-shaped leaves, bears several of its pretty bright coloured blossoms. They are nearly an inch across and of a bright carmine-red colour, the three lower segments being blotched with velvety crimson. The variety alba, which has pure white flowers, is very rare. It is now in flower in the cool portion of the T range. By botanists the genus Anomatheca is now merged into that of Lapeyrousia.

Pelargonium Stapletoni.

Many of the species of pelargonium are from their beauty well worth cultivation, and this is one of them. The stems are stout and club-like, while the lobed leaves present a somewhat silky appearance. The flowers, which are little more than half an inch across, are borne in branching umbels. In colour the flowers are bright rose with a dark blotch on the two upper segments. The name of P. Stapletoni does not occur in the "Kew Hand List." This species greatly resembles P. echinatum, but this last has the ground colour of the flower pure white. Now in bloom in the cool portion of the T range.

Chirita speciosa.

There are several species of chirita in cultivation, but this is a decidedly uncommon one, and, moreover, ornamental. It pushes up a stem clothed with oppositely arranged ovate leaves. The flowers borne on rather long peduncules from the axils of the leaves, are of a curved tubular shape, the inflated tube being violet-purple on the outside, while the expanded mouth is white. This, which is in flower in the intermediate portion of the T range, is a native of Java. It is referred to by the late Colonel Beddome in his "Annotated List of Gesneraceous Plants" as a lovely species, rare in cultivation.

Eranthemum tuberculatum.

In most of the eranthemums the flowers are produced in a terminal cone-shaped head or cluster, while in this species they are scattered over the shoots. It also differs considerably in habit from most members of the genus, for they commonly form upright sparely branching specimens, whereas this is of a free, dense, twiggy habit of growth. The flowers are pure white, and individually they suggest those of Bouvardia Humboldti. The eranthemum derives its name from the curious wart-like tubercules with which the stems are studded. It was introduced from New Caledonia nearly fifty years ago, and is now in flower in the intermediate portion of the T range.

Turneria ulmifolia elegans.

An uncommon plant in cultivation, but some of the Turneras are veritable weeds in the tropics. This, however, is a very pretty plant now in bloom in the intermediate portion of the T range. It is of a soft, rather erect growth, the leaves being oblong, serrated, about five inches in length, pubescent and soft to the touch. The flowers, which are freely borne from the axils of the leaves, are composed of five petals of a bright yellow colour. The expanded bloom is about a couple of inches in diameter.

Rhododendron Maddeni.

Of the numerous Himalayan rhododendrons in the Temperate House this is the last to unfold its blossoms. It forms a rather loose-growing bush, clothed with oblong-shaped leaves, scaly beneath, and about six inches in length. The flowers, which are borne in a loose corymb, are of an open funnel shape, about four inches in length, and as much across the expanded mouth. They are pink in the bud state, but become white after expansion. The edges of the segments are somewhat crisped. This species is also sometimes known as R. Jenkinsi.

Leptospermum Nicholli.

Nearly all the leptospermums have white or pale-coloured blossoms, but in this the flowers are of a deep red, as may be seen on a specimen in the Temperate House. It is of compact growth, and likely to prove a valuable greenhouse plant or outdoor shrub in the particularly favoured parts of the south-west.

K.

Mr. William Deal, F.R.H.S., "Brooklands," Kelvedon, Essex, gives a cordial invitation to all interested in sweet peas to inspect his crops growing for seed. He has about 12 miles growing on sticks, stocks equal to any in the country. Crops are about half-a-mile from Kelvedon station.—[Advt.]

GROUPING HARDY FLOWERS.

The report of York Gala in the Gardeners' Magazine of June 24 well describes a new class which introduced a new method of arranging hardy flowers, viz., their arrangement in bold groups of one kind on the ground, where they could be conveniently inspected. Although the premier exhibit at York, from Messrs. W. Artindale and Son, was very much admired as being uncommon and effective, even that left some room for improvement, and, naturally, it would, being the first attempt at an exhibition of the kind. On the principle that we are all copyists in horticultural tastes, I venture a few suggestions for improvement on this meritorious exhibit. The position at the end of the tent was not quite the most favourable, as the eaves of the canvas were not sufficiently high to allow a more suitable background. The acers and bamboos used were too light in colour and density to show off to best advantage the richly-coloured flowers in front. The introduction of some conifers or pines would have improved the background. Amongst the groups of flowers a few specimen bamboos or weeping or semi-weeping trees would have given additional grace. The arrangement of the groups of flowers might have been more undulating, as it was a little difficult to see many of the plants at the back. Let it be understood I greatly admired this attempt at reform in the arrangement of hardy flowers, but I think an improvement was possible, and merely offer these suggestions for the consideration of the exhibitors of hardy flowers.

E. Molyneux.

CANKER IN MELONS.

This dreaded disease is sometimes the cause of failure in melon culture; attacking the plants just as the fruits are about to ripen, it frequently prevents them from bringing the crop to maturity. Most growers have theories as to its cause and cure, but how far these are correct is another matter. There is one supposed cause that I think may be said to have failed to impress us, and that is the existence of moisture around the stem of the plant. Some growers recommend us not to wet the base of the stem, either by watering or syringing, but rather to water between the plants.

For the last two seasons we have grown melons in pots with entire success, in addition to those in borders. These have been watered in the usual way, and consequently water has been all around the stems, yet not one of these plants showed the least signs of canker, and all matured either three or four handsome fruits. The pots were twelve inches in diameter.

I am of opinion that canker is probably caused by an unsuitable rooting medium. A too rich compost, for instance, which creates a gross and unhealthy plant that collapses under the strain when its vigour is most needed. This points out how necessary it is to build up a sturdy, healthy specimen capable of resisting the dreaded disease.

Incidentally, I may remark that gumming is more liable to occur with a gross and sappy plant than with one of sturdy, firm growth. I find that pure yellow virgin loam, with a little mortar rubble or charcoal added, suits melons admirably, and our plants grown in that show no signs of canker. The varieties we grow are Eminence, The Peer, Royal Jubilee, and Superlative.

J. Gardner.

MULCHING.

Mulching is a very old and excellent means of retaining a steady supply of moisture about the roots of trees or plants. Evaporation is prevented by the natural process of covering the soil, and, apart from preserving a uniform degree of heat and moisture, this covering is also constituted so as to supply a substantial amount of nourishment. The common practice of placing a covering of long strawy manure around the stems of trees or plants is, in reality, copied from one of nature's most ingenious processes. The changes which occur in the condition of soil due to what is commonly known as "weathering," consist in the first place of a breaking-down or disintegration of the surface soil particles. And as soon as this fine covering is formed over the seed-bed, it naturally conserves warmth and moisture in the soil below, and so assists in the preparation of an ideal seed-bed. When it is remembered that the seed on germination first throws out delicate rootlets and root hairs, which explore the soil in every direction for moisture, it is easy to understand how necessary this natural mulch is in the process of germination.

The capillarity of the soil is a feature of soil science which is generally understood by most practical gardeners. More especially during periods of drought does this property of the soil come into prominence, for a fine surface assists in breaking the capillary tubes which bring supplies of moisture from the reservoir a little below the surface. Mulching has this effect even if it consists of no more than a slight stirring of the surface soil by means of the hoe; and indeed the usual purpose to which this work of hoeing is assigned, namely, the destruction of weeds, is comparatively unimportant when compared with the conservation of moisture and warmth that is also effected. Weeds are certainly a bad feature in any garden, but the unchecked effects of drought are likely to be a worse one.

Therefore, it is plainly seen that, by the simple process of hoeing the surface soil, the gardener may not only tap the moisture resources of the lower soil, and bring them to the surface for the roots of plants, but can at the same time prevent the evaporation of such moisture by undue heat. One of the best arguments against the neglect of hoeing and mulching is that the sun at its height draws the moisture from the soil, and takes with it the warmth, so that root action is hampered not only by lack of moisture, but also by a low temperature.

If the mulching consists of long manure or other material containing plant food in a sufficiently soluble state, it proves doubly beneficial by reason of its fertilising properties, which become washed down into the soil by rain or by artificial watering. It is usual to give a mulching of manure about four inches thick, and, if thought desirable, a slight covering of soil may be placed over to hide the manure. It is advisable in the case of an excessively dry soil to water it thoroughly before giving the mulch.

A favourite form of mulch consists of fresh horse manure that has been composted and well turned so as to induce uniform cooling. It is also recommended to add a little superphosphate, and in the case of fruit trees, a sprinkling of double sulphate of potash and magnesia. Excessively thick mulchings are not to be recommended on any account, neither must any material of this kind be used until fermentation has properly ceased; otherwise there will be a danger of a crop of weeds springing up from the seeds contained in the unfermented material. Not only this, but the complete fermentation of the manure renders its nutritive ingredients more available as plant food.

All newly-planted trees and shrubs are greatly benefited by a good mulching of fermented litter, partially rotted manure, leaves, and other suitable covering after the surface has been hoed a few times, so as to admit air and warmth into the soil. Mulchings should not be given too early, because they prevent the soil becoming warm near to the roots, but the proper time is usually just before the droughts of summer, and it is always advisable to apply them immediately after a good shower of rain, it being well borne in mind that this practice does not increase the store of manure in the soil, but merely conserves that amount of moisture which may be present at the time of its application. Fruit trees and bushes that are newly transplanted have their roots very near to the surface, and in a small compass; hence, it is easy to see how quickly they will become dried up by the heat of the sun on the surface soil. Mulching prevents this, and in the case of wall trees or roses in a south or south-west aspect, plenty of water must be given before the mulching is placed over the roots. Some growers use various forms of material, such as spent hops from the brewers, lawn mowings, or cocoanut-fibre refuse.

J. C. N

ROSE FRANCES CHARTRES SETON.

A beautiful hybrid tea, the flowers rich purple-rose. A.M., R.H.S., July 4. Messrs. William Paul and Son.

CENTRANTHUS RUBER.

One of the most familiar flowers of the garden is the red Valerian (Centranthus ruber). A chalk-loving plant and a Britisher, it is often met with growing wild in most uncongenial surroundings; it seeks a foothold where the necessaries of plant life seem almost denied, and yet with indomitable spirit it obtains and maintains a hold, contending successfully against all comers. A charming instance of the naturalising of this wilding, and most unconventional in character, is found on the chalk cutting above Guildford Railway Station, in Surrey, where its characteristic beauty is displayed, not in stunted, starved plants as the situation might warrant, but vigorous to the utmost degree, and in such quantity that the rugged face of the chalk cliff is painted with ruddy colour from top to bottom, presenting a picture of rare beauty among surroundings that do not lend themselves to floral effect in the slightest degree.

The possibilities of the valerian for naturalising have long been recognised, and considering that it embraces a rich crimson and white form, besides the type, the possibilities of these in combination should be great. Moreover, it covers an extended season when in flower, and is easily propagated by seeds, and in a soil such as it favours naturally, it is one of the most reliable of all perennials.

Thomas Smith.

RAMONDIAS FROM SEED.

One of the most fascinating branches of gardening is raising hardy plants from seed, among which we include ramondias, as they are most cherished occupants of the rock garden. Of conspicuous beauty when in flower, they are always interesting on account of the evergreen rugose leaves, which are arranged in rosettes, and having the underside of the leaves densely covered with a felt of tawny hairs that in times of drought protect the leaves from excessive transpiration. All the members of this genus succeed in good loamy soil mixed with peat; they require a shaded position, and to be planted in almost vertical positions among rockwork.

Ramondias are somewhat variable in colour from seed; this tends to increase interest, as it is exceptional to obtain any but pleasing colours in the flowers. Seed ripens freely on open-air plants, and when harvested may either be sown direct or deferred till spring. The latter is the best season, as it is of first importance to secure a full period of growth in the first year, and once the seed germinates growth should be encouraged to this end. For those who desire to sow the seed now I would mention that pots and pans of a small size are most suitable for seed sowing, and the soil may consist of loam, peat, and sand in equal parts, and is best passed through a fine sieve. Germination is hastened by placing in a warm greenhouse; but as soon as the seedlings are well through the soil a position in a cool greenhouse or sheltered garden frame, with the pots or boxes on a coal-ash bottom, is most favourable to growth. The seed pans must be kept free from weeds, and as soon as the seedlings can be handled transplant into shallow boxes, using soil slightly rougher than already recommended, and allow two inches between the plants. Having filled the space allotted them in the boxes the plants are then ready for potting up, and when established in these receptacles they may be used for permanent planting in the open.

Ramondias are exceedingly sensitive to drought, and rarely succeed in positions open to direct sunlight. Shade meets their requirements, and if planted in a well-drained position in a compost of rich loam, peat, and broken stone, they invariably succeed. Vertical planting is of great importance as it prevents the centres of the plants from becoming silted up with soil, which otherwise detracts from their appearance and causes the flowers to damp off. The majority of rare and choice hardy plants can be raised from seed, and, apart from the pleasure this work affords, there is the possibility of raising an improved form, or, it may be, a distinct variety.

Seedlings of ramondias flower in their third year, and increase in size for a number of years after.

THOMAS SMITH.

Carrots.—Owing to the continuous dry weather main crop carrots are in many cases a faulty crop. Where this is so, to ward off a scarcity, make a considerable sowing of a Shorthorn variety in ground that is in a rich condition. After the drills are drawn out pour water along them several times to ensure ample moisture. Also sow soot on the surface, and do everything possible that is conducive to the encouragement of growth. Where young crops are looking sickly dust them over with nitrate of soda and apply a light watering. And should the foliage be infested with fly a syringing with quassia extract will render valuable assistance in removing it.—C. F.

VARIATION IN HYBRIDS.

In the introduction to his comprehensive and highly interesting paper on variation in hybrids, which appears in the current issue of the Royal Horticultural Society's "Journal," Mr. A. Worsley writes:

I have experimented with several fertile hybrids and analysed the variations which take place in the ensuing generations, and in most of these experiments I found that the hybrids and their self-fertilised progeny are means between their parental extremes, although there are instances in which one parent influences the hybrid and its progeny to an extent exceeding that of the other parent. Now if we take one (suppositious) case and note eight divergent characteristics between the parents (inter se), we shall probably find that the hybrid holds a strictly equipoised position as regards the bulk of these characters, but may incline towards the female in some and towards the male in others. To reach this result it is not enough to examine the first few individuals of the hybrid race that come into flower, but we must wait until the whole of them have flowered and until a critical analysis of them all can be made.

To be sure of our ground we must also apply this analysis to the whole of those characters in which the parents differ inter se, and not merely to some of them. For if we submit a hybrid to an incomplete analysis we may conclude that the male is dominant, simply because we have taken no count of those other characters in which the hybrid inclines towards the female.

In the succeeding generations of self-fertilised plants we shall note some variation from the equipoised hybrid type. This variation may be great or small, and follows no known law. For instance, a true new species may result from hybridisation, such being the case when the subsequent variations from the hybrid type do not exceed about 3 per cent., and when the preference of individuals for the pollen of other individuals (in bi-sexual flowers) is sufficiently strong to ensure the breeding out of these variant characters. I have had no personal experience as to whether new species can be artificially produced by hybridisation among those bi-sexual plants which are normally self-fertilising.

When I have followed these hybrid progeny by critical analysis into the second and subsequent generations I have not been able to satisfy myself that reversion to certain specific characters follows the allegations of the Mendelian advocates. In the first place I have never been able to find in hybrids any characters that were absolutely dominant or recessive, but have only discerned a certain relative or partial inclination towards the specific characters. Nor have I as yet found a single instance of absolute reversion to either specific type; but I have found that, in the subsequent generations, all sorts of intermediate forms crop up equipoised between the hybrid type and either parent. For instance, if the hybrid type inclined towards the male in colour of flower and towards the female in another respect, I find that some individuals in subsequent generations will do just the opposite, as though the law of change indicated a course of variation which would in time fill up every gap between the two extreme forms represented by the species originally crossed.*

But to this consummation there is the evident bar of the association of different characters. We constantly find that certain pairs of characters cannot be dissociated from each other, but continually occur together in individuals. This association of certain characteristics (so long as it obtains) appears to rule out the possibility of the occurrence of certain conceptually possible intermediate forms. The antirrhinums give us one instance of this, for among the dwarf self-coloured forms every rogue as to height is also a colour-rogue, whereas those that are typical in stature will probably not produce 1 per cent. of colour-rogues.

If we define a species as "A group of closely related individuals as between whom procreative variation has suffered a temporary and partial arrest," we mean by this definition that we reserve the use of the term "species" to plants which reproduce themselves true from seed with the number of variants limited to (say) 3 per cent. But this, again, may mean no more than that the association of characters has been so extended as to include all the noticeable characteristics of the type. In this sense variation becomes a question of permutations and combinations, and in every "good" species all the characters hang together so that variation is brought to a standstill for the time being, or reduced within very narrow limits.

By hybridisation this fixity is broken up to some extent, or, in a few cases, a new set of associated characters supersede the old associations. Now if the hybrid is crossed with another hybrid, greater variation becomes evident, until in florists' plants we note an ever-growing inconstancy. All this hypothetical fixity in "good" species is, however, relative and not absolute. There exists a certain percentage of variants from the type, and I contend that we cannot foretell with certainty the trend of such variation. For as the germ-plasm of every plant contains within itself immeasurable possibilities of reversion to all or any of its ancestral characters, however remote, it is clear that the apparent fixity of any species is a something bounded by time and conditions. For the time variation is bounded by the association of certain characters, but how or when this association will be broken, or what variation or reversion may then ensue, cannot be foretold.

This question of variation depends entirely on parentage, and could probably be determined with some exactitude if the ancestry of any plant was known. But inasmuch as the complete ancestry of no plant can ever be known, and is, in fact, an impossible thought, all we can do is to imagine that the earliest-known ancestors of plants with which we deal possessed characters absolutely fixed and invariable, and from this false basis to deduce certain mathematical ratios of probable variation. On this assumption we may declare that a proportion will revert to one parental type, a proportion to another, and that such reverted individuals will have attained the same measure of fixity that their parental types possessed. This has been known for a very long time in a general way, and all the Mendelian advocates claim is that in certain already tested cases they now know in what ratio such reversions will occur; but they do not claim that this ratio is applicable in any general sense. My own experiments teach me that we can only reach an approximation, not any precisely known result; and that in different hybrids and cross-bred plants these results also vary, and are in great part dependent on the association of characters, and these again on pre-existing associations in their ancestors.

Violets.—The surface of the soil should be frequently broken with the hoe, and the plants liberally watered during dry weather. At the close of hot days damping overhead is beneficial, and if there is any appearance of red spider syringing with soot water will usually check it. Occasional waterings with liquid manure from the farmyard may be given.—E. C. P.

---

* As an example, I hybridized Hippeastrum vittatum with H. equestris and produced the hybrid H. × Mandevillei, which showed some inclination towards the female. There are eight divergent characters as between the species inter se, which I designate a b c d e f g h, or A B C D E F G H, using small letters if the characters of the second generation resemble those of the female species, and capital letters if resembling the male species. Now the Mendelian assertion of recessive characters would produce variants as they are here written (above); but I have found none such. The hybrid type produced $a\ b\frac{c}{2}\ \frac{d}{2}E\ F\ g\ h$ and the variants of the second generation such formulæ as $A\ b\frac{c}{2}d\ e\ f\ g\ \frac{H,}{2}$ etc.

BORDER CARNATIONS.

The popularity of border carnations is characterised by the manner in which their cultivation is taken up in almost every garden, large or small. It is unnecessary for me to attempt to describe their usefulness for both garden and indoor decoration, as this is so well known, but perhaps a few hints on their cultivation would not be out of place at this time of the year, when preparations have soon to be made for propagating young plants for the ensuing season.

It is not everywhere that one sees border carnations successfully grown; this is due in some instances to the unsuitable conditions of the soil, but in others to the unsatisfactory methods adopted in their cultivation, and many failures and poor results can be attributed to this latter cause.

One of the most important operations in connection with the culture of border carnations is the layering of the young shoots. This is often left until too late in the season. My experience is that the first half of the month of July is the best time for the work, as it then gives the layers ample time to root previous to their being planted out into their permanent quarters. In layering the operator should be most careful to make the cut in the stem of the young shoot quite three parts of the way through the stem, below a joint, and to continue it through the joint lengthways for about an inch. When pegging the layer down, the incision should be opened by making the layer beyond the peg to stand nearly upright; this part of the operation is very essential, as one often comes across layers badly rooted when lifting because the incision has not been made sufficiently deep, or opened enough when being pegged down.

Layers made early in July are by the first week in September ready for planting in their permanent quarters, and if a little care has been taken in previously preparing the soil for them, little fear need then be entertained as to their living through the winter and early spring. One often hears the remark, "Carnations stand badly here through the winter." Nine times out of ten the failure could be traced to late layering and necessarily late planting.

Much advantage is gained by early autumn planting, as it is not then necessary to pot the layers and winter them in frames; further, a spring-planted carnation never makes such a good plant as one planted early in the autumn, and, consequently, does not give the same wealth of bloom. I have often had as many as fifteen to twenty flower stems on an autumn-planted layer, but never remember seeing a spring-planted layer carrying nearly that quantity. I will admit that in some very cold, damp districts autumn planting is not practicable, neither is it always successful in the case of very tender varieties with weak constitutions.

T. B. Field.

Clerodendron myrmecophilum.—It is about seven years since public attention was directed towards this showy clerodendron, but up to the present it does not seem to be much grown. It is really a very beautiful plant, among whose desirable qualities is that it flowers freely in a comparatively small state. It is of upright growth, whose sturdy stem is clothed with long lanceolate leaves, and terminated by an upright pyramidal-shaped panicle of flowers disposed in regular whorls. The colour of the flowers is a bright orange-amber, and they are individually about one and a-half inches across. The long prominent stamens are red. This clerodendron is a native of Singapore, so that the temperature of a stove is necessary for its well doing.—W. T.

FEEDING AND TOP-DRESSING CHRYSANTHEMUMS.

Expert cultivators of these subjects can tell at a glance whether the plants are in a fit condition to be fed or not. Furthermore, they know exactly when the proper time has arrived to apply a top-dressing.

As a rule, the beginner is over eager to commence the work of feeding and top-dressing, with the result that harm may accrue to the plants.

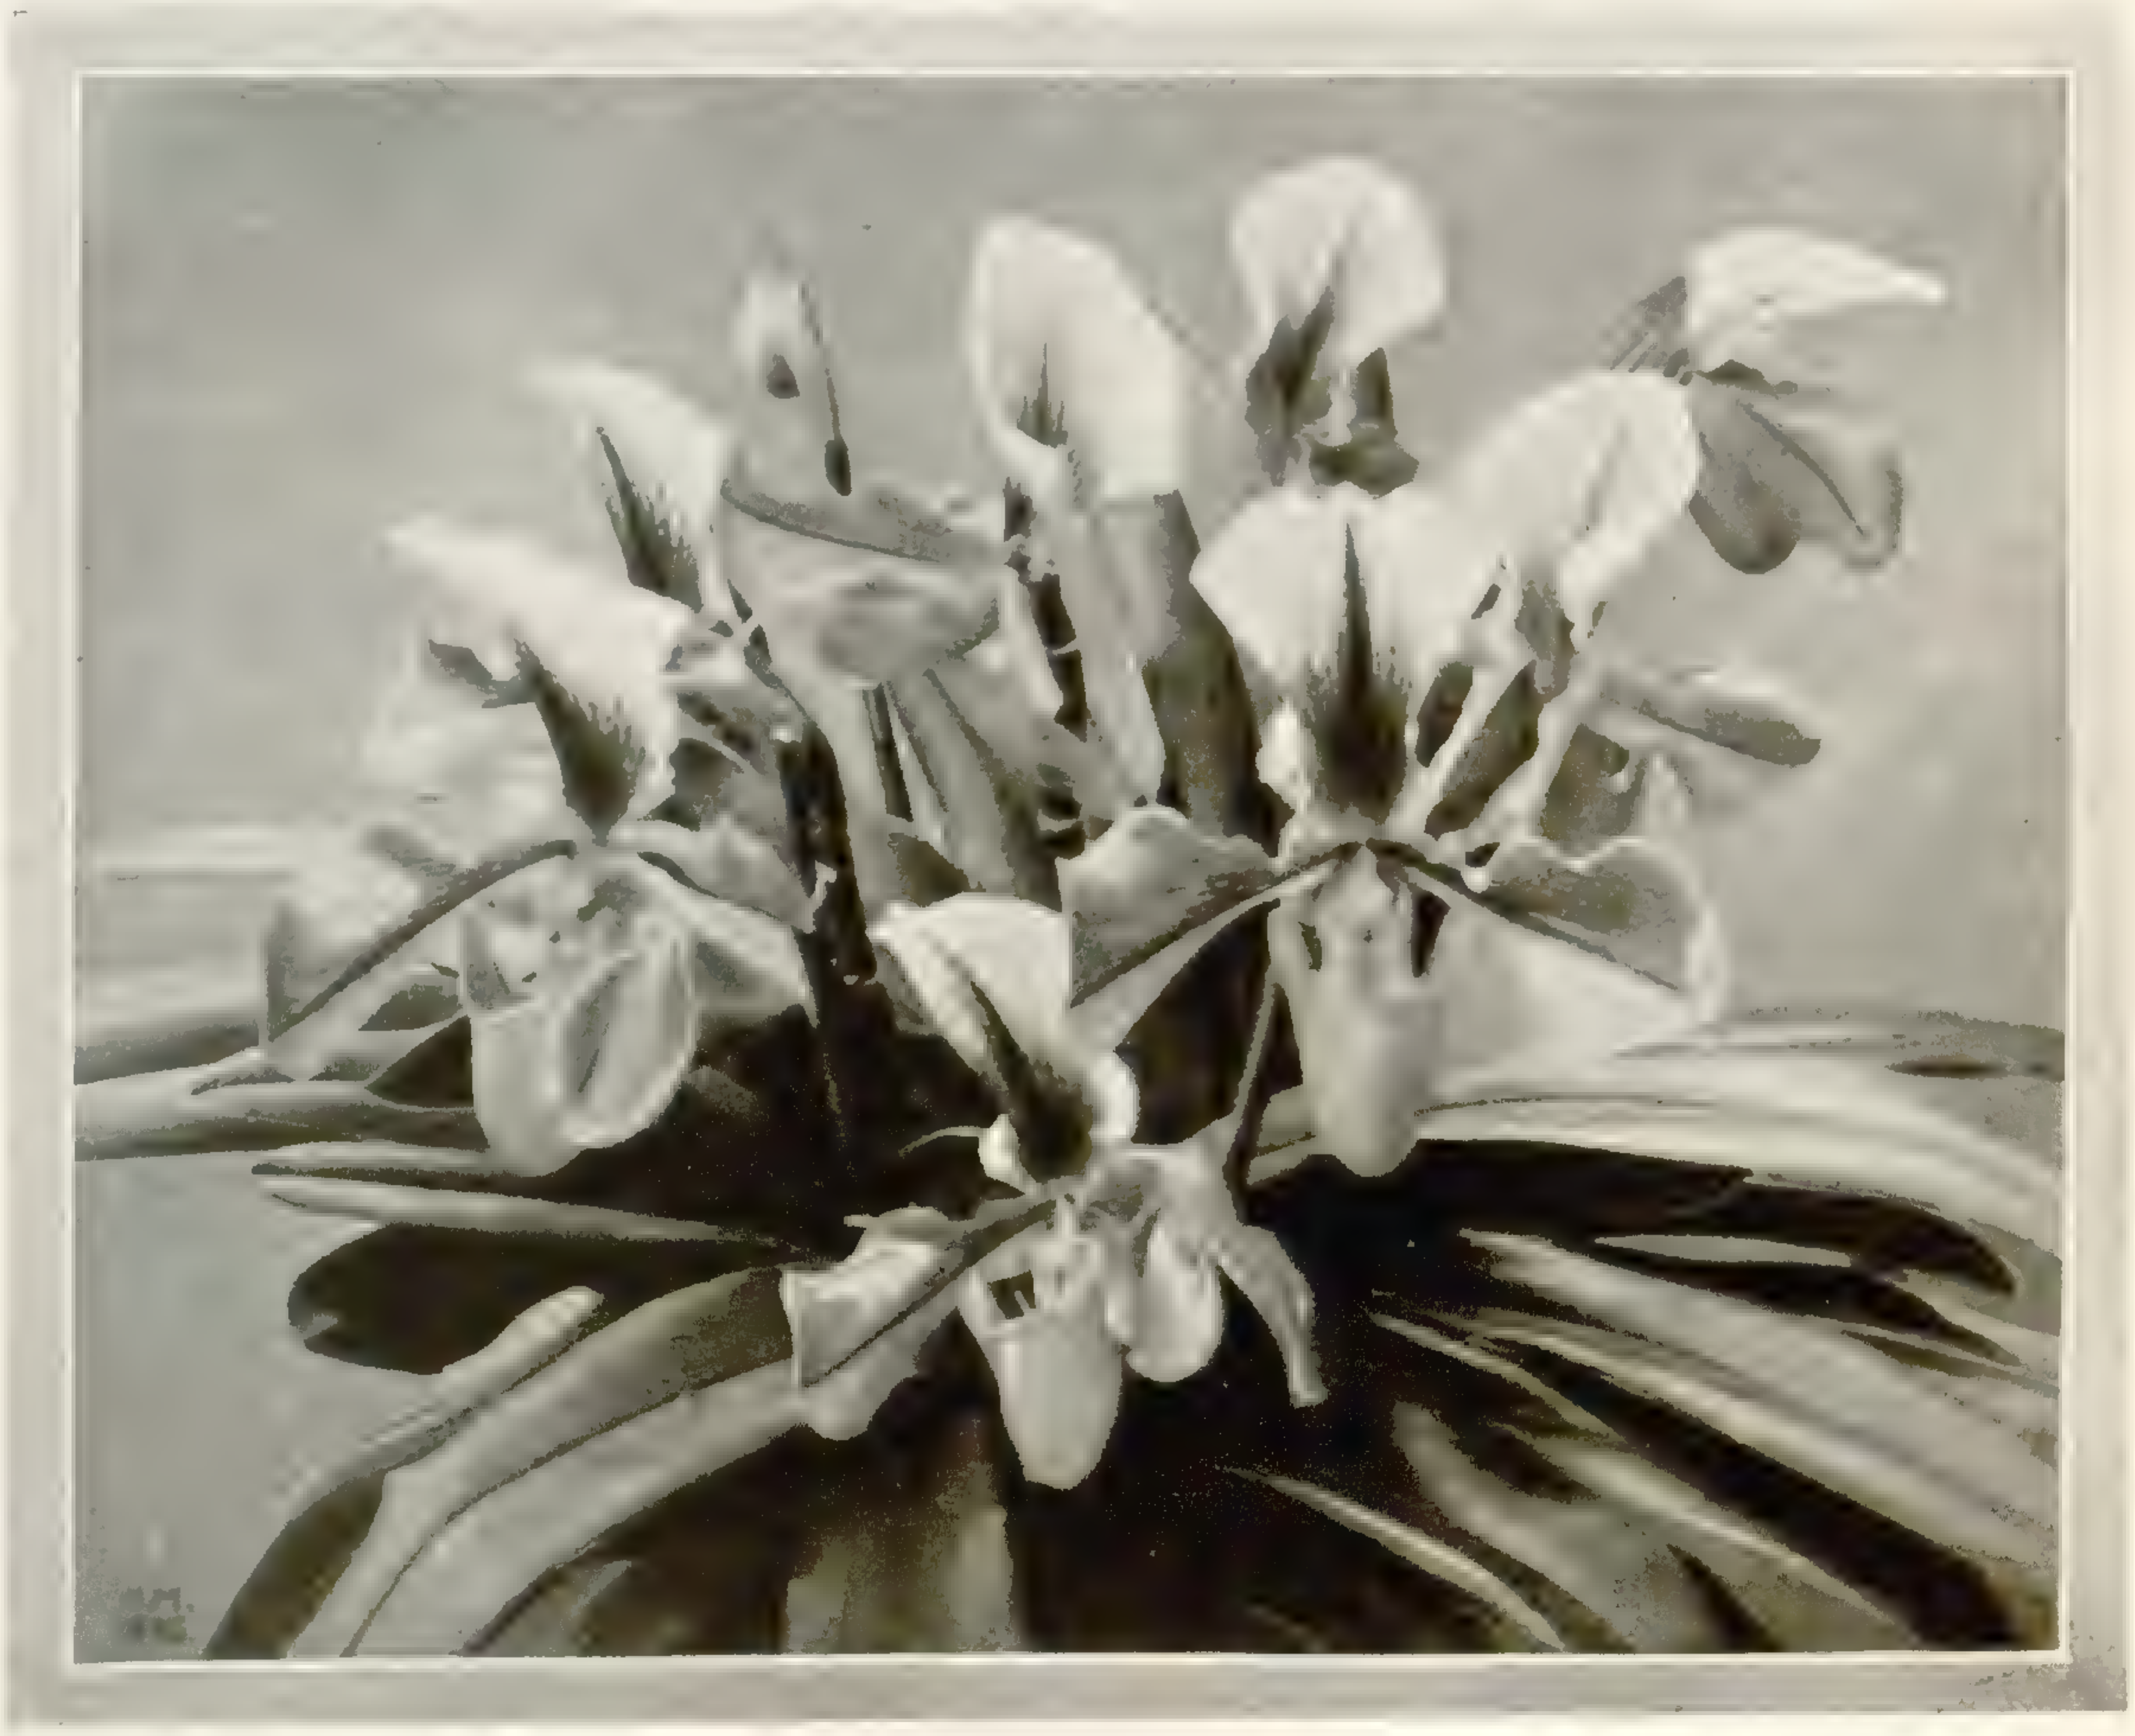
During the past two years those plants were the most satisfactory that were fed judiciously with cool artificials—mainly after the flower buds had been secured. But I know of instances where forcing manures, such as nitrate of soda, were applied several times during the month of July, and, as a spell of very dull, cool weather followed, the stems grew rapidly, the leaves being large and flabby, and the buds had extra long stems, and were very late in developing. We have recently experienced a long spell of hot, dry weather, followed by several weeks of moderately cool, wet weather, and in these circumstances the growth of the plants is very satisfactory. Now, it would be a pity for a beginner to spoil nice plants through over-feeding them. If the wood is moderately matured when the buds—the first crowns—appear, it will harden rapidly afterwards, and it is at this critical stage that judicious feeding does so much good in keeping the precious buds steadily progressing and strengthening their stems. Weak applications of clear soot water and liquid manure may be given after the middle of July, and sandwiched between the doses of artificials right up to the time that the flowers are half open. Concentrated manures must be applied according to the directions given with them.

An expert grower would not hesitate to put on some top-dressing material before the flower buds are secured, but I think a novice would act wisely if he waited until all early crown buds were taken before he applied a top-dressing, as it is more difficult to tell afterwards whether the soil beneath is dry or not. Incurved varieties, and many of the Japanese sorts, which show buds towards the end of August, may be top-dressed early in that month. Soak the fibrous loam in liquid manure before it is used, and lay the compost thicker near the rim of the pot than at the stem of the plant.

Geo. Garner.

CYPRIPEDIUM CHRYSOTOXUM.

Among those cypripediums that thrive under moderately cool conditions there is one that is at present not over-plentiful in collections, but which promises to become popular. It is C. chrysotoxum, a hybrid between such old favourites as C. Lathamianum and C. villosum. This appears to have been raised by M. Duval, and to have first flowered in 1900. The name given is a suitable one, inasmuch as the blooms are particularly bright, the lip and the petals being bright burnished yellow-green. The petals have a darker median band, and the large white dorsal sepal has deep yellow-green and brownish shading at its base and a purplish central line. C. chrysotoxum Victor is particularly well coloured, and though here, as in the type, the dorsal sepal is too much reflexed along the lateral margins to be regarded as quite in accord with the modern fashion, which demands a broad, rounded, flattened dorsal sepal, the variety is conspicuous in any collection of cypripediums, and is very attractive. The plant here represented is from Mr. J. Gurney Fowler's collection at Glebelands, South Woodford, and the gardener, Mr. J. Davis, was awarded a Cultural Commendation for it at the first meeting of the Royal Horticultural Society held during the present year; it then carried nine fine flowers.



CYPRIPEDIUM CHRYSOTOXUM VICTOR.
Flowers yellow-green, white, and purple.

HOW TO GROW SWEET PEAS.—"Sweet Peas and their Cultivation," by C. H. Curtis (Secretary of the National Sweet Pea Society), is a complete guide to the successful culture of sweet peas for home or exhibition. Price 1s. net, by post 1s. 2d., or bound in cloth 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

ROSE NOTES.

Since my last notes we have had some of the most welcome and delightfully steady summer rains I ever remember. Already the great benefit of these is apparent in the cleaner condition of growth. Fortunately it has arrived in time to make a considerable difference to the roses for most of the exhibitions, the prospects for which were far from good a week or so back from the time of writing (June 27). A sprinkling of artificial manure, and the hoe used once more to check seedling weeds that are certain to appear after these showers upon a warm soil, will be doing good in all ways.

I have often noticed the wonderful cleansing powers a summer rain has among our roses, but seldom more so than in the present instance. Whilst wandering among our roses to-day I was struck with the many varieties so aptly named as to almost describe themselves, Rainbow and Papillon, for example; also Sunset and Sunrise, Crepuscule, Milky Way, Snowstorm, Viridiflora, Boule de Neige, Flocon de Neige, and Goldfinch, are all aptly named, and describe themselves. Many others might be mentioned. Such names, with their brevity and descriptiveness, appeal to me far more than the extra-long foreign names too frequently given, which are difficult to write, or to pronounce. A person's name should be sufficient without describing him as the director of certain palm gardens, as in the case of Palmengarten-Director Liebert. Some names are much too long and troublesome for the average rose grower.

Of course, we shall be busy now with budding, and all stocks will run well after these genial showers. A very slight sprinkle of artificial manure will help any that are inclined to be backward owing to the rather unpropitious spring, when the cold, drying winds rather checked them. As a rule we do not manure our stocks, preferring to feed the plants as maidens, thus getting a stock more congenial to the bud, and not flooding it so much. We think, too, that such stocks and buds ripen better, and are helped to pass through the trials of winter. It also seems of little use to grow a lot of wood upon the stocks only to cut it clean away during the following winter or early spring.

A little more care in the selection of rose buds might be an advantage in some cases, and I believe much of the indifferent stock of some varieties is due to this point. To do the work mechanically is not sufficient. The bud itself should certainly be in the best possible condition, and this is not secured without close care. For example it is quite useless to insert a bud the seat of which is not properly formed so as to rest well upon the wood beneath the raised bark of the stock. Also, some varieties differ considerably as to the outside appearance of the bud when best suited for the operation. Only experience and careful observation can overcome this, and, as already noted, to put in a bud minus a prominent base or seat is useless. Any forcing in of the bud through the stock not having sufficient sap should be avoided. This can be remedied by free watering, or cutting the growth afresh so as to encourage more young wood, with its attendant flow of sap. In the case of buds being a little dry when received they should be cut off fresh at the bottom and top of the stick or shoot, and immersed in water for a time. Not only is an over dry bud almost impossible to remove from the rose shoot, but it is in the worst possible condition to grow, however carefully we may have succeeded in inserting it. A little more attention to these details are worth notice, and I feel sure many failures may be traced to their neglect.

Roses in pots, and now ripening their wood, should not be kept too dry at the roots. This does not matter so much when half plunged, otherwise much harm may be done. Overhead syringings will be beneficial, but at no time should the wood be allowed to shrivel.

Rosarian.

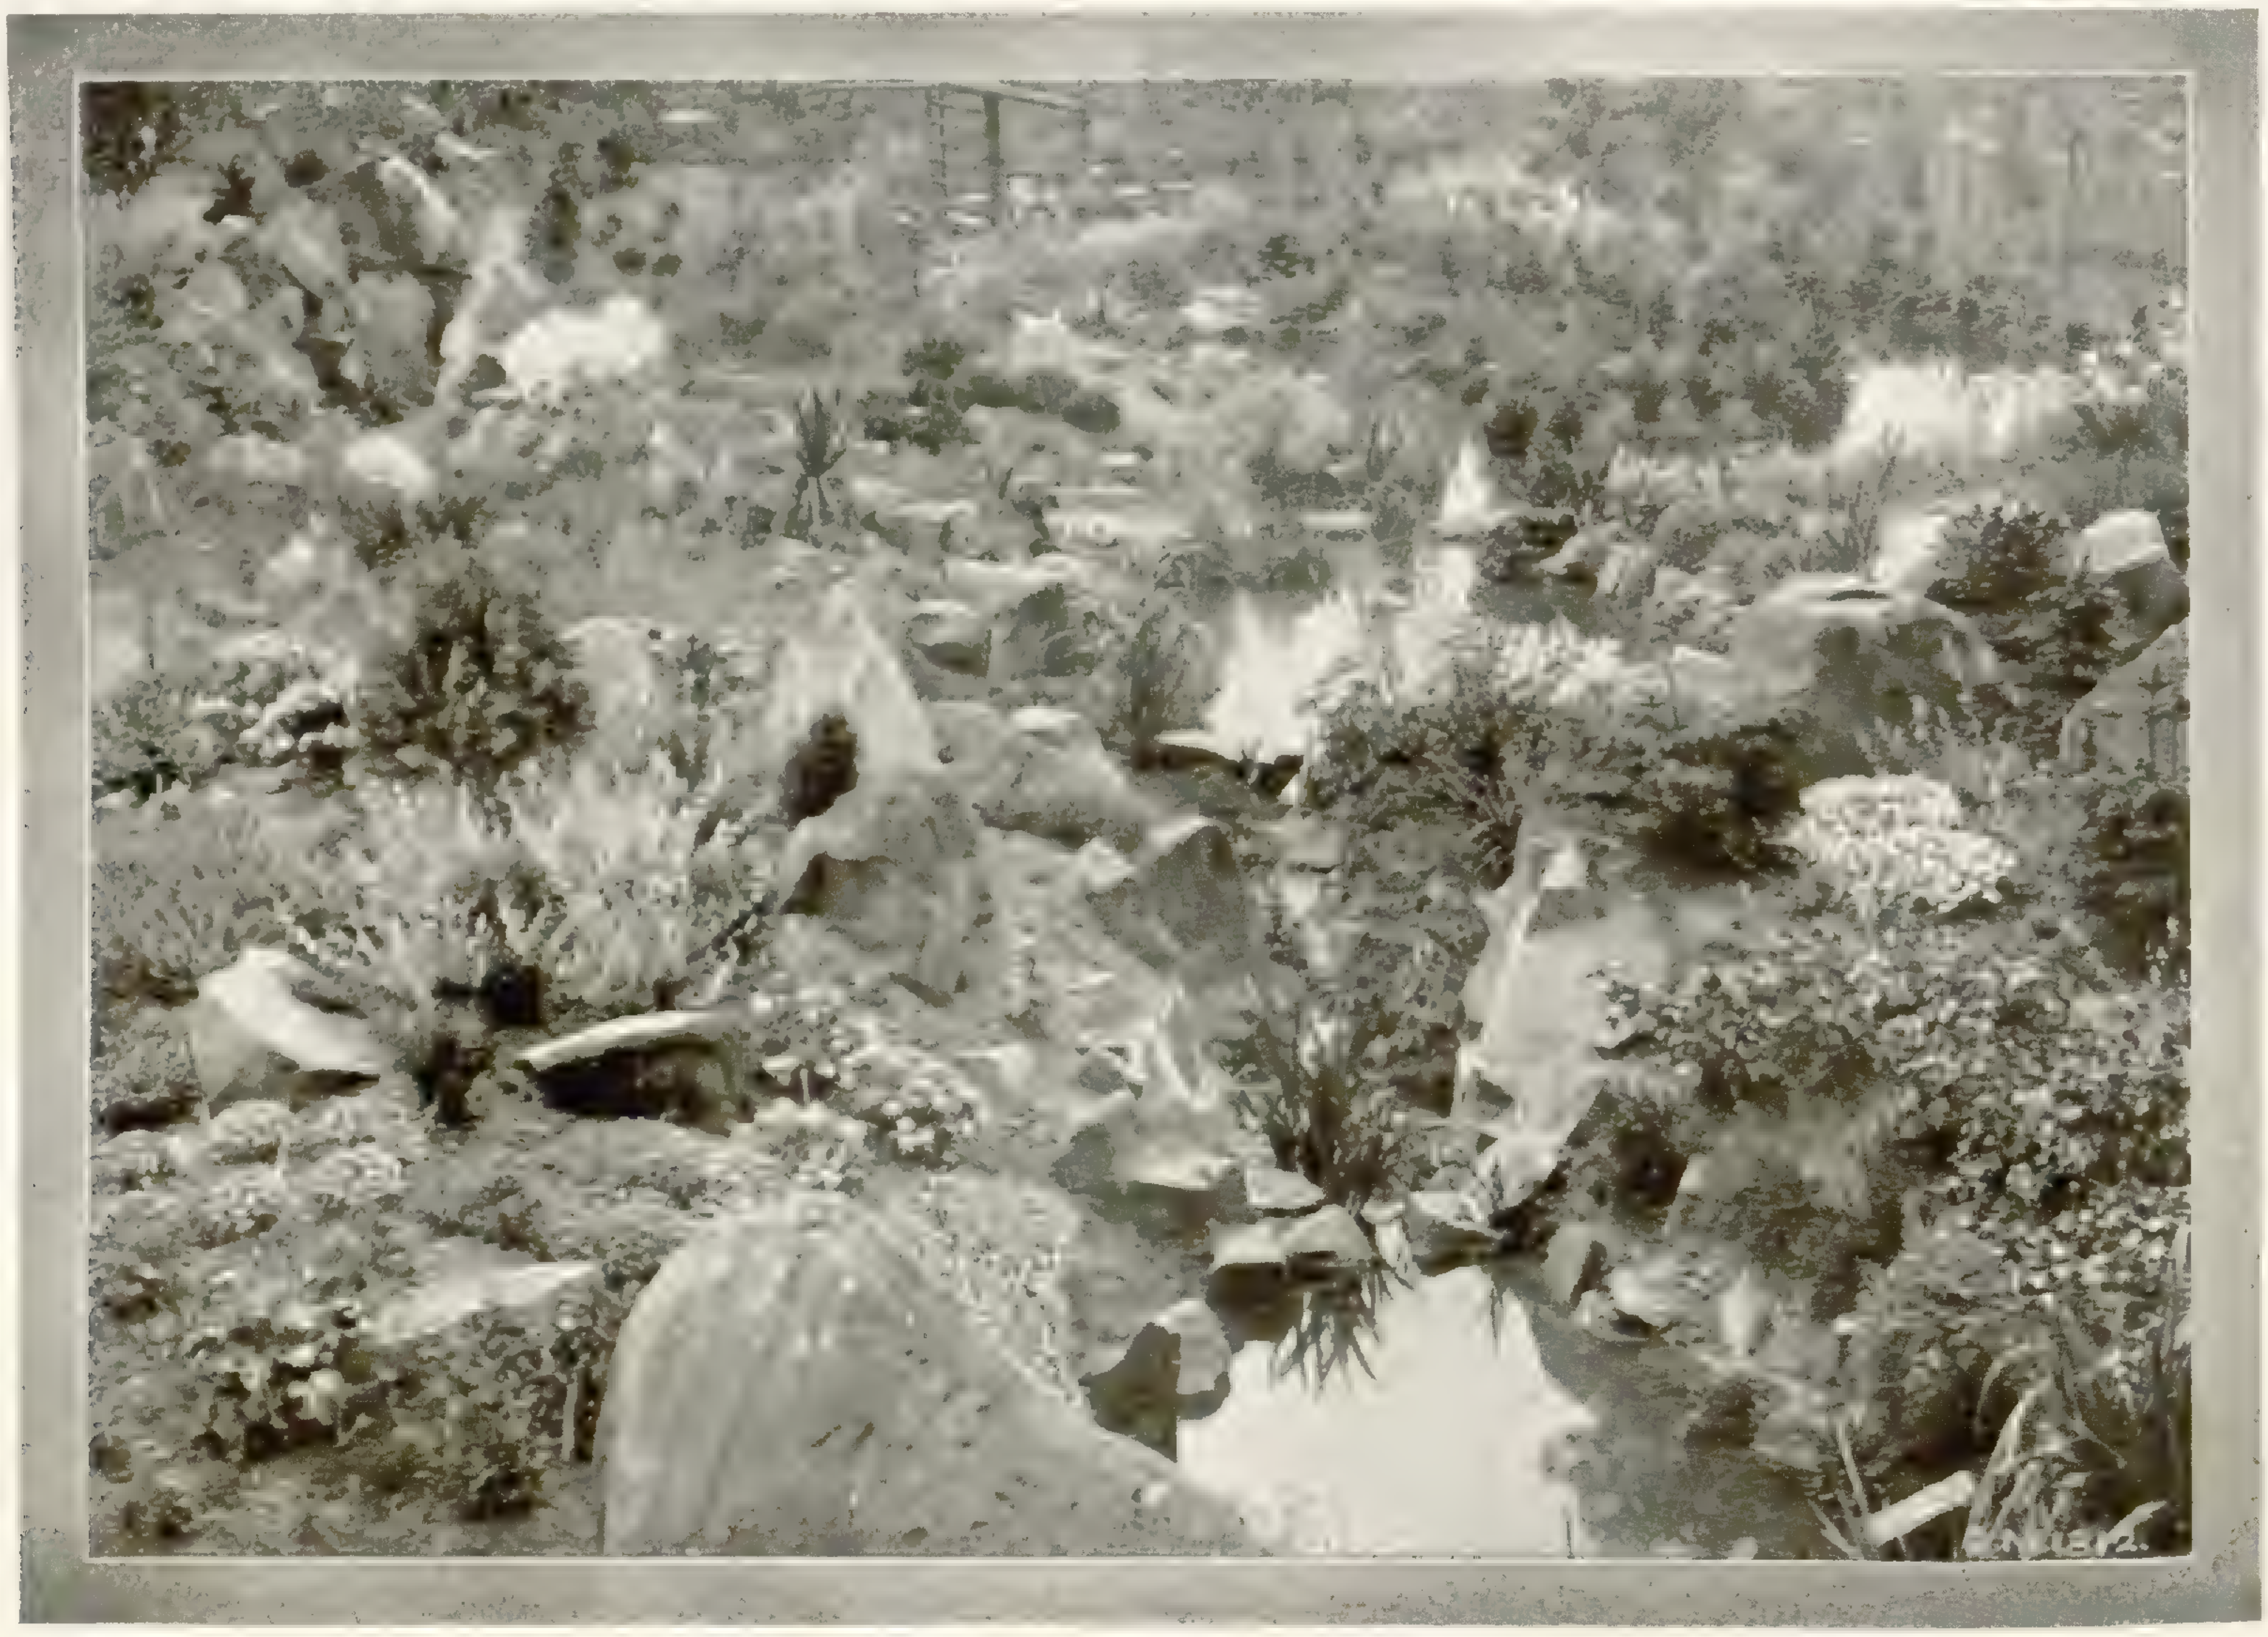
THE JAPANESE IDEAL IN PRACTICE.

The ever-increasing interest bestowed upon the garden art and floral beauties of Japan by English garden lovers has led us into many by-ways of garden adornment, and when the full force of the novel invasion has worn off, we shall awake to find our gardens better (or the reverse) for the potent influence of Japan.

I am one of those who firmly believe in the value of the interchange of ideas, and am fully of opinion that wisdom in horticultural, as in all other matters, is acquired by diligent research and enquiry; therefore, I have welcomed the inflowing tide of Japanese ideas.

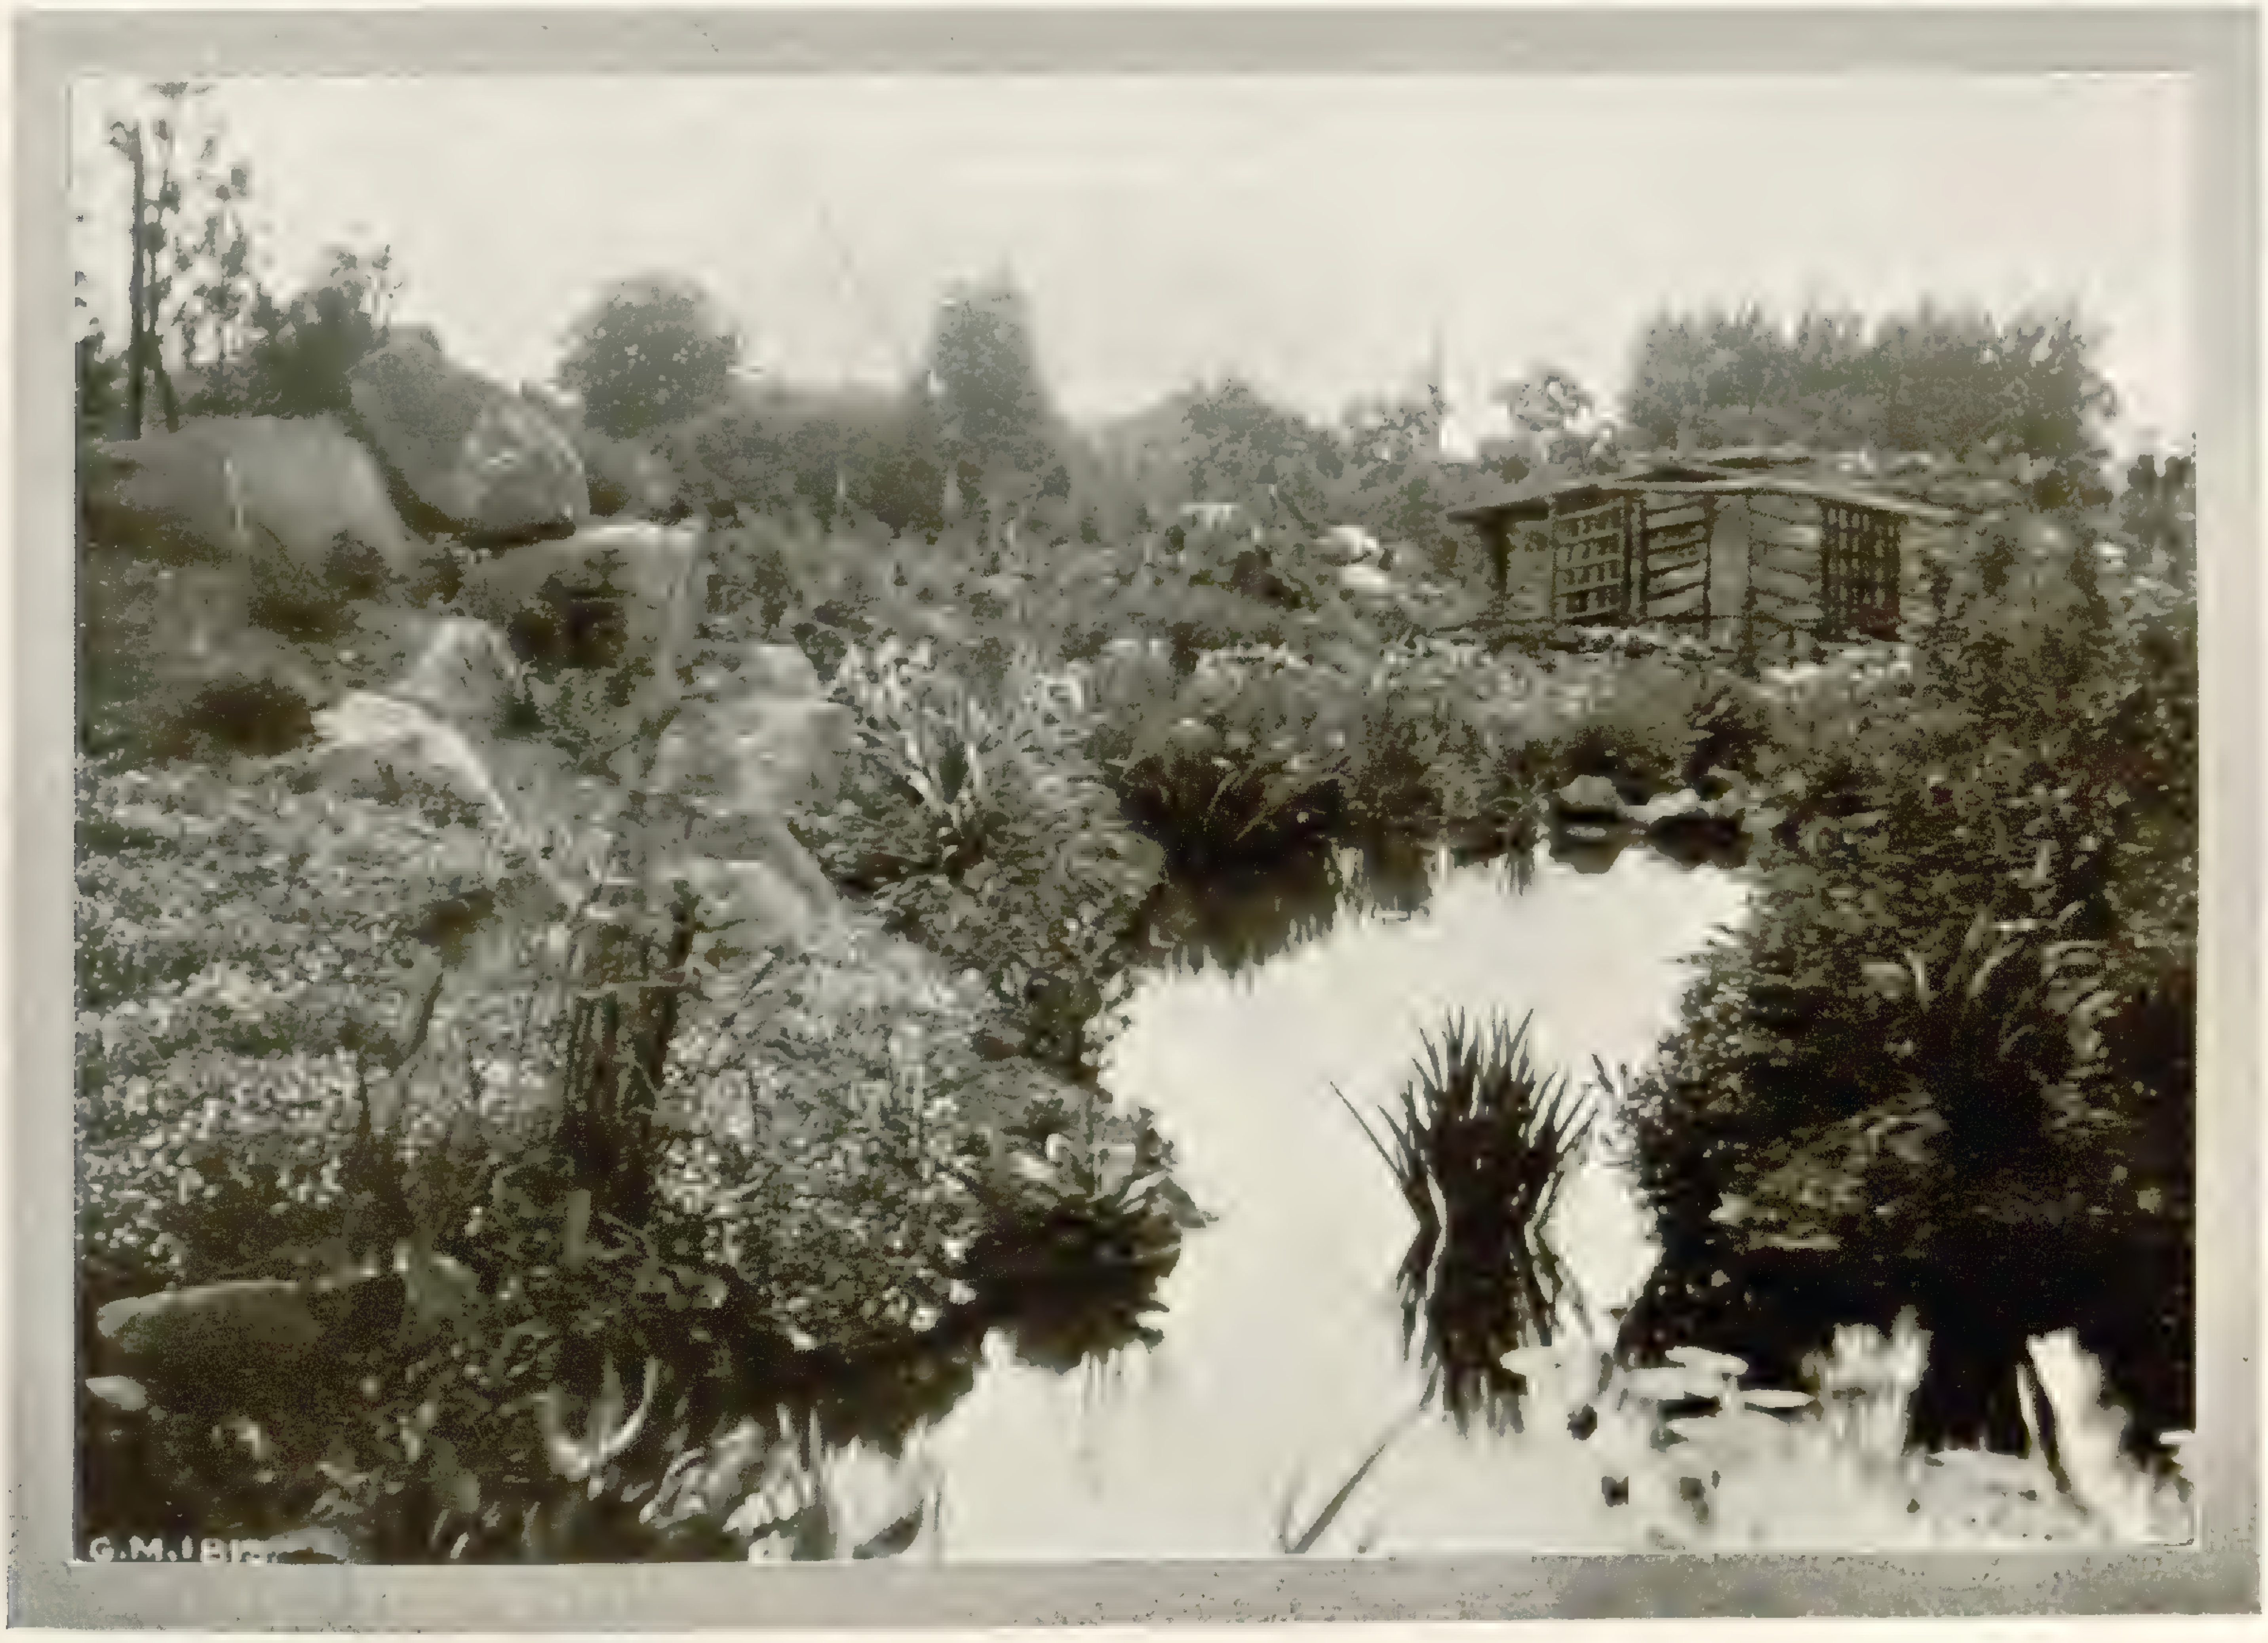
To those whose knowledge of Japanese ideals is confined to dwarf trees and lily bulbs I may be permitted to point out that as copyists of Nature the Japanese landscape gardeners have no equal. The fact that the leading exponents of the art can portray a native landscape, with hill and dale, woodland and winding river, on a piece of ground a few yards square, or on a stretch of a hundred acres, and equally well in either case, will give us an idea of the care and capabilities of the Japanese gardener. It has been my endeavour to bring the ideals of Japan into line with modern English requirements, and one rejoices to find that the blending of the best of both gives such happy results.

The extended use of water in garden scenery has ushered in the reign of entirely new groups of subjects, which have gone



VIEW IN THE BEAUTIFUL ROCK AND WATER GARDEN
Designed in accordance with the Japanese ideal, at Holland House, Southcliff, Essex, the residence of Mr. and Mrs. Lilley.

far to enhance the general interest. The use of rocks, and suitable shrubs and plants for the planting up of the same, and the free, unfettered display of the wild garden, are naturally fitted to co-operate with the Japanese ideals in the forming of an interesting garden. Picture "a garden where stepping-stones wind through drifts of blossoming plants, where sloping banks and valleyed depressions are the rule and not the exception, and where the limpid pools and rock-girt eminences are replete with life and beauty." Such is the garden in brief. It must give life and delight, and afford peace and repose. If a summer-house or tea-house be provided it must be in keeping with the garden scene and not violently opposed to it. The artificial must be obliterated by the natural. Flower and shrub groupings should look as though they had been disposed by Nature's hand, and the entire formation, whether of small extent or large, must not be cramped in appearance or formal in outline.



SUMMER HOUSE IN THE JAPANESE GARDEN AT HOLLAND HOUSE, SOUTHCLIFF, ESSEX.

I am able to emphasise my remarks by means of views of the semi-Japanese effect obtained in the making of the new gardens at Holland House, Southcliff, Essex, the residence of Mr. and Mrs. Lilley. The view looking south from the larger rock formations shows something of the effect of the waterways between the sloping mounds, with a vista of a portion of the valley garden beyond. The fact that two years previous to the penning of these notes the same ground was a flat stretch of grass land, overlying heavy clay, will give some idea of the possibilities of an uninviting site, and the charm of a garden which has been made as natural and as diverse as possible.

The intense interest attaching to such a garden, with the plantings specially arranged so as to give the longest possible period of blossom (practically the whole year through) will be apparent to all, while the desire for diverse formations, embodying hillocks, depressions, boulders, waterways, stepping-stones, streamlets, and wild garden effects, has provided the means of grouping alpines and rock plants, aquatics and waterside plants, shrubs and herbaceous subjects within the confines of a single garden.

I wish also to demonstrate the blending of the many features in a perfectly natural way. It is not necessary to shut the rock garden away from the wild garden, or either from the waterways. They can be blended into a perfectly fitting whole, with nothing to jar or offend the taste of the most fastidious of garden critics.

The second illustration gives the rustic tea-house amidst its setting of sloping banks and unfettered growth viewed from the island. Here, though the area pictured is not large, we have an effect which embodies harmony and simplicity. The lines of the tea-house are in keeping with the natural garden in which it is placed, and though the photograph does not show the depression in which it is situated, nor the pool below it, yet it is sufficient to indicate the peacefulness and charm of the garden.

The whole question is fraught with the deepest interest. In it we perceive the greatness of the movement, which is breaking away from the formal traditions of the past and its accompanying gaudy colour schemes. In the march forward we are utilising to the full the ideas and subjects which lie around us on every hand. Rigid lines and geometrical patterns have now but little weight. The formal pathway has to surrender to the charm of stepping-stones, where the blossoms can creep between. The stone fountain with its adornment of cupids, or similar additions, has little interest as compared to the streamlet with its vigorous growth of rushes, reeds, and sagittarias, its drifts of mimulus, myosotis, and ranunculus, its groups of irises, primulas, and astilbes, while the ever-attractive, ever-changing scenes of floral beauty in the natural garden give an abounding interest with which no formal design, be it ever so grand in conception, can really compete.

Returning momentarily to the garden illustrated, I may say that though it is exposed to the fury of the gales, being in a very wind-swept position, yet, by reason of broken outline, its protecting rocky slopes, and ridges that catch every glimmer of sunshine, we obtain a perpetual display of blossom, for even in the dullest time of the winter there is ever some beauty to brave the elements, and to entice the flower-lover from the house to the garden.

As in all gardens, the hand of time will add to the general effect, by the general increase of growth in plant and shrub life. The formal garden in many cases is good for but a few brief weeks, and then replenishing must take place, but with the natural ideal firmly established one has a garden for a life-time.

P. S. Hayward.

Coronilla glauca.—Before Cytisus racemosus became so popular as a market plant, this coronilla was often to be seen in Covent Garden Market. It is now, however, much less grown than formerly, still for greenhouse decoration the beautiful yellow blossoms and its continuous-flowering qualities stand it in good stead. The glaucous tint of its prettily-divided leaves form another pleasing feature. The cultural requirements of this coronilla are not at all exacting, as it will thrive in ordinary potting compost, and may be placed out of doors during the summer. In the extreme West of England it is looked upon as a hardy shrub. It is a native of the South of Europe, and was introduced in 1772.—W. T.

SWEET PEA NOTES.

The change in the weather from intense heat to cool and moist conditions has had a very beneficial effect on the growth of sweet peas, and the plants are now growing very much stronger, and the flower stems are lengthening nicely, and this is what is wanted, both from an exhibitor's point of view and for general cutting purposes, as stems under ten inches long are rather short for effective decoration.

The very strong winds are apt to blow the vine about considerably, and constant attention must be given to the ordinary rows to prevent the tops coming over.

Those that are being tied and trained for exhibition purposes will also need regular attention, as the softer growth will not stand up long under wind and wet, so all spare time must be given to keeping them in good order, and this is more essential just now than at any time, as the flowers now pushing forward will very probably be needed for exhibition, and once the vine gets out of an upright position the flower stems will become deformed and so prove useless.

In a previous note I recommended giving the plants a rest by taking off a few sets of flower buds, but, under the moister conditions now prevailing, and the resulting vigorous growth, any further thinning in this way should not be necessary, for it should be borne in mind by exhibitors that quality and substance in the flowers are the two chief points to be aimed at, and a too drastic mode of thinning does not tend to this end, but rather to a big, floppy, and ofttimes double standard flower, which is far from being beautiful.

With many people the matter of exhibiting will be uppermost in their minds, and, with so many shows offering good prizes for sweet peas, it ought not to be difficult for intending exhibitors to make up their minds where they will exhibit.

It must not be forgotten that competition in the sweet pea classes is now quite exceptionally keen, and exhibitors should be careful not to enter in more classes than they can manage thoroughly well, as it is certainly more gratifying to win in one good class than to enter in three or four, and probably go down in all of them; so beginners should select one or two classes in which they think they have a fair chance of winning, and use every endeavour to make their exhibits as strong as they possibly can. If they do not win, they should take a quiet look round afterwards with an unbiassed mind, and it is quite probable that they will see their own faults and their neighbours' strong points, and so prepare themselves for the next show, when previous errors (probably in arrangement) may be rectified, and possibly a prize or two will be the result.

Returning to points of culture, quite early in the spring I believe I gave a list of varieties that require shading so as to show them in perfect colour. I need hardly go over the ground again, but I would remind readers that all the salmons (including Stirling Stent) must be shaded, also many of the orange-shaded varieties; to these I would add the variety Charles Foster, as I doubt if this will ever be shown in good form without a little shade, as the flowers have a quite blue tint if exposed to much sun. It is quite easy, however, to overdo the shading, and for the salmons very thin tiffany or butter muslin is sufficient, and even less shading than this will do for the orange varieties, two or three thicknesses of fish netting being all that is required to keep most of them from burning. Three days previously is quite early enough to put on the shading before a show, and if it can be kept 3ft. or 4ft. above the flowers, so much the better, so that a good current of air can pass between the bloom and the tiffany, as I have found them scald as quickly with hot air as they do from the direct rays of the sun.

I have heard it said that flowers of the above-mentioned shades are much more brilliant if cut very young and opened in water, but my experience is very different to this; in fact, quite opposed to it, and, further, very young flowers never open properly, and certainly do not get nearly as large as when the spikes are left on the plants and cut just before the top bloom is at its best, or when this is about three parts open. However, to make quite sure, intending exhibitors might try this for themselves by cutting some very young blooms and opening them in water, and compare them with those opened on the plant under the shading as advised.

Another point: do not put the flowers in a dark place after cutting, but put them in a light, airy place away from the sun, and the size they will attain under this treatment is very often surprising.

T. Stevenson.

VISIT TO A SCOTTISH SCHOOL GARDEN.

A few days since I had the pleasure of being one of the guests of the Ellon and Deer branches of the Scottish Educational Institute, which met at Ellon, Aberdeenshire. The joint outing was under the auspices of the Aberdeen and North of Scotland College of Agriculture, and the Ellon School Board, and the main object was to view the success which has been achieved in the work of school gardens at Drumwhindle School under Mr. Lewis Gavin, head master. The day was an ideal one, and the large company of over eighty teachers were under the guidance of Mr. Gavin, and Mr. George G. Esslemont and Mr. F. A. Thomson, of the Aberdeen and North of Scotland College of Agriculture.

The company foregathered at Ellon, and a drive of a few miles to Drumwhindle, which was greatly enjoyed, brought the company to one of the finest school gardens in the three kingdoms. The garden measures a quarter of an acre, and is enclosed by a dyke on the sides touching the school grounds and the public road, while a close wooden fence, built by the boys of the school, borders the other two sides. At two corners of the garden there are neatly constructed rockeries. In one at the north side some rustic woodwork has been neatly wrought in, and the whole were planned and carried out by the boys. The plants for the rockeries were supplied by the Cruickshank Botanical Gardens, Aberdeen, and the herbaceous plants were obtained from gardens around Drumwhindle, while the rustic woodwork of the arches was supplied by the Earl of Aberdeen, from Haddo House. Coming now to details, we found in the first border all the plants prominently named on green labels of wood in white printing. Round the walls were trees comprising roses, apples, plums, and cherries. Later in the season, Mr. Gavin explained, it was the intention to experiment in budding and grafting, and budding had already been performed on thorn stocks. To the left of this border was a small plot in which the younger children were allowed to plant various specimens under the direction of the teachers, but the gardening otherwise is done and confined to the grant-earning pupils over 12. Next to be seen were a few hybrid perpetual roses and the various classes of herbaceous plants, as campanulas, veronicas, Michaelmas daisies, etc., with two beds of carnations, chrysanthemums, and dahlias.

Passing on to the centre of the garden, the members of the party were shown the ten vegetable plots, each measuring 30 feet by 9 feet, and each worked by a boy and girl in "partnership." Mr. Gavin explained to us that this system of partnership wrought exceedingly well; the boy did the hard work, while the girl did the tidying, for the girl would not be so inclined to leave the plot in a state of disorder as a boy might be. The plots contained cabbages, potatoes, shallots, onions, carrots, beetroot, parsley, turnips, and lettuces. In referring to the potatoes, Mr. Gavin pointed out that experiments had been made with planting out whole and cut potatoes for seed, and it was found that the whole potatoes planted produced almost twice the crop of that realised from the cut seed. For the growing of vegetables there was a system of granting marks to the scholars, and this had proved most encouraging to the enthusiastic pupils.

Near the south wall we found an admirably designed crown of violas, which had been planted in token of the Coronation year, and the decoration gave every sign of proving a beautiful display. In the work of designing, we were told, the scholars were left to their own initiative, and certainly the result reflected the highest credit on all concerned, and especially was this shown in the different seats and arches made in rustic work.

The company were then taken to a border of gooseberry bushes, which the pupils were taught to prune carefully. Here, also, we found raspberries nicely trained on wires with plenty of space between each plant and row. Next to this was a seed bed from which the pupils obtained the various seedling plants. Two neighbouring plots were devoted to experimental purposes—in one the growing of grains, supplied by the Aberdeen and North of Scotland College of Agriculture, and in the other turnips, the manure for which was kindly supplied by Provost Rae, Ellon. We also found here a small patch devoted to the growing of a huskless grain from Manchuria, and the results here are looked forward to with much interest. Adjacent to the foregoing we found a plot containing five different varieties of peas, to test the percentage of fertility and production. Then to the north is a plot of vegetable marrows, each pupil having the care of one marrow. We were then led to the carrot bed, where there were three rows sown without any manure, three other rows with rank farmyard manure, and three more rows with nitrate of soda.

The herb border was a source of much interest to the visitors. Here were found mints, thymes, rues, hyssop, sage, borage, etc., and the children are to have lessons in the various properties of the herbs. About 60 feet of the border facing south is devoted to biennials and annuals, all coming away capitally despite the dry weather. The wall facing the same direction is covered with rambler roses and various tropæolums.

Needless to add, the descriptive remarks and interesting information heard from Mr. Gavin were greatly enjoyed, and the hearty vote of thanks accorded to this gentleman for his afternoon's labour was nothing more nor less than value honestly received.

W. K.

Gentiana septemfida.—Ere the first flush of the rock garden display is over the charming crested gentian begins to unfold its flowers. It is one of the loveliest species in a genus replete with good things, and is of enhanced value owing to the period when it flowers, namely, June and July. It is a deciduous species, and forms a neat rounded bush of prostrate and erect stems some 9 to 12 inches in height; the flowers are large, cylindrical, azure blue with a white throat, and are arranged in clusters on the terminal points of the annual stems. Gentiana septemfida belongs to the stay-at-home section, and forms a tufted root stock which takes some time to establish, hence it is desirable to group several plants together in order to convey a lasting impression of its great beauty. It succeeds in a rich, gritty loamy soil, with or without limestone, requiring a plentiful supply of moisture during the growing season, and with these conditions present it withstands abundant sunshine.—Thomas Smith.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CATTLEYA WARSCEWICZI (GIGAS), in its varied forms, is one of the most beautiful of the genus, and, as it flowers at the season of the year when other members of the family are growing, it is exceedingly useful. The plants now have their growths so far advanced that in most cases they are displaying their flower sheaths, and so must now be given every encouragement that will assist them to develop their growths and produce satisfactory flowers. There are several forms of C. Warscewiczi; some are exceedingly shy flowering, in fact, the majority of the plants fail to give satisfactory flowers unless their pseudo-bulbs are properly ripened, and even then a great deal will depend on the treatment given. There is no cattleya that derives greater benefit from the effects of strong light, all the protection needed is to prevent actual scorching of the foliage, and unless the shy-flowering kinds are grown under these somewhat hard conditions, they may be cultivated for years with most unsatisfactory results. I find it advisable to grow the whole of the varieties of this species suspended near the roof glass in shallow pans. With the early-flowering varieties, or in cases where plants have failed to bloom, there is a great difficulty in preventing the plants making a second growth, and in such cases it is advisable to select a position where the plants may be kept in a cooler state with a reasonably free and drier atmosphere about them. Root action usually commences with the maturing of the growths. Any plants that require repotting should be attended to as soon as they pass out of flower, using a lasting compost of about equal proportions of fibrous peat, osmunda fibre, and chopped sphagnum, with sufficient sand and broken charcoal added to render the compost porous. Give freshly potted plants every encouragement to root into the new compost.

CATTLEYA AUREA is another species which I have found to grow best and give most satisfactory results when grown in as small a receptacle as possible and suspended near the roof glass. From the time growth commences until this reaches maturity, the plants require a hot humid atmosphere, and a liberal amount of root moisture. Many of the plants flower before the actual completion of the growths, so that care must be taken not to commence resting conditions before growth is finished. The natural hybrid C. Hardyana, which is imported with C. aurea, varies very considerably in its time of flowering; in some cases it flowers even earlier than C. Warscewiczi, while others flower quite late in the autumn. The conditions and treatment required are the same as that found successful with the above-mentioned species.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

NIDULARIUM MEYERDORFI. — The brilliant scarlet leaves which immediately surround the flower spike of this interesting stove plant, together with the base of the beautiful green foliage, render the plant most attractive and well worth a position in any collection of foliage plants. An intermediate temperature will be found suitable during its flowering season; our plants are now making an attractive display, after which the suckers will be removed from the parent plants and potted up singly; they may be kept close and freely growing during the autumn if it is desirable to flower them early next summer.

POINSETTIAS which are now well-rooted in sixty-sized pots may be shifted into four-inch or five-inch pots according to the size and strength of the stock treated; use the best procurable fibrous loam (yellow, if possible) and peat, with charcoal and sand to keep the compost porous and sweet. Poinsettias should not be allowed too much rooting space, as when cultivated in small pots with the assistance of regular but judicious feeding they become more thoroughly ripened, and consequently retain their foliage in a better condition, while the bracts are usually of better quality. Immediately after potting poinsettias must be shaded from the sun, and a gentle spraying overhead with the syringe will be beneficial and prevent damage to the foliage from insects. As the plants become established somewhat in the new soil they may be gradually hardened off to cool pits or frames, and kept as near the glass as circumstances permit; allow each plant to stand clear of its neighbour and admit air on all favourable occasions.

BOUVARDIAS are now ready for their final flowering pots, and it will be advisable, particularly in the north, to repot them without further delay, so that they may become well established before the winter months arrive. When they are not disposed to branch naturally, the extreme tips may be removed to induce the shoots to break into more bushy growth; this practice may be repeated again until the end of July, after which the flower spikes should be allowed to extend. Weak liquid manure may be applied occasionally, with an alternate application of clear soot water. A central stake should be firmly fixed to each plant, and the main shoots neatly looped to it. Red spider and aphis, which are often troublesome pests, must be kept in check by syringing with insecticide. The plants which are now in their cool pits or frames will require abundance of light and ventilation during favourable weather, but during excessive hot sunshine they need a thin shade. Close the frames early during the afternoon and syringe thoroughly to encourage free root action and assist the plants in maintaining that sturdy and healthy appearance which is so desirable.

ADIANTUM CUNEATUM.—When one is anxious to maintain a supply of this indispensable fern for winter decoration, it is advisable to subject the plants to somewhat cooler conditions, and for this purpose heated pits or frames are well adapted, using artificial heat only to counteract damping and during cold nights. The plants should be thinly disposed, and allowed ample ventilation. Cold draughts must be avoided. The ferns may also be exposed gradually to the sunshine, and where this method of procedure is practised an excellent supply of fronds will be obtained throughout the winter.—JOHN DONOGHUE, Bardon Hill Gardens.

FRUITS UNDER GLASS.

MELONS.—These are very delicious in hot weather when ripened up well, and at this season can well be grown in frames, and if planted as recommended in a former calendar the plants will be showing a goodly number of fruits. If planted in a pit as recommended there ought to be eight to twelve melons per light; give these liquid manure at every other watering, and a little top-dressing of a fertiliser will help the final swelling of the fruits. See that each melon is set upon a slate or pot to expose it to the sun and also to keep it from the soil. Prevent the foliage becoming too thick by constantly pinching out the laterals. When watering is being done do the work thoroughly. Syringe the plants well at shutting-up time, and if in unheated frames, this should be done earlier than is usual in frames that have hot-water pipes; if necessary give a light sprinkling at 7.30 to 8 o'clock. We have now begun to cut our second and third batches from the houses. Successional crops will now require supports, and I know nothing better than the melon nets, which can be bought cheaply and will last several years if rolled up and kept in a dry drawer when not in use. Lateral growths should be stopped as advised for frame culture, and sublaterals pinched close back, and if seed is required for stock, grow a batch of melons in a separate house, and pollinate with own pollen. Sow seeds now for the last crop, which should ripen in September and October; sow in small pots, and place in a warm pit, choose good sterling varieties for this crop.

STRAWBERRIES FOR FORCING.—No time should be lost now in preparing for a supply of layers. Early runners are not extra plentiful this season. Prepare a suitable compost, which should consist of maiden loam well broken up, and some decomposed horse manure, a 32 pot full of bone-meal to every wheelbarrow load of compost, and a 48 pot full of soot. This should be well mixed up. It is best to prepare enough for the whole series of layers. Small pots may be used for the runners, or the runners may be laid into the fruiting pots direct. If a hot season and when runners are late, the latter is perhaps the best method. If layered in small pots no crocks need be used; put a few loose lumps of soil in the bottom, fill up with soil, make firm, and fasten the layer on with a wire peg, which will keep it securely. Place as many pots as possible close together as this will save time in watering; do not layer from barren plants. In about a fortnight the plants will be ready for removal. If layered in the fruiting pots the pots must be well drained and the soil made very firm by ramming. Royal Sovereign, President, Keen's Seedling, and the old Vicomtesse Hericart de Thury are still unsurpassed.

ORCHARD HOUSE.—Keep the trees well supplied with liquid manure, and as soon as the cherries are finished, give the trees a thorough cleansing with a good insecticide. Keep the growths of plums and pears pinched in, so that too much growth is not made at the expense of the fruit; water thoroughly as often as necessary, and be quite sure that the water reaches all the roots, as nothing will cause the leaves to become a bad colour and the fruit to drop more quickly than excessive dryness at the roots.—W. A. COOK, Leonardslee Gardens.

THE FLOWER GARDEN.

ROSES.—The early-flowering varieties of the rambler section which have ceased blooming will now require attention with regard to pruning and thinning. In many cases the best results are obtained from the previous year's growth, therefore it is necessary to give the young shoots every encouragement by tying them in their permanent places at an early period. Where these are growing on arches or pergolas the growths should be taken quite off the supports, and sufficient of the old wood cut out to allow the young growths to be trained in thinly and evenly. A good top-dressing of well-decayed manure will prove of great benefit, and copious waterings should be given during dry weather. This latter remark also applies to all at this season of the year, as it greatly assists them in the production of the second crop of flowers and in the formation of new growth for next season's flowering. All decaying blooms should be removed, and the beds occasionally stirred over with a hoe. From the middle to the end of the month the budding operations may be proceeded with, the actual time to be decided upon by the way in which the bark leaves the wood. When it is found that the bark parts from the wood easily and cleanly budding should be proceeded with.

DAFFODILS.—When these become overcrowded, the flowers are naturally small, hence the need for lifting and dividing. If growing in beds or borders by themselves the task is an easy one, but when in grass the work is more difficult, and the grass is bound to have a patchy appearance after lifting. The poeticus section is the one which usually commences to grow first, and these should be the first to receive attention. It is not advisable to divide the roots too severely, as in many instances the wound caused by breaking off the side bulbs often induces disease or rot.

VIOLAS which are being grown for propagating purposes should be pruned by cutting off all the old growths close to the ground. This operation will encourage the plants to produce young shoots suitable for cuttings. Immediately these latter are large enough they should be taken off and inserted in sand in a cold frame, which should be kept close and shaded till root action commences.—E. C. POOLEY, Gnaton Gardens.

EXHIBITIONS AND MEETINGS.

Festival of Empire Rose Show.

A very extensive rose show, organised by Mr. Geoffrey Henslow for the Festival of Empire, was held at the Crystal Palace on Thursday, June 29, and, though there were few flowers of super-excellence, there was a very even range of quality all through, and everyone appeared to be very satisfied, both with the classes, the flowers, and the general arrangements. No cash prizes were offered, and there were nearly silver cups enough for everyone, and gold and silver medals galore, and, as a great number of these prizes were gifts the show was of unusual interest. So successful was this exhibition that we understand another display will be organised for September. Judges and exhibitors, officials and Pressmen were entertained at luncheon under the genial presidency of Lord Windsor, and afterwards Lady Plymouth distributed the prizes to the successful competitors.

NURSERYMEN.

The Canadian Pacific Railway Company's fine silver cup for forty-eight roses was won by Messrs. B. R. Cant and Sons, Colchester, with a fine set of blooms that contained Yvonne Vacherot, Lyon Rose, F. K. Druschki, White Maman Cochet, Bessie Brown, Captain Hayward, J. B. Clarke, Harry Kirk, Mdme. Jules Gravereaux, Maman Cochet, and B. Cant, particularly good; Messrs. Alex. Dickson and Sons, Newtownards, Co. Down, second, and Messrs. R. Harkness and Co., Hitchin, third.

The best three dozen blooms, distinct, which won Lord Northcote's silver cup, came from Mr. Hugh Dickson, Royal Nurseries, Belfast, who had a beautiful set of clean, fair-sized flowers, with J. B. Clarke, Mrs. David McKee, Horace Vernet, Bessie Brown, Lieut. Chauve, and Princess Beatrice as specially good; there were five competitors, and Mr. George Prince, Longworth, came second; and Messrs. G. and W. H. Burch, Peterborough, were third.

For two dozen flowers, distinct, Mr. J. Mattock, New Headington, Oxford, led, and he had Lyon Rose, H. Dickson, Charles Darwin, and Duke of Wellington in good form; Mr. Henry Drew, Longworth, second, and Mr. W. R. Chaplin, Joyning's Nurseries, Waltham Cross, third; seven entries.

The best sixteen varieties, three blooms of each, were shown by Messrs. A. Dickson and Sons, who led from six competitors, and had excellent flowers of Mrs. Theodore Roosevelt, Mrs. W. J. Grant, Horace Vernet, G. C. Waud, and Gloire de Chedane Guinoisseau; Messrs. Frank Cant and Co., Colchester, second, and Messrs. B. R. Cant and Sons, third. Of eight trebles there were fourteen entries, and the cup as first prizé was won by Mr. George Prince, Longworth, who scored with Mrs. T. Roosevelt, Avoca, Lyon Rose, J. B. Clarke, F. K. Druschki, Ulrich Brunner, etc.; Messrs. R. Harkness and Co., second, and Mr. Henry Drew third.

The Earl of Plymouth presented a silver cup for the best eighteen teas and noisettes, and this was won by Mr. George Prince, Longworth, with somewhat small but bright, clean flowers of Mrs. E. Mawley, Mdme. Constance Soupert, Comtesse de Nadaillac, The Bride, Mdme. de Watteville, etc.; Messrs. B. R. Cant and Sons second, and Mr. Henry Drew third. For a dozen tea or noisette roses there were five entries, and here Mr. John Mattock scored a first, and was followed in order by Messrs. J. Jefferies and Son, Cirencester, and the King's Acre Nursery Company, Hereford; in every case the flowers showed signs of the recent wind and rain. The gold medal for a dozen trebles, teas or noisettes, was won by Messrs. B. R. Cant and Sons, whose best flowers were of White Maman Cochet, Bridesmaid, Golden Gate, Maman Cochet, and Muriel Grahame; Mr. G. Prince second, and Messrs. A. Dickson and Sons, third. The gold medal for six trebles fell to Messrs. Robert Harkness and Co., Hitchin.

NURSERYMEN'S ROSES IN VASES AND DECORATIVE VARIETIES.

For a dozen varieties of exhibition roses in vases, seven blooms of each, the "Daily Telegraph" Cup was the premier award, and here the winners were Messrs. D. Prior and Son, Colchester, whose best vases were of Mrs. Theodore Roosevelt, Mrs. J. Laing, Lyon Rose, Avoca, Maman Cochet, and White Maman Cochet; Messrs. R. Harkness and Co. second, and Messrs. Alex. Dickson and Sons, third.

There were three entries of nine varieties of tea or noisette roses in vases, seven blooms of each, and here nearly all the flowers were badly weathered; Mr. J. Mattock led, winning Sir J. Lyons' cup; Medea and Mdme. Jules Gravereaux were good; Mr. Henry Drew second, and Mr. George Prince third.

There were five big banks of decorative roses, each composed of two dozen bunches in as many varieties, and here the Empire Festival Cup was won by Mr. John Mattock, New Headington, with a very fine display that included grand bunches of Crimson Damask, Peggy, Betty, Simplicity, Mdme. Abel Chatenay, Warrior, Mrs. Flight, and Leuchtstern; Messrs. Frank Cant and Co. second, and Mr. George Prince third. Messrs. W. Spooner and Son, Woking, came first for eighteen vases of decorative roses, with Messrs. J. Jefferies and Son second, and Messrs. G. Mount and Sons, Canterbury, third.

The best dozen flowers of any new rose were examples of Leslie Holland, crimson, from Mr. Hugh Dickson, Belfast; Messrs. Perkins and Sons, Coventry, second, with G. C. Waud, and Messrs. Harkness and Co third with Lyon Rose. Messrs. B. R. Cant and Sons led for a dozen roses, introduced during 1908 or later; Ethel Malcolm, Lyon Rose, Rhea Reid, and Claudius were the most striking; Messrs. A. Dickson and Sons second, and Mr. Hugh Dickson third.

The best dozen blooms of a H.P. rose were grand clear examples of Mrs. John Laing from Messrs. R. Harkness and Co.; Mr. J. Mattock second with the same variety; thirteen entries. Out of fifteen competitors Mr. J. Mattock led for a dozen blooms of a H.T. rose with Mrs. Theodore Roosevelt in fine condition; Messrs. Stuart Low and Co., Enfield, second, with Lyon Rose, and Messrs. G. Mount and Sons third with White Killarney. There were fifteen entries of a dozen blooms of a tea rose, and here Messrs. D. Prior and Son led with White Maman Cochet; with Messrs. B. R. Cant and Sons second, and Messrs. R. Harkness and Co., third with Mrs. E. Mawley.

AMATEURS.

In the open amateur division Mr. Conway Jones secured the Empire Festival Cup for three dozen roses with a moderate set, in which Mrs. E. Mawley, White Maman Cochet, and F. K. Druschki were good flowers; Rev. J. H. Pemberton second. Mr. Alfred Tate won the Duke of Fife's cup for twenty-four flowers, and he showed Helene Guillot, Mrs. T. Roosevelt, Bessie Brown, Florence Pemberton, Mdme. M. Soupert, and Mrs. J. Laing well; Mr. Skeys, gardener to F. Dennison, Esq., Cranford, Leamington, second; and Dr. T. E. Pallett, Earl's Colne, Essex, third.

For a dozen trebles Mr. Alfred Tate was again to the front, and the varieties noted in his previous win were also good here, with Mdme. Melanie Soupert also fine; Mr. F. Dennison second, and Mr. G. A. Hammond, Cambrian House, Burgess Hill, third. For a dozen blooms of any rose Mr. Alexander Hill Gray, Beaulieu, Bath, led with Lyon Rose in fine form; Mr. A. Tate second, with Bessie Brown, and Dr. Pallett third with Frau Karl Druschki.

In the section for growers of fewer than 3,000 plants, there were three entries of two dozen flowers, and here Mr. Burdfield, gardener to E. M. Eversfield, Esq., Denne Park, Horsham, won the King's Acre Nurseries' Cup with a good set of blooms; Mr. G. R. Bonnor, Barnwood, Gloucester, second, and Mr. J. A. L. Fellowes, Banwell Rectory, third. There was a rare competition in the class for eighteen blooms, and here Mr. H. Robins, Ingatestone, scored from thirteen entries with a very fine set in which A. K. Williams, Florence Pemberton, Mrs. T. Roosevelt, Mrs. J. Laing, G. C. Waud, and Mrs. Sharman Crawford were especially good; Mr. O. G. Orpen, West Bergholt, was a good second, and Mr. W. O. Times, Hitchin, came third.

Dr. Charles Lamplough, Alverstoke, led for eight trebles, followed by Mr. E. M. Eversfield and Mr. W. R. Hammond. Dr. Lamplough also led for six blooms of one variety with beautiful flowers of Frau Karl Druschki; Mrs. W. Upton, Belgrave, Leicester, and Rev. L. C. Chalmers Hunt, Willian Rectory, Hitchin, were also prize-winners in this section, while Messrs. J. Cheal and Sons' cup for six trebles was won by Mr. Wm. Upton, his J. B. Clarke and Mdme. Jules Gravereaux being fine; Mr. James Gibb, Westfield, Reigate, second, and Rev. F. R. Burnside, Great Stanbridge, Essex, third.

AMATEURS' TEA ROSES.

In the chief amateurs' class for tea roses, eighteen blooms were required, and the silver cup offered as first prize was won by Mr. A. Hill Gray, Bath, with Ernest Metz, Dr. F. Guyon, White Maman Cochet, Maman Cochet, Mrs. E. Mawley, R. W. Smith, and Baronne H. Snoy, in fine condition; Mr. Conway Jones second, and Mr. Alfred Tate third. Mr. Eversfield had the best dozen tea roses, and was followed closely by Mr. O. G. Orpen, with Dr. F. H. Cooke, Birch, third.

AMATEURS' DECORATIVE ROSES.

The Empire Cup for eighteen bunches of decorative roses was won by the Rev. J. H. Pemberton, Havering, who had a fresh set that included Gustave Regis, Electra, Macrantha, Aglaia, Una, and Lady Curzon; Mr. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, second, and Mr. F. Chambers, gardener to H. V. Machin, Esq., Gateford Hill, Worksop, third. The N.R.S. Cup for a dozen varieties was annexed by Mr. Conway Jones, Heathcote, Gloucester, who was followed by Viscountess Enfield, Dancers Hill, Barnet, and Mr. O. G. Orpen, West Bergholt, Colchester.

For six bunches of decorative varieties Mr. F. A. George, Redhill, Worcester, beat Dr F. Cooke, Birch, Colchester, and Mr. J. Hart Lochmuir, Potters Bar. The Rev. J. H. Pemberton led for six vases of the sweetest-scented roses, winning with Seagull, Zepherine Drouhin, York and Lancaster, Moschata, Mdme. Alfred Carriere, and Rene Andre; Mr. A. Tate second, and Mr. F George, Worcester, third.

FLORAL ARRANGEMENTS.

Mr. Howard Williams, Willow Cottage, North Finchley, had the best vase of roses; Mr. O. G. Orpen led for ladies' sprays and also for gentlemen's buttonholes. Mr. H. Williams scored for a bowl of roses with Mrs. J. Laing well arranged, and Mr. Peters Wood, Broom Lodge, Weybridge, scored for a basket of roses, and in every case the competitor was good all through.

Mrs. Alex. Robinson, Norhyrst, Carshalton, led for a table decoration of roses, winning a silver cup for a design in Mdme. Abel Chatenay, croton leaves, and asparagus sprays; Miss Jessie Langton, Raymead, Hendon, second, and Mrs. Curnock Sawday, Rydal Mount, Weybridge, third.

NEW AND MEDAL ROSES.

The silver cup for the best new rose was won by Messrs. Alex. Dickson and Sons, Newtownards, with Queen Mary, a brilliant yellow and rose-shaded variety; Mr. Hugh Dickson second with the deep dark crimson King George V., and the same firm third with the Hon. G. Lawson Johnston.

The gold medal offered by Messrs. Clay and Son, Stratford, for the best bloom in the show, was won by Messrs. D. Prior and Son, Colchester, with a glorious flower of Frau Karl Druschki.

NON-COMPETITIVE.

Messrs. Kelway and Son, Langport, Somerset, contributed a large collection of delphinium spikes, showing all shades of blue from the palest shade to deep violet; Lord Napier, Lemberg, Knight of Langport, Star of Langport, Summer Sky, Dr. Lodwidge, and Empress Queen were a few particularly fine varieties. Messrs. A. A. Walters and Son, Bath, showed a large group of beautiful spikes of their exquisite blue and white delphinium named Rev. E. Lascelles.

Mr. A. Hemsley, Crawley, put up a little rock garden, the chief occupants of which were Gypsophila Stevensi, Aster alpinus, Primula Littoniana, P. Poissoni, Œnothera mexicana, dianthuses in variety, and Sedum Powelli. Mr. Walter Easlea, Eastwood, Essex, staged a large collection of roses, showing popular varieties in baskets and vases; Lyon Rose, Mdme. Jules Gravereaux, Marquis de Sinety, Charlotte Klemm, and General Macarthur were varieties well shown.

Richmond.

Favoured with fine weather, and held amid the most delightful surroundings in the famous Old Deer Park, the Richmond flower show was a good one on June 28, but not nearly so good as on some previous and recent occasions. Probably the Norwich Show kept back some of the traders, while Windsor, Walton, and other rose shows provided attractions which rosarians, trade and amateur, could not resist. Five big tents were used, and there was plenty to look at, to interest, and instruct, notwithstanding the slight falling off in entries.

GROUPS AND PLANTS.

In the open class for a group of plants arranged for effect on a space of 100 sq. ft. the premier award of £8 fell to Mr. H. Burfoot, gardener to Sir Max Waechter, The Terrace House, Richmond, who had a very pretty exhibit, elegantly composed of pink spiræas, bright crotons, liliums, humeas, palms, ferns, and gloxinias, with a veiling of gypsophila over the ferns and below the latter subjects. Messrs. Card and Denny, Thames Ditton, came second with a rather heavy group of crotons, palms, campanulas, begonias, liliums, pelargoniums, etc.; Mr. T. J. Broom, gardener to Miss Langworthy, Gays House, Holyport, third.

Mr. G. Hale, gardener to Samuel Larkin, Esq., The Ridgways, Haslemere, was easily first for a 60ft. group, winning with a pleasing arrangement, in which cattleyas, læliocattleyas, odontoglossums, phalænopsis, and miltonias were associated with the usual foliage plants; with the exception of spiræas orchids were the only flowering plants used; Mr. W. H. Keary, gardener to Mrs. Cowper Coles, Hedingham House, Twickenham, second.

For six palms there was but one entry, and for this Mr. H. Burfoot was awarded a second prize. Mr. H. Lawrence, gardener to Mrs. Vaughan Arbuckle, Stawell House, Twickenham, scored for half a dozen specimen ferns, and Mr. H. G. Worsfold, gardener to A. King Farlow, Esq., Teddington Hall, Middlesex, was a good second. Caladiums, always well shown at Richmond, were best displayed on this occasion by Mr. A. Allum, gardener to L. Warde, Esq., Petersham House, Petersham, who had six medium-sized, finely-coloured specimens; Mr. H. Lawrence was second. Coleuses were not so good as usual, and Mr. Lawrence and Mr. Allum were awarded second and third prizes respectively.

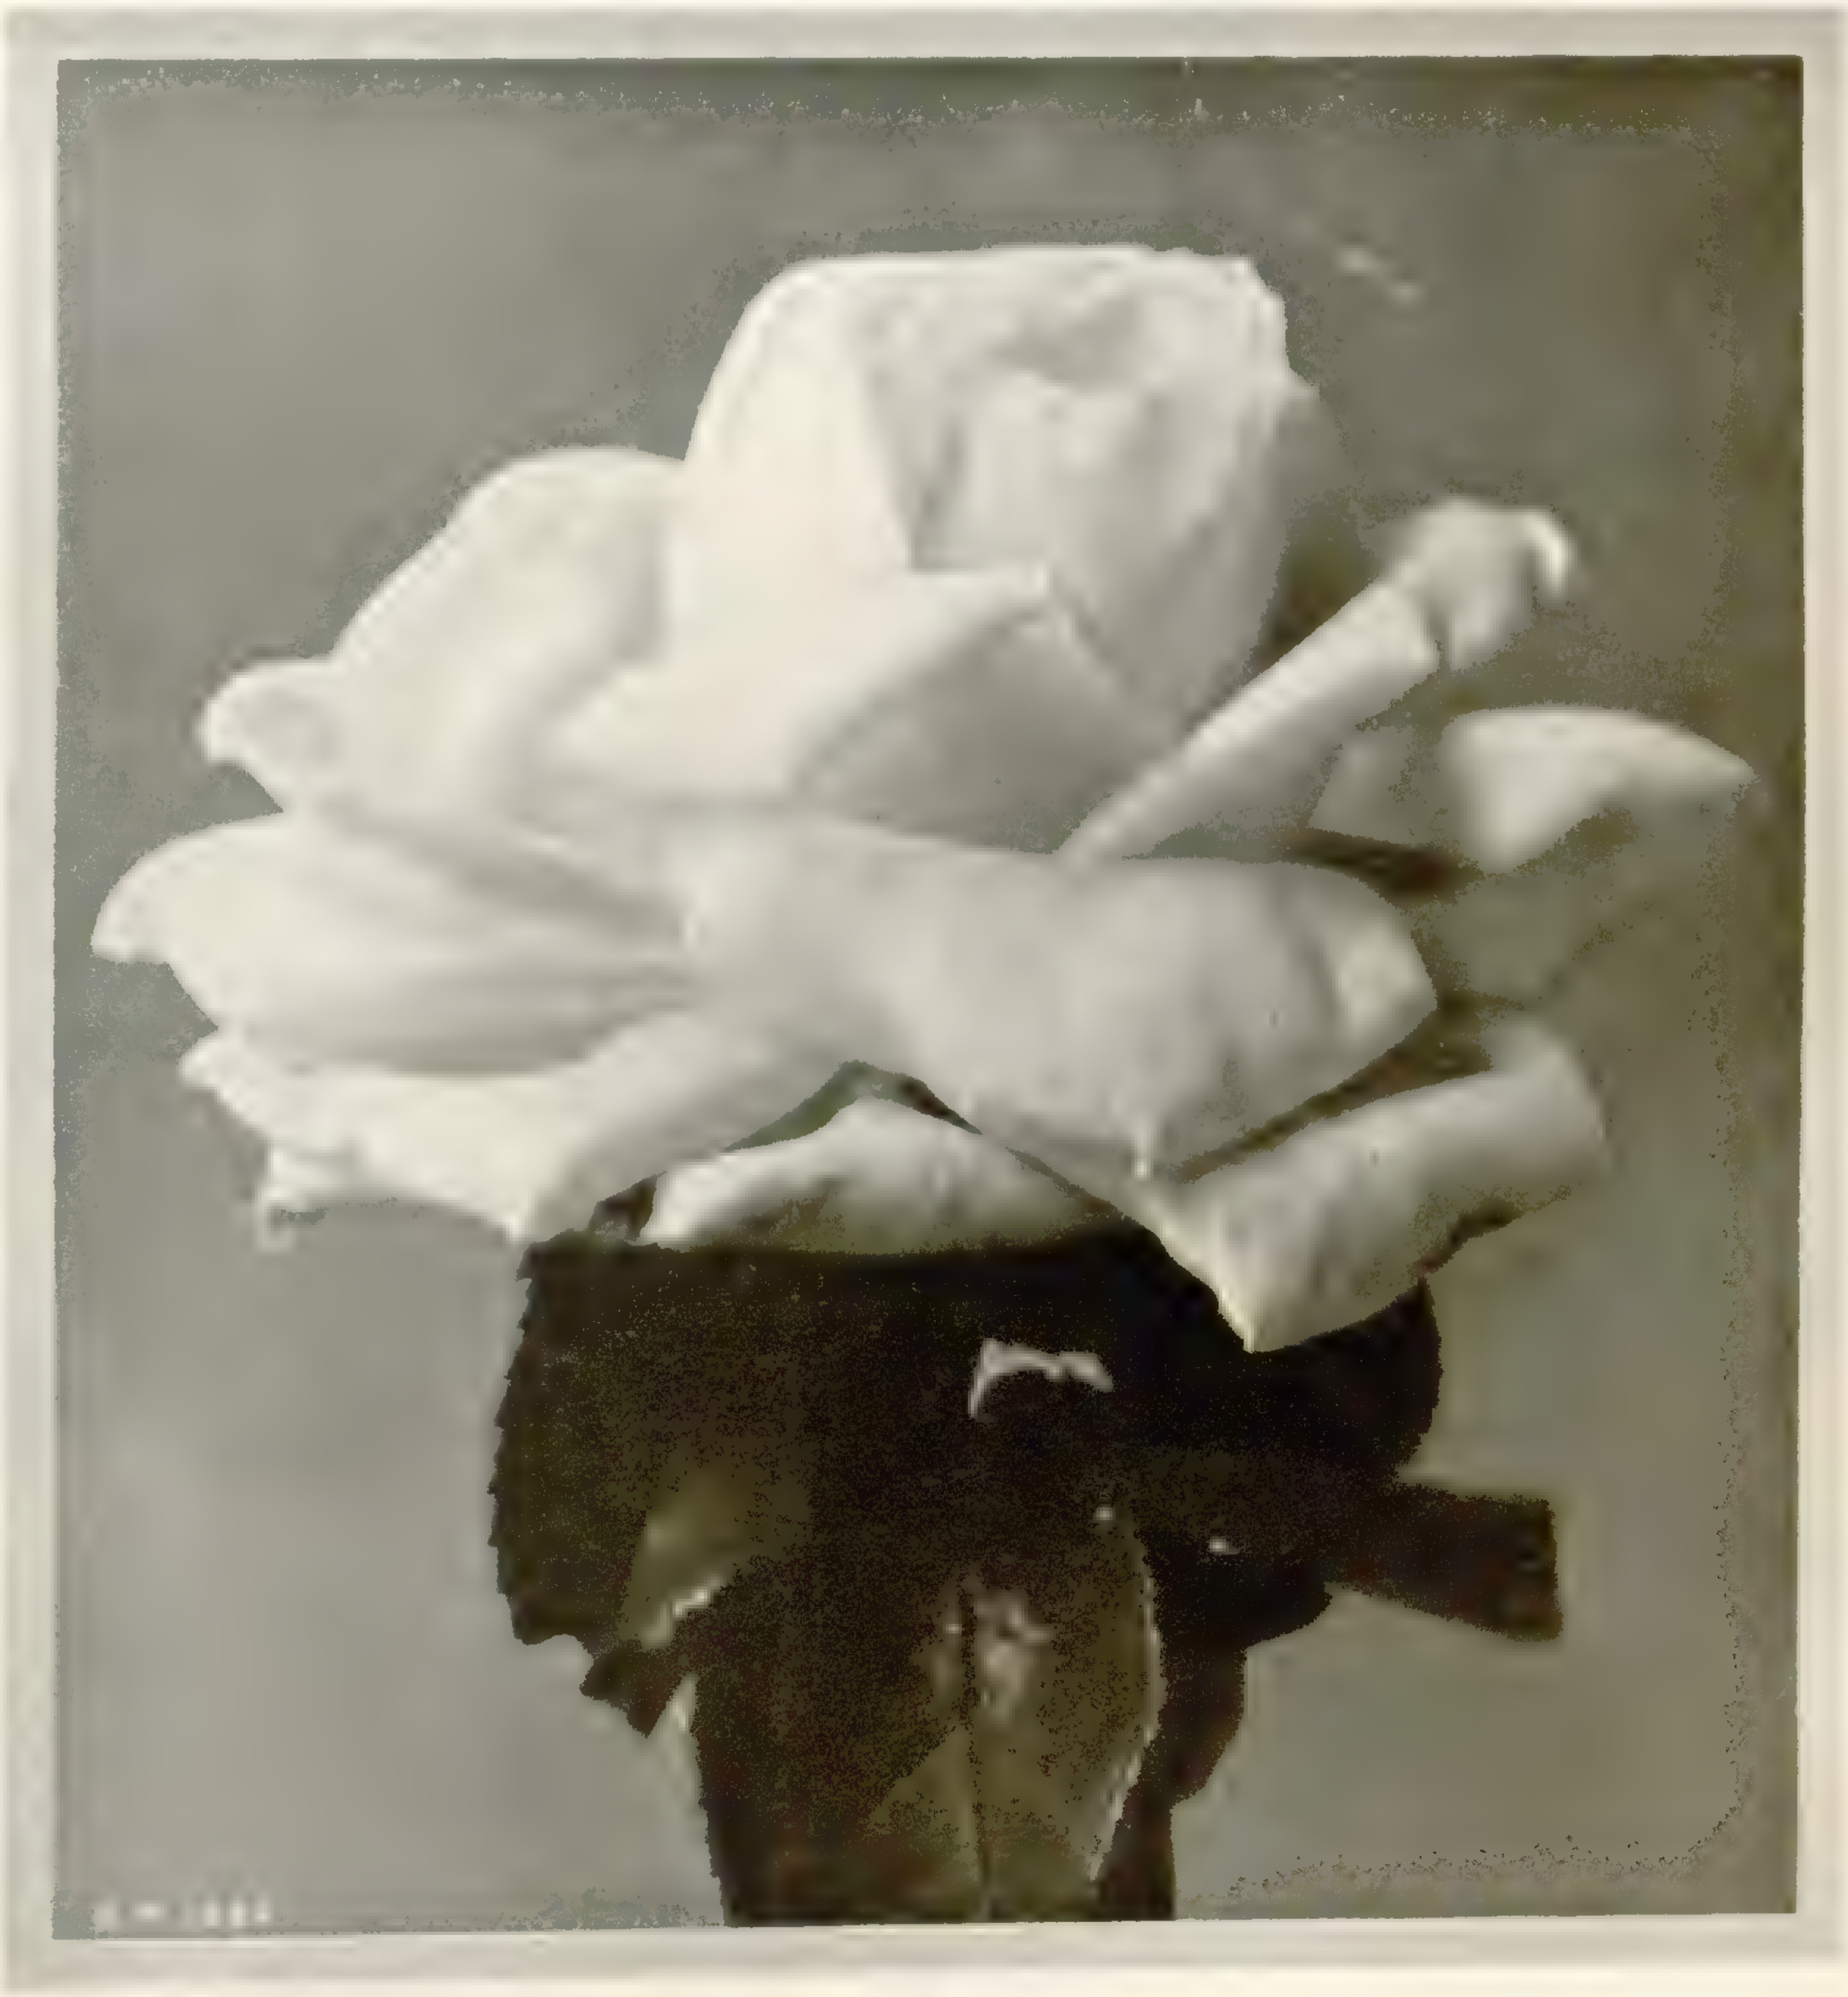
The graceful pillar-shaped fuchsias were very pretty, and for six specimens Mr. Keary led the way with very freely-flowered plants that included the old Rose of Castile; Mr. Lawrence second.

Mr. W. Chant, gardener to E. D. Bennett, Esq., Darby Lodge, Sunbury, had easily the finest half dozen gloxinias, perfect plants. Mr. W. J. Hill, gardener to G. Atkins, Esq., Manaton, East Sheen, led for six tuberous begonias, and the latter scored for streptocarpuses with big, freely-flowered plants.

The best half-dozen orchids, distinct, were from Mr. A. Howard, gardener to H. Little, Esq., Baronshalt, Twickenham, who presented Cattleya Gaskelliana, C. Mendeli, Lælia purpurata, L. Pacuvia, L.-c. Tyntesfieldense, and L.-c. Zephyra; Mr. S. Fiddeman, Franch Court Road, Tooting, second, and Mr. Hale third.

CUT FLOWERS.

The Gunnersbury Park Challenge Cup was easily won this year by Messrs. Frank Cant and Co., Colchester, as this firm had no competitors in the class for forty-eight trebles. Their best blooms were of Lyon Rose, Mdme. Melanie Soupert, Florence Pemberton, Mrs. Theodore Roosevelt, Bessie Brown, Mrs. J. Laing, Mrs. Cocker, Frau Karl Druschki, and Konigen Carola. For a dozen roses, three blooms of each, Messrs. W. Crisp and Sons, West Bergholt, scored a first, and had nice flowers of Bessie Brown, Lyon Rose, Mrs. J. Bateman, and Mrs. Theodore Roosevelt; Messrs. G. and W. H. Burch, Peterborough, second, and Mr. Henry Drew, Longworth, Berks, third.



BLOOM OF ROSE FRAU KARL DRUSCHKI.

Selected for the Award of the Gold Medal given by Messrs. Clay and Son for the best bloom in the Festival of Empire Rose Show. Exhibited by Messrs. D. Prior and Son.

For two dozen roses, three blooms each, Messrs. G. and W. H. Burch led the way, showing Lyon Rose, A. K. Williams, Frau Karl Druschki, Her Majesty, and Lady Ashtown well; Mr. Henry Drew came second, and Messrs. W. Crisp and Son, third. Messrs. Frank Cant and Co., Colchester, scored for a dozen hybrid teas, their Mrs. Roosevelt, Helen Guillot, and Florence Pemberton being the best examples; Messrs. G. and W. H. Burch, second, and Mr. Henry Drew third.

The best dozen H.P. or H.T. roses were fine examples of J. B. Clark, shown by Mr. Henry Drew, Longworth; Messrs. Frank Cant and Co., second, with Mrs. John Laing; and Messrs. G. and W. H. Burch third with the latter variety. For a dozen tea roses Mr. Henry Drew scored with Mdme. Jules Gravereaux in fine condition; Messrs. G. and W. H. Burch second, and Messrs. W. Crisp and Sons, third, all with the same variety. Mr. A. Gregory, gardener to W. J. Turner, Esq., Pallanga, Teddington; Mr. Allum, Mr. G. Farel, 71, High Street, Hampton Hill, were leading prize-winners in the amateur rose classes.

Floral arrangements were pretty numerous, but scarcely such a feature as on some previous occasions. Mrs. Martin, North Road, Richmond, had the best basket of flowers, a pretty combination of white liliums and golden Spanish irises. The Mayor's prize for a table decoration was won by Mrs. A. Robinson, Norhyrst, Carshalton, with roses, croton leaves, and sprays of Francoa ramosa; Mrs. A. Bide, Farnham, second, with the Lyon rose prettily set out. Mrs. Robinson was first in another class with roses and lily of the valley; Mrs. Bide second with pink and orange sweet peas. Mrs. Bide had the best basket of roses. Mr. W. Fromow, The Quadrant, Richmond, led for a rose bouquet.

In the Eckford class for nine bunches of sweet peas Mr. S. Jordan, Addlestone, was placed first, Mrs. A. Ireland, Helen Lewis, and Tenant Spencer being the best varieties; Mr. C. Howe second, and Mr. S. Fuller, gardener to J. N. Stuart, Esq., Broomhill, Northolt, third. Messrs. Webb and Sons' prizes for eight bunches of sweet peas were won by Mr. T. J. Broom, and Mr. E. Skelton, Townshend Terrace, Richmond. Sir Thomas Skewes Cox's prizes for nine bunches of sweet peas were won in a fine competition in order by Mr. G. Baldwin, Greenford Green; Mr. W. Mousley, West View, Ashford; and Mr.

T. J. Broom. Mr. Baldwin had a fine lot, and especially good were Constance Oliver, Helen Lewis, Sunproof Crimson, Elsie Herbert, and Maroon Paradise. For six bunches, distinct, Mr. Baldwin was again the leader, his Asta Ohn and Thomas Stevenson being particularly good; Mr. T. J. Broom second and Mr. W. Mousley, Ashford, third.

For hardy flowers, twelve bunches, Mr. Allum led the way, his gladiolus and Lilium croceum being well represented; Mr. Skelton second. Mr. Allum was the only exhibitor of two dozen bunches of hardy flowers, and here his campanulas, Lychnis chalcedonica, delphiniums, and English Irises were conspicuously good.

FRUIT AND VEGETABLES.

Mr. W. Lintott, gardener to Sir Walpole Greenwell, Bart., Marden Park, Caterham, was the only exhibitor of six dishes of dessert fruit, and he thoroughly deserved the first prize, which carries with it the Waechter Challenge Cup and a cash award; he had three excellent bunches each of Foster's Seedling and Black Hamburgh grapes, a Hero of Lockinge melon, fine Royal Sovereign strawberries, Brown Turkey figs, and Early Rivers nectarines.

Mr. Lintott was first for three bunches of black grapes with neat clusters of Black Hamburgh; Mr. F. M. Tayler, gardener to T. J. Messom, Esq., The Hut, Strawberry Hill, second, with heavier, smaller-berried bunches that had been rubbed somewhat in carriage; Mr. G. Baldwin, gardener to A. W. Perkin, Esq., Greenford Green, Harrow, third. Mr. Lintott scored for white grapes with heavy bunches of Foster's Seedling, and Mr. Baldwin was second. Mr. C. Howe, gardener to G. T. Biddulph, Esq., Douglas House, Petersham, was first for two dishes of strawberries, and he staged grand fruits of Waterloo and Latest of All; Mr. H. Riley, West Lodge, Kew Gardens, second with The Bedford and Bedford Champion.

There was good competition in the vegetable classes. For a dozen distinct kinds Mr. T. J. Broom was placed first, and he had excellent Reliance Globe beet, New Standard carrots, White Tripoli onions, and Stourbridge Marrow peas, etc.; Mr. C. Howe second, and Mr. E. Montague, gardener to Colonel Biddulph, Grey Court, Ham, third.

In the class provided by Messrs. James Carter and Co., for nine kinds of vegetables, Mr. T. C. Howe was first, Mr. T. J. Broom second, and Mr. R. Keene, Manor Grove, Richmond, third. Mr. Keene was first in a special class for nine kinds in a very keen local competition. Mr. Keene, Mr. T. J. Broom, and Mr. E. Watts, Audley Road, Richmond, won awards as placed for six kinds of vegetables in the class provided by Messrs. James Veitch and Sons.

NON-COMPETITIVE.

Mr. H. Eckford, Wem, Salop, presented a big group of sweet peas that included Luminosa, Nancy Perkin, Arthur Unwin, Maud Holmes, and a host of older popular varieties. Mr. L. R. Russell sent hardy flowers in big bunches; Mr. W. H. Young, Mercury Nurseries, Romford, exhibited bright coleuses and elegant ferns; Mr. Karl Therkildsen, Old Southgate, presented cut roses; Messrs. T. S. Ware, Lim., Feltham, put up a very big and attractive group of delphiniums and other useful hardy flowers.

In the large double tent Mr. L. R. Russell had a long range of semicircular groups of well-grown stove plants that made a most effective display; alocasias, crotons, caladiums, and choice dracænas were prominent, with ixoras and anthuriums as flowering plants. Mr. H. E. Fordham, Twickenham, had a beautiful group of gloxinias, ferns, and liliums. A group of Japanese maples from Messrs. Fromow and Sons, Sutton Court, Chiswick, showed the great diversity of form and colour these elegant little trees possess. Hydrangeas, roses, Lilium speciosum, and L. Henryi from Messrs. James Veitch and Sons, Chelsea, made up a beautiful light-coloured display. Mr. William Thompson, Sheen Nurseries, Richmond, contributed a group of Acer Negundo, big palms, and hydrangeas.

Southampton Flower Show.

JUNE 27, 28.

The annual summer show of this society was held on the County Cricket Ground, and was a decided success. The entries were not so numerous as in some previous years, but the quality was of a high standard. Roses showed the effect of recent cold showery weather, yet, in spite of this, there was a fine display in this section. Fruit and vegetables were of a high order of merit, and trade exhibits were numerous, adding much to the attractiveness of the show.

ROSES.

Roses occupied the principal place in the prize list, there being twenty-two classes provided for them. Many of these were open to all. The principal class was for forty-eight blooms distinct. There were three competitors, and Messrs. D. Prior and Son, Colchester, won the premier position with medium-sized, highly-coloured flowers, some few displaying the effects of adverse weather. The most noteworthy blooms were Lady Ursula, Mdme. Jules Gravereaux, Mrs. John Laing, G. C. Waud, White Killarney, Hugh Dickson, Maman Cochet, Mrs. Stewart Clark, Florence Pemberton, and Lady Ashtown. Mr. H. Drew, Longworth, Berks, was second with excellent blooms.

Three staged in the class for twelve triplets, Mr. G. Prince, Longworth, Berks, winning with nice clean specimens of J. B. Clarke, Avoca, Mildred Grant, Mrs. S. Crawford, Frau K. Druschki, White M. Cochet, and Hugh Dickson. Mr. H. Drew secured the second position with desirable blooms of the Lyon Rose, Mrs. J. Laing, and J. B. Clarke.

Tea or noisettes in twelve varieties were contributed by four entrants. Mr. G. Prince secured the leading position with Mrs. E. Mawley, Mrs. Myles Kennedy, Comtesse de Nadaillac, and Lady Hillingdon. Mr. H. Drew second. The last-named was first for six blooms of any one dark variety with medium-sized examples of J. B. Clarke, Mr. G. Prince coming second. Messrs. D. Prior and Son, with clean, shapely blooms of Frau K. Druschki, was first among seven competitors in the class for any one white rose. Mr. Prince second with the same variety. Although there were but two competitors in the class for a display of decorative roses, arranged in a space of 7 feet by 3 feet, they created much interest. Mr. Elisha J. Hicks, Twyford, was first with nicely-arranged bunches of popular sorts of H.T. and polyantha kinds. Mr. Ernest Hicks second.

For gardeners and amateurs there was much encouragement. The "Munt" silver cup was offered for eighteen distinct varieties, and seven entered. Dr. C. Lamplough, Kirkstall, Alverstoke, was an easy first prize winner with high quality, if not large, blooms of popular varieties, A. K. Williams, W. Shean, and Frau K. Druschki being noteworthy. E. Percy Sugden, Esq., Uplands, Wimborne, was a good second. Dr. Lamplough was also successful with six varieties, three of each, staging good blooms of Hugh Dickson, Dean Hole, and W. Shean. Mr. A. C. Gregory, gardener to H. D. Broughton, Esq., Beech Hurst, Andover, second. D. Seaton, Esq., Woodside Cottage, Lymington, won for twelve tea or noisettes with neat, if small specimens. Miss Helen C. Aylmer, West End, second. For two vases mixed roses Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore House, Bishop's Waltham, was distinctly ahead of the other five entrants with a nice selection of varieties, in which Lyon figured prominently. A. Fort, Esq., Winchester, second.

SWEET PEAS.

Sweet peas are here a great feature, as they have long been, the early date ordinarily suits this neighbourhood to a nicety. Messrs. Toogood and Sons, Southampton, offer liberal prizes. For six bunches distinct Mr. G. Hoar, gardener to F. G. Raidore, Esq., Woodfield, Havant, was placed first, a decision that did not meet with universal approval; many persons favoured the third prize set from Mr. Usher, gardener to Sir Randolph Baker, M.P., Branstone Manor, Lyndhurst, but no doubt the judge favoured the extreme freshness of the premier collection. Mr. Usher was particularly successful in other classes, winning the premier award in the special classes provided by Messrs. Sutton and Sons, Reading, for six bunches; Messrs. Webb and Sons, Stourbridge, for eight bunches; and also Messrs. J. Carter and Co.'s prize for six, with high-class blooms of such popular varieties as Mrs. H. Dickson, Evelyn Hemus, John Ingman, Edrom Beauty, Clara Curtis, Othello Spencer, and Mrs. Usher. Mr. H. H. Lees, Warblington Cottage, Havant, was a good second in several classes.

FRUITS AND VEGETABLES.

Fruit was not plentiful, but it was of good quality. Mr. Ellwood had the best black grapes, large, shapely bunches, with finely-developed berries of Black Hamburgh. Mr. Foskett, gardener to Mrs. Ubsdell, New Milton, showed the best white grapes—nice examples of Foster's Seedling. Peaches from Mr. Surjour, gardener to Mrs. R. S. Farman, Rownhams, were very fine Hale's Early. Mr. Usher was first for a dish of nectarines. Strawberries are expected to be well shown in this neighbourhood, and so they were on this occasion. For two dishes Mr. Westron, gardener to L. Walker Munro, Esq., Brockenhurst, was first with handsome fruit of Bedford Champion and Givon's Late Prolific.

Vegetables are here numerously and well staged. Messrs. Toogood and Sons offered ten prizes for six dishes, and Mr. Ellwood was easily first with medium-sized high quality examples of cauliflowers, potatoes, peas, carrots, and tomatoes, all unnamed. Mr. Mattingley, gardener to Admiral Sir J. Hopkins, Greatbridge House, Romsey, second. Mr. Ellwood also secured Messrs. Sutton's premier prize for six dishes with Magnum Bonum cauliflower, Ideal potatoes, White Leviathan onions, Centenary peas, and Perfection tomatoes. Mr. Mattingley again second. Mr. Ellwood was unapproachable also in Messrs. J. Carter and Co.'s class for six dishes.

MISCELLANEOUS.

Trade exhibits were numerous, and did much to render the show a success. Mr. H. Burnett, Guernsey, had carnations R. F. Felton, Mrs. C. F. Raphael, Mikado, Snow Queen, and Afterglow (gold medal). Messrs. B. Ladhams and Co., Shirley, contributed an interesting collection of herbaceous cu flowers as gaillardias, heucheras, scabious, hemerocallis, campanulas, and an extensiv collection of pinks (silver-gilt medal).

Mr. M. Prichard, Christchurch, had Japanese iris in find condition, delphiniums variety, amongst which the Rev. Lascell was conspicuous, dark blue, with a pu white centre, Kniphofias Goldelse and Ruf with choice campanulas and Lilium Harriso made up a fine exhibit (silver-gilt medal).

Mr. J. Stevenson, Wimborne, had swe peas in quantity and of conspicuous quali The leading varieties were Thomas Steven- Enchantress, Constance Oliver, Mrs. Dickson, and John Ingman (silver medal.

Messrs. Jarman and Co., Chard, had ro sweet sultans, etc. Mrs. Lumley, Hava displayed sweet peas in quantity. Stir Stent, Clara Curtis, Elsie Herbert, and Av lanche were the most prominent. Mess Toogood, Southampton, had a fine exhib sweet peas, the collection consisting of varieties as Mrs. Hugh Dickson, Elsie He bert, Gladys Bert, The King, Minnie good, and Princess Victoria.

Messrs. W. H. Rogers and Sons, Southa ton, contributed roses in pots and in gr of cut blooms, with trees and shrubs, and interesting and well planted rockery.

Messrs. Kelway and Son, Langport, had grand display of delphiniums, as many fifty varieties, such as Star of Lang lavender and blue; Lemberg, extra da purple-violet; Monarch of All, Royal B Dusky Monarch, Viscount Melville, Lovely. The latter mauve and blue.

Great Exhibition at Olympia.

(Continued from page 492.)

to join in this fashion, as everyone profited by the arrangement.

In the rock garden furnished by Mr. Clarence Elliott, Stevenage, the chief subjects were Campanula pusilla alba, C. p. Miss Willmott, C. Standsfieldi, C. pulloides, C. glomerata, Saxifraga cochlearis minor, Sedum Liebmannianum, and the citron-scented variegated thyme.

Some beautiful carnations were shown by Mr. H. Lakeman, Thornton Heath, Surrey: Splendour, Linkman, Lady Hermione, The King, Winsor, Trojan, and Britannia were a few of the best.

Mr. A. F. Dutton, Iver, Bucks, presented perpetual carnations in good form, his most effective varieties being Victory, O. P. Bassett, Enchantress, Rose Doré, and Fair Maid.

A large table filled by Messrs. J. Carter and Co., Raynes Park, with begonias, a glowing set of sweet peas, streptocarpuses, gloxinias, and some excellent petunias, provided an effective contribution.

Mr. C. W. Breadmore, Winchester, brought sweet peas in fine condition, and showed them largely; a few varieties that especially appealed to us were Marjory Willis, Mrs. C. W. Breadmore, Charles Irving, A. N. Dickson, Princess Mary (a new blue), Scarlet Monarch, Edrom Beauty, Iris, Marjorie Linzee, and Dusky Monarch; altogether there were some hundred and fifty bunches and nearly fifty varieties.

Messrs. T. S. Ware, Lim., Feltham, filled a long table with finely-grown tuberous begonias, grand flowers of wonderful size, form, colour, and substance; the plants were pleasingly grouped and hanging baskets filled with drooping varieties were suspended over the rest. Lady Cromer, Patrick Ainslie, Captain Lafone, Thomas Rooney (beautifully crimped or frilled), Marjory Tait, and W. A. Ainslie were fine varieties, but the pink Lady Cromer was the outstanding one.

Cut roses were prettily disposed by Messrs. B. R. Cant and Sons, Colchester, and the brightness of their stands of Juliet, Mdme. M. Soupert, Mrs. Peter Blair, Mdme. Ravary, Lyon Rose, Mrs. Alfred Tate, and Harry Kirk made the group most attractive.

Conspicuous in Messrs. H. Cannell and Sons' group of begonias, from Swanley, were the big double flowers of a pure white variety named Snowden.

An interesting collection of gladioli from Messrs. William Bull and Sons, Chelsea, showed the range of colour now available in the Colvillei varieties.

Messrs. Robert Sydenham, Lim., Birmingham, put up a brilliant set of sweet peas, their Earl Spencer, Maud Holmes, Empress, Thomas Stevenson, Edith Taylor, and some new scarlet seedlings making a rare show.

Opposite their vegetable group Messrs. Sutton and Sons, Reading, put up a big collection of sweet peas, most effectively grouped, the tall stands of The King, Doris Usher, Southcote Beauty, Queen, Helen Lewis, etc., being connected with festoons of smilax. Mrs. Hugh Dickson, Masterpiece, Thomas Stevenson, Clara Curtis, Bobbie K., Mrs. Routzahn, Mrs. Hardcastle Sykes, and Marbled Blue were varieties finely shown in large vases.

The Oxford roses from Mr. G. Prince, Longworth, maintained their reputation for brilliance of colouring, the Lyon Rose being exceptionally well shown in the centre of the group.

A really good exhibit of cut carnations, representing the best of the perpetual varieties, was submitted by Mr. C. F. Waters, Balcombe; the flowers were associated with asparagus sprays; White Enchantress and the new Georgia were very fine.

Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, showed sweet peas in grand condition, and also effectively. It was a rare show from a private garden, and was greatly admired; Elsie Herbert, John Ingman, Tennant Spencer, Constance Oliver, Doris Usher, Mrs. A. Ireland, Helen Lewis, Earl Spencer, Clara Curtis, and Mrs. C. W. Breadmore were shown in great big stands, several hundred spikes in each, while other varieties were staged in vases.

Messrs. Frank Cant and Co., Colchester, had charming roses in abundance, and they made a feature of Lyon Rose, Antoine Rivoire, Countess of Gosford, Mdme. M. Soupert, Mrs. A. Tate, Elizabeth Barnes, G. C. Waud, and Gottfried Keller.

New roses from Messrs. Alex. Dickson and Sons, Newtownards, attracted rose-lovers, who feasted their eyes on Harry Kirk, Viscount Carlow, Betty, Duchess of Wellington, Alex. Hill Gray, Carine, Mrs. Cornwallis West, H. V. Machin, and other good varieties.

Roses were very boldly shown by Messrs. Stuart Low and Co., Enfield, this firm putting up well-filled stands and vases of such telling sorts as Mdme. Ravary, Mdme. Abel Chatenay, Lyon Rose, White Maman Cochet, Frau Karl Druschki, and the rich yellow Duchess of Wellington. Carnations were equally well shown by this firm, who had stands, bowls, and hanging baskets of popular perpetual and Malmaison varieties.

A sweet pea pergola was a novel feature, and this was arranged by Messrs. Kelway and Son, Langport, and connected their two tables of delphiniums; the latter were extensively displayed, and Beauty of Langport, Monarch of All, Lady Georgina, and Dusky Monarch were a few leading varieties.

Mr. Bertie E. Bell, Guernsey, exhibited carnations finely, both in size and colour; Britannia, Rose Doré, Winsor, Enchantress, Mikado, Mrs. C. W. Ward, and Alma Ward were very charmingly shown. Opposite these were the carnations from Mr. C. Engelmann, Saffron Walden, and here, of course, Carola was the centre of attraction, its big crimson flowers dominating everything else.

The violas and sweet peas exhibited by Messrs. Jones and Sons, Coton Hill, Shrewsbury, provided a fragrant and elegant show; the sweet peas were very fresh and clean.

Mr. Hillman, gardener to Wm. Gott, Esq., Frenython, Par Station, Cornwall, exhibited Malmaison carnations well, and there were no fewer than sixteen varieties in this contribution from the far west.

Mr. G. Lange, Hampton, had perpetual carnations in great beauty and variety, and the Somerford Nurseries, Christchurch, showed these beautiful flowers in bowls and baskets, making a variation from the usual stands and vases.

Very wonderful begonias were brought up from Twerton-on-Avon by Messrs. Blackmore and Langdon, the plants being superbly grown, and the flowers of grand size and colour. It was difficult to select, but Marie Nicholas, Mrs. T. W. Harrison, Black Knight, C. E. Small—very large, by the way—Pink Pearl, Mrs. W. C. Ainslie, Lady Tweedmouth, and Rose Superb, were a few extra fine varieties. The same firm presented a bold group of delphiniums.

The carnations from Mr. H. Burnett, Guernsey, were again good and well shown in large vases; Mrs. Raphael and Mrs. Burnett were in fine colour.

Clipped trees, cut to represent all manner of queer animals, steeple tops, chairs, boats, etc., etc., were exhibited largely by Messrs. Wm. Cutbush and Son, Highgate, N.; Messrs. Piper and Co., Bayswater, and Mr. Carlton White, New Bond Street, and each contribution had many admirers.

Mr. J. D. Webster, Chichester, brought up sweet peas and carnations; Mr. A. A. Fabius, Emsworth, sent ferns; Mr. H. Hemsley, Crawley, put up a rock garden with alpine and herbaceous plants; and Mr. G. Reuthe, Keston, showed hardy plants in great variety.

EXHIBITS IN THE ANNEXE.

Messrs. J. Cheal and Sons, Crawley, had a most interesting exhibit in the annexe; there was a summer house set in a pretty rock garden; an arbour round which was a dry wall furnished with neat little plants; belts and groups of ornamental trees and flowering shrubs; a long pergola, with its climbing roses, ornamental vines, and garden seats in sheltered nooks inviting everyone to test the comfort of the firm's handiwork. The pergola was a great attraction, and seemed to link up the big hall with the garden of the annexe.

Messrs. Hobbies, Lim., Dereham, arranged a rose garden with pillars, arbours, and temples clothed with rambling roses in variety; there were also arches of roses, while standards, weeping standards, dwarfs, and vases of roses filled up the ground-work.

Messrs. Wm. Paul and Son, Waltham Cross, had a large and wondrously beautiful group, in which weeping standard roses hung their lovely heads over a perfect riot of colour produced by dwarf plants, and baskets after baskets of fine flowers of all the best varieties of the Queen of Flowers. We cannot particularise much, but we must mention such varieties as Juliet, Lady Downe, Leuchtfleur, Mdme. M. Soupert, Mrs. Peter Blair, Lyon Rose, Mdme. Ravary, Harry Kirk, Mdme. Abel Chatenay, Hugo Roller, etc. This was a lovely exhibit, and the centre of admiring crowds all the time.

A large plantation of elegant Japanese maples associated with golden conifers and waving bamboos made a distinct and pleasing feature in the annexe, and it was pleasant to turn to it from the brilliance of the flowers. This was arranged by Messrs. Fromow and Sons, Chiswick.

Drifts of spiræas, and groups of delphiniums formed a backing for a little stream and pool furnished with reeds, hardy ferns, and lovely water lilies; this contribution was from Messrs. Phillips and Taylor, Bracknell.

Ferns were splendidly shown by Messrs. J. Hill and Sons, Edmonton, whose big dicksonias, blechnums, davallias, and cyatheas were a wonder unto many. A very large and bold group was this; in the foreground were elegant nephrolepises, gleichenias, gymnogrammas, adiantums, and platyceriums, all in the pink of health and condition.

Messrs. J. Jackman and Son's exhibit of clematises attracted attention, the big bright flowers, some as large as plates, showing up well over a groundwork of ferns.

Messrs. Pulham and Son, Broxbourne, had a fine pergola supported by rocky pillars, and furnished with roses. Behind it was a rock garden, prettily planted with choice hardy ferns, while in front was a water lily pool with its banks filled with suitable hardy flowers and flowering shrubs, with grassy plots between the rock masses.

Messrs. Paul and Son, Cheshunt, exhibited growing roses, as well as groups of cut flowers, and here the pretty variety named Cloth of Gold, and the equally beautiful Goldfinch were outstanding features of great merit.

Against a scenic background Messrs. R. Wallace and Co. grouped the choicest of hardy flowers into borders, divided in the centre by steps leading up to the gates of a pergola. Then came a grass walk bordered by a dry wall, fully furnished with neat plants, and with a grouping of choice hardy ferns along its base. Below this were stepping stones over a lily pool, the pathway leading prettily among groups of fine Kæmpfer irises, Spiræa palmata, Lilium myriophyllum, Orchis foliosa, Lilium superba, and drifts of Astilbe Rosy Morn. It was a charming garden, skilfully and yet naturally planned, and very finely executed.

Messrs. W. Cutbush and Son, Highgate, contributed a large pool of water lilies, with big gunneras, bamboos, and phormiums along the banks. Near the water were large groups of Kæmpfer irises, quaint sarracenias, pink spiræas, funkias, Lilium philippinense, L. speciosum, L. giganteum, L. Browni, and L. auratum; while beyond the bamboo bank was a herbaceous border that looked as though it had been in position for years.

Mr. Maurice Prichard, Christchurch, also had a pretty exhibit with fine groups of Iris Kæmpferi, banks of Spiræa palmata, and Kniphofia rufa, etc.; here also was a pleasing lily pool and a marginal rock garden, with big groups of bold hardy flowers beyond.

Messrs. T. S. Ware, Lim., Feltham, had their water lily pool surrounded by Japanese irises, and three distinct rock garden groups admirably furnished, and showing a finished appearance that lent to them a specially natural effect.

In the middle of the annexe Messrs. J. Carter and Co., Raynes Park, laid out a Japanese garden that was a miracle of ingenuity and a work of much skill and labour. An irregular stream meandered through it and under little bridges, passing through groves of hydrangeas and between banks of Japanese irises. Here was a rocky bank filled with cool ferns, and there some little groups of quaint, dwarfed trees. On mounds and occupying prominent positions were rare old Japanese stone lanterns, and by the waterside were bronze waterfowl. A beautiful Sciadopitys verticillata stood in splendid isolation. There was a well and stepping stones and other attractions, and the whole was ringed in by a bamboo fence, pierced here and there by gates, over which were pretty artistic porches.

The exhibit from Messrs. G. Bunyard and Co., Maidstone, consisted of a pool in which water lilies were numerous and beautiful; there were hosts of pink spiræas and astilbes along the banks, with bamboos for a background. A herbaceous border and rock garden formed a part of the display, and these were separated from the pool by a neat pathway. Carpenteria californica, Pinus Montezumæ, Campanula Hosti alba, and the English irises were notable flowers here displayed.

Messrs. Webb and Sons, Wordsley, had a temple of sweet peas, and under it grouped more sweet peas, and a choice collection of vegetables and fruits, the latter consisting chiefly of melons and tomatoes. The whole was very effective.

Phloxes and zonal pelargoniums made up a bright exhibit from Messrs. H. J. Jones, Lim., Ryecroft Nursery, Lewisham; Harry and Fred Gulliver were especially brilliant new varieties among many other good seedlings obtained from the fine Paul Crampell variety.

GALLERY EXHIBITS.

Messrs. S. Bide and Sons, Farnham, had two large exhibits, one of roses and one of sweet peas; the latter stood the heat well, and the flowers were bright and good, especially the bunches of Clara Curtis, Edna Unwin, Bertha Massey, Dudley Lees, and Sunproof King.

The Rev. E. Lascelles delphinium was the outstanding feature in Messrs. A. A. Walters and Son's exhibit of hardy flowers.

Messrs. G. Gibson and Co., Leeming Bar, had a grand lot of hardy flowers in the gallery, and here there were some excellent delphiniums, the showy Verbascum Caledonia, Campanula Moerheimi, C. Wm. Lawrenson—a new blue persicifolia seedling of great merit, and the handsome Gaillardia Lady Rolleston.

Messrs. Seagrave and Co., Gleadless, brought up a selection of cut zonal pelargoniums and an effective contribution of the finest violas.

Messrs. A. Young and Co., Hatherley, brought up a pleasing exhibit of perpetual carnations, where Duchess of Devonshire, Lady Audley Neild, Cheltonia, Mrs. Greswolde Williams, J. Whitcombe Riley, Alvina, and some new seedlings were the most attractive varieties.

The Guildford Hardy Plant Nursery sent hardy flowers, and Mr. Vincent Slade showed a group of cut zonal pelargoniums, chiefly double varieties.

Very bright were the gaillardias staged by Messrs. B. Ladhams, Lim., Shirley, Southampton; Aurora, Superb, Rownham's Queen Shirley, Sunset, and Southampton were all brilliant desirable varieties; Campanula persicifolia coronata was also good in this group.

Messrs. W. Wells and Co., Merstham, showed good phloxes and some especially good pentstemons; and from the Thatcham Fruit Farm, Newbury, came vases of popular perpetual carnations.

Mr. J. Mattock's fine exhibit of roses was rather wasted in the gallery; he had beautiful stands of Simplicity, Lyon Rose, Crimson Damask, and the single Lady Curzon.

M. Gebruder Teupel, Quedlinburg, Germany, showed new acalyphas, with pale greenish tassels; the best were named Acalypha A. Wagneriana, A. Dorothæ, and A. Tuscani.

Mr. Frank Lilley, Guernsey, was a large exhibitor of gladioli of the Colvillei section, English irises, and the graceful Sparaxis pulcherrima.

Mr. Hugh Dickson, Belfast, showed beautiful new roses, notable varieties being Mrs. E. Allen (A.M.), Lady Perrier, Frank Thorpe, Mrs. Sam Ross, Leslie Holland (A.M.), Mrs. R. W. McClure, and Mrs. P. H. Coutts; probably very few people saw this gold medal exhibit of new varieties owing to the unfortunate position it occupied in the gallery.

Messrs. J. Forbes, Lim., brought down from Hawick a collection of their beautiful phloxes, but by the time we reached the exhibit the flowers were suffering from the heat, but G. A. Stroehlin, Lady de Bathe, and Lady Raleigh kept up remarkably well.

Mr. William Deal, Kelvedon, had among popular varieties of sweet peas, good bunches of his special varieties Colleen, Bertrand Deal, Winifred Deal, and Scarlet Monarch, the latter a very rich colour.

Messrs. J. Godfrey and Sons, Exmouth, showed a good strain of Canterbury bells and violas. Other exhibitors were Messrs. F. Smith and Co., Woodbridge, hardy flowers; Messrs. Rich and Co., Bath, hardy flowers; Mr. H. N. Ellison, West Bromwich, new ferns, and Dracæna Braunti variegata; Messrs. Jarman and Co., Chard, sweet peas and sweet sultans, a pretty display; Messrs. J. K. King and Sons, Coggeshall, sweet peas, including the bright Nancy Perkin and St George; Messrs. Gilbert and Sons, Dyke, liliums and sweet peas; Messrs. W. and J. Brown, Peterborough, hardy flowers; Mr. J. Box, Lindfield, sweet peas; Mr. W. Alsen, Denmead, Hants, sweet peas, a fine collection, set up in a most unfortunate and dark position; and Messrs. J. Jackman and Son, Woking, who in an equally unfortunate position in the gallery set up a quantity of roses and cut hardy flowers.

ORCHIDS.

The wonderful group of orchids set up in the central avenue by Messrs. Charlesworth and Co., Hayward's Heath, was of a size and quality that one expects at the Temple Show. Phalænopsis Rimestadiana, associated with bright odontiodas, made up the centre, while all along the back were big oncidiums. At one end the graceful white spikes of phalænopsis hung out over choice odontoglossums, and at the other end white odontoglossums and phalænopsis were asociated. In one of the bays Cattleya Warscewiczi, Lælio-cattleya Martinetti King George (A.M.), and Cattleya Warneri alba were prominent, while in the other bay Odontioda Cooksoni, Cattleya Warscewiczi, Cattleya Mossiæ Aureole, L.-c. Sylvia (F.C.C.), Odontoglossum Olympia, red, brown, and blush (A.M.), Oncidium Lanceanum, and Disa grandiflora were all finely shown.

Messrs. Sander and Sons, St. Albans, had a few good things forward; Odontioda Bradshawiæ Sander's var. (A.M.), Odontoglossum eximium King George (A.M.), O. ardentissimum Queen Mary (F.C.C.)., a fine flower, with bluish-purple markings, and Cattleya gigas Sanderiana were all capitally shown.

Mr. Gurney Fowler showed Anguloa Cliftoni, with six big aromatic flowers, and also sent a grand plant of the old Oncidium macranthrum.

Mr. Harry Dixon, Spencer Park Nursery, Wandsworth Common, and Mr. C. F. Waters, Balcombe, also contributed groups of orchids.

Messrs. Mansell and Hatcher, Rawdon, Leeds, presented a large and very beautiful exhibit of orchids staged in elegant style. Phalænopsis, graceful odontoglossums, Cattleya gigas, and Lælio-cattleyas filled up the centre, and the flanking groups were composed chiefly of odontoglossums and Lælio-cattleyas. In the bays the masdevallias were particularly good, being very finely grown and flowered. Some of the gems in the collection were Odontioda Bradshawiæ, Cattleya Mossiæ Ashworthiæ, C. Gaskelliana alba, Cypripedium Rolfeæ, L.-c. Martinetti, Coryanthes speciosa, Odontoglossum Queen Alexandra, the beautiful Cattleya Mossiæ Queen Mary (A.M.), Cœlogyne pandurata, the rare Vanda Charlesworthi, and the miltonias.

Mr. E. V. Low, Haywards Heath, had in his group of orchids fine plants of Odontoglossum Vuylstekianum, Oncidium macranthum, Bulbophyllum virescens—a wonderful orchid, Cypripedium Sanderæ, and Cattleya Mossiæ Reineckiana.

From Gatton Park, Mr. Collier, gardene to Sir Jeremiah Colman, Bart., brought u Bulbophyllum virescens with two umbels quaint long-tailed flowers, Odontoglossu Thomsonianum, Anguloa Cliftoni, and othe rare orchids.

The showy group from Messrs. Stuart Lo and Co., Enfield, contained a central mou of the vivid Renanthera Imschootiana a abundance of Epidendrum vitellinum mai and odontiodas. Varieties of Cattleya Mossiæ, the fine Lælio-cattleya Eudora, Cattleya Warscewiczi, and the bold and striking Stanhopea tigrinum, were all backed up by tall and graceful oncidiums in great variety.

FRUITS AND VEGETABLES.

Choice fruits, as growing, in pots, were exhibited by Mr. G. Camp, gardener to S. Heilbut, Esq., The Lodge, Holyport, Maidenhead; the peaches, plums, and cherries were well furnished with fruits, and the Bohemian Black Bigarreau cherry was very fine; plums were fairly good, but the fine pineapples—Queen and Charlotte Rothschild—attracted most attention because they are now so seldom seen growing.

A standard Peregrine peach trained umbrella fashion, and carrying a good crop of fruits, was the centre of attraction in a group of pot fruit trees submitted by The King's Acre Nursery Co.; apples and pears, many of them carrying ripe fruits, made up the bulk of the display, but nectarines, plums, figs, and currants were included.

Strawberries were splendidly shown by Messrs. Laxton Brothers, Bedford, and conspicuously good were their baskets of Waterloo, Rival, Givon's Late Prolific, Utility, The Bedford, and Latest.

Mr. F. Streeter, gardener to H. S. Barton, Esq., Hewshott House, Liphook, brought up a goodly collection of vegetables, his cauliflowers, Standwell lettuces, Best of All tomatoes, and Duchess of York peas being among the best dishes.

Mr. A. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, Shenley, showed a very fine collection of melons, and set the fruits up in good style; his principal varieties were Frogmore Scarlet, Countess. Hero of Lockinge, Rochford's Variety, A1, and Royal Jubilee. From the Horticultural College, Swanley, and from Messrs. Le Laicheur and Sherris, Henfield, came groups of melons. In addition to melons, Mr. Grubb presented a splendid collection of choice vegetables, and he arranged these so well that the ladies had to confess the group was a beautiful one; Quite Content, Duke of Albany, Alderman, and Stourbridge Marrow peas were very good; White Eclipse and Forerunner cauliflowers were also fine, and turnips, tomatoes, and potatoes were all so good that it is difficult to say which were the best dishes.

Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, showed a collection of dessert fruit that made everyone's mouth water; it was a big display in which a few of the specially good dishes were of Hale's Early and Dymond peaches, Lord Napier nectarines. grand; Black Hamburgh and Foster's Seedling grapes, Lady Sudeley and James Grieve apples, Jefferson plums, Waterloo strawberries, Brown Turkey figs, Emperor Francis cherries, with melons galore. Mr. Gibson won the Sherwood Cup with this very fine exhibit.

Messrs. Sutton and Sons, Reading, set up vegetables in most attractive fashion, and their large collection of choice varieties proved very attractive; their collection of peas was also of special interest. Magnum Bonum and White Queen cauliflowers, Golden Wax Pod beans, Early Giant and Centenary Marrowfat peas, Perfection tomatoes, and Table Dainty marrows were a few dishes that appealed specially to us in a collection where everything was of first-rate quality.

A collection of fruits from the Locksheath Nurseries, Swanwick, was specially attractive by reason of the number of Cantaloup melons it contained. Apples from New Zealand, including good examples of Sturmer Pippin and Monroe Favourite, were shown by the New Zealand Government, 19, Victoria Street, S.W.

Choice fruits, growing on pot trees, came from Messrs. T. Rivers and Son, Sawbridgworth; it would be difficult to overpraise the pot vines, oranges, cherries, Lady Sudeley and Peasgood's Nonsuch apples, Bigarreau de Schreken cherries, and the Thomas Rivers, Sea Eagle, Late Devonian, and other fine peaches so splendidly shown by this firm.

SUNDRIES, APPLIANCES, ETC.

Almost as wonderful as the floral display, but, of course, in an entirely different way, was the huge and varied array of garden tools, implements, and requisites of every possible description. It seemed that the very best tool for every operation, the best ornament for every situation, and the best remedy for every plant disease was on view.

The Jeyes' Sanitary Compounds Company, Lim., 64, Cannon Street, E.C., exhibited samples of their horticultural specialities. Cyllin Soft Soap, Cyllin Fluid, and Jeyes' Horticultural Wash were all shown in tins of various sizes. A large variety of highly-polished brass-bound tubs were shown by Mr. Alex. Hamilton, 115, City Road, E.C., the designs, as well as workmanship, being such as to render the tubs suitable for conservatory, verandah, or drawing-room. Heating apparatus and small portable propagators were shown by Messrs. Charles Toope and Son, Stepney, E., the New Cult boiler and the "Toope Patent" being useful-looking constructions.

Both ornamental and plain pottery was shown by the Tilehurst Potteries, Lim., Reading. The coloured glazed ware was very artistic and beautiful. Messrs. Chas. P. Kinnell and Co., Lim., Southwark Street, S.E., had their well-known boilers on view. The Anglian and the Horseshoe are of excellent construction for private or nursery gardens, while the "Covent Garden," an immense horizontal tubular boiler, is the most up-to-date pattern for the large market grower. The Thames Bank Iron Company were also exhibitors of greenhouse boilers, the "Economic" tubular, and the "Heel" being both good boilers of high reputation. Messrs. Pearce and Co., Holloway Road, N., erected a very useful little span-roof greenhouse, made of good materials, and designed with a view of obtaining the maximum of light.

A big variety of pots, bowls, and vases were displayed by Messrs. D. Dowel and Son, Hammersmith. Plain garden pots, from one inch to two feet in diameter, and a series of very sensibly-made bulb bowls were the chief features. Messrs. Pulham and Son, 71, Newman Street, W., showed garden vases of elaborate and artistic character, the various pieces being grouped on a paved square with sun-dial in centre. Hawe's water cans were exhibited in a complete series of sizes, and in many new shapes. The Clapton firm has so long been noted for the excellence of their cans that we need not eulogise them here.

The GARDENERS' MAGAZINE and "Amateur Gardening" were represented by a table made attractive with coloured plates and photographic illustrations of flowers and plants. Books on almost every phase of gardening were also on view. Messrs. Liberty and Co., Lim., Regent Street, W., occupied a large space with an exhibit of large garden vases, pillars, balustrades, and terrace ornaments, the stand being made the more effective by the aid of palms, hydrangeas, and other suitable plants. Trellis-work, garden seats, large and handsome vases, sundials, and other garden furniture were admirably represented on Mr. J. P. White's stand. The Pyghtle Works, Bedford, always show well.

The cane chairs, stools, and tables known as Dryad furniture were exhibited by Mr. H. H. Peach, Dryad Works, Leicester. A great variety of beautifully made table vases, flower bowls, and ornaments came from the Coldrum Pottery, 11, Sloane Street, S.W. A roomy span-roofed greenhouse, and a smaller amateur's house, were erected by Messrs. W. Duncan Tucker and Sons, Lim., Tottenham, who also had on view span-roofed frames of substantial make and good pattern. Mr. G. Slatter, 4, Long Row, Nottingham, a new maker of lawn mowers, showed machines with attachments for edging, verge cutting, etc., the latter being a very ingenious and useful invention. The Abol syringes, insecticides, and spraying fluids were attractively displayed by Messrs. E. A. White, Lim., Paddock Wood, Kent. The small ladies' syringes and hose terminals were useful additions to the original set of patterns.

Chemicals of all descriptions, and for all manner of uses, were shown by Messrs. Walter Voss and Co., Milwall, E. Spraying machines were very largely in evidence.

TICULTURAL
PLIANCES.

MESSRS. E. WEBB AND SONS' SILVER CUP COLLECTION OF FLOWERS, FRUITS, AND VEGETABLES AT THE OLYMPIA SHOW.

Messrs. H. Hartjen and Co., 35-37, Noble Street, E.C., showed a number of machines which are worked by pneumatic pressure, each machine carrying its own pump. The Four Oaks Spraying Machine Company, Sutton Coldfield, Birmingham, showed machines for all purposes, their new Knapsack, furnished with an air chamber, which enables a pressure of 100lb. to be maintained, being a distinct advance. The well-made teakwood seats from Messrs. Castle's, Baltic Wharf, Millbank, were shown in a vast variety of sizes and shapes, the designs being contrived for comfort as well as appearance.

Whatever the owner of a garden is likely to require could surely be found among the hundreds of garden requisites or sundries displayed by Messrs. William Wood and Sons, Lim., Wood Green, N. To look for novelties on this firm's stand was to court confusion, for everything of the latest and most up-to-date character was represented. The firm also showed a fine group of garden ornaments, including figures in lead, which were reproductions of the Shepherd and Shepherdess in South Kensington Museum. A magnificent lead vase which attracted attention was of the same pattern as the well-known specimens at Hampton Court. The Brent Valley Bird Sanctuary Committee showed their nesting boxes, which are made in a manner that is calculated to attract the birds for which they are intended.

Paper pots, which are becoming popular both for seed raising and for packing plants, were shown by Messrs. Blake and McKenzie, Liverpool. The Permanent Printing and Process Company, Lim., 2, Sandland Street, Holborn, W.C., showed "Ivo" labels," which are of neat appearance, and very durable. The seats made of man-o'-war teak, by Messrs. B. Maggs and Co., Bristol, were shown in a number of very attractive styles. Rural table decorations, from Mr. J. Williams, 4a, Oxford Road, Ealing, were made beautiful with sweet peas and foliage. A bucket-like appliance made of perforated zinc on a galvanised frame, for soaking manures, was shown by Mr. A. H. Malden, Delamere, Poole, Dorset. Liquid manure can, with the aid of this infuser, be made in the space of a few hours, without the inconvenience of bags, etc. Wakeley's Hop Manure was on view, with pamphlets containing instructions for use, and testimonials from satisfied users.

Among spraying machines the Alpha forms were well to the fore. These excellent air-pressure machines have been described in our columns on several occasions, but it may be said that new sizes and shapes are being introduced as necessity demands. The Pattisson lawn boots, well known among our readers, were shown by the makers, Messrs. Pattisson and Co., 4, Greyhound Lane, Streatham, who also showed the Max water distributor, made in an improved form.

Samples of turf loam from Mr. M. Johnston, New Park, Cranleigh, Guildford, were of a quality that should make it possible to grow almost anything to perfection.

Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, S.E., exhibited the useful Acme labels, in sizes and shapes suitable for every purpose. Rose shades, trainers, and show boxes were also shown, as were flower holders, and a number of other useful things in the way of garden sundries. Messrs. James Crispin and Sons, Bristol, brought a span-roof greenhouse fitted with corrugated staging, and also a few models of garden frames. Flower pots, plain and ornamental, large and small, round, square, and, in fact, of all shapes, sizes, and designs, were shown by Messrs. Richard Sankey and Son, Lim., Royal Potteries, Bulwell, Notts. V2 and V2 K Fluids were brought up by Messrs. Wm. Cooper and Nephew, Berkhamsted. These popular insecticides were accompanied by other useful chemical preparations of horticultural value.

CERTIFICATES AND AWARDS.

Floral Committee.—Award of Merit to Rose Frances Charteris Seton, from Messrs. William Paul and Son, Waltham Cross; to Rose Mrs. Charles E. Allan, and to Rose Leslie Holland, from Mr. Hugh Dickson, Belfast; to Gladiolus nanus and Queen Mary, from Messrs. Smith and Son, Caledonia Nursery, Guernsey; to Dracæna Deremensis Warnecki, from Messrs. J. Veitch and Sons, Chelsea; to Sweet Pea Lady Knox, from Messrs. Dobbie and Co., Edinburgh; and to Pelargonium Lord Bute, from Mr. Treseder, Cardiff.

Orchid Committee.—First Class Certificate to Odontoglossum ardentissimum Queen Mary, from Messrs. Sander and Sons, St. Albans; to Lælio-cattleya Sylvia, from Messrs. Charlesworth and Co., Haywards Heath; and to Odontoglossum eximium King George, from Messrs. Sander and Sons, St. Albans.

Award of Merit to Odontioda Bradshawiæ Sander's var., from Messrs. Sander and Sons, St. Albans; to Odontoglossum amabile The Queen, from Messrs. Sander and Sons, St. Albans; to Cattleya Mossiæ Queen Mary, from Messrs. Mansell and Hatcher, Rawdon, Leeds; to Lælio-cattleya Martinetti King George V., to Odontoglossum Olympia, and to Cattleya Dupreana, all from Messrs. Charlesworth and Co., Haywards Heath.

Cultural Commendation to Mr. J. Gurney Fowler, for Oncidium macranthrum and Anguloa Cliftoni; and to Mr. H. S. Goodson, for Cattleya Mossiæ Wagneri Goodson's var.

Fruit Committee.—Award of Merit to Strawberry Peter's Olympia, from Mr. H. F. Sturgis, Leatherhead.

CUPS AND MEDALS AWARDED.

Gold Medal.—To Messrs. J. Carter and Co., Raynes Park and Holborn, for Japanese garden; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Mr. Hugh Dickson, Royal Nurseries, Belfast, for roses; Messrs. Dobbie and Co., Edinburgh, for sweet peas; Mr. Amos Perry, Enfield, for delphiniums; Mr. L. R. Russell, Richmond, Surrey, for tree and standard ivies; Messrs. Thomas Rivers and Son, Sawbridgeworth, for fruit trees in pots; Messrs. James Veitch and Sons, Chelsea, for stove and greenhouse plants, fuchsias, etc.; Messrs. R. Wallace and Co., Colchester, for a natural water and formal garden.

Coronation Cup.—To Messrs. H. B. May and Sons, Edmonton, for ferns.

Olympia Cup.—To Messrs. William Paul and Son, for roses.

Sherwood Cup.—To the Duke of Portland (gardener, Mr. Gibson) for a collection of British-grown fruit.

Silver Cup.—To Sir Randolph Baker, Blandford (gardener, Mr. A. Usher), for sweet peas; to Cecil F. Raphael, Esq. (gardener, Mr. Grubb), Shenley, for fruit and vegetables; to Mr. B. E. Bell, Guernsey, for carnations; Messrs. Blackmore and Langdon, Twerton-on-Avon, for begonias; Messrs. W. Cutbush and Son, Highgate, for foliage and flowering plants; Messrs. W. Fromow and Sons, Chiswick, W., for Japanese maples; Messrs. J. Hill and Son, Lower Edmonton, N., for hardy and exotic ferns; Messrs. Gunn and Son, Olton, for phloxes; Messrs. S. Low and Co., Enfield, for orchids; Messrs. Paul and Son, Cheshunt, for roses; Messrs. Sutton and Sons, Reading, for fruit and vegetables; Messrs. Mansell and Hatcher, Rawdon, Yorks, for orchids; Messrs. E. Webb and Sons, Stourbridge, for vegetables and sweet peas; Mr. M. Prichard, Christchurch, for water garden; Mr. Charles Turner, Slough, for carnations and roses; Messrs. G. Bunyard and Co., Maidstone, for rock, water, and herbaceous garden; Mr. H. Burnett, Guernsey, for carnations; Messrs. J. Cheal and Son, Crawley, for garden and pergola; and to Messrs. Pulham and Son, New Street, W., for rock garden.

Silver-gilt Flora Medal.—To E. J. Johnstone, Esq., Groombridge (gardener, Mr. Paskett), for carnations; Messrs Barr and Sons, Covent Garden, for herbaceous plants and Japanese dwarf trees; Mr. A. F. Dutton, Iver, Bucks, for carnations; Messrs. Kelway and Son, Langport, for delphiniums, sweet peas, etc.; Messrs. E. W. King and Co., Coggeshall, for sweet peas; Mr. F. Lilley, Guernsey, for summer-flowering gladioli; Messrs. J. Peed and Son, Streatham, for caladiums and flowering plants; Messrs. Sander and Sons, St. Albans, for orchids; Messrs. T. S. Ware, Lim., Feltham, for begonias, herbaceous flowers, and alpines; and to Mr. J. Box, Lindfield, for herbaceous flowers and sweet peas.

Silver-gilt Knightian Medal.—To H. S. Barton, Esq., Liphook (gardener, F. Streeter), for vegetables; S. Heilbut, Esq., Maidenhead (gardener, G. Camp), for fruit trees in pots; and to King's Acre Nurseries, Lim., Hereford, for fruit trees in pots.

Silver-gilt Banksian Medal.—To Messrs. J. Carter and Co., Raynes Park, for flowering plants; Messrs. B. R. Cant and Sons, Colchester, for roses; Messrs. G. and A. Clark, Lim., Dover, for hardy herbaceous plants, etc.; Messrs. G. Jackman and Son, Woking, for clematis, herbaceous plants, etc.; Mr. J. Mattock, Oxford, for roses; Mr. R. C. Notcutt, Woodbridge, for roses and herbaceous plants; Mr. G. Prince, Oxford, for roses; and to Mr. C. F. Waters, Balcombe, for carnations.

Silver Flora Medal.—To Messrs. Jones and Sons, Lim., Shrewsbury, for sweet peas and carnations; Messrs. J. Piper and Son, Bayswater, W., for cut trees and fuchsias; Messrs. Carter Page and Co., London Wall, for sweet peas, etc.; Messrs. H. Cannell and Sons, Swanley, for begonias, etc.; Mr. G. Reuthe, Keston, for alpine and herbaceous plants; Mr. L. R. Russell, Richmond, for stove and foliage plants; Messrs. Robert Sydenham, Lim., Birmingham, for sweet peas; Mr. W. E. Alsen, Denmead, Hants, for sweet peas; Messrs. J. Forbes, Lim., Hawick, N.B., for phloxes, delphiniums, etc.; Messrs. A. Dickson and Sons, Lim., Newtownards, for roses; Mr. C. Engelmann, Saffron Walden, for carnations; Messrs. B. Ladhams, Lim., Southampton, for hardy flowers; Messrs. J. Veitch and Sons,

The combination head
the Pine Spray Syringe

provides for every spraying requirement without
addition or removal of a single fitment. The cha
from "rose" to "spray" is made by merely
turning the syringe, and delivery through either
be directed up or down by bending the adjust
joint. The

PINE SPRAY SYRINGE

can be instantly adapted to the needs of any par
cular plant, whether the spray required is coarse

Sole proprietors,

ROBINSON BROTHERS, LTD.,
WEST BROMWICH.

Lim., Chelsea, for flowering plants; Messrs. S. Bide and Sons, Lim., Farnham, for sweet peas, etc.; Mr. C. W. Breadmore, Winchester, for carnations and sweet peas; Messrs. Seagrave and Co., Sheffield, for violas, pansies, etc.; Messrs. F. Smith and Co., Woodbridge, for herbaceous plants; Messrs. G. Stark and Son, Norfolk, for sweet peas; and to Messrs. Hobbies, Lim., Norfolk, for roses.

Silver Banksian Medal.—To Mr. E. V. Low, Haywards Heath, for orchids; Mr. H. H. Crane, Highgate, for violas; Messrs. R. H. Bath, Lim., Wisbech, for carnations and herbaceous flowers; Messrs. W. and J. Brown, Stamford, for roses and hardy flowers; Messrs. G. Gibson and Co., Yorks, for hardy flowers; Mr. A. Ll. Gwillim, Sidcup, for begonias; Messrs. R. Harkness and Co., Hitchin, for roses; Mr. G. Lange, Hampton, for carnations; Mr. S. Mortimer, Farnham, for cucumbers; Mr. J. D. Webster, Chichester, for sweet peas and carnations; Messrs. Jarman and Co., Chard, for centaureas and sweet peas; Messrs. Young and Co., Cheltenham, for carnations; the Craven Nursery Company, Yorks, for rock garden; the Guildford Hardy Plant Nursery, Guildford, for herbaceous plants; the Somerford Nurseries, Christchurch, for carnations; Messrs. Whitelegge and Page, Chislehurst, for herbaceous flowers.

Silver Knightian Medal.—To Swanley Horticultural College, Kent, for fruit; the Locksheath Nurseries, Southampton, for fruit, etc.; the New Zealand Government, Victoria Street, S.W., for apples; and to Messrs. Laxton Bros., Bedford, for strawberries.

Bronze Flora Medal.—To Mr. H. Dixon, Wandsworth Common, for orchids; Mr. H. Hemsley, Crawley, for alpine and hardy flowers; Mr. H. J. Jones, Lewisham, for pelargoniums and phloxes; Messrs. J. K. King and Sons, Coggeshall, for sweet peas; Messrs. W. Wells and Co., Merstham, for phloxes and pentstemons; Messrs. Carlton White, New Bond Street, for clipped trees; and to Mr. Frank May, Herts (gardener, Mr. T. F. Stannett), for carnations.

Bronze Knightian Medal.—To Misses Le Lacheur and Sherris, Sussex, for melons.

Bronze Banksian Medal.—To Mr. Wm. Deal, Kelvedon, Essex, for sweet peas; the Tully Nurseries, Ireland, for anemones, delphiniums, etc.

GARDEN SUNDRIES SECTION.

Silver-gilt Flora Medal.—To Messrs. W. Wood and Son, Wood Green, for artificial manures, insecticides, and garden furniture.

Silver-gilt Banksian Medal.—To Messrs. C. P. Kinnell and Co., Southwark Street, S.E., for boilers, pump, etc.; Messrs. Liberty and Co., Regent Street, W., for terra-cotta garden pottery; and to Mr. W. Poupart, Twickenham, for bottled fruits and appliances.

Silver Flora Medal. — To Alpha Extinguisher Co., Hereford, for sprayers of all kinds; Castle's Shipbreaking Co., Millbank, for teakwood garden furniture; the Four Oaks Syringe Co., for spraying machines, etc.; Mr. J. P. White, Bedford, for garden seats, chairs, etc.

Silver Banksian Medal.—To Messrs. Abbott Bros., Southall, for table trays, bee hives, etc.; the Coldrum Pottery Co., Sloane Street, for Coldrum pottery; Mr. Alex. Hamilton, Great Portland Street, for tubs, seats, chairs, etc.; Messrs. H. Hartjen and Co., Noble Street, for spraying machines, etc.; the Leyton Timber Co., Leyton, for rustic goods; Messrs. Lloyd, Lawrence, and Co., Finsbury, for lawn mowers, etc.; Messrs. Maggs and Co., Bristol, for garden furniture; Messrs. Sankey and Son, Nottingham, for horticultural pottery; the Thames Bank Iron Co., Upper Ground Street, for boilers, etc.; Messrs. W. Duncan Tucker and Son, Cannon Street, for greenhouses, frames, etc.

Bronze Flora Medal.—To Messrs. Blake and Mackenzie, Liverpool, for patent flower pots; the Brent Valley Bird Nesting boxes; the Permanent Printing Co., Peterborough, for Ivo labels; Mr. J. Pinches, Crown Street, S.E., for labels, etc.; Messrs. Pulham and Son, Newman Street, W., for vases and garden ornaments; Messrs. C. Toope and Son, Stepney Square, for heating apparatus; Messrs. E. A. White, Paddock Wood, for insecticides.

Bronze Banksian Medal.—To Messrs. W. Cooper and Nephews, Berkhamsted, for spray fluids, pumps, etc.; Messrs. J. Crispin and Sons, Bristol, for portable conservatory; Messrs. D. Dowel and Son, Hammersmith, for pottery, bulb bowls, etc.; Mr. J. Hawes, Clapton, N.E., for water cans; Jeyes' Sanitary Compounds, Lim., Cannon Street, for sprayers, washes, etc.; Messrs. Jules Lang and Son, St. Mary Axe, for preserving jars, glass bowls, etc.; the Patent Safety Ladder Co., Peterborough, for extension ladders, etc.; Messrs. Pattison and Co., Streatham, for horse boots, rollers, etc.; Messrs. Pearce and Co., Holloway Road, for greenhouse and heating apparatus; the Tilehurst Pottery Co., Reading, for flower pots and pottery; Messrs. W. Voss and Co., Millwall, for fertilisers, fumigators, etc.

FORTHCOMING ENGAGEMENTS.

MONDAY, July 10.—United Horticultural Benefit and Provident Society, Committee Meeting.

TUESDAY, July 11.—National Sweet Pea Society, Horticultural Hall, Westminster; two days.

Brighton and Sussex Horticultural Society; two days.

Wolverhampton Floral Fête; two days.

Saltaire Rose and Sweet Pea Show.

WEDNESDAY, July 12.—Bath Rose Show and Carnival; two days.

Hereford Rose Show; two days.

Elstree Horticultural Society.

Woodbridge Horticultural Society.

Beckenham Horticultural Society.

Cambridge Horticultural Society.

THURSDAY, July 13.—French National Horticultural Society.

Gresford Horticultural Society.

Leighton Buzzard Sweet Pea and Rose Show.

National Sweet Pea Society's Outing to Sutton Green, Guildford.

FRIDAY, July 14.—West of Scotland Rose Show.

National Sweet Pea Society's Outing to the Floral Farms, Wisbech.

SATURDAY, July 15.—Wood Green Horticultural Society.

MONDAY, July 17.—National Chrysanthemum Society's Outing to Cliveden.

TUESDAY, July 18.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m., on "Irises," by Mr. W. R. Dykes, M.A.; Scientific Committee at 4 o'clock.

WEDNESDAY, July 19.—National Rose Society, at Ulverston, in conjunction with North Lonsdale Rose and Sweet Pea Show.

Newcastle Flower Show; three days.

Nottingham Horticultural Society.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

OLD CRESTED MOSS ROSE.—Mr. H. Fletcher, of Annesley, Notts, who tells us he has been a subscriber to the Gardeners' Magazine for nearly fifty years, sends a few fragrant flowers of the old Crested Moss rose, and asks whether the variety is at all well known in gardens. Probably most growers know this old rose, with its heavily-crested calyx divisions, but very few give the variety a place in their gardens nowadays.

DISEASED TOMATOES.—T. G., Weston: The specimen sent was suffering from an attack of bacterial disease (Bacillus solanacearum). There is no real cure for the disease, but its spread may be prevented if affected plants are removed and burned directly they are seen to be suffering from an attack. Rotation of crops should be followed if it is not possible to remove the old soil and use new, otherwise a more severe attack may follow another year. When removing a diseased plant, take away also the soil immediately around the base of the stem.

DISFIGURED ROSE LEAVES.—K. G., Red Hill: The disfigurement of the rose leafage is due to the work of the Rose Slugworm (Eriocampa rosæ), which eats away the upper skin or epidermis of the leaves and the tissue, usually leaving the lower epidermis intact and quite white. Where the attack is a severe one the health of the plants is seriously injured. As there are at least two broods each year a sharp lookout should always be kept when there has been one attack. Spray the bushes with a nicotine solution or a hellebore wash composed of three gallons of water, 2oz. of flour, and 1oz. of freshly-ground hellebore. In cases of very bad attacks it is a good plan to remove two or three inches of the surface soil in winter and burn it or bury it deeply so as to kill the pupæ; good clean soil should be spread over the rose roots directly the old is removed.

HOLES IN PEACH LEAVES.—W. J. M., Oxshott: The trouble is due to the action of the Shot Hole fungus (Cercospora circumscissa), a pest which often attacks peaches, almonds, nectarines, apricots, and cherries. Not only do the circular patches drop out of the leaves, but the leaves themselves invariably fall before wood growth is complete, and so the prospects of a crop of fruit the following year are small. Sometimes the disease spreads with great rapidity, especially if the leaves are allowed to fall and remain, or if the circular patches are allowed to remain where they fall. Hang muslin under the trees to catch the falling and diseased foliage, which should be burned each day. Spray the trees with an ammoniacal solution of copper carbonate at intervals. This is made by mixing ¼oz. of carbonate of copper and 2¼oz. of carbonate of ammonia with eight gallons of water. Dissolve the carbonates in hot water, and then add the necessary quantity of soft water.

GRUB-EATEN ROSE LEAVES.—A. J., City: Evidently more than one insect pest has been busy among your roses, but the chief damage is due to the work of the Rose Emphytus (Emphytus cinctus), the larvæ of which commences to eat the leaves at the margin, and works down between the leading veins to the midrib. It is one of the sawflies, and, unfortunately, it does not confine its attention to the leaves, but may when full grown enter the stems and kill all the growth above the point of entry. Spray with a nicotine wash or with a hellebore mixture, as suggested in another reply for the rose slugworm.

BLUE-FLOWERED PEAS. — E. J. S., Shanklin: The plant sent is the blue-flowered form of the chickling vetch (Lathyrus sativus), a fairly common plant, native of Southern Europe, and a hardy annual. It is, therefore, not a sweet pea (Lathyrus odoratus), and is of no value whatever for its flowers and of little merit as a garden plant.

LOSS OF LEAVES ON JUNIPERS.—M. W., Shrewsbury: The loss of leaves is due to an attack of a common fungus, Botrytis cinerea, and one that occurs during damp weather or in damp situations. The progress of the disease can be checked by spraying the trees and wetting the surroundings for some little distance with a mixture composed of 11lb. sulphate of copper, 16lb. carbonate of copper, 1lb. permanganate of potash, 3lb. soft soap, and 100 gallons of soft water.

HANDY DICTIONARY OF GARDENING.—C. P. H., Everton: The book which best provides the information you desire, and in the condensed and compact form mentioned, is the "Encyclopædia of Gardening," by Mr. T. W. Sanders, F.L.S.; it can be obtained from W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C., price 3s. 6d.

DISEASED FIG TREE.—W. L. C., Cheadle: The fig tree is suffering from the attack of a parasitic fungus named Libertella ulcerata, a pest that was first fully described and figured in the GARDENERS' MAGAZINE of July 23, 1898. The disease gains entrance through wounds in the bark, hence great care should be taken to prevent the growths from becoming bruised or broken, while all cut surfaces should be tarred over. The parasite cankers the bark and works round the branch attacked until it has encircled it; the portion above the cankered and diseased part then dies, and when it is dead the fungus produces its fruiting stage, and is then in a condition to infect healthy trees should these have wounded surfaces. The disease may be checked if affected branches are cut out and burned, the cut being made through the healthy wood well below the cankered portion. The knife used should be disinfected before a second branch is cut out, and the cut surface of a branch should be tarred over immediately.

RESIDUE FROM THE MANUFACTURE OF ACETYLENE GAS.—B. T. S., Guernsey: The residue from the carbide used in the production of acetylene gas is valuable in the garden provided it is exposed to the air for some time previous to use, so that any harmful substance may become oxidised. Three weeks will usually be a quite long enough exposure, and then the material may be applied to ground needing lime at the rate of about half a bushel to the square rod. After its exposure as suggested, the carbide refuse is practically identical with slaked lime, and may be used for all horticultural purposes to which the latter is put.

NAMES OF PLANTS.

C. A., Horsham.—1, Campanula lactiflora; 2, Melilotus indica; 3, Dimorphotheca aurantiaca.

H. D. S., Saltaire.—1, Piper ornatum; 2, Costus igneus; 3, Pilea muscosa; 4, Odontoglossum triumphans.

E. M., Worcester.—1, Valeriana officinalis; 2, Fedia cornucopiæ—this was formerly known as a Valeriana.

H. G. B., Stansted.—The shrub is Jasminum humilis and the herbaceous plant appears to be Galega pannonica.

G. R. W., Greenford.—1, Thalictrum glaucum; 2, Veronica Colensoi; 3, Lilium Hansoni; 4, Brachycome iberidifolia.

F. L. B., Ripon.—1, Astragalus alopecuriioides; 2, Galega officinalis; 3, Iris ochroleuca; 4, Morina longifolia; 5, Olearia Haasti; 6, Cupressus macrocarpa lutea.

New Potato and Charlock Sprayer.—To the Royal Cornwall Show, recently held at St. Austell, the Four Oaks Spraying Machine Company, of Sutton Coldfield, contributed a new potato and charlock sprayer, for which they were awarded a silver medal. This new machine can be used for potatoes or charlock, and will spray from six to eight rows of potatoes at a time. It can be readily attached to an ordinary farm cart, and is so constructed that it will pass through a narrow gateway. As potato spraying has now become general on farms, the introduction of this machine is most opportune, and, having regard to its efficiency and the facility with which it can be used, it can hardly fail to become popular among growers.

Situations Wanted.

GARDENER (Head, where several are kept); thoroughly experienced in all branches, Inside and Out. Grapes, Peaches, Melons, Stove and Greenhouse Plants; 4½ and 11 years' excellent references as head; married, family out. E. STONE, 13, Coniston Road, Addiscombe, Croydon, Surrey.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here six years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working, where two or more are kept); good all round; 14 years as head in large and well-kept establishments; married; age 40; excellent references. E. MAYLETT, Park Hall, Salford Priors, Evesham.

J. F. G. BANNATYNE, Esq., Haldon, Exeter, will be pleased to recommend H. NICHOLSON as GARDENER (Head Working); thoroughly practical and reliable; life experience in all branches; 3½ years here; age 31. Address, NICHOLSON, Haldon Gardens, Exeter, Devon.

GARDENER (Head Working).—H. ESSAM can with confidence recommend his Foreman, where several are kept; life experience in all branches; age 31; married when suited; excellent references. Address, Closes Hall, Gisburn, Clitheroe.

GARDENER (Head Working), life experience Inside and Out; 5 years present situation as General Foreman; excellent refs.; disengaged when suited; age 28. T. CHAMBERLIN, Canons Park Gardens, Edgware, Middx.

GARDENER (Head Working); thoroughly experienced in Fruit, Flowers, Vegetables; Inside and Outside work, where two or three are kept; well recommended. Apply, F., care of Messrs. Charles Turner and Son, Royal Nurseries, Slough, Bucks.

GARDENER (Head Working or Good Second); 11 years' good all-round experience; highly recommended; abstainer; age 24; married when suited; disengaged. H. DRAPER, Maidwell, Northants.

GARDENER (Head Working), where one or two more are kept; life experience in all branches; aged 36; married, four children; 8½ years' excellent references. Apply GARDENER, The Wharf, Abingdon, Berks.

GARDENER (Head Working).—Gentleman recommends a good all-round Man, Inside and Out, where three or more are kept; used to Land and Stock if required; 12 years' good character; age 41. COLES, Sunbury Lodge, Sunbury-on-Thames.

GARDENER (Head or Single-handed); life experience in all branches; six years present situation; age 32; married, one child; good references. H. FORD, West Street, Harrow.

GARDENER (Head); good Single or Fruit Gardens Manager; Budder, Grafter, Pruner, Cucumbers, Melons, Vines, Chrys., Bedding Plants, Roses, Mushroom, ridge or flat; Kitchen, Lawn, Flower Garden. Special Prize 1910. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (good Single-handed or otherwise); life experience; good all-round Man in all branches; age 45; married, one child; would take very moderate wage with cottage for a comfortable place. Excellent testimonials; willing to be useful. F. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER (Single-handed or otherwise); over 2 years as Foreman in present situation; experienced Inside and Out; can be highly recommended by present employer; age 28. Apply W. BICKER, or Head Gardener, The Gardens, Avenue House, Church End, Finchley. Eastern Counties preferred.

GARDENER (Single-handed, or with Son to help); life experience in all branches; age 37; disengaged; good references. E. LIMEHOUSE, 11, Charleville Road, West Kensington.

GARDENER (Single-handed), seeks situation; 16 years' experience in flowers, fruit, vegetables; excellent references; age 30; single; disengaged.—F. HYDER, 7, Stamford Road, Watford, Herts.

AS JOURNEYMAN under foreman in Plant or Fruit Houses; age 20; six years' experience; excellent references; bothy preferred. B. WEST, Radway, Kineton, Warwick.

JOURNEYMAN, as Inside or Inside and out; age 24; 6½ years at present place; can be highly recommended; disengaged when suited. Apply B. HAYES, Lofts Hall, Saffron Walden.

JOURNEYMAN (Inside) seeks SITUATION; six years' experience, Inside and Out; good references; Bothy preferred. E. ARCHER, Ockham, Woking, Surrey.

YOUNG MAN, age 20, seeks SITUATION as Journeyman, Inside and Out; four years' experience all round and one inside; good references. GOOD, Charing, near Ashford, Kent.

GARDENER (Under), single, well experienced under glass; good references; second. State wages, age, experience, etc; abstainer preferred. THATCHER. The Manor, West Lavington, near Devizes, Wilts.

GARDENER (Inside or Out) seeks SITUATION; age 25; single; disengaged; good references; 5 years previous. F. F., 39, Flask Walk, Hampstead, N.W.

AS GARDENER; used to pony; over two years in present situation; age 24. Near London preferred. Apply J. SCOTT, 51, Manor Park Road, East Finchley.

KITCHEN GARDENER; life experience; take Lead or Single-handed; good character; age 32; married, one child; abstainer. A. HOARE, 2, Elm Grove, Nutbourne, Emsworth, Hants.

SITUATION as KITCHEN GARDENER and handyman; good alto chorister; married, age 25. F. AUGER, 22, Elm Grove, Bishop's Stortford, Herts.

YOUNG MAN (19½) seeks SITUATION, Inside (or Inside and Out); excellent character; willing worker; tall. State wages. V. MEPHAM, 3, High Path, Merrow, nr. Guildford, Surrey.

MR. EUINTON, Ewell Court Gardens, Ewell, Surrey, wishes to recommend strong Youth as IMPROVER (Inside); age 18; 2½ years in these gardens; Bothy preferred.

OUTDOOR work in Nursery or Gentleman's Garden required by strong, willing lad, but slightly afflicted. 35, Broomwood Road, Clapham Junction.

Situations Vacant.

WANTED, Working HEAD GARDENER; married, small or no family; two under kept; thoroughly understand early and late forcing of fruits and vegetables; 24s. week, house, garden, and coals. SANDEMAN, Crickhowell.

WANTED, FOREMAN (Outside, Working); must be first-class Budder, Grafter, well up in Roses, Shrubs, Fruit, Herbaceous, etc., Training, Planting, etc.; energetic; abstainer; house provided. State wages, experience, and copies of testimonials. FRANK E. SMITH and CO., 15-17, High Street, Belfast.

WANTED.—Thoroughly reliable MAN to take entire charge of Fruit and Plant Houses; age 24 to 28; must be a good decorator. Wages, with Bothy, etc., and copies of testimonials to Mr. GOULD, Shernfold Park, Frant, Sussex.

WANTED, active Young Married Man for Pleasure Grounds and Conservatory; able to use Scythe and make himself generally useful, duty every other week; 17s. per week; to live in lodge; wife to attend lodge gate; one child not objected to. Apply to W. T. INNS, Sion Hill Gardens, Wolverley, Kidderminster.

WANTED, Young Man, for small Nursery; must be well up in Cucumbers and Bedding Plants. State age, experience, and wages, to G. H. GRIMES, Hadleigh, Rayleigh, Essex.

THE BEST CABBAGES FOR AUTUMN SOWING.
SUTTON'S HARBINGER,
per packet, 1s. and 1s. 6d., post free.
Mr. H. Harris, Horsham, writes:—"Your New Cabbage, Harbinger, is a beauty. I planted out a bed of 600 last September, and they were ready for cutting early in April. They are really models of perfection, just the right size and quality for table, while the handsome leaves and habit of the plants are quite distinct features, and as they require very little room to develop a large number can be grown in a small space."

SUTTON'S APRIL,
per packet, 1s., post free.

SUTTON'S FLOWER OF SPRING,
per ounce, 1s., post free.

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Summer Flower Shows.

The recent summer exhibition held by the Royal Horticultural Society at Olympia has created a considerable amount of interest in the important question as to the best possible place in which to hold flower shows during the summer months. This question is one that has for a long series of years engaged the attention of horticulturists concerned with the management of societies having for their object the furtherance of gardening, without, it must be admitted, a satisfactory solution having been found. Whether such solution is possible has yet to be demonstrated. The question is not so simple as might appear to these who have not given it full consideration, but it bristles with difficulties, and we can hardly hope that the Olympia show will, owing to its exceptional character, render assistance of much practical value in any endeavour that may be made to remove them. If the only point to consider was the best method of presenting to public notice the products of the garden and nursery in the most interesting and attractive manner, as in the case of the fortnightly meetings at the Horticultural Hall, there would probably be no great difficulty in arriving at the conclusion that a spacious, well-lighted, and properly ventilated hall has the greater advantage. It might be urged by those who have a preference for the holding of exhibitions within four walls, that the success of such gatherings is less dependent upon the weather than is the case when the shows are held under canvas, and also that buildings possess conveniences that are in many cases wholly absent from sites in the open. The question, however, is too complex to be solved by conceding the point that, when exhibitions are held in spacious buildings the plants, flowers, fruits, and vegetables contributed to them can be inspected without any apprehension as to the health being impaired by walking in wet grass, or obtaining a wetting in passing from one part of the exhibition to the other during rainy weather. It is essential to recognise the fact that all the visitors to flower shows are not ardent horticulturists, and derive pleasure only from the products in competition. A large proportion of the visitors to these gatherings derive as much pleasure from meeting their friends and having a chat with them, or listening to the band amid pleasant surroundings, as from the floral display. This has been the case from the earliest days of horticultural exhibitions, and is likely to continue; and as these visitors contribute materially to the financial results the aid they render in this important particular must be fully recognised. Still keeping these visitors in view, it may with advantage be pointed out that, if the tents are unpleasantly hot, as is often the case in an ordinary summer, owing to indifferent ventilation, they can have a walk through them and then return to the open, find a seat in a shady position, and enjoy a conversation with their friends, or the music, as may be the most agreeable. The conditions under which summer flower shows are held in buildings are altogether different. Visitors have to remain within the walls of the latter from the time they enter the exhibition until they leave, and, however much they may be interested in the various objects, the time comes when a strong desire is felt to obtain a rest for both the mental and physical faculties, and preferably where the fresh air and blue sky can be enjoyed concurrently therewith. Moreover, the opportunities for pleasant conversation are not great, and unless we are much mistaken few ladies would consider a building a suitable place in which to display to the best advantage a summer frock. The exhibition at Olympia, as already intimated, may not be able to render so much assistance as could be desired in determining the relative advantages of holding summer flower shows in buildings and in tents in the open, because of the enormous proportions of the building, and the great wealth of material that was as usual placed at the disposal of the Royal Horticultural Society. For the purposes of horticultural exhibitions on a large scale, Olympia possesses possibilities that are probably unequalled by any other building in the United Kingdom; and it is unfortunate these were not more fully demonstrated on this occasion. The visitor on entering the large hall could not well fail in being impressed with the magnitude of the display and the high quality of the products, or to appreciate the thought and labour involved in carrying out the arrangements. It was unfortunate that a few meritorious collections were assigned a position in the gallery, and where they failed to receive the attention they so fully deserved, but it should be remembered that it is not easy to avoid a few slips in allotting the spaces at an exhibition of great magnitude. Much was done to make the exhibition attractive, but the efforts that were made in this direction fell short of the necessities of the case in two important particulars. Nothing was done to screen the plants and flowers from the sun's rays, or to break up the comparative uniformity of the huge banks that flanked the sides of the central walk in the great hall. The roof is partly of glass, and the glare of the sun was so strong as not only to materially reduce the duration of the freshness of the cut flowers, but to give flatness to the general effect and to render it impossible to enjoy the soft colouring which constitutes so great a charm of large numbers of flowers. A screen of canvas or muslin, or some other fabric, would have greatly improved the appearance of the whole of the products, and would have amply repaid its cost, which would probably not have been great, seeing that the committee of the Horse Show, held a few weeks since, provided such a screen for the protection of visitors from the rays of the sun. The fine banks of plants and flowers were impressive by reason of their magnitude, but their appearance generally would have been immensely improved by arranging on each side of the central walk a dozen or so of palms with feathery leafage, and from fifteen to twenty feet in height. Palms of this description placed on pedestals about three feet in height would have broken up the uniformity of the display without in any way interfering with the inspection of the various collections. It is somewhat strange there should in this country be so great a

MR. T. TURTON.

difficulty in appreciating the value of palms in preventing the inartistic uniformity characteristic of exhibitions in which the objects show but little variation in height. The National Rose Society had, for the purposes of its Metropolitan show, a structure of canvas and wood that was as nearly perfect for the purpose to which it was put as we can hope to see; but as the eye ranged over several long lines of boxes at one time the effect was somewhat monotonous. A few palms, about three feet high, placed down the centre of some of the tables would have changed all this, and greatly improved the general effect.

Mr. T. Turton, whose portrait is given in this issue, has achieved so high a degree of success as a cultivator and exhibitor of various kinds of fruit during the past thirty years, that he has become well known to a wide circle of horticulturists; and by those who are fully acquainted with his work, he is regarded, and properly so, as one of the foremost gardeners of his day. It would occupy much space to state in detail Mr. Turton's many achievements in connection with fruit culture since he first made his appearance as an exhibitor, but it may be mentioned that he has exhibited with success at the autumn fruit shows of the Royal Horticultural Society since they were re-established, now many years since. Mr. Turton was successful in winning the fruit packing prize offered some years since by Messrs. Webber, of Covent Garden, and it is not surprising he should remember with pleasure his success in this competition, for it afforded proof that he could pack, as well as grow, fruits in the best possible manner. It may be assumed that the winning of the prize was all the more gratifying from the fact that he had to contend with such strong competitors as the late Mr. Coleman, of Eastnor Castle. Although Mr. Turton has achieved so high a degree of success as an exhibitor of hardy and other fruits, it must be said that he has not been less successful in the cultivation of the other products that come under the gardener's care, and of this he has given ample proof both at Reading and Sherborne. It is of interest to mention that Mr. Turton, after the necessary preliminary training, spent between one and two years in the Royal Gardens, Kew, leaving at the end of 1872 to fill a position in the Grimston Park Gardens, which were then under the charge of Mr. H. J. Clayton. He remained at Grimston Park until 1875, when, on the recommendation of Mr. Clayton, he left to fill the position of foreman at Heckfield Place. This post Mr. Turton occupied three and a-half years, and in the performance of his duties he evidently satisfied that able gardener, Mr. W. Wildsmith, for in December, 1878, he was, on the recommendation of his chief, appointed head gardener at Maiden Erleigh, Reading, a position he occupied until January, 1899, when he succeeded the late Mr. W. G. Prognell as head gardener at Sherborne Castle, the seat of J. K. D. W. Digby, Esq., the position he holds at the present time.

The Potato Crop.—In its special report on the condition of British crops, "The Times" states that potatoes are not so good as they were last year, nor as in 1909—both good years. The frost of June 10 left its mark, especially upon early varieties. A note to this effect is common throughout all districts from North to South, and where the crop has escaped estimates are high. Reports are, in fact, very divergent, as, for example, in Kent, where one correspondent estimates his early crops at 25 per cent. of a full crop, several others use the satisfactory figure of 100. Bedfordshire reports vary between 60 and 105; Hunts and Essex between 90 and 100; Lincolnshire from 75 to 100; Norfolk and Suffolk from 80 to 100; Yorks, East and North Ridings, from 90 to 100; Berks, 70 to 105; Rutland, 80 to 105; Cornwall, 75 to 102; Dorset, 75 to 105; Gloucester, 50 to 100. Wilts supplies six reports all agreeing to 100, while Durham reports (11 in number) vary from 85 to 120. Wales sends 25 reports varying from 50 to 105; Scotland contributes 76, all between 75 and 110. It is evident that if it had not been for the late June frost potatoes would have been one of the most promising crops of the year.

The National Trust, which has for its object the preservation of places of historical interest or natural beauty, was held at Hinehead on the 8th inst., and the report presented to the members afforded abundant evidence of the excellent work that is being accomplished. Princess Louise (Duchess of Argyll), the president, was unable to be present through indisposition, and Sir Robert Hunter, chairman of the Executive Committee, presided. In moving the adoption of the report, Sir Robert Hunter said the income from annual subscriptions amounted to £466, while the total receipts were £1,688. The expenses for the maintenance of the properties of the Trust and general management amounted to £1,572, leaving a surplus of £116. The Trust had 35 different properties. During the year the council made special efforts for the purchase of Grange Fell and the Borrowdale Birches, in the Lake District. For the success of those efforts they were indebted mainly to Canon Rawnsley. Princess Louise had contributed £100 in memory of King Edward, after whom a portion of the Fell was to be named "The King's How." A similar memorial had been given to the Trust in Kent, where 34 acres on One Tree Hill had been presented by Dr. and Mrs. Jamieson Hurry in memory of Mr. Arthur Hill. Another important acquisition was 80 acres of Marley Common and Kingsley Marsh, which were to be purchased by the Trust from Lord Leconfield. It was the intention of Mr. and Mrs. Arthur Lee to transfer to the Trust, subject to their life interests, Coombe Hill, Bucks. The council also hope to acquire two buildings of antiquity—the Old Priest's House at Muchelney, in Somerset, and the Chantry Chapel at Buckingham.

Sir F. W. Moore, V.M.H.—Before leaving Dublin on Wednesday, the King held an investiture at the Castle, and conferred the honour of knighthood on Mr. F. W. Moore, director of the Glasnevin Botanic Gardens. We heartily congratulate Sir F. W. Moore on the distinction that has been so deservedly conferred upon him.

R.H.S. General Examination in Horticulture.—The report on the general examination in horticulture held by the Royal Horticultural Society in April last has been issued, and from this we learn that 202 candidates entered for the senior, and 68 for the junior examinations. Four of the seniors were unable to be present. The examiners, the Rev. Professor Henslow, V.M.H., and Mr. James Douglas, V.M.H., state that of the senior candidates obtaining a place in the pass list, 33, or 16 per cent., secured places in the first class; 95, or 48 per cent., in the second class; while 69, or 35 per cent., appear in the third class. Only one candidate failed altogether. The answers of the candidates in the first class are said by the examiners to have been remarkably good, and in dealing with the questions relating to horticultural practice, the candidates displayed a good practical knowledge of hardy fruit cultivation, and the various systems of training fruit trees to walls, and also of the chemical composition and the use of manures. Of the 68 juniors, four were placed in the first, 18 in the second, 25 in the third, and 19 in the fourth. Last year there were 112 junior candidates, and it is stated in the report that this falling off was in some measure due to those responsible for the entry of juniors failing in a large number of cases to acquaint themselves with the date of the examination until it had been held, although the syllabus was issued nine months previously. In the senior examination, G. M. Grover, Studley College, Warwickshire, was at the head of those who obtained a place in Class 1, and Mr. A. Bouston, Arlesley House, Hitchin; J. W. Hart, University College, Reading; and E. R. Taylor, Studley College, were bracketed for the second place. The juniors who obtained a place in the first class were H. C. Elsden, H. Germany, and H. Hammerston, all of the Technical School, Chelmsford; and F. R. Harding, of the Industrial School of the same town.

Wandsworth Common.—A strong opinion prevails in the district that the proposed sale of land adjoining the Royal Victoria Patriotic School, Wandsworth Common, should not take place. The Wandsworth Borough Council will at their next meeting consider the following recommendation from one of their committees: "That the London County Council be asked to receive a deputation from this council on the subject, and that the County Council be informed that this council (whilst still of opinion that if the land is to be alienated from the asylum, it should be restored to the common without purchase) would be willing to contribute £1,000 towards the purchase of the 20 acres of land in question, with a view to its being preserved as a public open space, subject to the Battersea Borough Council also contributing, to local subscriptions being made, and to the County Council contributing the greater part of the cost of acquiring the land." It has been stated that the Parks Committee of the County Council will be prepared to receive a deputation on July 21.

National Hardy Plant Society's Outing.—On the invitation of Sir Frank Crisp, the members of the National Hardy Plant Society will visit the beautiful gardens of Friars Park, Henley-on-Thames, to-day (July 15). The members of the party will meet at Henley Station at 1.15 p.m., and those coming from London will travel by the train leaving Paddington at 12.5 p.m., and return by the train leaving Henley at 6.35 p.m. The committee hope that a goodly number of members will take advantage of the opportunity thus afforded for inspecting the fine gardens and comprehensive collections of hardy plants at Friars Park.

Awards to Cucumbers.—A short time since a sub-committee of the Royal Horticultural Society's Fruit and Vegetable Committee visited Wisley, and recommended that Awards of Merit be made to Cucumber Pride of the Market (Messrs. Barr and Sons) and Telegraph Improved. This recommendation has been confirmed by the full committee, and approved by the council, and these excellent cucumbers have now received the recognition they so well merit.

NATIONAL SWEET PEA SOCIETY.

This youthful and vigorous society held its eleventh exhibition at the Royal Horticultural Hall, Westminster, in brilliant weather on July 11 and 12, and if the display was not quite the largest of the series it was one of the finest, the quality all through being superb. A point that struck us was the greater variety of colouring the flowers presented as compared with other years. Only a few years ago pink was the predominating sweet pea colour,but now there are good blue, orange, carmine, buff, purple, rose, cerise, mauve, lavender, maroon, and other shades. The show was very effective, the traders filling the spaces next the walls all around the competitive exhibits. The music gallery was tastefully decorated with palms and ferns and sweet peas.

The competition was excellent and the Irish flowers were superb. There was a good attendance.

TRADE EXCLUDED CLASSES.

The Sutton Cup for the best twenty-one varieties representing the finest varieties as indicated by the National Sweet Pea Society, was won by Mr. A. E. Usher, gardener to Sir Randolf Baker Bart., Ranston, Blandford, with rare spikes of big blooms; his Mrs. Townsend, Helen Lewis, Mrs. A. Ireland, J. Ingman, and Mrs. C. W. Breadmore were exceptionally good; Mr. Mosing, gardener to A. W. Stirling, Esq., Holm Lea, Goring, second, and Mr. G. F. Hallett, gardener to Sir Thomas Hesketh, Bart., Easton Neston, Towcester, third. For twenty-four bunches, Mr. Usher was again to the front, and here he had Othello Spencer, Helen Lewis, Senator Spencer, and Bertie Usher in good form; Mr. Tubb, Oakbank, Sevenoaks, second, and Mr. E. Keith, gardener to the Right Hon. Sir G. O. Trevelyan, Bart., Wallington Hall, Cambo, Morpeth, third.

Mr. Thomas Stevenson, gardener to A. G. Mocatta, Esq., Woburn Place, Addlestone, won the Eckford Cup with a dozen exquisite vases of Anglian Pink, Thomas Stevenson, Princess Victoria, Queen of Norway, Evelyn Hemus, Clara Curtis, Maud Holmes, Marjorie Linzee, Helen Grosvenor, and Nubian; Mr. Usher came second, Mr. A. Moring third, and Mrs. Bartlett, Tolleshunt Knights, Witham, fourth.

The Coronation Cup, presented by Mr. Sherwood, was won by Mr. E. Cowdy, Greenhall, Longhall, co. Armagh, with a dozen of the finest bunches of sweet peas ever seen, they were of marvellous quality, colour, form, and substance, and as fresh as the proverbial daisy; the varieties were Nubian, Mrs. C. W. Breadmore, Flora Norton Spencer, John Ingman, Countess Spencer, Sunproof Crimson, Elsie Herbert, Gladys Burt, Clara Curtis, Mrs. Hardcastle Sykes, Chas. Unwin, and Tennant Spencer. Mr. Thomas Jones, Ruabon, came second, Mr. Thomas Stevenson fourth, and Mr. W. H. Prophet, gardener to R. P. Brook, Esq., Par Station, Cornwall, third; about twenty-five entries. Mr. Cowdy annexed the Breadmore Challenge Plate for a dozen bunches with another grand lot, wherein Earl Spencer, Edna Unwin, Marjorie Linzee, and Mrs. W. J. Unwin were splendid; Mr. W. H. Prophet came second, and Mr. E. Broad, The Lawn, St. Austell, third.

In the six-bunch class Mr. Prophet led with fine examples of Doris Burt, Mrs. Hardcastle Sykes, Mrs. Chas. Foster, Helen Lewis, George Herbert, and Mrs. C. W. Breadmore; Mr. T. Vickers, gardener to W. H. Rawnsley, Esq., Well Vale, Alford, Lincs., second; and Mr. Usher third. Mr. Prophet scored for cream pink or pink varieties, three vases, with Mrs. Henry Bell, Constance Oliver, and Countess Spencer, and for three bunches of new varieties Dr. J. E. Phillips, Malpas, scored, with Chas. Foster, Mrs. R. Hallam, and Lancashire.

OPEN CLASSES.

The winner in the classification class was Mr. Usher, whose Helen Lewis, Dazzler, Mrs. Charles, Earl Spencer, and Asta Ohn were excellent; Mr. H. W. Tigwell, Greenford, Harrow, second, with smaller, bright blooms. Mr. L. G. Bealing, Burgess Street Nurseries, Bassett, scored in the class for twelve bunches, distinct, with a beautiful set; Mr. Fairbairn, gardener to E. Otter, Esq., Stanhope, Greenford, proved a capital second; Messrs. E. W. King and Co., Coggeshall, third. The best bunch of a new sweet pea was a grand vase of Bertha Massey shown by Mr. Stevenson; it is a beautiful light mauve; Mr. Bealing second, with Bertram Deal; and Mr. Broad third with Thomas Stevenson. A curious class was the one for a bunch of two varieties, and here Mr. Prophet led with Paradise Ivory and Nancy Perkins, a lovely blend; Mr. Vickers second with Paradise Ivory and Audrey Crier.

The Burpee cup class is for a display of waved sweet peas, arranged on a space 8ft. by 3ft., with a height not exceeding 4ft. Here Mr. C. W. Breadmore, Winchester, won this fine cup with a well set up table on which we noticed Elsie Herbert, Senator Spencer, Aurora Spencer, Mrs. C. W. Breadmore, Mrs. R. Hallam, Marjorie Linzee, Tennant Spencer, and Princess Juliana; Mr. J. R. Box, Lindfield, second; and Mr. W. E. Alsen, Denmead, third.

Mr. Usher had the best set of American sweet peas, and his selection included Senator Spencer, Mrs. Routzahn, Asta Ohn, Clara Curtis, and Othello Spencer; Mr. R. Wright, Formby, was a good second; and Mr. Tigwell third. Mr. Prophet showed the finest single bunch of Countess Spencer, all four-flowered spikes.

SWEET PEA DOBBIES' THOMAS STEVENSON.

A fine strain of this brilliant scarlet variety. F.C.C., N.S.P.S., July 11.
Messrs. Dobbie and Co.

Mr. R. Wright was unfortunately disqualified in the class for three varieties selected from a given list, and here Mr. Usher scored with Anglian Pink, Anglian Orange, and Queen Mary. The E. W. King challenge cup was annexed by Mr. W. H. Prophet, who has succeeded in converting his new employer, Mr. R. P. Brook, into a sweet pea enthusiast; in the space allowed there was not sufficient room for his great bunches and splendid blooms of Mrs. A. Ireland, Etta Dyke, Tom Bolton, Mrs. Hugh Dickson, King Edward Spencer, Elsie Herbert, Dazzler, Senator Spencer, Asta Ohn, Mrs. C. W. Breadmore, and Tennant Spencer; Mr. Vickers second; Mr. Broad, third.

SPECIAL VARIETIES.

In the trade-excluded class Messrs. Dobbie and Co.'s chief prizes were won in order by Mr. Thos. Jones, Ruabon, who showed Edrom Beauty, Masterpiece, Romani Rauni, Sunproof Crimson, Audrey Crier, and Isabel Malcolm; Dr. Phillips was a capital second, and Mr. A. L. F. Cook, Iver, Bucks, third, in a very keen competition. Mr. Unwin's prizes for six selected varieties fell in order to Mr. Usher, Mr. Thos. Jones, and Mr. Prophet; while Messrs. S. Bide and Sons' prizes for six bunches were secured by Mr. Usher and Mr. M. J. Green, Eynsford. In other classes provided by Messrs. Stark and Son, Mr. W. Deal, Mr. Dipnall, Robert Sydenham, Lim., and Messrs. Jones and Sons, the leading awards were made in favour of Mr. A. L. F. Cook, Mr. Usher, Mr. Green, Mr. Prophet, and Mr. Thos. Jones.

AMATEURS.

In the special amateurs' division the new Hawlmark cup, presented by Messrs. Alex. Dickson and Sons, Newtownards, for a dozen bunches, distinct, was properly enough won by Mr. Jas. Hall, of Moy, Co. Tyrone, so another cup went to Ireland, and in this case made the return journey. Mr. Hall had a fine set, Sunproof Crimson, Tennant Spencer, Mrs. C. W. Breadmore, and Asta Ohn being his best varieties. Mr. H. H. Lees, Warblington, Havant, was a good second, and Mr. F. J. Harrison, Roundens, Ulverston, was placed third in a keen competition. In the two other classes in this section Mr. J. Beach, Elphicks Farm, Horsmonden; Mr. H. H. Lees, and Mr. J. Haycocks, Gyfelia, Wrexham, scored well.

SWEET PEA BARBARA.

Flowers large, rich orange-red. F.C.C., N.S.P.S., July 11. Mr. Holmes.

SMALL GROWERS.

The small growers turned out in great numbers, and fought hard for the Horace Wright cup, this trophy falling to Mr. C. R. Jaggs, Hertford Heath, who had a finely-grown set of popular varieties; Mr. F. Green, Swaythling Lawn, Southampton, came second; and Mr. L. C. B. Hockin, High House, Sutton Green, Guildford, third. The Walter Voss cup for six bunches was annexed by Mr. J. Beech, Elphick's Farm, Horsmonden, with a most creditable exhibit of bright blooms; Mr. E. Waterman, South Cottage, Seal, second; Mr. Howard B. Young, Horfield, Bristol, third. Mr. F. Green, Southampton; Mr. W. H. Holloway, Shrewsbury; Mr. W. W. Powell, Gamlingay, Sandy; and Mr. Waterman, were other leading winners in this section.

DECORATIONS.

Mrs. Alex. Robinson, Carshalton, led in the table decoration class with a very light arrangement, in which greenery was freely used; Mrs. F. G. Bealing third. Miss M. E. Jones, Shrewsbury, led for a vase of sweet peas, a delightful arrangement of pink, cream, and blue flowers. Mrs. Maslin, Ongar Hill Cottages, Addlestone, scored for an epergne of sweet peas with a tasteful effort in cream and soft orange.

NEW VARIETIES.

First Class Certificates were awarded to Dobbies' Thos. Stevenson, a rich scarlet variety, reserved for the silver medal, from Messrs. Dobbie and Co., Edinburgh; and to Barbara, a rosy-salmon variety, from Messrs. Holmes, Norwich.

Awards of Merit, to F. Seymour Davies, a violet flushed elegant variety, from Mr. F. Seymour Davies, Farnham, Surrey; to Mauve Queen, a rich mauve variety, from Messrs. Dobbie and Co.; to Red Star, a vivid orange-scarlet variety, from Mr. A. Malcolm, Duns; to May Campbell, rosy flame on cream ground, from Messrs. Dobbie and Co., Edinburgh; to Mrs. B. Gilbert, a light marbled variety, from Messrs. Gilbert and Son, Dyke.

TRADE DISPLAYS.

The trade exhibited finely, and special mention must be made of the superb flowers contributed by Mr. R. Bolton, Carnforth. Medals were awarded as follows:

Large Gold.—Mr. Robert Bolton, Carnforth.

Gold.—Messrs. Dobbie and Co., Edinburgh; Robert Sydenham, Limited, Birmingham; Messrs. Jas. Carter and Co., Raynes Park.

Silver-gilt.—Messrs. Sutton and Sons, Reading; Mr. Wm. Deal, Kelvedon; Messrs. S. Bide and Son, Farnham; Mr. J. R. Box, Lindfield.

Silver.—Messrs. E. W. King and Co., Coggeshall; Mr. J. Stevenson, Wimborne; Messrs. Carter Page and Co., London Wall; Mr. C. W. Breadmore, Winchester; Messrs. Stark and Son, Great Ryburgh; Mr. W. E. Alsen, Denmead; Messrs. Jones and Sons, Shrewsbury.

Bronze.—Messrs. Jarman and Co., Chard; Messrs. Aldersey and Jones, Tilston; Messrs. W. Lumley and Co., Hayling Island; and Mr. W. Cantley, Bury St. Edmunds.

VIOLETS IN FRAMES.

I have not heard of anyone who did not love violets; but have had ample evidence of the fact that these flowers are very highly appreciated during the winter and spring months. They fill a big gap at that period when flowers are scarce and costly. Plants intended for frame cultivation should be well prepared; for more flowers and of better quality, can be obtained from three dozen plants properly prepared than from one hundred that may be lifted from a plantation grown without any special care being bestowed upon them. Probably many inexperienced cultivators fail to obtain satisfactory returns for their labour through procrastination in planting. I am a firm believer in getting the plants well established in their winter quarters by the end of October. It is neither necessary nor advisable to cover the plants in the frames thus early with the glass lights; but when the latter are put on the plants soon respond to frame treatment and yield an abundance of bloom.

During the summer time the plants in the garden must be kept quite free from all runners and flower buds, as it is important that the crowns be matured and very prominent, as in the case of strawberries for forcing. Furthermore, frequent applications of liquid manure and syringings with clear soot water will do a vast amount of good, and help materially to build up grand clumps for lifting.

The clumps should be planted in the frame during the latter part of August, or, at latest, the early part of September. There will not be any need for making a hotbed. I prefer a cool bed, and one composed of manure, the top portion of which should be well rotted, the lower part may be littery, but it must be made very firm. The compost should be a mixture of loam and leaf-soil, with sand or road-grit to ensure porosity; and it must be put on quite one foot deep over the manure bed, sloping from back to front, so as to be of equal distance from the frame-lights at all points. The leaves of the plants should just be free from touching the glass.

Ample space between the clumps is desirable; in the case of large-leaved varieties, such as Princess of Wales, 16 inches from centre to centre of the clumps will do, whereas one foot will be sufficient in the case of small-leaved sorts, such as Marie Louise. Firm planting is essential, but treading upon the soil between the plants afterwards should be avoided. Prepared clumps will not need any shading nor covering with the lights, a thorough watering and an occasional syringing during bright weather being sufficient, but unprepared plants should have the lights put over them and light shading afforded them also for a time—ten days or so—until they are somewhat recovered from the check given.

If the soil be of good quality and resting on a bed of rotted manure, there will not be any need to give manure water; and, although the compost must be made firm, the surface should be loosened from time to time to keep all sweet and clean around the plants.

Geo. Garner.

MALMAISON CARNATIONS.

Malmaison carnations are largely grown in most gardens of importance, as they are especially useful for a variety of decorative purposes. Well-furnished plants present an attractive appearance in the conservatory, and the blooms are invaluable for filling large vases in the dwelling-house. No other plant requires exactly the same treatment as Malmaison carnations, and on that account it is necessary to devote a house entirely to them to ensure a full measure of success. Probably no other subject needs more careful attention, but they will give an ample reward for the care and attention devoted to them.

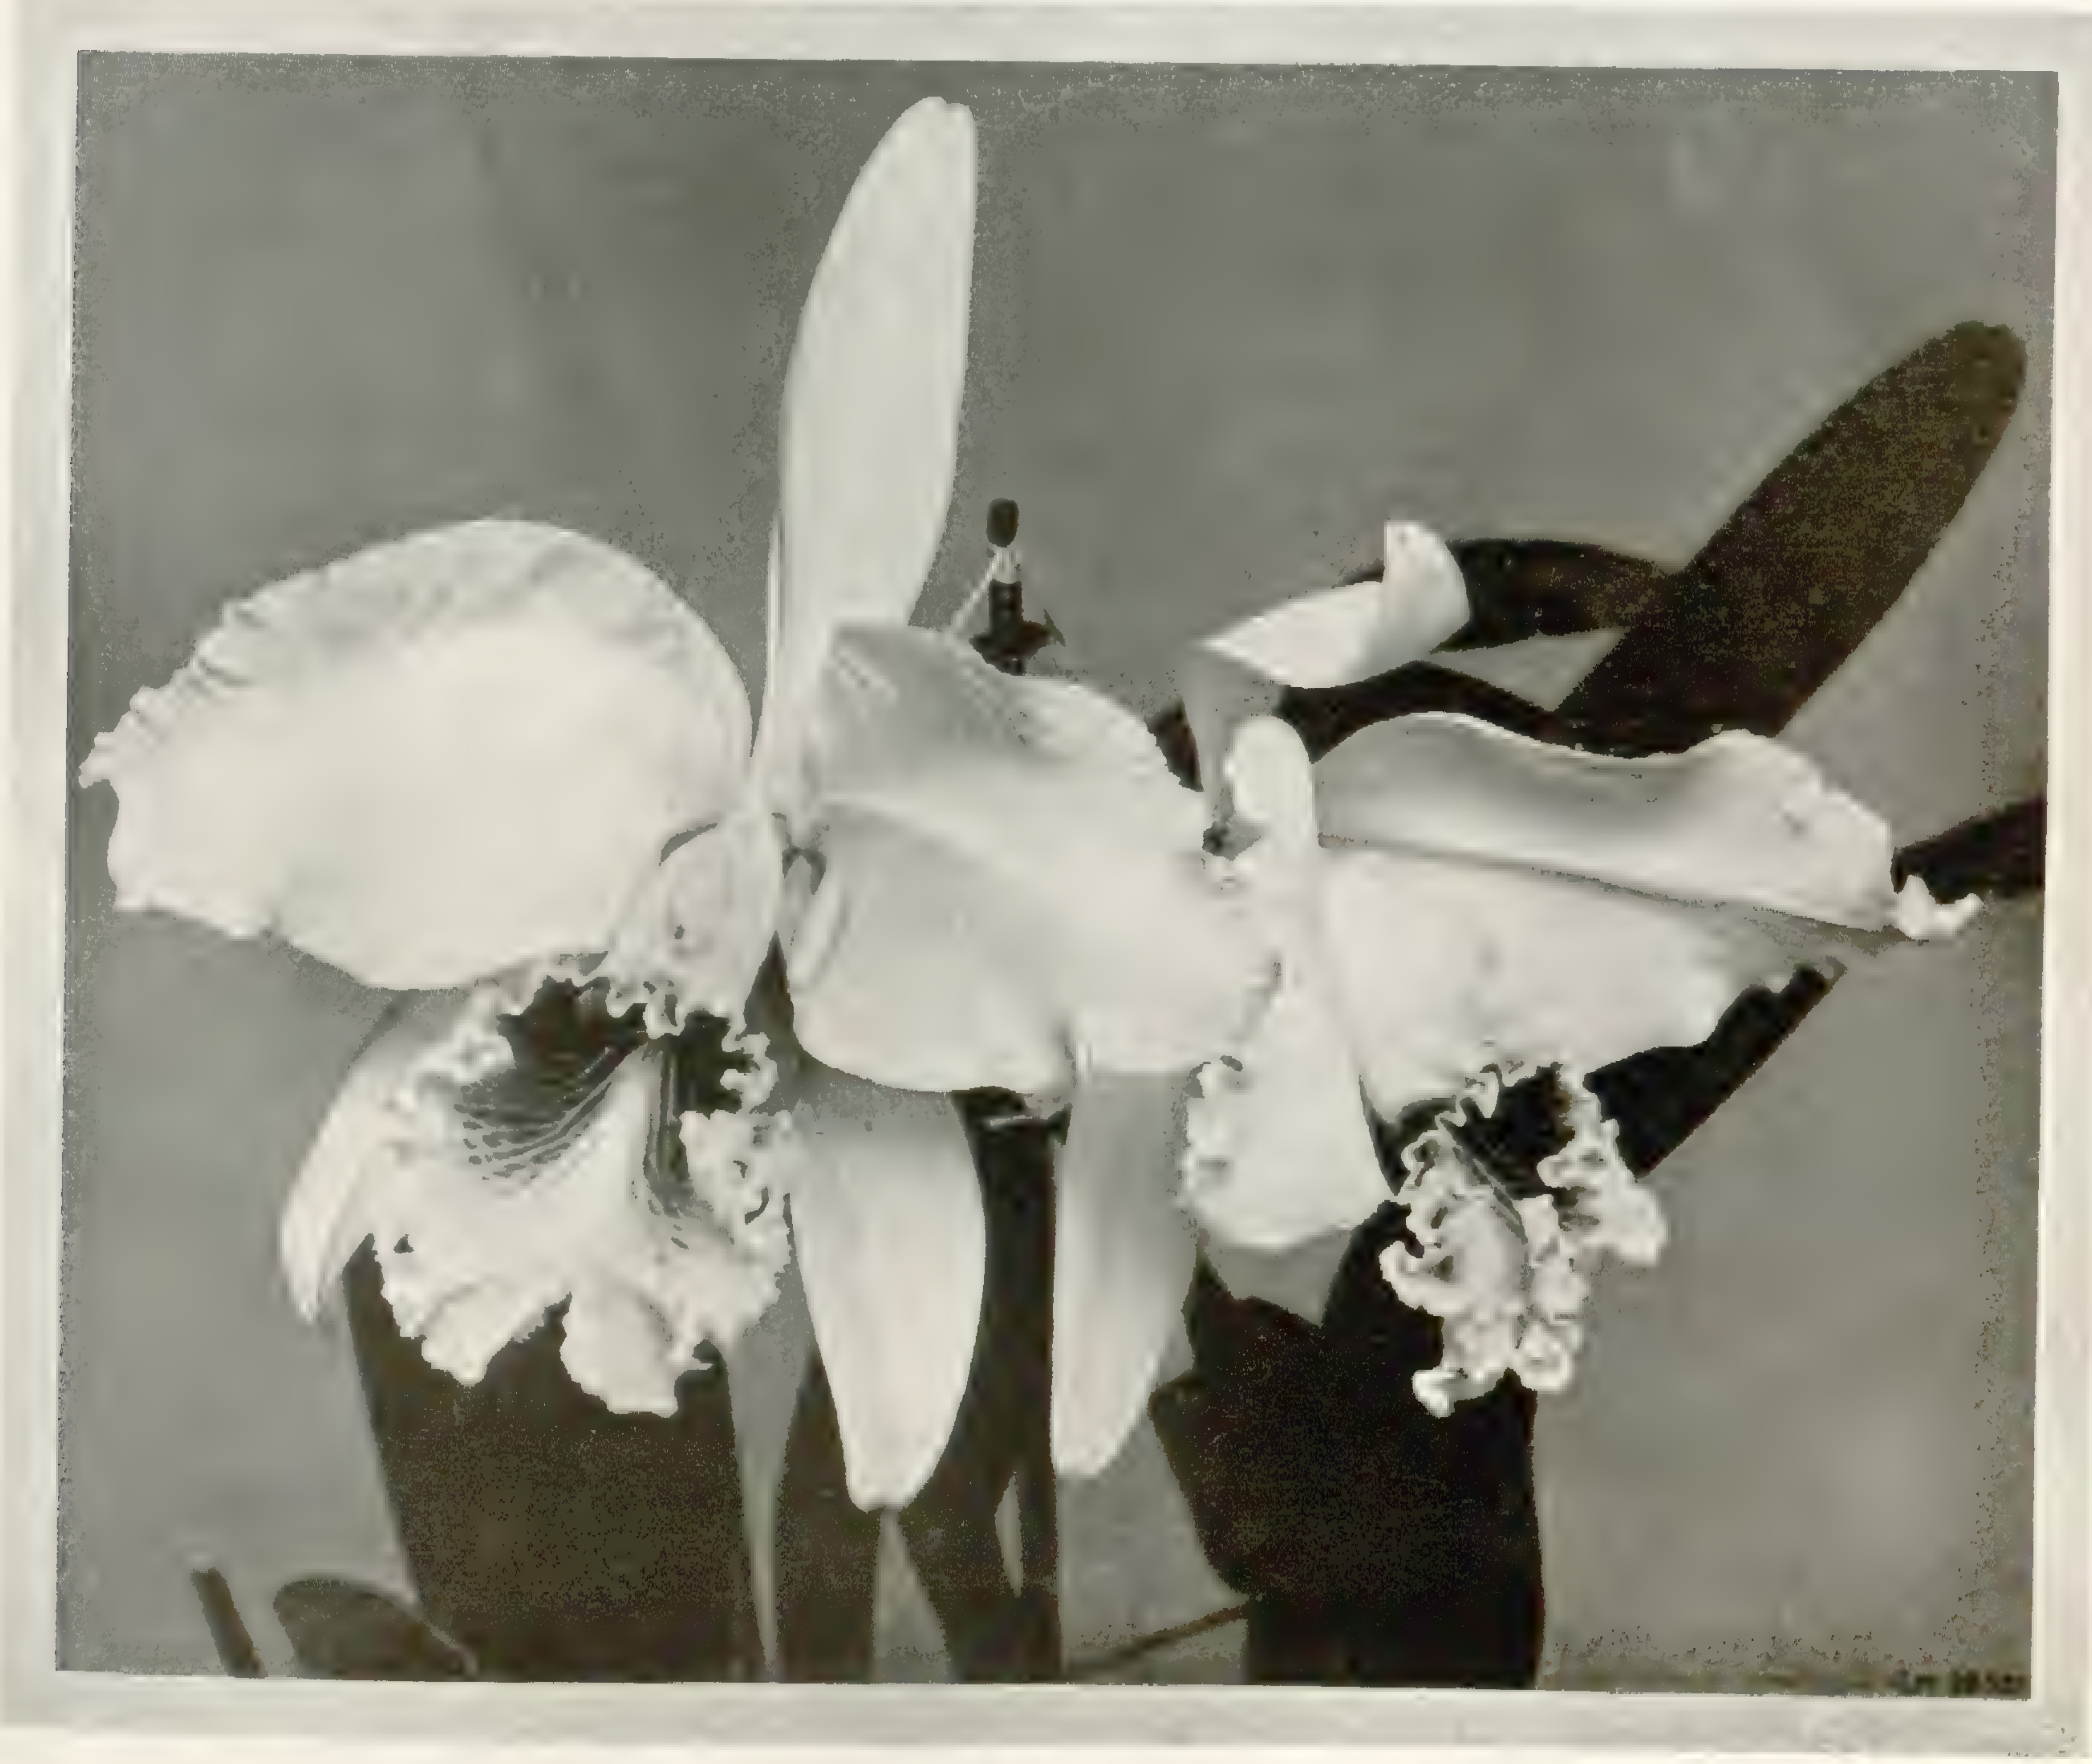
Malmaisons are propagated by layering in a cold frame in July, or as soon as the flowering season is over. Keep the layers shaded until they are rooted, then air may be freely admitted. Take care not to allow the layering compost to become dry. The layers root readily in light sandy soil, and a spraying with the syringe on a bright afternoon is highly beneficial. Put the young plants into 60-size pots, using a porous compost, and stand them in an unheated frame, which should be kept close and shaded until they are rooted. When they are well rooted put them in 32-sized pots, in which they will remain during the winter. A suitable compost consists of three parts good fibrous loam, one part leaf-soil, some wood ashes, broken bricks of a porous nature, and silver sand.

A good place to keep the young stock during the short days is a specially constructed span-roof pit provided with a heating apparatus. One can then ensure the maximum amount of light, while the temperature can be easily regulated, and this may range from 40 degrees to 45 degrees during the winter. Give attention to staking and tying as required, and remove all decaying leaves from the plants. In some localities, and especially low-lying districts, rust is very troublesome, while in other places it refuses to thrive. The best plan is to cut off the affected leaves and burn them. By removing infected leaves, maintaining a dry atmosphere during dull winter days, and by propagating from clean stock I am of opinion that it is possible to eradicate this disease. During the winter Malmaison carnations require watering with great care, as either a too dry or too wet condition of the soil about the roots is detrimental to them. Allow the soil to become moderately dry before giving water, and then supply sufficient to well moisten the soil.

With the lengthening days of February the plants will commence active growth, and, provided that they have received the right treatment during winter, will make rapid progress. About the end of that month it will be time to commence spring potting, using 9in. and 10in. pots, and the compost recommended above. Pot firmly, and exercise especial care with the watering, it being preferable to allow the plants to remain a few days before being watered in. Some growers prefer to let their plants flower in 32's, but the method here advised is preferable, as butter furnished and more vigorous plants are obtained. As the days lengthen admit air freely, and spray between the pots in bright weather, affording them shade from the sun during the middle of the day. As the side shoots develop place a separate stake to each, and tie them with green raffia. These plants may be allowed to produce a single bloom, but when an early batch is required the following season, it is an advantage to pinch out the tips of the main shoots in the previous February, as this causes them to break away stronger and rather earlier. Plants that are forming their flower buds should have a light top-dressing of artificial manure, and regular applications of soot water are very beneficial. Pay strict attention to disbudding, and fumigate occasionally to prevent an attack of green-fly.

There are numerous good varieties, amongst them being Princess of Wales, salmon-pink; Duchess of Westminster, rose-pink; Calypso, flesh colour; Mrs. Trelawny, dark salmon; Sir Charles Freemantle, deep rose; Lord Rosebery, salmon-scarlet; Maggie Hodgson, deep crimson; Yaller Gal; Nell Gwynne, pure white; and Nautilus, flesh pink.

J. Gardner.



CATTLEYA MOSSIÆ ALBA QUEEN MARY.

Flowers white with rose marking on the lip. A.M., R.H.S., July 4. Messrs. Mansell and Hatcher.

BUDDING.

The rose may be budded very well in the spring if the buds are extracted with a small portion of wood adhering to them, but, as a rule, it is usually done in the summer, and if grafting should fail in the spring, the plant may be budded in July, and a season so saved. Budding, in reality, is a means of inducing a kind of parasitic growth. The stock in which the bud is inserted supplies the nourishment which is to nourish the latter, and help it to become properly knitted together in the stock. This nourishment is given to it by the young outer wood of the stock, so that it appears of first importance that this outer wood should be in sap; the bark must part freely from the wood, and the sap should be in an active state. One important point about budding is that there is no transference of any kind of material or substance from the stock to the bud. The only material result is that a thin layer of wood develops between the line of junction. Below this line of junction the wood retains all the properties of the stock, and no other; above the line, except in a few instances, the wood retains all the properties of the tree from which the bud is taken, and no other. The commonest form of stock is a briar, while upon this stock may be developed any variety of rose.

In taking a bud preference should always be given to those which may be removed from summer shoots. They should be well grown, plump, and requiring no further development to bring them to maturity. As a rule, it is best to take the buds from medium-sized shoots, for gross shoots will bear soft, immature, and large buds, which rarely succeed. Similarly, the buds of weak, partially developed shoots will be small and difficult to handle properly. The best time at which to take these shoots for budding purposes is usually after mid-summer, during July or August. No time must be lost after removing the buds before inserting them in the stock, but, if necessary, the shoots may be preserved in damp moss or other suitable material in order to prevent them drying. Then, before taking the buds, the shoot may be placed in water for some little time, so as to plump up the buds.

The method of budding is as follows: First of all, a portion of the stock must be chosen wherein to insert the bud. When this is noted, a shoot well furnished with plump buds should be selected, and a clean-cut slip of bark and wood, about 1½ inches long, containing one of the buds at about the middle of the slice, removed from the shoot. This slip, which contains the bud, will have a kind of shield of wood attached to it, and by inserting the flattened haft of the budding knife between the bark at the upper end of the slip and the wood, the latter may be forced out with a sharp jerk. In the centre of the slip will be noticed the base of the embryo bud. This must not on any account be disturbed, otherwise the slip will be useless. Always choose the upper end of the slip for jerking out the wood, for some slight damage to the bark is unavoidable; and this end will be subsequently cut off when the bud is inserted in the stock.

To prepare the stock for the insertion of the slip, a cross cut must be made in it at the selected spot, and a slit about an inch long cut in a direction leading towards the stem in the case of a side shoot or downwards in the case of a vertical stock. The two cuts on the stock will be in the form of a long T, the knife just piercing the bark. Then, with the end of the budding knife the bark or rind on each side of this T cut should be raised slightly, and the slip containing the bud inserted under the two angles of the T-shaped cut, and pushed down into the bottom of the slit. The shield or bud may be readily handled by means of a leaf-stalk or petiole. Great care must be taken to fit the shield exactly in the slit made in the stock, and the topmost portion of the shield which overlaps the slit should be cut off, but not too closely to the bud. This should be done so that the inner bark of the bud will just rest on the outer wood of the stock.

To keep the shield in position, it may be bound on to the stock with raffia, bast, worsted, or cotton wick, or other suitable material. Anything that holds the bud down closely to the stock and does not cut into the bark is the best material to use. With a month or so after budding the bandage may be loosened or removed, although it is usually a sign of failure if the leaf-stalk or petiole shrivels up quickly. If the bud is a success the leaf-stalk will be retained for a week or two. About eight days after the insertion of the bud, some growers prune down the stock to the branch which is immediately above the bud on the opposite side, and this branch is stopped by being cut down to two or three eyes; all the side wood is destroyed, and when the bud has pushed its fifth leaf, it may be induced to branch by pinching it at the top. As a rule, it is advisable to be careful in shortening the stock, and generally this must be done very slightly, especially if the stock is a vigorous growing one and the bud has taken well. The latter is then apt to be started into growth, and this growth rarely has time to become well matured before winter.

J. C. Newsham.

WALL SHRUBS FOR A NORTH ASPECT.

Walls having a north aspect are admittedly the most difficult to clothe with vegetation, as little or no sun ever falls upon them, while in many instances buildings or trees encroach in such a manner as to cause draughts, against which none but the hardiest plants are able to succeed. So unfavourable are the conditions at times that one dare not venture beyond the various forms of climbing ivies (hedera), yet these, under systematic treatment, form an inimitable wall covering, and should have preference where the conditions are so adverse as to preclude more interesting plants.

Before planting wall shrubs on a north exposure the position should be carefully drained in order to ensure a warm root run, which, more than anything, favours success; if the natural soil is of a light character little preparation is called for beyond trenching and manuring, but with soil of a heavy nature and liable to become close or baked with rain or drought, a liberal dressing of gritty material should be added along with the manure; in this way a border some two feet in depth and three feet wide may be prepared in order for planting.

Of evergreen shrubs for such a position the well-known Berberis Darwini will grow to a height of 12 to 15 feet; progress at first is slow, but if the main shoots are early encouraged and trained, and the side growths stopped at an early stage so as to divert the strength into the main stems, it soon makes headway, and fills out into a dense close mass of branches, and its freedom of flowering in such a position is quite a revelation. Cotoneaster Franchetti and C. pannosa are admirable on a north wall; rapid in growth, neat, and most attractive in autumn when clothed with the conspicuous orange-red fruits.

Azara microphylla is one of the most ornamental of evergreen wall plants; the small glossy green leaves are closely set on the slender branches, and form an ideal wall covering. It is not suitable for a north aspect in cold localities, and where the soil is heavy, but in all seaside and favoured districts it is quite reliable in this position, succeeding best on a limestone or chalky soil. Bridgesia spicata (Ercilla) is a free-growing evergreen that clings as tenaciously as ivy, filling out well as it grows; the leaves are thick, leathery, roundish-ovate in form, and the flowers are of a purplish colour, borne in dense racemes. It is somewhat slow to start, but once established in good soil will cover from three to four feet in one season.

Of deciduous shrubs, Jasminum nudiflorum and J. officinale give excellent results when not overcrowded; the main stems should form a ground work, trained from 15 to 18 inches apart, and the lateral branches be pruned back to the first joint or lowest bud every year after flowering. Cydonias, treated on the same principle, will grow to 12 and 15 feet in height, and will flower much more freely on the spur system than when allowed to grow unrestrained. An excellent specimen of the old Cydonia japonica, over 10 feet high and planted in a north aspect, came under my notice last spring; it had been carefully trained as indicated, and the wealth of blossom could not readily be excelled. The varieties C. Maulei, alba, atrosanguinea, and superba should be given preference, as the flowers are of a large size and of conspicuous merit.

Buddleia Veitchiana and B. magnifica are excellent in a north aspect, when not overshadowed by trees and buildings. I tried them three years ago in a cold, sunless position, but fully open to air and daylight, and the result was most satisfactory; both plants are exceedingly vigorous in growth, and in order to give them justice a fair extent of wall should be at their disposal. Given conditions similar to those suggested for buddleias, the old favourite rose William Allen Richardson will generally succeed in a north aspect; the ideal position is the angle of a north and west wall, with the roots in the north border, training the shoots along the west wall. I have grown it on loam soil in Dumbartonshire and on chalky soil in Lincoln, and these conditions and such a position appear favourable to the development in the highest degree of the rich orange-apricot flowers for which this old favourite is so much esteemed.

The various forms of self-clinging ampelopsis are among the most brilliant of wall plants for a north aspect. Of these muralis and Veitchi are most reliable and constant in their leaf-colouring in autumn, and so certain are the results in this respect, even when the roots are in a sunless position, that it is quite unnecessary to assign it a south wall to the exclusion of much rarer and less vigorous plants, and especially those coming from somewhat warmer climes, and flourishing in sunny positions.

Local conditions, to some extent, influence the selection of plants for particular positions; some care and attention bestowed upon the initial planting of unfavourable sites results in much greater variety, with increased beauty and interest added to the garden. The plants suggested are representative of the hardiest and most reliable for the position thus briefly indicated.

Thomas Smith.

THE VALLEYED GARDEN.

The possibilities of a garden are largely influenced by the landscape it embraces. The garden on the flat must ever retain a certain formality, if it is to be effective. Where one can take an undulating stretch of land with characteristic rises, slopes, and depressions,one has indeed a first-rate basis for a natural garden.

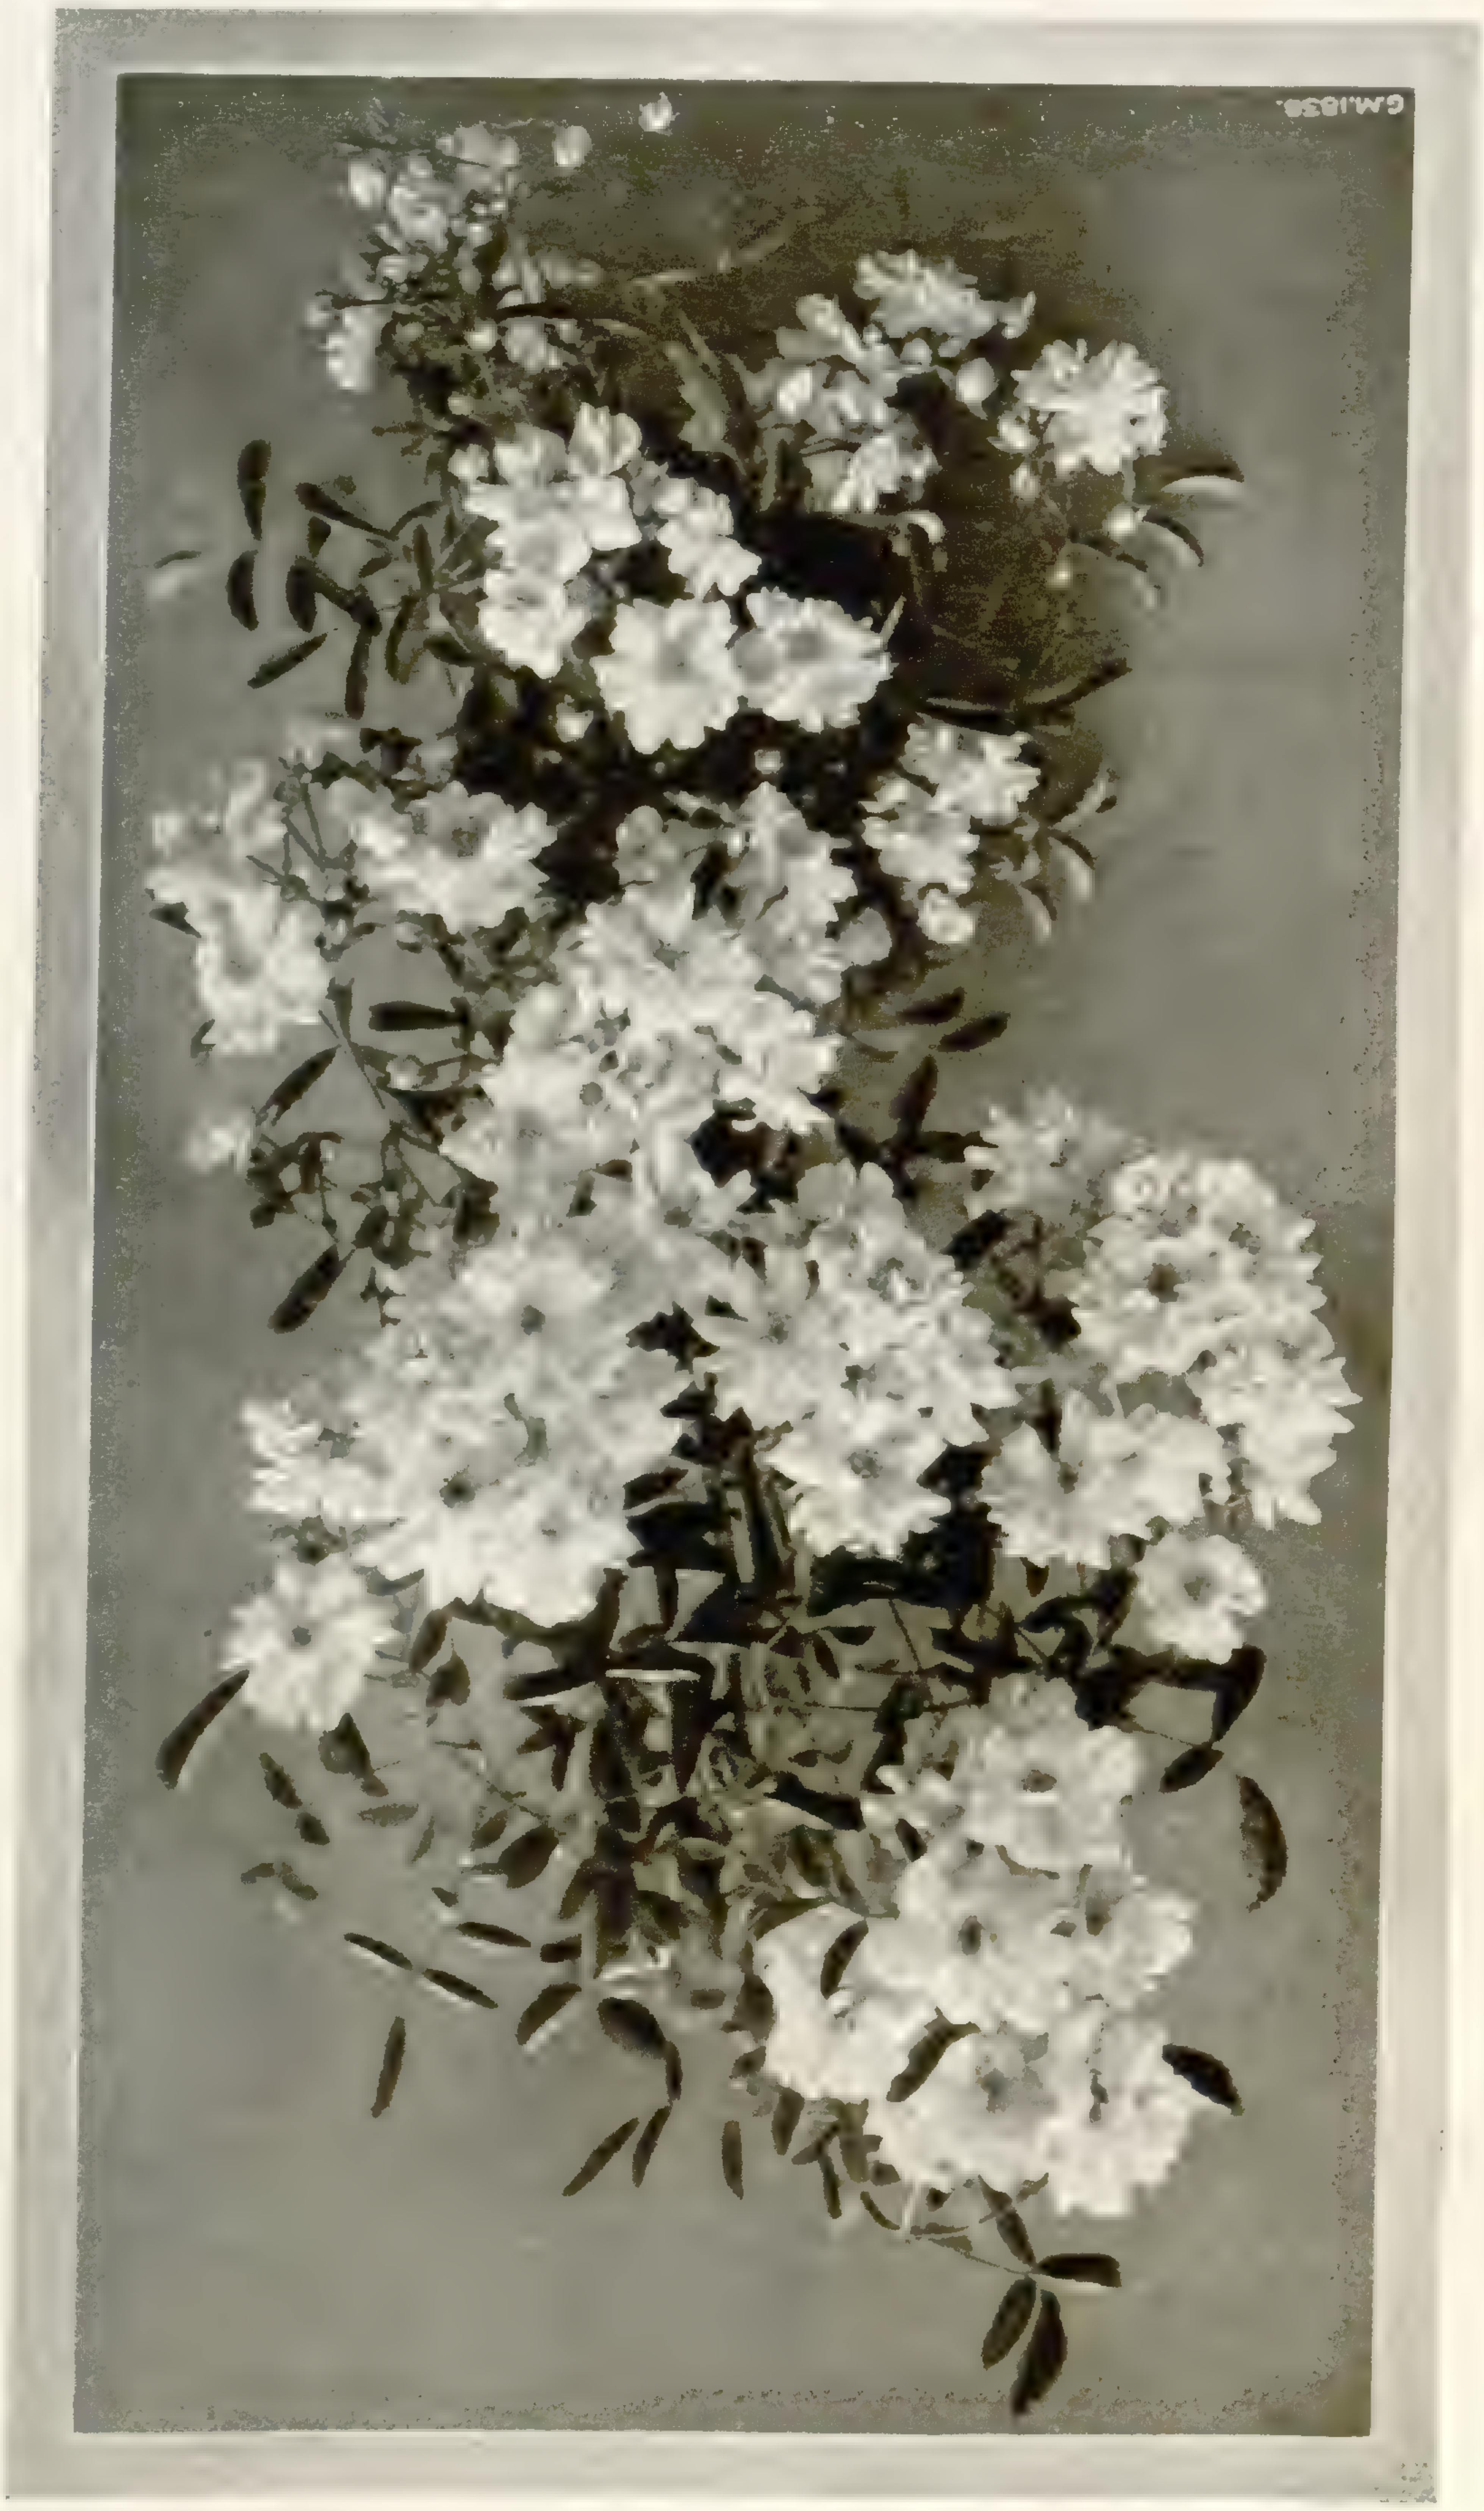
Often such undulating land will be partially wooded, and here again is offered a sterling asset to the making of a garden. By a judicious survey one is enabled to select trees to stand in isolated beauty. Others may be chosen to form groups or to act as windbreaks for the protection of shrubs and choice floral subjects. A treeless garden is the most difficult to bring into perfect beauty. In it one has to plant subjects that will take a generation to become effective. On the other hand, if goodly trees are existent, then one has a background to work to, the landscape is adorned, and the whole view can be broken up to give both colour and effect.

Even if the undulating site be not clothed with trees, even then it far surpasses, both in value and appearance, the site upon the level. Simple valleyed depressions break up the landscape charmingly, and throw into bold relief the higher ground and rising slopes. Shrub plantings show themselves far more effectively upon a sloping bank than elsewhere. Each member of the group is delineated in a way impossible with any level ground groupings,and each receding from its fellow according to its position on the slope,emphasises the distance admirably.

Then, again, the crowning of ridges will call for extended care, and will in the hands of the successful planter give splendid results in pictured beauty. I do not think these "ridges crowned" are fully appreciated in our English gardens. There are wonderful possibilities to be gained in way of picturesque beauty by the judicious crowning of the ridges with tree, shrub, or plant colonies. Whether it be a grand scenic background, encompassed by pines and firs, or a simple rockery ledge covered with mountain dianthus or alpine poppies, it is the tree or plant life that gives harmony to the scene. It is imperative that the high points are crowned, and crowned well. Whether one uses pines or cedars, azaleas or rhododendrons, scarlet oak or maple, the effect of foliage and blossom against the skyline provides a most telling feature.

Standing in the valley, with eyes turned upward to the high ridges, one can mark the beauty of the picture. Changing skies emphasise, accentuate, or contrast the masses of foliage in a most picturesque manner. Even if the ridges were crowned with berberis, with broom, or even ericas, even then the charm is great. It matters not whether the valley sides are faced with great rocks or simply planted with wild heaths, ferns, gorse, and similar subjects, the charm is retained in either case by the ground formation. It is, however, the garden maker's part to increase the beauties and to emphasise the natural effects. The Japanese idea of improving upon Nature can be followed successfully. Dominant points can be utilised to give the keynote to the whole scene. The effective clothing of these points must be the first objective of the planter, the rest can be filled in afterwards. The great thing is the correct treatment of the main points, and upon the success of this the whole scheme is dependent.

Then, again, if the question of water is entered upon in the valley garden scheme one must necessarily allow the existence of water in the base of the valley. It may be in the form of a running stream or a series of pools, or (even if space permits) a goodly sheet of water. In any case, if water comes into the valley garden, it must, of course, be shown in the lower levels. The question of furnishing such water-courses or pools will entail additional care from the planter. The disposition of the true aquatics, nymphæas, nuphars, villarsias, aponogetons, hottonias, Alisma natans, etc., together with such moisture-loving subjects as calthas, waterside irises, osmundas, typhas, saggittarias, butomus, ranunculus, gunneras, eulalias, astilbes, bog primulas, and many others will provide a thought-stirring task, if it is to be truly effective.



NEW WICHURAIANA ROSE ETHEL.
Flowers bright pink. Card of Commendation, National Rose Society, July 7.
Mr. C. Turner.

Paths for the valley garden will also require thought. In many the traditional gravelled path will still hold sway, being cleanly and serviceable at all seasons. Stepping stones may, perhaps, be favoured in others, and where the stones are carefully placed and set, they will furnish a dry, lasting footway that will be in complete harmony with the rest of the natural garden. One thing should be borne in mind, that flat, undressed stones are far better for forming a foot way in the valley garden than stones that have been squared and dressed. The rough surface of undressed stones affords a better foothold, especially during wet or frosty weather, and also are more natural in appearance.

Steps from the lower ground to higher levels may also prove necessaries. These can be let into the banks, with a draping of ferns or low shrubs flanking them. Waterways, if existent, should be crossed, and here stepping stones or bridges will be needed. With regard to the stepping stones they should be placed so as to give the surface two and a-half or three inches above the water-level. Bridges, if used, should be simple in design, the simpler the better. In a small garden a bridge of rustic timber "simply placed" is far more effective than an ornate design in stone. But in a large garden a stone bridge may not be out of place, especially if it is to support much traffic. In any case, it must be designed to be in keeping with the garden scene.

So the valleyed garden leads our thoughts into many details, bringing a host of requirements in its train. A mass of detail has always to be arranged even if the plan be ever so simple in effect. It may be thought, however, from these notes that the valley garden must inevitably be confined to the larger gardens where plenty of space is available. It is not so, although ample space means the attainment of finer effects. Why, even the most moderate garden could have its shaded dell for ferns and wood lilies. A rock-girt valley, with the sides adorned with campanulas, aubrietias, alyssums, lithospermums, saxifrages, and many other trailing rock plants, can be made even on a small scale. There is a great charm about some of these small rock valleys during spring and summer-time, when the display of blossom is profuse, and even during the dull days of winter there is more life and beauty in the little rock valley than in any other part of the garden.

It may be that the valley, with its diverse scenery, its sheltering influence, its warm nooks, where the spring flowers blossom first and the autumn flowers stay the latest, will become a more influential feature in our English gardens in the coming days.

P. S. Hayward.

SOPHORA VICIIFOLIA.

Although this shrub has only been in cultivation for a dozen years or so, it has been in the country quite long enough to prove that it will occupy a foremost place in the ranks of ornamental shrubs, while there can be no doubt as to its hardiness. A native of China, it grows into a medium-sized bush five or six feet high in the open ground, and several feet taller when planted against a wall. The branches are armed with short sharp spines, which appear here and there from the nodes. The pinnate leaves are one and a-half to two inches long, and they are made up of from eleven to fifteen oval leaflets. During June the flowers appear in profusion in axillary racemes. They are white, slightly shaded with violet, the calyx also being violet in colour. It is not a difficult shrub to grow, for, once established in loamy soil, it gives less trouble than a broom. As is the case with several other members of the same order however, it is rather difficult to establish, except it be placed in a permanent position when quite small. Seeds ripen freely, and form a ready means of increase. It may also be increased by means of cuttings of half-ripe wood taken in July, and inserted in pots of sandy soil in a close frame. Plants grown from cuttings blossom earlier than seedlings, and it is not an uncommon thing to find tiny plants a year or two old blooming freely. Anyone who is desirous of obtaining a choice June-flowering shrub for a lawn specimen might well choose this.

W. Dallimore.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM ARDENTISSIMUM QUEEN MARY.

This distinct form of a now very popular hybrid has large rounded flowers with a white ground and bright purplish-violet blotches. F.C.C., R.H.S., July 4. Messrs. Sander and Sons, St. Albans.

CATTLEYA MOSSIÆ ALBA QUEEN MARY.

An extremely beautiful and chaste variety; the sepals and petals are of purest whiteness, and the lip is white, faintly tinged with pink and with soft yellow centre. A.M., R.H.S., July 4. Messrs. Mansell and Hatcher, Rawdon, Leeds.

LÆLIO-CATTLEYA SYLVIA.

A handsome and showy hybrid derived from L.-c. Ascania crossed with L.-c. Hippolyta Phœbe. The shapely medium-sized flowers have rich yellow sepals and petals, shaded with rose-red, and a yellow lip with a large central area of brilliant crimson. F.C.C., R.H.S., July 4. Messrs. Charlesworth and Co., Haywards Heath.

ODONTOGLOSSUM AMABILE THE QUEEN.

In this shapely flower the ground colour is pure white, and on each sepal and petal is a central bright purple marking. A.M., R.H.S., July 4. Messrs. Sander and Sons.

ODONTIODA BRADSHAWIÆ SANDER'S VAR.

Another grandly coloured hybrid with flowers of good size and splendid shape. The general colour is orange-scarlet, but this is margined with rosy mauve. A.M., R.H.S., July 4. Messrs. Sander and Sons, St. Albans.

ODONTOGLOSSUM OLYMPIA.

This fine odontoglossum is a hybrid of unknown parentage. In shape and size it stands in the front rank; it has a white ground with heavy blotches and bars of reddish brown, and the colouring rivals that of a fine blotched O. crispum. A.M., R.H.S., July 4. Messrs. Charlesworth and Co., Haywards Heath.

ODONTOGLOSSUM EXIMIUM KING GEORGE.

This is a striking variety of the hybrid between O. ardentissimum and O. crispum. The intense claret-purple colouring covers the greater part of each segment, but is set off by a narrow white margin. A sturdy grower and with a handsome spike. F.C.C., R.H.S., July 4. Messrs. Sander and Sons.

CATTLEYA DUPREANA.

C. Warscewiczi and C. Warneri are the parents of this hybrid, and the latter species has shown a marked influence upon the progeny. C. Dupreana has flowers of the finest size and shape. The ample sepals and petals are lovely rosy purple, and the beautiful lip is crimson with whitish side lobes. A.M., R.H.S., July 4. Messrs. Charlesworth and Co., Haywards Heath.

PELARGONIUM LORD BUTE.

A decorative variety with medium-sized flowers of deep rich maroon shade, edged with rose. The plants are vigorous, free blooming, and carry the flowers in good trusses. A.M., R.H.S., July 4. Mr. W. Treseder, Cardiff.

SWEET PEA LADY KNOX.

A strong-growing variety, cream ground with rose flushing. A very pretty form. A.M., R.H.S., July 4. Messrs. Dobbie and Co., Edinburgh.

GLADIOLUS NANUS QUEEN MARY.

An early-flowering variety with elegant spikes of soft salmon-coloured flowers, with creamy blotches on the lower segments. A.M., R.H.S., July 4. Messrs. Barr and Sons, Covent Garden.

DRACÆNA DEREMENSIS WARNECKI.

An interesting as well as beautiful dracæna and one that promises to be very useful. The elegant leaves are a foot or so in length, and two or three inches wide. The colour is deep green along the margin, then comes a line of creamy white, and then the paler green central area of the leaf. A.M., R.H.S., July 4. Messrs. James Veitch and Sons, Chelsea.

STRAWBERRY OLYMPIA.

A late heavy-cropping strawberry derived from a cross between Givon's Late Prolific and St. Antoine de Padoue. The roundish fruits are of good size, bright red, and of fine flavour. A.M., R.H.S., July 4. Mr. Peters, Givon's Grove, Leatherhead.

ROSES.

Leslie Holland.—This deep glowing crimson H.T. variety has already been well shown this year, and it promises to be a first-class exhibition variety. The petals are broad and substantial, making up a bold flower. A.M., R.H.S., July 4. Mr. Hugh Dickson, Belfast.

Frances Charteris Seton. — A lovely new H.T. rose with pointed buds and shapely flowers that have slightly reflexing petals. The colour is rosy-cerise with purple shading. (See illustration on p. 495, July 8.) A.M., R.H.S., July 4. Messrs. Wm. Paul and Son, Waltham Cross.

Mrs. Charles E. Allan. — A charming rose of a pretty apricot-yellow shade. A.M., R.H.S., July 4. Mr. Hugh Dickson, Belfast.

Mrs. Sam Ross.—A hybrid tea rose of buff colour with a basal flaming of deep gold, and a pretty flesh pink flush over the centre. A wonderful colour combination. Gold Medal. N.R.S., July 7. Mr. Hugh Dickson, Belfast.

Mrs. R. Draper.—A very sweetly fragrant H.T. rose of large size and full form. The pale pink of the inner surface of the petals harmonises with the darker carmine pink shade on the exterior. Gold Medal, N.R.S., July 7. Mr. Hugh Dickson, Belfast.

Danae.—A perpetual-flowering cluster rose with yellow flowers, blooming from June to October. In the bud state the colour is quite deep yellow, but the fully-opened flowers are creamy white. Of vigorous habit. Silver-gilt medal, N.R.S., July 7. Rev. J. H. Pemberton, Havering, Essex.

Souv. de Portland, Oregon. — This is a pretty H.T. rose with moderate-sized prettily-shaped blooms, and slightly reflexed petals. It is a fragrant variety, and of fairly vigorous growth. Silver-gilt Medal, N.R.S., July 7. Mr. Hugh Dickson, Belfast.

Ethel.—A Wichuraiana variety with semi-double flowers of medium size, and of a lovely soft pink shade. The blooms are carried in large clusters, and are most effective. Card of Commendation, N.R.S., July 7. Mr. Chas. Turner, Slough.

Mrs. Muir Mackean.—A fine hybrid tea of brilliant rosy crimson shade; the flowers are of fair size, and excellent shape, broad petalled, and fragrant. Card of Commendation, N.R.S., July 7. Messrs. S. McGredy and Sons, Portadown.

Nancy Williams.—A very large flowered broad-petalled H.T. rose of full size and form, and making a deep bloom. The colour is deep flesh-pink, approaching the shade of Mdme. Abel Chatenay. Card of Commendation, N.R.S., July 7. Messrs. S. McGredy and Sons, Portadown.

British Queen.—A hybrid tea rose of purest whiteness; the blooms are of large size, fragrant, deep, and broad-petalled. Appears to be a vigorous grower. Card of Commendation, N.R.S., July 7. Messrs. S. McGredy and Sons, Portadown.

Sunburst.—A very showy H.T. rose of deep nankeen yellow shade, with long buds and broad petals. It is sweetly scented, and of vigorous habit. Card of Commendation, N.R.S., July 7. Messrs. G. Beckwith and Son, Hoddesdon.

Coronation. — A large full H.P. rose of silvery-pink shade; it has an excellent habit, and is of bold appearance; slightly fragrant. Card of Commendation, N.R.S., July 7. Mr. Hugh Dickson, Belfast.

THE USES OF LIME.

> "A reserve store of lime is as indispensable an adjunct to a well-managed garden as the manure heap."—Anon.

A very small minority of gardeners, probably, regard lime as a thing to be kept in stock, and never allowed to run out, but its uses are so important, and so various, that the need of it in most gardens is second only to that of stable or farmyard manure. A little book might well be written upon it, but all that can be done in the limited space at disposal is a general survey of the useful purposes it serves.

Its first and most important use is as a manure, it being one of the four most important plant foods in the soil. Heavy soils need it more than light ones, but there are few old garden soils—except those with a chalky subsoil, which is constantly being turned up to replace the loss of lime from the top soil—which, as a result of the application of animal manures for many years, do not tend to become poor in lime, at least in the top spit, lime being constantly lost by drainage, and removal by the crops, while organic manures do but little to make good the loss. Any gardener can readily test the condition of his soil in this respect by mixing together a dozen samples of the surface soil, putting a little of the mixture into a tumbler, and pouring on it enough hydrochloric acid to cover it. If the mixture effervesces freely the soil needs no lime, but if it is quite inactive, or only bubbles very feebly, lime is necessary.

The best way in which to apply lime is in the air-slaked lime form, at the rate of 10 to 20 lb. to 40 square yards (10 to 20 cwt. per acre), and the best time to apply it is in the autumn and winter, dusting it in the trench as digging proceeds. There are some plants to which lime is poison, notably the heath family, which includes rhododendrons and azaleas, while there are others to which an abundant supply is a necessity for the best results, as, for instance, gypsophila, the very name of which means lime lover. Humble plants like wallflowers, antirrhinums, and stocks are never at their best unless a sufficiency of lime is present in the soil, while to stone fruit trees nothing is a greater necessity. But the application of lime must not be overdone, or the soil will soon be impoverished.

We must next consider lime, not simply as a manure, but as a soil corrective. The action of lime in the soil may be likened to the humour of Falstaff, who, Shakespeare tells us, was not only witty in himself, but the cause of wit in other men. Similarly, lime is not only a manure, but its application to the soil serves to unlock the stores of plant food already existing there, but in a form in which plants cannot avail themselves of it. Reserves of potash in the soil are unlocked and set free, while the decay of organic matter is hastened, and nitrogen liberated ready for the plants' use. Besides this, soils which have been manured for years with animal manures tend to become sour, even sometimes when they are overlying chalk; and in a soil which is sour some of the most important kinds of germs, such as those concerned in the decay of organic matter —manures and the residues of crops—the breaking down of the humus, and the conversion of ammonia into nitrate, are hindered, or even stopped altogether in their work, as in the case of peat, and plants suffer in consequence from lack of available plant food, apart from the fact that they soon become unhealthy when growing in such a medium.

As a destroyer of pests, too, a supply of lime, always ready to hand, is scarcely less valuable, and it is the damp and heavy soils, for which lime is so especially necessary as a manure, that also suffer from those pests for which lime is such an antidote. Slugs, for instance, though not always, or even generally, killed by the first sprinkling, do not survive a second dose if it follows within a few minutes of the first. Thus, when a piece of slug-infested ground is cleared of carrots, turnips, violas, radishes, etc., in the dampness of the autumn, two dustings of lime over the ground, with an interval of five or ten minutes between them before the ground is dug, will fairly clear it of slugs if the application is made in the early morning when the slugs are all out, and will, at the same time, supply a constituent to the soil in which it is probably deficient.

Richly-manured ground, too, often becomes infested with grubs and soil pests of various sorts, such as turnip flea, clubbing and galling in the cabbage tribe, and the like, and a thorough mixing of lime with the soil will do more to alleviate this state of things than anything else. Among the other uses of this nature for which lime is valuable might be mentioned the limewashing of trees and the dusting of trees in damp weather with freshly-slaked lime to clean the stems and branches, and, incidentally, deter the birds from pecking the buds. It will also help to destroy moss on the lawn by its scorching effect and by drying and sweetening the soil.

A few general remarks must conclude these notes. As lime may injure the roots of growing plants it should not be used as a manure in the spring and summer. It should not be applied in lumps, not only because it is wasteful, but because where lumps go they may destroy the germ life of the soil. Where superphosphate of lime —a very acid manure is used on well-manured ground, it is a good plan to mix it with a quarter to a half its weight of lime, its acidity being thereby neutralised and the superphosphate producing a better effect. It has, in fact, in the operation of mixing, become basic superphosphate, combining the advantages of basic slag and superphosphate—solubility without acidity. Where lime cannot easily be obtained chalk will answer the same purpose as a manure, though less quickly. It should be applied at two or three times the rate of lime, say, one to two pounds to the square yard, and should be broken up as small as possible and well mixed with the soil. If left on the surface during the winter the weather will reduce it to a powdery state.

Gas lime may also be used, but with great care, as the fertility of a soil may be destroyed for a year by its indiscriminate use, as it contains such strong and poisonous compounds of sulphur. Another effect of lime which should be mentioned is its power to lighten clay soils by coagulating, or rendering friable, the clayey content which gives it its tenacious character. Basic slag deserves more than a passing mention when dealing with this subject, as a good sample should contain some 15 per cent. of free lime, besides the phosphate of lime of varying percentage according to the grade. It is therefore the best manure that can be applied to soils which have become black by reason of many years of animal manuring, and as it is so cheap—less than 5s. a cwt.—and can be stored indefinitely in the dry without deterioration, no gardener with anything but a sandy or chalky soil should be without it.

These remarks may fitly close with an old adage as a warning note:

"Lime without manure
Makes both garden and gardener poor."

Alger Petts.

PEACH TREES ON OPEN WALLS.

In former years both peaches and nectarines were well grown on the open walls in many districts, but now, even with all the up-to-date improvements, well-trained healthy peach trees are the exception rather than the rule. How is this? Have gardeners become less competent, or is there some agency at work that militates against the well-being of the trees? It is well to look into this matter closely, and see whether it is possible to find the cause of this seeming degeneration. I was walking round a garden a short time ago where at one time the peach trees were a picture of health, and their well-trained shoots and fine crops were a pleasure to behold. Now they are objects of misery and decay. It cannot be that the climate has changed, for the winters are no more severe than of old; it must therefore be the system of culture that has worked this difference in their health.

Why do we plant peaches and nectarines against south and south-west walls? Simply because they are tender fruits, and require the protection of these structures. Some of the walls in the old gardens were heated with flues to generate a little warmth in the early part of the year; the shoots were nailed close to them, so that they might benefit by this extra warmth. Now it would appear that instead of nailing the shoots close to the walls they are trained to wires, so that a cold current of air passes between the shoots and the wall. I have asked many gardeners what advantage there is in wiring walls, but none, so far, have been able to give me a satisfactory answer. Some will tell us that it saves time and trouble in nailing; others say that it looks neater, and so forth, but none have, so far as I recollect, been able to point out the advantages the tree derives from a wall being wired.

Has anyone ever seen a well-trained healthy peach tree on a wall in the open that is growing against a wire trellis? For my part I cannot call to mind one single tree in any garden that I have visited, and this has caused me to come to the conclusion that it is the cold current of air passing at the back of the shoots that, in a large measure, is the cause of failure.

The cold current counteracts the advantages and benefits that the trees would otherwise derive from the action of the sun upon the walls. If you place your hand on an exposed brick wall in the evening after a bright sunny day you will find that it retains the heat a long time after the sun has disappeared below the horizon, thus showing that trees trained close to its surface are benefited by this extra warmth.

I was much interested a while ago in the peach trees at Wych Cross Gardens, in Sussex, and anyone who is desirous of seeing well-trained highly cultivated, flourishing peach trees would do well to pay a visit to this place. Though the elevation is something like six hundred feet above the sea level, and the site is exposed to the elements, and though the soil is a cold hungry clay, here peach trees, under the skilful management of that able gardener Mr. Field, are luxuriating in a marvellous way, bearing full crops of fruit even in the worst of seasons. Here the walls are not wired; each shoot is secured in position by a nail and shred, the old cast nails being used, as these, if broken off, do not injure the wall. One wall, about one hundred yards long, is covered with some of the best trained and most fruitful trees it would be possible to find. Not far from this garden is one where the walls are wired, and though the trees are but young they are a picture of misery, not a fruit on them.

While writing about peaches let me add that disbudding is an all-important operation, and it is by selecting the most suitable young shoots that an evenly balanced tree is produced. No man, let him take as great an interest in training as he will, can make a tree look perfect if the shoots are in the wrong place. Select all shoots that are to be retained growing from the lower branches on the upper side, while those that are trained at an angle of 45 degrees should be taken from the lower side. This will cause them to grow more evenly, the more upright ones being less vigorous, while the lower ones will be more robust. Very little winter pruning will be needed on a well-cared-for tree, as all superfluous shoots will have been removed in the summer. The syringe should be frequently applied during the summer evenings to keep the foliage clean. If protection is given in spring against cold winds and frosts, the supplies of water ample in dry weather, and proper drainage provided for the borders, then peaches of the finest quality may be gathered in abundance.

H. C. Prinsep.

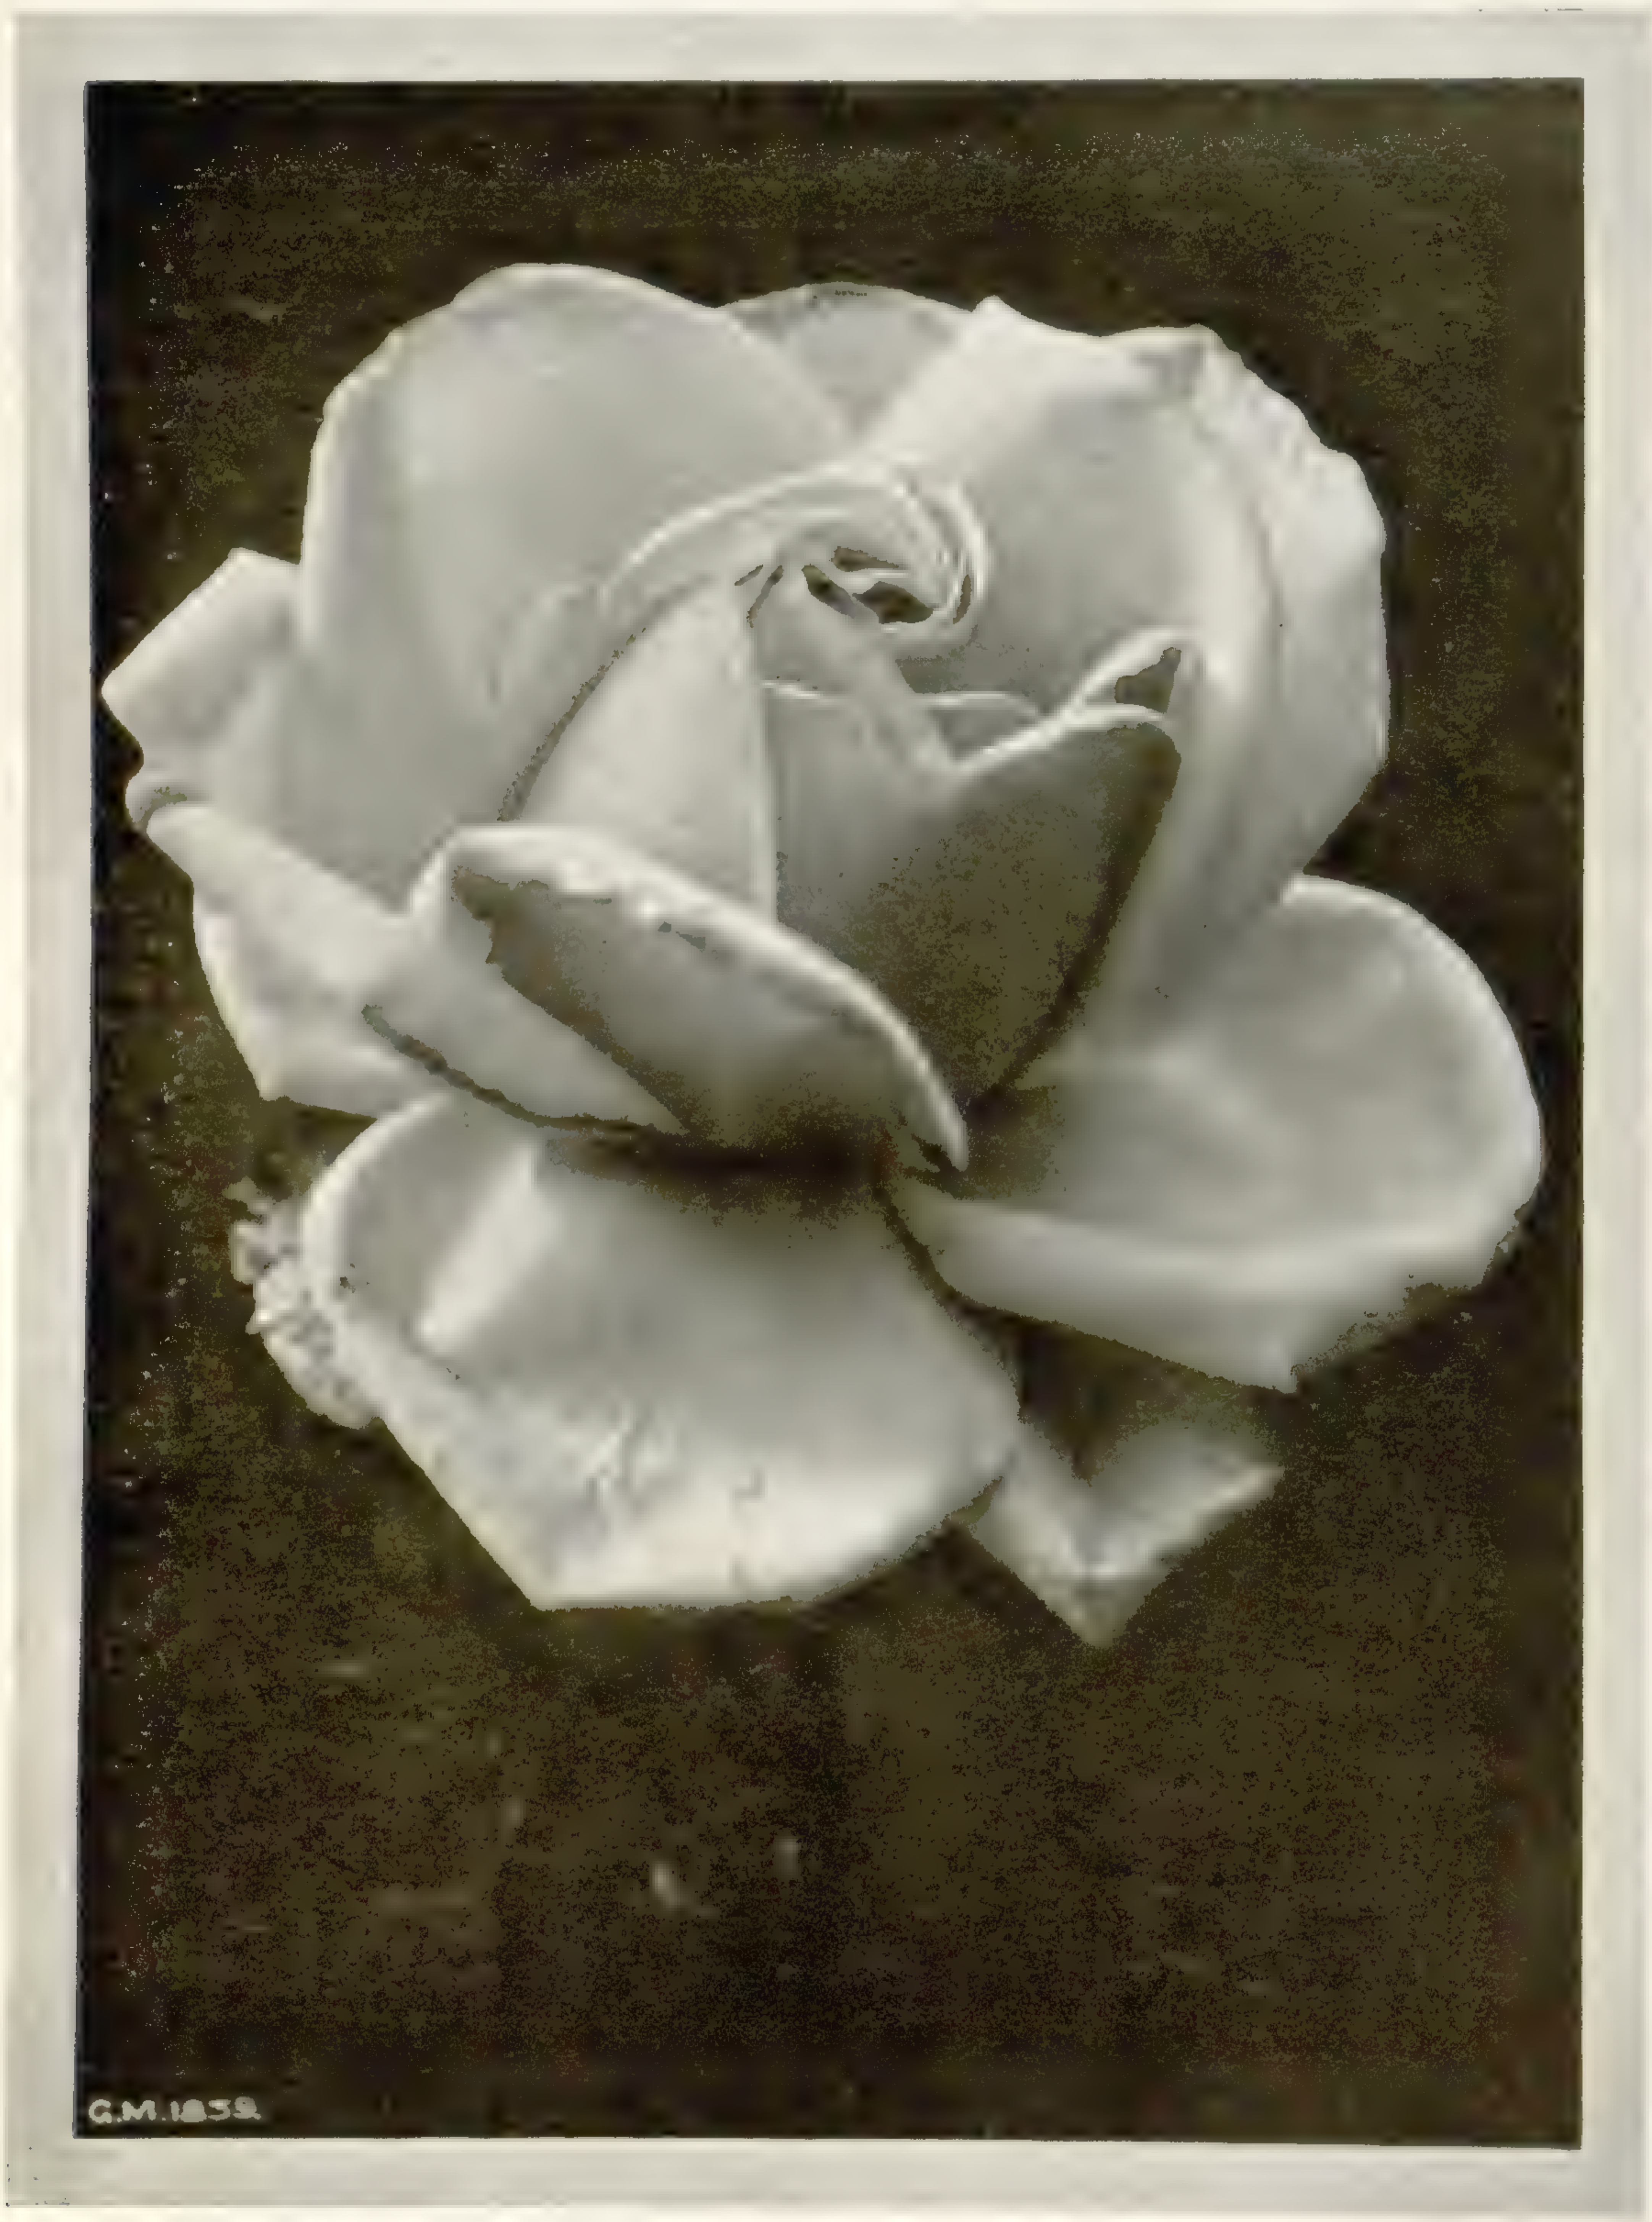
AFFORESTATION IN SCOTLAND.

A great and notable advance towards practical action for the afforestation of Scotland is made by Lord Lovat and Captain Stirling, of Keir, in the survey which they prepared for the Royal Scottish Arboricultural Society. What Lord Lovat and Captain Stirling have done is to prepare a scheme by which afforestation may proceed and the present value of the land not be seriously diminished, while ultimately, of course, it would be greatly increased. They have worked out the plan on a typical area on the line of the Caledonian Canal. They bring out very clearly the importance of the low ground for wintering sheep or deer, and they show that it would destroy the value of a sheep farm or deer forest to take all the low ground and plant it all at once. What they propose is a gradual process of planting, so that at no single moment would the grazing or sporting value of the land be seriously diminished.

Some may be inclined to think that the authors of the survey have been unduly solicitous for sporting interests, but it has to be recognised that, as things stand, the sporting value of the land is its greatest value, and, therefore, cannot be lightly pushed aside. Then, again, the authors show how intimately afforestation is bound up with the question of small holdings. Forest work would provide the part-time employment which would help a small holder to supplement his income and make a comfortable living. It is just because of the lack of such outside work that there is so little prospect for a small holder in the poorer parts of Scotland. In the survey now issued this aspect of the subject is fully dealt with, and for the first time we have a definite estimate of the amount of labour that would be required on a particular area, and of the means which a Government Forest Authority might take, on a commercial basis, to provide crofts and houses for these crofter-labourers. The great value of the survey lies in the fact that in this, as in other details, the authors have not indulged in mere generalities, but have given actual figures, and thus furnished tangible material upon which we may proceed to the practical consideration of the subject. No doubt their estimates will be subjected to criticism, but the important thing is that they are there, and that at last we have something to focus discussion upon.

With regard to the conditions upon which afforestation is to be carried on, Lord Lovat and Captain Stirling recommend that the Forest Authority should not purchase, but should lease, the land which it is going to plant. This course is much cheaper, as it does not involve the sinking of so much capital at the outset. Of course, there will be some who may think that many of the objections which apply to ordinary tenancies or dual ownership in agricultural land apply to this dual system of forestry. Apparently the State, which is in this case the tenant, is to embark capital in afforesting the land, and by so doing is to enormously improve the value of the land, and of the countryside generally. Yet this improvement, like a farmer's improvements before the passing of the Agricultural Compensation Acts, is to be allowed to pass to the landowner, like so much unearned increment. The point is one that will no doubt be kept in view when the powers that be come to close quarters with it, but meantime the Royal Scottish Arboricultural Society have to be heartily congratulated, and particularly Lord Lovat and Captain Stirling, upon the accomplishment of a survey that reflects the greatest credit on all concerned.

W. K.



H.T. ROSE MRS. R. DRAPER.
Flowers rich pink. Gold Medal, National Rose Society, July 7. Mr. Hugh Dickson.

OLEARIA HAASTI.

This is a grand flowering shrub for sandy soils and town gardens. In the southern counties the plants begin to flower during the latter part of July, and continue to blossom for about six weeks. During the past thirty years I have had some considerable experience in the planting of trees and shrubs near the sea in various parts of the country, and have never seen a better flowering shrub for growing in an exposed position where the soil is mainly sand, or very light loam.

In one case the plants formed a very effective dividing fence; they required very little pruning, being so very compact in habit, and withstood the strong gales without suffering any noticeable damage. Few plants possess more fibrous roots than these, and, consequently, when lifted and replanted in the right season, but few specimens fail to grow satisfactorily afterwards if they receive ordinarily good treatment.

For the filling of small borders in town gardens the Olearia Haasti, with its profusion of white flowers, is a most suitable shrub. Cuttings of young shoots, inserted in sandy soil under a handlight soon form roots, and make nice specimens.

G. B.

Mr. William Deal, F.R.H.S., "Brooklands," Kelvedon, Essex, gives a cordial invitation to all interested in sweet peas to inspect his crops growing for seed. He has about 12 miles growing on sticks, stocks equal to any in the country. Crops are about half-a-mile from Kelvedon station.—[Advt.]

AMONG THE ALPINE FLOWERS.

Blithe summer with all its joys is with us, though for the time happily at least, the drought and great heat which prevailed have passed away, to the pleasure of many of our alpine flowers. They have left indelible traces upon some few plants which could not be fully attended to in the pressure of other affairs, but, on the whole, we have little reason to sorrow for losses, while in many ways the glowing time was a welcome one. But with the change to cooler skies, and with the effects of the welcome rainfall visible, we cannot but appreciate some of the beauties displayed to us by our flowers. Many there are, and we take high pleasure in them and their ways.

Cytisus Schipkaensis.

Happily trailing over a low piece of rockwork is the pretty Cytisus Schipkaensis, which to those who followed with keen intensity the long-past grim struggle in the Schipka Pass during the Russo-Turkish War, always conveys a feeling of surprise and pleasure that the fateful ravine has given us this thing of beauty instead of some forbidding plant. Like the rose of the song which sprang from the breast of the beloved dead, so to us this little broom brings with it only thoughts of the heroes on either side who lost their lives in that dread conflict. The cytisus is in itself a thing of beauty which gives us lasting pleasure by its pleasing trailing branches clothed with pleasant foliage and with its clusters of white flowers freely borne at the extremities of these branches. My plant has been in position for some six years or so, and, though some assert that it is not hardy, yet it is enduring here in open soil, among stones, facing due south, and fully exposed.

Gypsophila repens rosea.

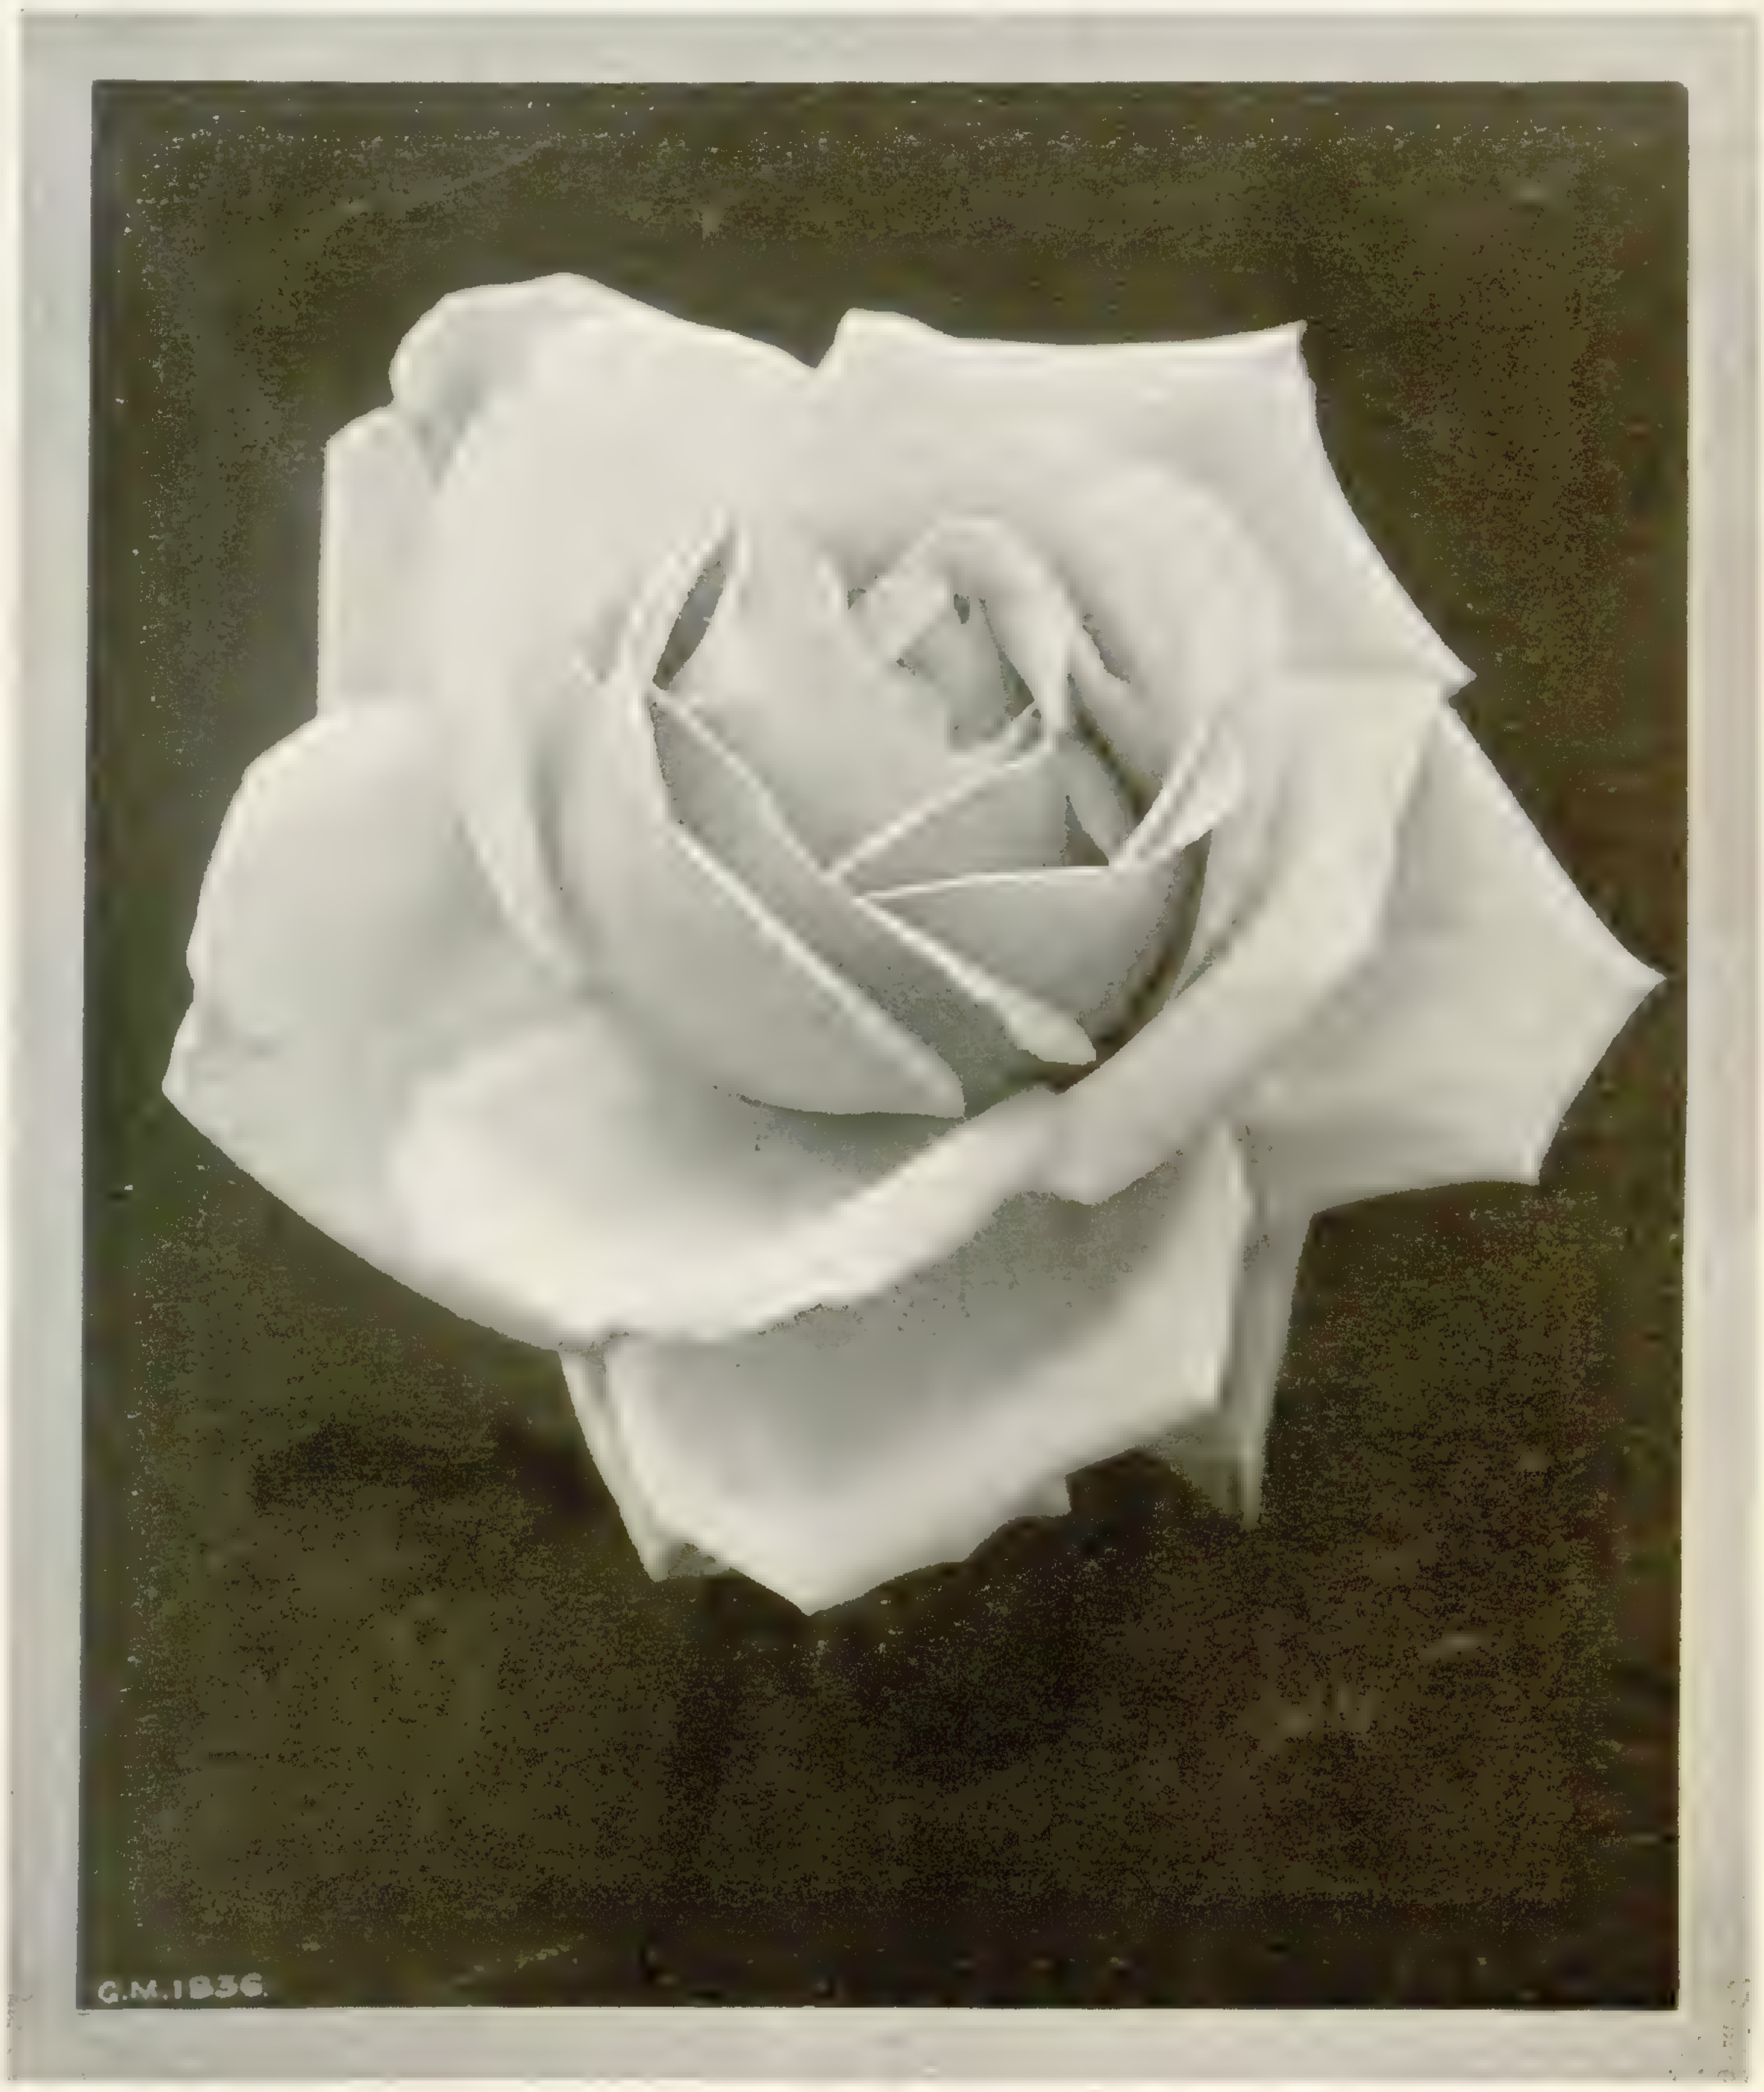
A lovely little thing is the rose-coloured variety of Gypsophila repens, which in summer clothes the portion of the rock garden in which it grows with neat leaves and crowds of lace-like flowers. It has even more than the refinement of inflorescence possessed by the popular G. paniculata, while for the alpinist it has the virtue of a dwarf, pendant, or prostrate habit, such as makes it more suitable for his wants. It is impossible to study it without keenly appreciating the loveliness of this denizen of the rockery, while even the casual passer by is inspired with admiration for this beauty. The white form is pretty, but that with rose-coloured flowers is exquisite, the contrast yet harmony between the glaucous leaves and the small rosy flowers being undeniably beautiful in the extreme. This is not a difficult plant to grow in the rock garden or over the stone edging of a border. It delights in sun, although not averse to partial shade, while it prefers lime or similar matter, although not resenting its absence. For covering some low stones or rock it is a plant of the first order. Free soil with plenty of grit about it will suit G. repens rosea well.

Hypericum coris.

One does not so often hear about this St. John's Wort as at one time, but it deserves recognition at our hands as much now as when it was more frequently seen. It is not a novelty now, and such species as Hypericums fragile and reptans have been more sought after, but H. coris is so distinct from either of these in the possession of a more erect habit and the small bright yellow flowers on its neat stems clad with narrow leaves, that we may well include it among the first half-dozen of the dwarf hypericums. It at one time bore a reputation for partial tenderness, but I do not think that this is justified, as I have seen it growing happily in a good many gardens under widely differing climatic conditions. It is an accommodating plant, liking, perhaps, a level spot in the rock garden, and giving there a greater abundance of its golden yellow flowers in summer. Any moderatedly light, well-drained soil will suit H. coris well. Nor does it appeal the less to us, but rather the more, because it is a member of a genus of plants to which much mystical power was accorded. Our little subject is not likely to be the precise St. John's Wort referred to in the following lines, but it is a sister flower, and as we think of it so may we recall the legends and superstitious practices of which the hypericum was the centre. On St. John's Eve the following rite was performed by the maiden of Lower Saxony:—

> "The young maid stole through the cottage door,
> And blushed as she sought the plant of power;
> Thou silver glow-worm, O, lend me thy light!
> I must gather the mystic St. John's wort to-night,
> The wonderful herb, whose leaf will decide
> If the coming year will make me a bride."

Smile as we may at such superstitions and practices, we cannot deny that even the little Hypericum coris with its modest beauty is all the more interesting because it belongs to the race which has such a powerful influence for good against the evil powers so feared in the olden times.



NEW H.T. ROSE MRS. S. ROSS.
Flowers rich cream colour tinted rose. Gold Medal, National Rose Society, July 7.
Mr. H. Dickson.

Dianthus petræus plenus.

It is many years since the writer first made acquaintance with a lovely little double white Pink, which was a gem of the first water for the rockery, although it is not everyone who cares for double flowers in the alpine garden. This flower was the double form of the white variety of Dianthus petræus, a lovely little alpine pink, not yet too much cultivated. This double white variety must have been in cultivation for many years, but it is now scarce, and it was with peculiar pleasure that I came across it the other day, and once again added it to my garden, whence it was lost years ago. I recollect that it was rather a favourite with our late departed friend, the Rev. Charles Wolley Dod, of Edge, Malpas, and he probably kept it in his garden after many others had neglected it. The growth is rather trailing, attains only a few inches high, and gives little pretty white fringed flowers on small grassy foliage. It is propagated by cuttings, but with reasonable care will last for years without renewal. It is to be hoped that this little alpine pink will once more be sought after and cultivated. We can hardly have too many of such charming flowers as the alpine dianthuses, of which this forms such an attractive member. Amid the many alpine flowers which come in June and last through July we have few finer in their own quiet way than Dianthus petræus plenus.

S. Arnott.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

DECIDUOUS CALANTHES.—Plants that were treated as advised in a previous note on calanthes will now have their growths advanced to the stage when the new pseudobulbs commence to form. It is at this stage that particular care is needed. I would point out the necessity of preventing any moisture accumulating in the centre of the developing growths; drip from the roof, careless watering or syringing of the leaves, will naturally convey moisture to the base of growth, where there is no possibility of evaporation, and where it will become stagnant and quickly subject the young growth to injury. This is especially the case where the growths are sappy as a result of heavy shading. Where moisture is observed in the centre of the growths, it is a good plan to lay the plants on their sides, so that the growths may hang at a proper angle to permit the moisture to drain away.

WATERING.—Calanthes having practically filled their pots with roots, they require much sustenance, and care must be observed that they are not permitted to remain in a dry condition at the roots for any lengthened period. It is difficult to lay down any hard and fast rules for watering, as such are liable to be misleading. Owing to the vastly different conditions under which the plants have to be grown, there is need for discretion; one can scarcely look for such rapid evaporation of moisture in the more or less smoke-laden atmosphere of manufacturing districts and the immediate neighbourhood of large towns as we find under brighter surroundings and a pure atmosphere. With bright and drying conditions, and the plants practically root-bound, they may require water daily or even twice in the day. With duller surroundings much less root moisture will be needed, and it should only be given when the plants require it.

INJURY TO FOLIAGE.—In the early stages of growth and up to the stage now under notice, the foliage of calanthes is particularly subject to injury from strong light. From now up to the time when the pseudo-bulbs reach maturity the light should be gradually increased; this will not only harden the foliage, but will also assist the ripening of the pseudo-bulbs as they advance. One frequently sees large sappy pseudo-bulbs producing flowers of inferior quality. It is better to risk the ripening and falling off of the leaves than to protect and retain the foliage at the cost of inferior colour and texture in the flowers.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

MALMAISON CARNATIONS.—Layering must now be taken in hand, commencing with those which have stood outside, and continuing with others as they go out of bloom. Before layering, each plant must have a most careful examination for any signs of rust or disease, as it is most essential to the well-being of the young stock that the parent plant is absolutely clean and healthy. Allow about six or eight shoots to a plant, and do not overcrowd in the frame. After layering, the whole should be well watered. A little ventilation may be left on from the commencement and increased as the plants make roots. Syringe in the morning and evening, and shade during the hottest part of the day. When the layers have become nicely rooted they may be severed from the old plant

HERBACEOUS CALCEOLARIAS.—When sowing the seeds of these most useful greenhouse plants, rather more than ordinary care is necessary to obtain the best results. Prepare a seed-pan by well draining it, and fill with a mixture of loam and leaf-soil in equal proportions with a good supply of sand. Make moderately firm, and leave the surface rather fine. Well water with a fine-rosed can until the whole is moistened through. Leave the pan to drain for an hour or so, after which the seeds may be sown as evenly as possible, and not thickly. The merest sprinkling of fine soil is sufficient for a covering, as the seed is so very small and apt to be buried, which causes uneven germination. When sown, place a sheet of glass over the pan, which should again be covered with brown paper to prevent evaporation. Remove to a moist, shady corner in a cold frame. It is a good plan to place the pan on an inverted pot standing in water, as this will prevent slugs getting at the seedlings. As soon as germination takes place, remove the coverings, and admit air cautiously to harden the seedlings and enable them to bear the light, but they must be shaded from sunshine. Very great care in watering is necessary at this stage of growth.

GENERAL WORK. — Early-flowering climbers will require pruning to enable them to make new growths, which will ripen up before the winter season. Attend to potting and repotting of plants as soon as they become ready, also to staking and tying of such plants as may require it. Ventilate freely on all possible occasions in all houses which contain plants in full flower.—A. GRUBB, Porters' Park Gardens.

HARDY FRUITS.

APPLES FOR DESSERT.—The smaller varieties of apples include many of the best-flavoured ones, and to get them large enough to be presentable for the table a severe thinning should be carried out, it being now possible to tell which are likely to make good specimens. Margil, Lord Hindlip, Cockle's Pippin, and Braddick's Nonpareil are of excellent flavour in their season, but, excepting under the most favourable condition, they fail to grow to perfection. All malformed and the smaller fruits, where the trees are cropping heavily, may be removed, remembering that the trees will give almost the same weight in fruit, although perhaps half the number be cleared from the tree.

KITCHEN APPLES.—Many of the large cooking apples will, if thinned, be ready for use for sauce and tarts, and would in some cases also find a ready sale if sent to the market. In small gardens where but little room can be given to apple culture, early varieties could be easily dispensed with, as many of the long-keeping varieties will cook equally well, and in most instances both crops and trees would benefit by judicious thinning. If apples are required for exhibition purposes, thinning can be carried on gradually until within a fortnight or so of the finishing of the fruit, when but a few dozen specimens are left on the trees. The present is the most critical time for exhibition apples.

STRAWBERRIES.—The beds may now be cleared of all litter, hoeing off at the same time old plantations that are past their best, cutting away a few of the old and rusty leaves from the plants to be retained for next season's fruiting, thereby letting air and light to the crown of the plants. Beds may now be prepared for new plantations, and whatever the soil may be, whether light or heavy, it should have been broken up deeply during the winter in order to obtain the best results; in short, a deep well-tilled soil is not subject to extremes of temperature or moisture, but is maintained in a steady, regular, healthy condition. Where deep culture is systematically carried out, and strawberries come into a regular system of rotation, then, of course, little stress need be laid on the ground preparation, as highly cultivated ground is always in good condition. Room should, if possible, be found on a very warm border for a few early strawberries, preferably near a wall or greenhouse, as here ripe fruit may usually be found a fortnight in advance of that on the main beds; but to obtain such fruits young strong plants should be planted each season, and these may be placed a foot or fifteen inches apart.

WASPS AND OTHER INSECTS.—Wasps' nests should be sought after diligently and destroyed. In this locality they are already very numerous. On bright days they may be located by standing quietly facing a dark background, when the flight of the wasps may be traced to their nests. About half a pint of tar poured in their holes after dark and the nest dug out and burnt on the following day will be the surest way of avoiding annoyance later. Earwigs and woodlice should be trapped on peach walls by small pots filled with moss broad bean stalks, or the like, tucked among the branches; examine the traps on alternate days and destroy the vermin.—J. WHITTLE, Cheveney Gardens.

THE KITCHEN GARDEN.

CELERY.—The later plants will by this be ready for planting out into trenches. Use care in removing them by safeguarding their roots and securing a good ball of earth to each plant. The work is much assisted by giving a thorough soaking of water previous to disturbing them. Should the weather be hot and dry, pay strict attention to watering, and give a light shade until root action has commenced in the new soil. All crops of celery will be subject to attack from the celery maggot from now, consequently they will require frequent examination. Carefully remove the affected parts and give dustings of soot to the foliage when moist; this, if not actually destroying the pest, will greatly improve matters by assisting the plants to grow out of the attack. Liberal waterings should be given.

LATE BROCCOLIS.—These should now be planted out in their permanent bed, thus allowing them to become established before winter. Soft-grown pants rarely stand the winter satisfactorily, especially should i prove severe in wind and frost. Therefor it is an advantage to plant firmly and no too thickly, giving sufficient space to allo sun and light to reach the stems and foliag to ensure hard growth. Do not plant them in rich soil.

COLEWORTS AND COUVE TRONCHUDA.—Crops of these are invaluable f cutting during the autumn and early wint months. Where plants are in the seed be have them either pricked out in nursery be or planted out into open quarters. Groun at this season is mostly occupied with crop and there is yet time for planting fro nursery beds—if room is a consideration—for a month or so. Coleworts can be plante thickly at about one foot apart, but t tronchuda should be eighteen inches apar

ENDIVE.—Make a sowing of endive provide the early supply of this useful sal plant. It is not necessary for this sowin to occupy a south border, but an open quart of the garden will do, as the plants will gr to a large and profitable size before bei checked by extreme cold weather. Dr drills at fifteen inches apart and thin plants out when ready to at least twe inches in the row. The cut-leaved variety very decorative, and more suitable to at this season than later, being somew less hardy than the broad-leaved Batavian

TURNIPS. — If a substantial sowing turnips is made during the next week o to precede the winter crop, there wi time for the bulbs to develop and giv supply during the autumn and early wi Choose a rich soil, and give the surfa dressing of soot previous to drawing ou drills, which should be twelve inches a If the turnip fly shows itself give a dressing of soot, accompanied with a dusting of nitrate of soda. Dobbies' M Carter's Jersey Lily, and Snowball are varieties to sow for this crop.

COS LETTUCE. — From early Augus wards lettuces will grow slowly, which the need for a larger stock of plants on Make a good sowing now, prick out the plants as soon as ready into several to secure a supply over a long period CHARLES FLACK, Cholmondeley Castle dens.

EXHIBITIONS AND MEETINGS.

National Rose Society.

The National Rose Society's Metropolitan Exhibition was held in the Royal Botanic Gardens, Regent's Park, in brilliant weather, on July 7. A building that had been specially erected for a ball, with a raised boarded floor, and a soft canopy overhead, accommodated the vast majority of the exhibition blooms, and provided a rare feast of floral colour and fragrant beauty. All things considered, the flowers showed a high average of quality, and though there were few stands or flowers of extraordinary merit, everyone seemed surprised to see so many good blooms, the brilliance of the T. and H.T. roses causing much comment. The great heat of the day soon caused many flowers to collapse, and quite early in the afternoon blooms were withering badly. We may be wrong, but we fancy that rose competitors do not pay enough attention to the provision of a sufficiency of water in the tubes and stands.

The decorative exhibits were fairly good, and the table decorations rather better than usual. There was a rare crowd of visitors, and the gay summer frocks of the hosts of fair ladies who came to pay tribute to the Queen of Flowers added to the brilliance and effectiveness of this fashionable function. Once again the new roses were a great attraction, and the Floral Committee was liberal with awards. The arrangement of the show was good, and Mr. Mawley, and all who helped him, deserve congratulations.

There were a number of non-competitive displays, ranging from labels to orchids, but we have recently dealt at some length with similar exhibits, and practically the same exhibitors, in connection with the Olympia Show.

NURSERYMEN.

In the nurserymen's championship class the competition is always keen, and on this occasion there were six entrants for the trophy. Seventy-two roses, distinct, were required, and Mr. Hugh Dickson, Royal Nurseries, Belfast, was the winner. His best flowers were of Frau Karl Druschki, Coronation, Snowstorm, J. Bell, Chas. K. Douglas, Tennyson, Chas. de Lapize, Leslie Holland, Archie Gray, Mrs. D. McKee, King George V., Mdme. Maurice de Luze, Mrs. T. Roosevelt, Mrs. C. Ross, Mrs. Stewart Clark, Hugh Dickson, and Florence Pemberton. Messrs. Alex. Dickson and Sons, Newtownards, came second with a bright set, in which their own varieties figured well; Messrs. R. Harkness and Co., Hitchin, third; and Messrs. D. Prior and Son, Colchester, fourth.

For forty varieties, three blooms of each, Messrs. B. R. Cant and Sons, Colchester, led, and their best flowers were of Yvonne Vacherot, Her Majesty, O. Terks, Maman Cochet, Dean Hole, The Bride, Mdme. Jules Gravereaux, Mrs. T. Roosevelt, and Avoca; Messrs. Robt. Harkness and Co., Hitchin, second; and Messrs. Alex. Dickson and Sons third.

The China Trophy and first prize for forty-eight blooms, distinct, was annexed by Mr. G. Prince, whose flowers were very bright and fresh, especially his Comtesse de Nadaillac, White Maman Cochet, Bridesmaid, Mdme. Jules Gravereaux, Lady Ursula, and Kaiserin Augusta Victoria; there were nine entries; Mr. W. H. Frettingham, Beeston Nurseries, Notts, coming second; and Messrs. G. and W. H. Burch, Peterborough, third. Mr. W. R. Chaplin, Joyning's Nursery, Waltham Cross, came to the front for two dozen blooms, winning from seven competitors, Her Majesty, Dean Hole, and Miss Isabel Milner were good in this stand; Mr. E. J. Hicks, Hurst, Berks, second; and Mr. J. Mattock third.

The best set of sixteen trebles out of nine entries was from Mr. Hugh Dickson, who had a capital lot of Mrs. D. McKee, Hugh Dickson, Mrs. H. Dickson, Countess of Caledon, Leslie Holland, etc.; Messrs. G. and W. H. Burch second; and Messrs. Perkins and Sons, Coventry, third.

NEW GARDEN ROSE DANAE.

Flowers of medium size, soft cream-yellow. Silver-gilt Medal, National Rose Society, July 7. The Rev. J. H. Pemberton.

The D'Ombrain challenge cup for two dozen tea or noisette roses was won by Mr. G. Prince, Longworth, with some lovely flowers, some of the best being Niphetos, Mdme. Jules Gravereaux, Bridesmaid, Innocente Pirola, Mrs. E. Mawley, and White Maman Cochet; Mr. Henry Drew second; and Messrs. B. R. Cant and Sons third. The best dozen tea roses came from Messrs. Chapman and Collin, Royal Road, Leicester; Messrs. Jefferies and Son coming second; and Messrs. G. and W. H. Burch third.

Sixteen trebles of tea or noisette roses is a severe class, and here Mr. G. Prince scored with a set that contained fine examples of Mdme. Jules Gravereaux, White Maman Cochet, Mrs. E. Mawley, Molly S. Crawford, Souv. de Pierre Notting, and Muriel Grahame; Mr. Henry Drew second, and Messrs. W. Crisp and Sons, Colchester, third.

The premier award for a dozen vases of exhibition roses, seven flowers of each, fell to Messrs. Alex. Dickson and Sons, Newtownards, whose best examples were of Mabel Drew, Duchess of Wellington, Bessie Brown, Lyon Rose, Duchess of Portland, and Mrs. Cornwallis West; Messrs. D. Prior and Son second, and Messrs. G. Jefferies and Son, Cirencester, third. For nine vases under similar conditions Mr. G. Prince was an easy first, and his Mdme. Jules Gravereaux was very fine; Mr. J. Mattock second, and Mr. H. Drew, Longworth, third.

DECORATIVE ROSES.

There was a fine competition in the class for the President's prize for nine baskets of perpetual decorative roses, and here Mr. Walter Easlea, Eastwood, Essex, secured first prize for beautiful baskets of Mr. A. R. Waddell, Mdme. Melanie Soupert, Betty, G. C. Waud, Prince de Bulgarie, Gen. McArthur, Mdme. Abel Chatenay, and Lyon Rose; Mr. J. Mattock, Oxford, second, and Messrs. S. Bide and Sons, Farnham, third. For five baskets of perpetual decorative roses Mr. Hugh Dickson, Belfast, was to the front with lovely baskets of Lady Pirrie, Nellie Parker, Hugh Dickson, Sea Bird, and Mrs. James White, all new seedlings; Messrs. Spooner and Son, Woking, second, and Mr. James Pigg, Royston, third.

The best set of eighteen vases of perpetual decorative roses was from Messrs. J. Jefferies and Son, Cirencester; Lyon Rose, Mdme. Abel Chatenay were good, but none of the varieties were labelled; Mr. J. Barrow, Oadby, Leicester, second, and Mr. G. Prince third.

There were four competitors in the attractive class for thirty-six bunches of decorative roses, and these made a rare show. The Turner Challenge Cup given as first prize was won by Mr. J. Mattock, Oxford, with a grand set that included splendid bunches of Marquise de Sinety, Helene, W. A. Richardson, Maharajah, Legion d'Honneur, Gottfried Keller, Peggy, and Philadelphia Rambler. Mr. G. Prince was a good second, and Messrs. Paul and Son, Cheshunt, third. There were three entries of eighteen bunches, Messrs. W. Spooner and Son leading with a lovely set; Mr. J. Barrow second. For eighteen bunches of summer-flowering roses Messrs. W. Spooner and Son again scored, chiefly with fine bunches of rambling varieties; Messrs. Frank Cant and Co., second.

Mr. J. Pigg led for nine bunches of new decorative roses; and Messrs. Frank Cant and Co., Colchester, scored for a dozen bunches of Wichuraiana varieties, and they showed excellent bunches of Hiawatha, Leontine Gervaise, Alberic Barbier, and Dorothy Perkins.

Mr. T. Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone, scored for five stands of decorative roses, and showed Hiawatha and Blush Rambler finely; Mr. J. W. Smith, Sparrows, Herne Hall, Bushy Heath, second, and Mr. O. G. Orpen, West Bergholt, Colchester, third.

GROUPS.

The premier award and gold medal for a representative group of roses arranged on a floor space of 250 square feet went to Messrs. Paul and Son, Cheshunt, who were especially strong in cut flowers and in the number of classes represented. The group was tastefully arranged, and highly attractive. The second award was made in favour of Messrs. Hobbies, Lim., Dereham; with a beautiful group in which weeping standards were freely used, and there were large groups of Lyon Rose, Mdme. Melanie Soupert, Joseph Hill, Lady Ashtown, etc.

The best-arranged and most representative group of cut roses was the one staged by Messrs. W. and J. Brown, Peterborough. This firm made a grand display with high stands of rambling varieties and lower stands and bowls of Lyon Rose, His Majesty, Mr. P. Blair, and a host of bright tea and H.T. varieties, with sprays of polyantha roses along the front. A Gold Medal was awarded; the Silver-gilt Medal was won by Mr. F. M. Bradley, Church Street, Peterborough, and the Silver Medal by Mr. J. Mattock, Oxford, each of whom showed well.

OPEN CLASSES.

Mr. W. Bentley, Leicester, led for a stand of a crimson rose, with J. B. Clarke finely shown; King's Acre Nursery Company, Hereford, second, with Hugh Dickson, and Messrs. Stuart Low and Co., Enfield, third with G. C. Waud. Premier award for eighteen blooms of any but a white, yellow, or crimson rose was won by Mr. W. Bentley, Belgrave, Leicester, with Mrs. Theodore Roosevelt; Messrs. S. McGredy and Son, Portadown, second, with Mrs. Amy Hammond, and Mr. Hugh Dickson, third, with Mrs. Theodore Roosevelt. Messrs. S. McGredy and Son led for a white or yellow rose in a stand with Lyon Rose; Mr. Hugh Dickson second with Mrs. D. McKee.

For nine flowers of any new rose the chief award was secured by Mr. Hugh Dickson with Leslie Holland, and Messrs. A. Dickson and Sons, Newtownards, second with Mrs. Cornwallis West. The best dozen blooms of new roses came from Messrs. A. Dickson and Sons, who showed Jewel, Mabel Drew, Mrs. E. J. Holland, Duchess of Westminster, Lyon Rose, etc.

AMATEURS.

The amateur championship for the best thirty-six roses, distinct, was won this year by Mr. E. B. Lindsell, who was in grand form, and set up beautiful examples of Mdme. Jules Gravereaux, Comtesse de Nadaillac, Mrs. Stewart Clark, Frau Karl Druschki, Ulster, Mrs. J. Laing, Her Majesty, Souvenir d'Elise Vardon, Mildred Grant, Dean Hole, and Bessie Brown; Mr. Mease, gardener to Alfred Tate, Esq., Downside, Leatherhead, second, and Mr. W. Boyes, Middleton, East Yorks, third.

Mr. Lindsell also had the best two dozen flowers, and was followed in this class by Mr. Tom Park, Asken Mill, Bedale, and Mr. F. Dennison, Crawford, Leamington. Mr. Alfred Tate annexed first prize for a dozen trebles, and he showed tea roses finely here, Yvonne Vacherot being very fine; Mr. Tom Park second, and Mr. E. B. Lindsell third.

Dr. Pallett, Earl's Colne, Essex, was first for a dozen flowers of any other than a tea rose, and he scored with Mrs. W. J. Grant; Mr. H. V. Machin, Gateford Hill, Worksop, second, with Bessie Brown. The Hobbies Cup for twenty-four blooms, open to growers of fewer than 3.000 plants, was won by Mr. H. A. Darlington, Park House, Potters Bar, who was followed in order by Mr. E. M. Eversfield, Denne Park, Horsham, and Mr. W. Boyes, Middleton. Mr. Boyes scored for a dozen blooms of a variety in this section with the popular Frau Karl Druschki, the Rev. R. Powley, Warminster, coming second.

The amateurs' tea rose trophy was won by Mr. O. G. Orpen, West Bergholt, Colchester, who had a lovely box of flowers, his best being Souv. de S. A. Prince, Medea, Muriel Grahame, Mdme. Hoste, Maman Cochet, White Maman Cochet, and Catherine Mermet; Mr. Conway Jones, Hucclecote, Gloucester, second, and Mr. Tom Park, Bedale, third; six entries. Mr. Eversfield led for a dozen tea roses, and he had a very large Maman Cochet; Mr. O. G. Orpen second, and Mr. Alfred Tate third.

For eight trebles Mr. O. G. Orpen scored with Mdme. Jules Gravereaux, White Maman Cochet, Maman Cochet, Maréchal Niel, The Bride, Catherine Mermet, Souv. de Pierre Notting, and Souv. de S. A. Prince; Mr. Eversfield second, and Mr. B. Fortescue, Dropmore, third. The Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead, led for a dozen tea roses, and Mr. Conway Jones, Hucclecote, Gloucester, came to the front for exhibition roses in vases.

Decorative roses arranged in baskets were splendidly shown by Mr. H. V. Machin, whose sets of Pharisaer, Kaiserin Augusta Victoria, and Harry Kirk were very greatly admired. Mr. H. A. Darlington annexed the first prize for seven vases of decorative roses, and Mr. Orpen was first for six trebles. In other classes for decorative roses the leading competitors were Mr. Alfred Tate, Mrs. Whiteman, Bengeo, Herts, Mr. Edward Mawley, and Mr. A. H. Williams, Harrow.

Dealing briefly with the other amateur divisions, we may note that Mrs. E. Croft Murray, Pennall, Ryde, won the Christy Cup for two dozen flowers, and Mr. Courtney Page, Ridgeways, Enfield, won a piece of plate for twelve blooms, distinct. The Rev. Chalmers Hunt also secured a piece of plate, and so did Mr. H. Clinton Baker and Mr. W. Upton. The Grahame Memorial prize fell to Mr. W. Moore, Priest Hill, Caversham, for nine flowers, while the Rev. F. Kershaw, Corsley Rectory, Warminster, adds the Ben Cant Memorial Cup to his list of wins. In the maiden growers' class Mr. J. B. Walker, Market Deeping, won the piece of plate offered as chief award. Dr. Pallett won the Harkness Cup with a good set of twelve blooms in an open amateurs' class, and Mr. Boyes was successful in the class for six blooms, winning the Hammond Cup.

FLORAL ARRANGEMENTS.

The best round dinner table decoration was one of The Lyon Rose and Irish Elegance, arranged prettily by Miss Florence Molyneux, Swanmore Farm, Bishop's Waltham; Mrs. O. G. Orpen, West Bergholt, used the same varieties, and came second; Miss J. B. Langton, Raymead, Hendon, third, with a charming table of macrantha. Irish Elegance rose, most elegantly disposed by Mrs. H. A. Gerhold, Windsor Road, Penarth, secured first prize as a dinner table decoration. Mrs. Alex. Robinson, Norhyrst, Carshalton, second; and Mr. Howard Williams, Willow Cottage, Finchley, third with a pretty table of Blush Rambler.

Mr. Charles Turner, Slough, had the best arch of roses, and covered it entirely with Crimson Rambler; Mr. H. Drew, Longworth, was a good second. Mrs. G. A. Hammond, showed the best bowl of roses, and used The Lyon Rose effectively; many others used the same variety. Mrs. O. G. Orpen scored for a basket of roses, and here she used the varieties Mrs. O. G. Orpen and Blush Rambler.

MEDAL ROSES.

Silver medals were granted as follows in the amateur division: To H.T. rose Avoca, from Mr. E. B. Lehmann; best T. rose, White Maman Cochet, from Mrs. Aitchison, The Elms, Shenfield; and to H.P. rose Frau Karl Druschki, from Rev. J. H. Pemberton, Havering.

In the nurserymen's division the best H.T. rose was Mrs. Stewart Clark, from Mr. Hugh Dickson, Belfast; best T rose, Mdme. Jules Gravereaux, from Mr. G. Prince, Longworth; and best H.P. rose, Hugh Dickson, from Messrs. R. Harkness and Co., Hitchin.

Hanley Horticultural Fete.

JULY 5 and 6.

The show opened on July 5 for two days in Hanley Park, Staffs, was the fifteenth annual event under the auspices of the Hanley Horticultural Society, and in every way this year's show was worthy the society. Glorious weather prevailed, and the display in the five tents was of a high order of merit, although it must be admitted certain sections have been finer in former years than on this occasion. This remark applies chiefly to the roses, sweet peas, and the specimen plants. Mr. Poulson, the secretary, and his enthusiastic committee, were as ever genial and obliging. A deputation of the National Hardy Plant Society attended the show, and awarded a silver-gilt medal to Messrs. Harkness and Sons' fine collection of hardy flowers. Among the new plants that came before the deputation was Campanula glomerata superba from Messrs. W. Artindale and Son; Digitalis lanata and Clematis recta, from Mr. F. Boukell; and new varieties of delphiniums from Messrs. Harkness and Sons. No certificat were awarded.

PLANTS.

Five competitors contributed to what always the great feature of the show, t groups of stove and greenhouse plants. T judges on this occasion had little difficulty selecting the winner, for good as were t remaining four, the effort of Messrs. Cypher and Sons, Cheltenham, stood w ahead. As one stood on either side this gr the first point that impressed itself u one was that there was a sympathetic bl ing of colours throughout. The colours dominant were shades of yellow, orange, deeper terra cotta. Here and there a rac of white orchids, or a delicate mauve catt gave relief, but there were no violent c trasts or jarring clashes of colour. The tons, palms, caladiums, and other fo plants were well grown, and placed where they were most required. Mr. W. Holmes, West End Nurseries, Chester made a good second. He used some v good crotons, graceful oncidiums, and ever-useful Francoa ramosa to good pur but Hiawatha roses in the centre jarred little. Third position was taken by Mr. W Manning, Redford Villa, Dudley; fourt Mr. W. Vause, Leamington; and Messrs. R. Simpson and Sons, Selby, Yorks

For a group of orchids occupying 100 square feet, Messrs. Cypher and Sons had things their own way. Among the host of lovely things they staged were Cattleya Gaskelliana, Lælio-cattleya Canhamiana magnifica, a fine form of Vanda cærulea, many good odontoglossums and cypripediums. Mr. J. H. Goodacre, gardener to the Right Hon. Earl of Harrington, Elvaston Castle, Derby, was the only exhibitor of a group of Malmaison carnations; the flowers were of medium size, and of fresh appearance. For six flowering and six foliage plants, Messrs. Cypher and Sons, Cheltenham, scored, showing splendid Ixora Williamsi, Erica Bothwelli, and Allamanda nobilis, an example of Croton Montefortenensis of brilliant colour, and some noble palms. Second prize went to Mr. W. Vause, Leamington; third, Mr. W. R. Manning, Dudley.

In the section confined to gentlemen's gardeners and amateurs, some really excellent groups of plants were arranged, the winner being Mr. Ben Smith, gardener to A. H. Maddock, Esq., The Cedars, Alsager. The features of this group were a central mound of liliums and carnations surmounted by a Cocos Weddelliana, tall crotons at the corners, with crassulas at the base, and several tall plants of Hiawatha and other roses. Mr. Chas. Roberts, gardener to Mrs. Swann, Halston Hall, Oswestry, took second place, using a number of anthuriums, dracænas, and crotons among roses, schizanthus, begonias, and other flowering plants. Mr. G. F. Goodill, gardener to Mrs. Meakin, Darlaston Hall, Stone, secured third; and fourth prize went to Mr. A. Townsend, gardener to Bernard Howson, Esq., Market Drayton. Mr. Ben Smith scored both for twelve caladiums and for six hardy ferns.

ROSES

were not nearly so good as we have seen them at Hanley, the prevailing fault being lack of substance. The big class for seventy-two distinct varieties found Messrs. R. Harkness and Co., Hitchin, first. Among his best flowers were Maman Cochet, Prince Arthur, and Mrs. Myles Kennedy. Messrs. Alex. Dickson and Sons, Lim., Newtownards, Co. Down, came second; and Messrs. Perkins and Sons, Coventry, third.
